(a) The denominator for calculating the proportion of children excludes Aboriginal and Torres Strait Islander children living independently and those whose living arrangements were unknown.

(b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported.

(c) The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer.

(d) Residential care includes family group homes.

(e) Victoria: During 2006-07, Victoria introduced a major new data system, which was progressively rolled out across the State. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with data for previous years.

(f) Queensland: There may be some children in the category residential care/independent living who had Aboriginal and Torres Strait Islander caregivers in facility-based care.

TABLE 4A.11.7

Table 4A.11.7 **Aboriginal and Torres Strait Islander children in out-of-home care by relationship of caregiver, by State and Territory, at 30 June 2005 to 2015 (number and proportion) (a), (b), (c), (d)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (e)</i>	<i>Qld (f)</i>	<i>WA (g)</i>	<i>SA (h)</i>	<i>Tas</i>	<i>ACT</i>	<i>NT (i)</i>	<i>Aust (j)</i>
(g) WA: A small number of children are placed with externally managed foster carers who are also their relative and have been recorded in the foster care category.										
(h) SA: During 2012-13, SA changed databases, which resulted in a data recording issue leading to an undercount of children placed in compliance with the Aboriginal Child Placement Principle. Due to these data issues, SA child protection data for this indicator for 2012-13 is likely to be incorrect and cannot be reliably compared with data for previous years.										
(i) NT: In the NT, children placed with family members have been included in the 'Aboriginal and Torres Strait Islander relative/kin' category. Improvement in data quality in 2008-09 resulted in a more accurate count of children in out-of-home care. The number of children in out-of-home care reported in 2007-08 was likely to be undercounted. Due to realignment of placement types to ensure better data integrity, data for the financial year 2012-13 may not be comparable with data provided for previous financial years.										
(j) Aust: For 2004, Australia total does not include NSW.										
(k) Reference to 'Aboriginal Child Placement Principle' has been amended to 'Aboriginal and Torres Strait Islander Child Placement Principle' from 2015, in accordance with the National Framework for Protecting Australia's Children, third three-year action plan, 2015–2018.

Syphilis	77	6	97	13	–	61

(a) The occurrence of chlamydia, gonorrhea and infectious syphilis among people aged 15 years or younger is described, based on cases notified to the National Notifiable Diseases Surveillance System and is summarised only for those jurisdictions in which Aboriginal and Torres Strait Islander status was reported for at least 50 per cent of notifications in each year over the past five years.

– Nil or rounded to zero.

RSE = Relative standard error. **CI** = Confidence interval.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Estimates with a Relative Standard Error (RSE) of 25 per cent to 50 per cent should be used with caution.

(c) In the General Social Survey and non-remote areas of the National Aboriginal and Torres Strait Islander Social Survey in order for a person to be a victim of physical or threatened violence, the threat must have been made 'in person'. This concept of 'in person' is not overt in the question used in remote areas of the National Aboriginal and Torres Strait Islander Social Survey.

(d) Includes not stated.

(a) Data are from public and private hospitals in all jurisdictions. Data for this report are based on the AIHW standard methodology of principal diagnosis of assaults. These data will not be comparable to results published in previous reports where a broader count was reported.

(b) Non-fatal refers to records where the mode of separation was not equal to 'died'. Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member. These are the fifth digit details of ICD-10-AM codes for assault X85–Y09, where the relationship of the perpetrator to the victim is spouse/domestic partner, 0; parent, 1; other family member 2. Hospitalisations were based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(c) Non-Indigenous includes hospitalisations where Indigenous status was recorded as non-Indigenous and for WA only where Indigenous status was not stated.

(d) Rate ratio is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(e) Rates per 100 000 population, directly age standardised using the 2001 Australian population.

.. Not applicable.

TABLE 4A.12.14

Table 4A.12.14 **Non-fatal hospitalisations for family violence related assaults, by Indigenous status, by sex, 2004-05 to 2014-15 (a), (b)**

	<i>Aboriginal and Torres Strait Islander</i>			<i>Other (c)</i>			<i>Rate ratio (d)</i>		
	<i>Male</i>	<i>Female</i>	<i>People</i>	<i>Male</i>	<i>Female</i>	<i>People</i>	<i>Male</i>	<i>Female</i>	<i>People</i>
2005-06	165.4	476.9	323.8	9.4	16.2	12.8	17.6	29.4	25.3
2004-05	175.2	456.9	319.3	8.7	15.8	12.2	20.2	29.0	26.1

(a) Non-fatal refers to records where the mode of separation was not equal to 'died'. Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member. These are the fifth digit details of ICD-10-AM codes for assault X85–Y09, where the relationship of the perpetrator to the victim is spouse/domestic partner, 0; parent, 1; other family member 2. Hospitalisations were based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Data are for public and private hospitals in all jurisdictions. Data for this report are based on the AIHW standard methodology of principal diagnosis of assaults. These data will not be comparable to results published in previous reports where a broader count was reported.

(c) 'Other' includes hospitalisations where Indigenous status was recorded as non-Indigenous or not stated.

(d) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the 'other Australians' hospitalisation rate (which includes Indigenous status not reported).

(e) Rates per 100 000 population, directly age standardised using the 2001 Australian population.

(f) From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. Data are for residents of these jurisdictions, and exclude separations from private hospitals in the NT.

.. Not applicable.

TABLE 4A.12.15

Table 4A.12.15 **Non-fatal hospitalisation rate (per 100 000 population) for family violence related assaults, by Indigenous status, by remoteness, 2012-13 to 2014-15 (a), (b)**

	Numbers			Crude rates per 100 000		AS rates per 100 000 (c)		Rate ratio (e)
	Aboriginal and Torres Strait Islander	Non-Indigenous (d)	Not stated	Aboriginal and Torres Strait Islander	Non-Indigenous (d)	Aboriginal and Torres Strait Islander	Non-Indigenous (d)	
2014-15								
Major cities	396.0	2 051.0	38.0	156.5	12.4	169.6	12.3	13.8
Inner and outer regional	625.0	833.0	20.0	194.8	13.7	221.3	15.4	14.4
Remote and very remote	1 540.0	96.0	6.0	1 044.4	24.6	1 052.2	25.2	41.7
2013-14								
Major cities	375.0	1 940.0	38.0	151.8	12.0	161.5	11.9	13.6
Inner and outer regional	625.0	817.0	12.0	199.8	13.6	219.4	15.2	14.4
Remote and very remote	1 649.0	91.0	8.0	1 128.4	23.6	1 149.6	22.9	50.1
2012-13								
Major cities	350.0	1 817.0	46.0	145.0	11.4	159.4	11.3	14.1
Inner and outer regional	552.0	787.0	27.0	180.9	13.3	203.7	15.0	13.6
Remote and very remote	1 847.0	111.0	9.0	1 275.2	29.0	1 298.5	28.5	45.5

(a) Data are from public and private hospitals in all jurisdictions. Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(b) Non-fatal refers to records where the mode of separation was not equal to 'died'. Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member. Data for this report are based on the AIHW standard methodology of principal diagnosis of assaults. These data will not be comparable to results published in previous reports where a broader count was reported.

(c) Rates by remoteness are calculated using AIHW derived populations using ABS population estimates and projections based on the 2011 Census. Age standardised (AS) rates directly age standardised to the 2001 Australian population.

Table 4A.12.15 **Non-fatal hospitalisation rate (per 100 000 population) for family violence related assaults, by Indigenous status, by remoteness, 2012-13 to 2014-15 (a), (b)**

<i>Numbers</i>			<i>Crude rates per 100 000</i>		<i>AS rates per 100 000 (c)</i>		<i>Rate ratio (e)</i>
<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (d)</i>	<i>Not stated</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (d)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (d)</i>	

(d) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only those for whom Indigenous status was not stated.

(e) Rate ratio is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

TABLE 4A.12.19

Table 4A.12.19 **Non-fatal hospitalisations for assault, by Indigenous status, by remoteness, by relationship of victim to perpetrator, Australia, 2014-15 (a), (b), (c)**

	<i>Hospitalisations (no.)</i>			<i>Crude rate per 100 000</i>		<i>AS rate per 100 000 (d)</i>		<i>Rate ratio (f)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (e)</i>	<i>Not stated</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (e)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (e)</i>	
Other (g)	1 234	229	14	836.9	58.7	856.5	58.4	14.7
Total assault (X85–Y09)	2 969	414	22	2 013.6	106.0	2 040.7	106.8	19.1

(a) Data are from public and private hospitals in all jurisdictions. Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(b) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Non-fatal refers to records where the mode of separation was not equal to 'died'. Hospitalisations were based on ICD-10-AM codes for assault X85–Y09.

(c) Data include all separations with a principal diagnosis of injury or poisoning (S00-T98) and a first reported external cause in the range X85-Y09. This specification is different to that used in previous OID reports.

(d) Rates per 100 000 population are calculated using calculated using ABS Estimated Resident Population by remoteness classification from the 2011 Census. Rates were directly age standardised to the 2001 Australian population.

(e) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.

(f) Rate ratio is the age standardised Aboriginal and Torres Strait hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(g) Other assaults includes assault by a carer, acquaintance or friend, official authorities, other specified person, person unknown to the victim, multiple people unknown to the victim or an unspecified person.

55–64 years	11	6.4	8.5	69	0.8	0.4	8.4	5.7
65+ years	–	–	–	90	0.8	0.4	–	np
Total	192.0	6.4	2.0	768.0	1.0	0.1	6.4	5.4

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in *Causes of Death, Australia, 2014* (cat. no. 3303.0).

(b) ICD-10 codes X85–Y09 and Y87.1 included.

(c) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Indigenous identification in mortality data. Data for these jurisdictions overrepresent Aboriginal and Torres Strait Islander populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions.

(d) Although most deaths of Aboriginal and Torres Strait Islander Australians are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these statistics are likely to underestimate the Aboriginal and Torres Strait Islander mortality rate. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous mortality rates because of these data quality issues.

(e) These data exclude 14 registered deaths where the Indigenous status was not stated over the period 2010–14.

Table 4A.12.25 **Homicide death rates (per 100 000 population) (crude rates), by Indigenous status, by age, NSW, Queensland, WA, SA and the NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

<i>Aboriginal and Torres Strait Islander</i>			<i>Non-Indigenous</i>			<i>Rate ratio (i)</i>	<i>Rate difference (j)</i>
<i>Deaths (no.)</i>	<i>Rate per 100 000 (h)</i>	<i>Variability band</i>	<i>Deaths (no.)</i>	<i>Rate per 100 000</i>	<i>Variability band</i>		

(f) Cells with small values have been randomly assigned to protect the confidentiality of individuals, so some totals will not equal the sum of their components. Cells with a zero value have not been affected.

(g) Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(h) Age-specific rates calculated per 100 000 estimated resident population of the midpoint for the time period.

(i) Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.

(j) Rate difference is the mortality rate for Aboriginal and Torres Strait Islander Australians minus the mortality rate for non-Indigenous Australians.

np Not published. – Nil or rounded to zero.

TABLE 4A.12.26

Table 4A.12.26 **Homicide death rates (per 100 000 population) (age standardised), by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

	<i>Aboriginal and Torres Strait Islander</i>			<i>Non-Indigenous</i>			<i>Rate ratio (i)</i>	<i>Rate difference (j)</i>
	<i>Deaths (no.)</i>	<i>AS rate per 100 000 (h)</i>	<i>Variability band</i>	<i>Deaths (no.)</i>	<i>AS rate per 100 000 (h)</i>	<i>Variability band</i>		
Males	119	8.8	3.7	499	1.3	0.3	6.8	7.5
Females	73	5.2	2.7	269	0.7	0.2	7.6	4.5
Persons	192	7.0	2.3	768	1.0	0.2	7.0	6.0

(a) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Indigenous identification in mortality data. Data for these jurisdictions overrepresent Aboriginal and Torres Strait Islander populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions.

(b) Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period.

(c) These data exclude 14 registered deaths where the Indigenous status was not stated over the period 2010–2014.

(d) Although most deaths of Aboriginal and Torres Strait Islander Australians are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these statistics are likely to underestimate the Aboriginal and Torres Strait Islander mortality rate. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous mortality rates because of these data quality issues.

(e) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–2012 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in *Causes of Death, Australia, 2014* (cat. no. 3303.0).

(f) Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(g) Population data between Census years are based on assumptions about past and future levels of fertility, mortality and migration, and have a degree of uncertainty.

(h) Directly age-standardised using the 2001 Australian standard population, by 5-year age group up to 75 years and over.

(i) Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.

TABLE 4A.12.26

Table 4A.12.26 **Homicide death rates (per 100 000 population) (age standardised), by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

(a) Remoteness area of homicide based on ABS postal area to remoteness area concordance 2001 (ABS Cat. No. 9921.0).

(b) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change.

(c) Excludes cases where Indigenous status of victim is unknown or remoteness area of homicide incident is unknown.

(d) Victims and offenders are either Aboriginal and/or Torres Strait Islander Australians. Includes victims of multiple offenders where the primary offender (based on AIC NHMP incident classification) is Aboriginal and/or Torres Strait Islander.

(e) Victims and offenders are not Aboriginal and Torres Strait Islander Australians. Non-Indigenous includes Caucasian, Asian and Maori/Pacific Islanders. Includes victims of multiple offenders where the primary offender (based on AIC NHMP classification) is neither Aboriginal nor Torres Strait Islander.

(f) Population denominators for remoteness areas have been derived by applying the proportions of Aboriginal and Torres Strait Islander people living in each remoteness area to experimental estimates and projections (low series) of the Aboriginal and Torres Strait Islander population published by the ABS. Non-Indigenous denominators have been derived by applying proportions of non-Indigenous people in each remoteness area to non-Indigenous population estimates derived by subtracting ABS Aboriginal and Torres Strait Islander population projections from the ABS total Estimated Resident Population for each year. Therefore, data should be used with caution.

(a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change.

(b) Table reflects Indigenous status and selected motives (based on AIC NHMP incident classification). Excludes cases where Indigenous status of victim is unknown or sex of victim is unknown.

(c) Both victims and offenders are either Aboriginal and/or Torres Strait Islander.

(d) Neither victims nor offenders are Aboriginal and/or Torres Strait Islander. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders.

(e) Domestic altercation includes jealousy, desertion/termination and argument of a domestic nature. Other argument includes other argument, revenge, envy, racial/sexual vilification & political/sexual gratification.

(f) Other includes mercy killing/consented suicide pact, apparently delusional and preventing the victim from testifying, escape relationship.

– Nil or rounded to zero.

(a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change. Excludes missing information.

(b) Table reflects Indigenous status and selected comparative statistics of primary victims and offenders (based on AIC NHMP incident classification) for incidents with multiple victims and/or offenders.

(c) Both victims and offenders are either Aboriginal and/or Torres Strait Islander.

(d) Neither victims nor offenders are Aboriginal and/or Torres Strait Islander. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders.

(e) Inter-racial homicides where either the victim or the offender is Aboriginal and/or Torres Strait Islander (including homicides involving an Aboriginal and/or Torres Strait Islander offender and a non-Indigenous victim, and a non-Indigenous offender and an Aboriginal and/or Torres Strait Islander victim).

– Nil or rounded to zero.

Total	52 595	100.0	171 980	100.0

(a) Includes adjustment for agency non-response and where the client statistical linkage key is incomplete. Excludes clients who did not state their Indigenous status. Indigenous status was not reported for 11 per cent of clients in 2014-15. Excludes clients who did not report a reasons for seeking assistance (2681 in 2014-15). Refer to the SHSC Annual Report for further details.

(b) Includes housing crisis; inadequate or inappropriate dwelling conditions; previous accommodation ended.

(c) Includes relationship/family breakdown; time out from family/other situation.

(d) Includes financial difficulties; housing affordability stress; employment difficulties; unemployment.

(e) Includes transition from custodial arrangements; from foster carer and child safety residential placements.

(f) Includes transition from other care arrangements; discrimination including racial and sexual discrimination; unable to return home due to environmental reasons; disengagement with school or other education and training; lack of family and/or community support.

AS = Age standardised.

(a) Includes adjustment for agency non-response and where the client statistical linkage key is incomplete. Excludes clients who did not state their Indigenous status. Indigenous status was not reported for 11 per cent of clients in 2014-15. Refer to the SHSC Annual Report for further details.

(b) Refer to the SHSC Annual Report for details on this data item.

(c) Per 10 000 population aged 10 years or over shows how many Aboriginal and Torres Strait Islander and non-Indigenous people out of every 10 000 Aboriginal and Torres Strait Islander and non-Indigenous people aged 10 years or over in the population of that sex became SHSC clients. The rate is estimated by comparing the number of Aboriginal and Torres Strait Islander and non-Indigenous SHSC clients aged 10 years or over with the estimated resident Aboriginal and Torres Strait Islander and non-Indigenous population aged 10 years or over with the designated sex as at 30 June 2014 (based on the 2011 Census of Population and Housing). Age Standardised (AS) rates are directly age standardised to the 2001 Australian standard population.

(d) The number of clients within a State or Territory relates to clients who ever received assistance from a SHS agency in that State or Territory. Since a client may have support periods in more than one State or Territory, state and territory figures do not sum to the national figure.

(e) Total (Australia) includes not stated sex, not stated remoteness and therefore the sum of the components may not add to the total.

.. Not applicable.

5–9 years		2 661	32.8	322	5 453	32.6	39
10–14 years		1 570	19.3	201	3 760	22.5	28
15–17 years		482	5.9	103	1 222	7.3	15
Total		8 118	100.0	278	16 730	100.0	33

(a) Clients were included if they were identified as experiencing domestic and family violence, were aged 0–17 (inclusive), and they presented to an agency with others at the beginning of their support. It is assumed that clients aged under 15 did not present by themselves.

(b) Includes adjustment for agency non-response and where the client statistical linkage key is incomplete. Excludes clients who did not state their Indigenous status. Indigenous status was not reported for 11 per cent of clients in 2014–15.

(c) Per 10 000 population shows how many children out of every 10 000 Aboriginal and Torres Strait Islander and non-Indigenous children in the population became SHSC clients. The rates are estimated by comparing the number of SHSC clients who were children with the corresponding projected resident population as at 30 June 2014 (based on the 2011 Census of Population and Housing).

TABLE 4A.13.4

Table 4A.13.4 Aboriginal and Torres Strait Islander crude imprisonment rates per 100 000 adult population, by sex, by State and Territory, 2000 to 2015 (a), (b), (c)

	<i>NSW (d)</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT (d)</i>	<i>NT</i>	<i>Aust (d)</i>
2004	1 607.7	862.4	1 363.7	2 863.7	1 410.9	521.4	1 135.4	1 519.3	1 588.8
2003	1 630.1	830.0	1 398.9	2 461.8	1 422.7	484.6	752.6	1 600.9	1 557.2
2002	1 603.7	781.8	1 431.6	2 172.4	1 463.3	577.3	1 237.6	1 321.6	1 492.8
2001	1 461.9	753.6	1 429.9	2 742.9	1 427.2	390.9	1 058.8	1 348.9	1 517.5
2000	1 390.1	704.2	1 350.8	2 635.0	1 445.1	380.9	1 040.5	1 171.3	1 433.5

(a) Crude means the rates have not been age standardised; thus, they do not take into account the different age structures of the Aboriginal and Torres Strait Islander and non-Indigenous populations.

(b) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS 'recast' the historical estimates for Aboriginal and Torres Strait Islander populations. As a result, the rates per 100,000 adult persons in this table have been recast, and all now use final ERP data based on the 2011 Census of Population and Housing.

(c) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.

(d) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

– Nil or rounded to zero.

(a) Age-standardised to the 2001 Australian population.

(b) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.

(c) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

(d) Data for NSW exclude ACT prisoners held in NSW prisons.

(e) Data prior to 2006 include people 17 years of age.

(f) Data in 2000 include people 17 years of age.

(g) Data for ACT include ACT prisoners held in the ACT as well as ACT prisoners held in NSW. From 2006, excludes breaches of periodic detention orders greater than three months.

(a) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.

Table 4A.13.6 Number and proportion of prisoners by legal status, by Indigenous status, by State and Territory, at 30 June, 2007 to 2015 (a)

	<i>NSW (b)</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT (b)</i>	<i>NT</i>	<i>Aust (b)</i>
(b) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

Table 4A.13.9 Mean and median age of prisoners, by sex, by Indigenous status, by State and Territory, at 30 June, 2007 to 2015 (a)

	NSW (b)	Vic	Qld	WA	SA	Tas	ACT (b)	NT	Aust (b)
(a) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.									
(b) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.									

– Nil or rounded to zero.

2008-09	19.1	15.2	23.6	38.3	19.6	7.4	30.0	15.3	22.0
2007-08	21.9	17.3	19.5	43.0	20.4	10.9	22.9	21.1	24.3

(a) Age is calculated at the start of the financial year if the first period of detention began before the start of the financial year, otherwise age is calculated at the start of the first period of detention.

(b) Numbers may not sum due to rounding.

(c) WA and the NT did not provide Juvenile Justice National Minimum Data Set data for 2008–09 to 2014–15 (WA) and 2011–12 to 2014–15 (NT), non-standard data for WA and NT are reported and included in Aust. totals. National totals may vary from those published in *Youth justice in Australia 2014–15* (AIHW 2016) for 2009–10 and 2010–11 due a different source of data for the NT.

(d) Rates are calculated using preliminary estimates for the Estimate Resident Population at December 2014 and 2015 and the number of young people on an average day rounded to whole numbers and may therefore vary from the rates published in *Youth Justice in Australia 2014-15*. In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS 'recast' the historical estimates for Aboriginal and Torres Strait Islander populations. As a result, the rates per 100,000 persons in this table have been recast, and all now use final ERP data based on the 2011 Census of Population and Housing.

5 Governance, leadership and culture

Strategic areas for action

Effective governance and leadership, and recognition of culture, play essential parts in the social and economic development of Aboriginal and Torres Strait Islander Australians, and influence virtually all indicators in the framework.

Governance refers to the way the members of a group or community organise themselves to make decisions that affect themselves and others, and includes both Aboriginal and Torres Strait Islander governance and government governance. Leadership is important to the development of a strong governance culture, and there are specific cultural aspects to Aboriginal and Torres Strait Islander leadership. The term ‘culture’ used here embraces the diverse Aboriginal and Torres Strait Islander nations and peoples, each with its own distinct cultural norms, law, language and identity, and which are dynamic in nature. Culture covers many positive outcomes that are important to Aboriginal and Torres Strait Islander Australians’ conception of wellbeing, and goes beyond overcoming disadvantage.

The following indicators are included in the ‘Governance, leadership and culture’ strategic area:

- Valuing Indigenous Australians and their cultures (section 5.1) — one of the principles of the Closing the Gap strategy is emphasising mutual respect between Aboriginal and Torres Strait Islander and non-Indigenous Australians, and is also part of the Australian Government’s response to the UN Declaration on the Rights of Indigenous Peoples
- Participation in decision making (section 5.2) — participation in decision making is a key element in the UN Declaration on the Rights of Indigenous Peoples, and has been cited as an important factor in self-determination and improving outcomes
- Engagement with services (section 5.3) — ‘Engagement’ is a broad concept that encompasses both accessibility (including barriers to access) and appropriate delivery

(including recognition of Aboriginal and Torres Strait Islander cultural perspectives in designing and delivering programs)

- Case studies in governance (section 5.4) — the case studies emphasise the importance of culture as an essential determinant of good governance
- Indigenous language revitalisation and maintenance (section 5.5) — for many Aboriginal and Torres Strait Islander Australians, language is an important aspect of culture and wellbeing
- Indigenous cultural studies (section 5.6) — cultural studies can benefit both Aboriginal and Torres Strait Islander people (can contribute to improved academic outcomes) and non-Indigenous young people (can lead to shared views and increased respect)
- Participation in community activities (section 5.7) — art and ceremony are significant markers of cultural strength, and there is evidence that a range of sport and community activities can foster self-esteem, social interaction and the development of skills and teamwork, leading to good physical and mental health and wellbeing
- Access to traditional lands and waters (section 5.8) — access to land and waters may allow Aboriginal and Torres Strait Islander Australians to practise and maintain their knowledge of ceremonies, rituals and history. There may also be other social and economic benefits from connection to traditional country (see section 9.2 on ‘Indigenous owned or controlled land and business’).

The Steering Committee acknowledges the diversity of Aboriginal and Torres Strait Islander cultures. While there has been general endorsement of the cultural indicators in this report, they may not reflect the aspirations of all Aboriginal and Torres Strait Islander Australians.

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 5A.2.1). These tables can be found on the web page (www.pc.gov.au/oid2016).

5.1 Valuing Indigenous Australians and their cultures¹

Box 5.1.1 Key messages

- Culture is a key aspect of Aboriginal and Torres Strait Islander wellbeing — not just knowledge and practice of culture by Aboriginal and Torres Strait Islander Australians, but respect for that culture among the wider community.
- In 2014:
 - the majority of Aboriginal and Torres Strait Islander Australians, and over half of the general community reported feeling personally proud of Aboriginal and Torres Strait Islander culture (86.3 per cent, and 56.5 per cent respectively)
 - nearly all Aboriginal and Torres Strait Islander Australians considered that it was important for all Australians to know about Aboriginal and Torres Strait Islander cultures (93.4 per cent) and history (94.1 per cent) and close to four out of five general community respondents regarded Aboriginal and Torres Strait Islander culture (79.5 per cent) and history (83.2 per cent) as important (table 5A.1.3).
- In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15 years and over:
 - more than one in three reported they felt treated unfairly (due to their Indigenous status) in the last 12 months (38.6 per cent) (tables 5A.1.11)
 - those living in very remote areas were less likely to have reported unfair treatment in the last 12 months than those living in major cities (34.5 per cent and 41.2 per cent, respectively) (figure 5.1.2).

Box 5.1.2 Measures of valuing Indigenous Australians and their cultures

There are five main measures for this indicator.

Four of the measures report data for Aboriginal and Torres Strait Islander Australians and the general population, aged 18 years and over, from Reconciliation Australia's Australian Reconciliation Barometer with the most recent data for 2014 (national: Aboriginal and Torres Strait Islander Australians and general community²).

Due to extensive revision to the Barometer, including the measurement instrument and sampling design, data from 2014 onwards are not directly comparable to earlier data.

- *Knowledge of Aboriginal and Torres Strait Islander cultures* is defined as the proportion of people rating their level of knowledge about Aboriginal and Torres Strait Islander cultures as 'high'

(continued next page)

¹ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, and Reconciliation Australia, for reviewing a draft of this section of the report.

² Reconciliation Australia advised that the general community sample was selected to be representative of the general community, and included a small number of Aboriginal and Torres Strait Islander Australians (1.5 per cent) in 2014.

Box 5.1.2 (continued)

- *Recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia* is reported using two proxy measures:
 - *Pride in Aboriginal and Torres Strait Islander cultures* is defined as the proportion of people who agree that they are personally proud of Aboriginal and Torres Strait Islander cultures
 - *Importance of knowledge about Aboriginal and Torres Strait Islander cultures and history* is defined as the proportion of people who agree that it is important that all Australians know about Aboriginal and Torres Strait Islander cultures, and the history of Aboriginal people in Australia.
- *Level of trust* is defined as the proportion of people rating their perceptions of the level of trust between Aboriginal and Torres Strait Islander Australians and the general community as 'high'
- *Level of prejudice* is defined as the proportion of people rating their perceptions of the level of prejudice between Aboriginal and Torres Strait Islander Australians and the general community as 'low'.

One measure reports data for Aboriginal and Torres Strait Islander Australians from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) (15 years and over)/National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) (18 years and over), with the most recent available data for 2014-15 from the NATSISS (all jurisdictions: Indigenous; remoteness).

Discrimination due to Indigenous status is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 18 years and over who felt treated unfairly against (including those who responded they did not know if they'd been treated unfairly) due to their Indigenous status, in the previous 12 months.

Culture is a key aspect of Aboriginal and Torres Strait Islander wellbeing — not just knowledge and practice of culture by Indigenous Australians, but respect for that culture among the wider community.

In 2014, Reconciliation Australia (RA) developed a framework to measure Australia's progress towards reconciliation (RA 2016). As a result of this work, the following five dimensions were identified to measure reconciliation in Australia:

- unity – recognition and understanding of Aboriginal and Torres Strait Islander histories and cultures as a proud part of a shared national identity
- historical acceptance — the acknowledgements of the past (including injustices) and their impacts (both historical and contemporary), and making amends
- race relations — all Australians understand and value Aboriginal and Torres Strait Islander and non-Indigenous cultures, rights and experiences which results in stronger relationships based on trust and respect and free of racism

-
- equality and equity — including equality for Aboriginal and Torres Strait Islander peoples (such as in health, education and employment), as well as cultural security, self-determination and their individual and collective rights
 - institutional integrity – the degree to which the nation’s political, business and community structures actively support reconciliation (Polity Research & Consulting 2015; RA 2016).

The data that support these measures are sourced from the main data source for this section, the Australian Reconciliation Barometer, with a number of measures in this section also used to report against the dimensions above.

Mutual respect

Reconciliation Australia explains that mutual respect:

... measures respect based on our level of understanding and pride in the cultures and contributions of Aboriginal and Torres Strait Islander peoples. We believe that as the level of knowledge and understanding increases, more Australians will share in the pride that Aboriginal and Torres Strait Islander people feel for their histories and cultures (RA 2013).

The term ‘cultures’ used here embraces the diverse Aboriginal and Torres Strait Islander nations and peoples, each with its own ‘distinct cultural norms, law, language and identity’ (AHRC 2013a). Aboriginal and Torres Strait cultures are not static, nor relegated to history, but are dynamic exchanges, which are ‘understood through engaging in inter-cultural dialogue, either in personal contact or through representations and signs’ (Langton and Council for Aboriginal Reconciliation 1994).

Knowledge of Aboriginal and Torres Strait Islander cultures

In 2014, a larger proportion of Aboriginal and Torres Strait Islander Australians rated their knowledge about the culture (69.0 per cent) and history (75.3 per cent) of Aboriginal and Torres Strait Islander Australians as ‘high’, compared with the general community respondents (29.9 per cent and 38.7 per cent respectively) (figure 5.1.1).

Figure 5.1.1 Perceptions of knowledge of Aboriginal and Torres Strait Islander history and culture, Aboriginal and Torres Strait Islander and other Australians, 2014^{a, b}

^a Participants were asked to describe their knowledge about the history, and culture of Aboriginal and Torres Strait Islander Australians on a scale ranging from 'no knowledge at all/very low, fairly low, fairly high, or very high'. ^b Participants from both groups completed the survey questionnaires online. Relative standard errors and 95 per cent confidence intervals for these data should be considered when interpreting these data, and are available in attachment table 5A.1.1.

Sources: Reconciliation Australia (unpublished) Australian Reconciliation Barometer 2014; table 5A.1.1.

Recognition of Aboriginal and Torres Strait Islander contributions to Australia

Aboriginal and Torres Strait Islander Australians contribute in every area of public, social and community life, including the arts, media, academia, politics, sport and business. However, there are no data currently available for the Steering Committee's preferred measure of 'recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia'. The Australian Reconciliation Barometer provides data for two proxy measures.

Importance of knowledge about Aboriginal and Torres Strait Islander cultures and history:

- In 2014, nearly all Aboriginal and Torres Strait Islander respondents considered that it was important for all Australians to know about Aboriginal and Torres Strait Islander cultures (93.4 per cent) and history (94.1 per cent)
- Close to four out of five general community respondents regarded Aboriginal and Torres Strait Islander culture (79.5 per cent) and history (83.2 per cent) as important (table 5A.1.3).

Pride in Aboriginal and Torres Strait Islander cultures:

- In 2014, the majority of Aboriginal and Torres Strait Islander respondents (86.3 per cent), and over half of the general community respondents (56.5 per cent) reported feeling personally proud of Aboriginal and Torres Strait Islander culture (table 5A.1.5).

Progress on a stronger relationship

Stronger relationships between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians build and sustain mutual respect, while mutual respect contributes to stronger relationships — a virtuous circle. For example, Aboriginal and Torres Strait Islander Australians were more likely to respond that they did not trust people, if they had reported they experienced discrimination (46.9 per cent) compared to those who had not (34.1 per cent) (ABS 2010).

A positive relationship is seen as essential to reconciliation (RA 2016), and a stronger relationship can be defined as:

... our perceptions of how we think the relationship is going and whether we think it is important. It also tests for high levels of trust and low levels of prejudice ... (RA 2013).

Data from the Australian Reconciliation Barometer are used to explore the levels of trust and prejudice, which reflect (usually negative) *attitudes* toward Aboriginal and Torres Strait Islander Australians. ABS survey data are used to explore the experience of discrimination, which is (usually negative) *behaviour and actions* toward Aboriginal and Torres Strait Islander Australians.

Trust

The Australian Reconciliation Barometer includes information on perceptions of mutual trust of both Aboriginal and Torres Strait Islander respondents and general community respondents aged 18 years and over. Data for 2014 show low proportions believed trust is high:

- in relation to *Aboriginal and Torres Strait Islander Australians trusting other Australians*, 40.0 per cent of Aboriginal and Torres Strait Islander respondents considered that Aboriginal and Torres Strait Islander Australians had a high level of trust in other Australians, which was larger than the proportion for the general community respondents (20.6 per cent)
- in relation to *other Australians trusting Aboriginal and Torres Strait Islander Australians*, 35.4 per cent of Aboriginal and Torres Strait Islander respondents considered that other Australians had a high level of trust in Aboriginal and Torres Strait Islander Australians, larger than the 25.4 per cent of general community respondents (table 5A.1.7).

Prejudice

Prejudice takes the form of unfavourable opinion or attitudes toward individuals who belong to a particular group. Reconciliation Australia notes that ‘high levels of prejudice reflect low levels of understanding about one another’ (RA 2013).

The Australian Reconciliation Barometer includes information on perceptions of prejudice of Aboriginal and Torres Strait Islander respondents and general community respondents towards Aboriginal and Torres Strait Islander Australians. Data for 2014 show that:

- 27.5 per cent of Aboriginal and Torres Strait Islander respondents perceived that other Australians held a ‘low’ level of prejudice toward Aboriginal and Torres Strait Islander Australians
- 36.1 per cent of general community respondents perceived that other Australians held a ‘low’ level of prejudice toward Aboriginal and Torres Strait Islander Australians (table 5A.1.9).

Data on the perceptions of knowledge about, and importance of, Aboriginal and Torres Strait Islander history and culture, as well as pride, trust and prejudice, by Indigenous status are available for 2008, 2010 and 2012 in tables 5A.1.2, 5A.1.4 5A.1.6 5A.1.8 5A.1.10. These data are not directly comparable with 2014.

Discrimination

The Australian Human Rights Commission (AHRC 2013b) states that racial discrimination occurs when a person is treated less favourably than another person in a similar situation, because of their race. The Australian Government has a legal obligation to promote equality and prohibit discrimination on the basis of race, as set out under the *Racial Discrimination Act 1975* (AHRC 2013b).

In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15 years and over:

- more than one in three (38.6 per cent) reported they felt treated unfairly (due to their Indigenous status) in the last 12 months (tables 5A.1.11)
- the most common experience of unfair treatment was through hearing racial comments/jokes (23.0 per cent), and the most recent experience of unfair treatment was from members of the public (8.7 per cent) (tables 5A.1.11 and 5A.1.13)
- those living in very remote areas were less likely than those living in major cities to have reported unfair treatment in the last 12 months (34.5 per cent and 41.2 per cent, respectively), mainly due to a lower proportion hearing racial comments/jokes (11.5 per cent in very remote areas compared to 27.5 per cent in major cities) (figure 5.1.2; table 5A.1.12).

Figure 5.1.2 Aboriginal and Torres Strait Islander Australians aged 15 years and over who felt treated unfairly against in last 12 months, by remoteness, 2014-15

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15; table 5A.1.12.

In 2014-15, 8.7 per cent of Aboriginal and Torres Strait Islander Australians aged 2 to 14 years were reported (by proxy) to have been treated unfairly at their current or previous school because of their background (tables 5A.1.20). Data by remoteness area are available in tables 5A.1.22-23.

Data from the 2012-13 Aboriginal and Torres Strait Islander Health Survey on how Aboriginal and Torres Strait Islander Australians aged 18 years and over felt after being discriminated against and what they did after discrimination are available in tables 5A.1.24-25, and data on the place and situation by State and Territory, and by remoteness are available in tables 5A.26-27.

Things that work

Box 5.1.3 Things that work — valuing Indigenous Australians and their cultures

Reconciliation Action Plans (RAPs) are formal reconciliation commitments undertaken by organisations, under Reconciliation Australia's RAP program. RAPs have been adopted by small and large organisations in business, government and in the community sector, and allow organisations to implement practical actions that build respectful relationships and create opportunities for Aboriginal and Torres Strait Islander peoples (RA 2016a). The RAP Impact Measurement Report 2015 (and previous reports) highlighted the demonstrated benefits of the program. Compared to the general community, people in RAP organisations:

- are more likely to trust Aboriginal and Torres Strait Islander peoples
- are likely to agree that Aboriginal and Torres Strait Islander peoples hold a special place as the First Australians
- are less prejudiced
- are more likely to be proud of Aboriginal and Torres Strait Islander cultures
- have more frequent contact with Aboriginal and Torres Strait Islander peoples (RA 2016b).

In 2015 there were 658 organisations that had created a RAP since 2006 — an increase from 590 in the previous year.

Future directions in data

The Steering Committee has identified 'recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia' as a key measure. However, there is no currently available data source for this measure.

5.2 Participation in decision making³

Box 5.2.1 Key messages

- Participation in decision making is a critical component of self-determination for all people.
- In 2014-15, among Aboriginal and Torres Strait Islander Australians aged 15 years and over:
 - one in four (25.5 per cent) felt they were able to have a say in their community all or most of the time, on issues important to them, and a further 42.5 per cent felt they could have a say, some or a little of the time (table 5A.2.1) — similar to 2008 (table 5A.2.2)
 - those living in remote and very remote areas, and older Aboriginal and Torres Strait Islander Australians were more likely to feel they could have a say in their community all or most of the time (tables 5A.2.3 and 5A.2.5).
- As at 30 June 2016, Aboriginal and Torres Strait Islander representation in Australian parliaments ranged from:
 - over parity in the ACT Legislative Assembly (5.9 per cent representation in parliament compared with 1.7 per cent Aboriginal and Torres Strait Islander representation in the total ACT population eligible to stand for election)
 - below parity in all other Australian, State and Territory governments (table 5.2.1)
 - between 2014 and 2016 the number of Aboriginal and Torres Strait Islander members of Australian parliaments increased from 13 to 17 (tables 5A.2.7 and 5A.2.8).

Box 5.2.2 Measures of participation in decision making

There are two main measures for this indicator:

- *Proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could.* There is currently no data source available for this measure.
- *Aboriginal and Torres Strait Islander representation in the Parliament of Australia and in State and Territory parliaments* is defined as the proportion of federal, state and territory parliamentarians who have identified as Aboriginal and/or Torres Strait Islander, compared to the proportion of the Australian population eligible to stand for parliament. Data are sourced from the Parliamentary Library. Data are as at 30 June 2016.

There is one proxy measure for this indicator:

- *Proportion of Aboriginal and Torres Strait Islander Australians who felt able to have a say within their community* is defined as the proportion of Aboriginal and/or Torres Strait Islander Australians aged 15 years and over who felt they were able to have a say within their community on issues that were important to them.

The data source for the proxy measure is the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2014-15 (all jurisdictions; remoteness; age).

³ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, and Reconciliation Australia, for reviewing a draft of this section of the report.

Governance, self-determination and participation in decision making

A critical element of governance is self-determination (see section 5.4). Participation in decision making is a key exercise of self-determination and empowerment. Broadly:

- external participation includes participation in electoral politics, participation in parliamentary processes, and direct participation in the broader governance environment
- internal participation includes Aboriginal and Torres Strait Islander governance, legal systems, institutions and internal decision making structures and processes (UN Expert Mechanism 2011, 2010, cited in AHRC 2012).

The State of Reconciliation in Australia report highlights the importance of Aboriginal and Torres Strait Islander involvement in decision making and notes the need to ‘... truly value and recognise Aboriginal and Torres Strait Islander peoples’ right to self-determination — to participate in and make decisions about their social, cultural and economic development ...’ (RA 2016, p. 67). While there is general agreement on the importance of Aboriginal and Torres Strait Islander participation in decision making (Gardiner-Garden 2010), there is a lack of data with which to measure this participation. There is currently no data source available for the main measure ‘Proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could’.

Aboriginal and Torres Strait Islander representation in the Parliament of Australia and in State and Territory parliaments

As noted by Australia’s Social Justice Commissioner, there is ‘no substitute for direct representation’ when it comes to Aboriginal and Torres Strait Islander participation in the decision making processes of government in Australia (Gooda, quoted in Kennett 2012). Parliamentary representation provides people with ‘a voice in parliament’. Aboriginal and Torres Strait Islander parliamentarians represent what are in effect two constituencies: their electorate, as well as broader Aboriginal and Torres Strait Islander Australia (Deshong 2013; Lloyd 2009).

In both the 2013 federal election and the 2012 NT election, there were a record number of Aboriginal and Torres Strait Islander Australians nominated as candidates (Deshong 2013). Although the small numbers involved can fluctuate over short periods, increasing numbers of Aboriginal and Torres Strait Islander candidates are being elected.

Aboriginal and Torres Strait Islander representation in the Parliament of Australia

As at April 2016, 1.8 per cent (4 out of 226) of federal parliamentarians (House of Representatives and the Senate) self-identified as Aboriginal or Torres Strait Islander, an increase from 0.9 per cent in 2014 (2 out of 226). This falls below the proportion of

Aboriginal and Torres Strait Islander Australians eligible to nominate to stand for election in 2016, at 2.7 per cent (tables 5.2.1, 5A.2.8). (Caution should be used in interpreting the representation in parliament due to the small numbers involved.)

Table 5.2.1 Proportion of Aboriginal and Torres Strait Islander Australians in parliament, relative to the proportion of Aboriginal and Torres Strait Islander people in the population eligible to enter parliament, as at June 2016^{a, b}

	NSW	Vic	Qld	WA	SA	Tas	ACT	NT	Aus Gov.
Aboriginal and Torres Strait Islander members of parliament (no.)	1	–	2	2	–	–	1	6	4
Aboriginal and Torres Strait Islander members as % of all members (%)	0.7	–	2.2	2.1	–	–	5.9	24.0	1.8
Aboriginal and Torres Strait Islander population as % of population (%) ^c	2.6	0.8	3.8	3.5	2.0	4.2	1.6	29.2	2.7

^a Current as at 30 June 2016. ^b Aboriginal and Torres Strait Islander members of parliament are counted in the jurisdiction of the parliament (e.g., NSW parliament counted in NSW, Parliament of Australia counted in Aust.). ^c Population is aged 18 years and over and eligible to enter parliament. – Nil or rounded to zero.

Sources: Gobbett, H. (2016) *Indigenous parliamentarians, federal and state: a quick guide* and unpublished (2016) jurisdictions; ABS (2014) *Estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat no. 3238.0.55.001; AEC (2016) *Size of the electoral roll and estimated participation rate as at 30 June 2016*; table 5A.2.7.

Aboriginal and Torres Strait Islander representation in the State and Territory parliaments

As at 30 June 2016, Aboriginal and Torres Strait Islander representation in State and Territory parliaments ranged from:

- over parity in the ACT Legislative Assembly (5.9 per cent representation in parliament compared with 1.6 per cent representation in the eligible population)
- below parity for all other State and Territory governments (table 5.2.1).

Felt able to have a say on important issues within the community

The extent to which people feel that they have a say on important community issues is a proxy for personal autonomy — control over decisions that affect them, and a feeling that their ideas and input are valued by the community.

Nationally in 2014-15, one-quarter (25.5 per cent) of Aboriginal and Torres Strait Islander Australians aged 15 years and over felt they were able to have their say within the

community, on issues that were important to them, all or most of time. A larger proportion (42.5 per cent) felt they could have a say some or a little of the time. These data are consistent with 2008 NATSISS data (tables 5A.2.1 and 5A.2.2). (The terms ‘have a say’ and ‘issues that are important to you’ were not defined in the survey, and respondents interpreted these terms based on their personal views (ABS 2016)).

For Aboriginal and Torres Strait Islander Australians aged 15 years and over:

- in 2014-15, a larger proportion in remote areas (29.1 per cent) felt they were able to have their say within the community on issues that were important to them all or most of time, compared to those living in non-remote areas (24.6 per cent). This difference was consistent over time (tables 5A.2.3 and 5A.2.4)
- in remote areas, there was a decrease in the proportion who felt they could have a say some or a little of the time within the community on issues important to them (from 45.5 per cent in 2008 to 38.1 per cent in 2014-15), and an increase in those who felt they had a say none of the time (from 26.6 per cent in 2008 to 32.9 in 2014-15) (tables 5A.2.3 and 5A.2.4).

Older Aboriginal and Torres Strait Islander Australians were more likely to indicate they were able to have their say within the community on issues that were important to them all or most of time compared with younger age groups, following a similar pattern in 2008. For example, in 2014 15 those aged 35 years and over were more likely to feel they had a say than those aged 15–24 years (figure 5.2.1). This may in part be explained by the role of elders in decision making in Aboriginal and Torres Strait Islander communities (Child Family Community Australia 2014; McIntyre 2001; Walker 1993), which may provide some context for the difference between the younger and older age groups, noting that there is ‘deep respect for the wisdom of elders, who are at the time ... both teachers and guides while they are participating in collective choosing’ (McIntyre 2001).

Data on participation within the community on important issues are also reported by State and Territory (tables 5A.2.1 and 5A.2.2).

Figure 5.2.1 Proportion of Aboriginal and Torres Strait Islander people aged 15 years and over that felt they had an opportunity, all or most of the time, to have a say on issues important to them, by age, 2008 and 2014^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008 and 2014-15; tables 5A.2.5-6.

Things that work

Box 5.2.3 Things that work — participation in decision making

Australian Electoral Commission's (AEC) electoral participation program is aimed at empowering Aboriginal and Torres Strait Islander Australians in exercising their right to vote, to improve levels of knowledge of democratic and electoral processes and to increase enrolment, through more than 20 AEC Indigenous and Community Engagement Officers, the majority of whom are Aboriginal and Torres Strait Islander people. The program began in April 2010 and is funded as part of the Australian Government's Closing the Gap initiative (AEC 2016). A 2011 evaluation found that the program's early results were positive, that it 'has a significant role to play in addressing the barriers to participation of Aboriginal and Torres Strait Islander people in democratic processes' and made a number of recommendations to improve the program's performance (Markiewicz and Patrick 2012).

Sources: AEC (Australian Electoral Commission) 2016, *Indigenous Electoral Participation Program*, Australian Electoral Commission, <http://www.aec.gov.au/indigenous/iepp.htm> (accessed 13 May 2016). Markiewicz and Patrick 2012, *Final Report Evaluation IEPP Volume 1* September 2012, http://www.aec.gov.au/about_aec/Publications/files/iepp-volume-1.pdf (accessed 13 May 2016).

Future directions in data

The Steering Committee has identified as a key measure for this indicator the proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could. However, no currently available data source incorporates the aspect of choice in participation — some data are available on whether or not a person participated, but not on whether lack of participation was voluntary or caused by some barrier. The development and collection of data to inform this indicator would assist in measuring Australia's progress in meeting domestic expectations and international human rights obligations.

Australia has over 560 local councils responsible for managing their region and district, yet there is little publicly available information on the number of Aboriginal and Torres Strait Islander Australian councillors. The Steering Committee would like to include information on levels of Aboriginal and Torres Strait Islander representation in local government in future reports.

5.3 Engagement with services⁴

Box 5.3.1 Key messages

- Engagement with services is critical to improve the outcomes of Aboriginal and Torres Strait Islander Australians. Engagement covers both accessibility of services and the appropriate delivery of services.
- In 2014-15, around one in four Aboriginal and Torres Strait Islander Australians aged 15 years and over (24.2 per cent) reported that they had problems accessing one or more services in the previous 12 months, down from 29.9 per cent in 2008. The largest contributing decrease was in the proportion who had trouble accessing legal services (2.1 per cent, down from 5.5 per cent in 2008), dental services (7.9 per cent, down from 19.5 per cent in 2008) and Aboriginal and Torres Strait Islander health workers (2.5 per cent, down from 5.6 per cent in 2008) (figure 5.3.1).
- Those in remote areas were more likely to indicate problems accessing services in the previous 12 months, compared with those in non-remote areas (33.2 per cent and 21.6 per cent, respectively). Barriers to access varied by remoteness, with the most common reason in remote areas being no services (17.7 per cent) and the most common reason in non-remote areas being waiting time/not available in time (10.7 per cent) (figure 5.3.2).
- Cultural barriers may also impact on access to services. Around one in 10 Aboriginal and Torres Strait Islander Australians aged 15 years and over spoke an Indigenous language as their main language, and of this group over one-third (37.9 per cent) indicated they had experienced communication difficulties (table 5A.3.5).

Box 5.3.2 Measures of engagement with services

There are three main measures for this indicator.

- *Accessing services* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who reported having problems accessing services. Data are sourced from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2014-15 (national; all jurisdictions; remoteness).
- *Communication with service providers* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who reported having difficulties communicating with service providers. Data are sourced from the NATSISS, with the most recent available data for 2014-15 (national: sex; age groups; remoteness).
- *Discharges against medical advice* is defined as the proportion of hospitalisations where patients left hospital against medical advice or discharged themselves from hospital at their own risk. Data are sourced from the AIHW National Hospital Morbidity Database, with the most recent available data for 2014-15 (all jurisdictions: remoteness; sex).

⁴ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, and Reconciliation Australia, for reviewing a draft of this section of the report.

Engagement with services is critical to improve the outcomes of Aboriginal and Torres Strait Islander Australians (Flaxman, Muir and Oprea 2009). Poor access to programs and services and ineffective service delivery can compound the disadvantage experienced by Aboriginal and Torres Strait Islander Australians (CGC 2001; Senate Select Committee on the Administration of Indigenous Affairs 2005). Access to primary health care is covered in section 8.1.

Engagement with services is a broad concept that encompasses:

- accessibility (including barriers to access and the availability of services)
- appropriate delivery (including cultural perspectives in designing and delivering programs, and communicating effectively with Aboriginal and Torres Strait Islander clients).

Effective services are a key component of the National Indigenous Reform Agreement. The Council of Australian Governments (COAG) has stipulated that governments will reform service delivery systems to ensure that government investments:

- deliver effective and accessible services that are taken up by Aboriginal and Torres Strait Islander people in urban and regional locations
- deliver culturally competent services that achieve good outcomes for Aboriginal and Torres Strait Islander Australians
- maximise linkages between Indigenous-specific and mainstream services
- deliver service models that respond to high levels of mobility amongst Aboriginal and Torres Strait Islander Australians (COAG 2012).

In January 2009, the Commonwealth and State and Territory governments signed the National Partnership Agreement on Remote Service Delivery, which aimed to improve coordination of remote service delivery (COAG 2009b). In his final report on progress, the Coordinator General for Remote Indigenous Services outlined a number of lessons for both governments and communities, which included:

- for government — have locally based and well trained staff, develop cultural competence of government and employ specific local knowledge; and government engagement with Aboriginal and Torres Strait Islander communities should be transparent, accountable and well administered
- for communities — governance and leadership must be strong and sustainable; communities should understand how to work with government, invest in planning with stakeholders in community and in government, and develop and deliver local cultural awareness programs to build the local capability and knowledge for those living and working in these communities (CGRIS 2014).

More information on Aboriginal and Torres Strait Islander governance and government governance is in section 5.4. Examples of effective service delivery are highlighted throughout this report in ‘things that work’ case studies.

Accessing services

Access to services can be affected by the way programs are designed, how they are presented and the cost to users (ANAO 2014; CGC 2001; Stewart, Lohar and Higgins 2011). In remote areas, this can be exacerbated by lack of services, lack of commercial competition and difficulties caused by lack of reliable infrastructure — transport and telecommunications — to enable access to services (Altman and Ward 2002; CGC 2001; Hudson 2010; Rennie et al 2013).

Failure to register births can make it difficult to obtain other forms of identification such as a driver's licence, passport, tax file number or other proof of identification later in life, which can create further difficulties with accessing services (Castan and Gerber 2015; Orenstein 2009). Centrelink and Medicare have arrangements that assist people to obtain identification documents for access to government services (Australian Government 2010).

Data on the number of unregistered births are currently not available. For future editions of the report, data may be available from an Australian Research Council Linkage Project 'Closing the gap on Indigenous birth registration', which aims to quantify the number of births not registered from 2000 to 2009 in Victoria, Queensland, the Northern Territory and Western Australia (Freemantle 2013).

Telecommunications have become increasingly important in accessing services, particularly with the rise of online service provision. Telecommunications in remote Aboriginal and Torres Strait Islander communities are complicated by geographic distance, harsh conditions and cost of infrastructure (ACMA 2008). The Productivity Commission is undertaking an inquiry into the future directions for the telecommunications Universal Service Obligation, with a final report due to the Australian Government in April 2017.

In 2009, the Australian, State and Territory governments signed the National Partnership Agreement on Remote Indigenous Public Internet Access, recognising the importance of improved increased access to 'online resources and services, principally for financial, educational, health, economic and social purposes' as well as to e-government services (COAG 2009a). In 2011, almost two-thirds (62.6 per cent) of Aboriginal and Torres Strait Islander households⁵ had an internet connection (up from 40 per cent in 2006), compared with 77.2 per cent for non-Indigenous households (ABS 2012).

In 2014-15, among Aboriginal and Torres Strait Islander Australians aged 15 years and over, 24.2 per cent reported that they had problems accessing one or more services in the previous 12 months, down from 29.9 per cent in 2008 (tables 5A.3.1-2). The largest decrease from 2008 was in the proportion who had trouble accessing dental services (from 19.5 per cent in 2008 to 7.9 per cent in 2014-15) (figure 5.3.1).

⁵ In ABS Census data, an Aboriginal and Torres Strait Islander household is a household where at least one person has identified as being of Aboriginal and/or Torres Strait Islander origin.

Figure 5.3.1 Aboriginal and Torres Strait Islander people aged 15 years and over who reported problems accessing services, by selected services, 2008 and 2014-15^a

^a Error bars represent 95 per cent confidence intervals around each proportion.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008, 2014-15; tables 5A.3.1-2.

Those in remote areas⁶ were more likely to indicate problems accessing one or more services in the previous 12 months, compared with those in non-remote areas (33.2 per cent and 21.6 per cent, respectively) (table 5A.3.3). Respondents were asked to indicate the barriers to the top three services they most had problem accessing. The barriers to services differed for remote and non-remote areas:

- in remote areas, the most common barriers were the absence of services (17.7 per cent), not enough services in the area (14.6 per cent), a long wait time/not available at the time required (12.0 per cent), and transport issues or distance to the service (10.5 per cent).
- in non-remote areas, the most common barriers were a long wait time/not available at the time required (10.7 per cent) or an absence of services in the area (6.8 per cent) (figure 5.3.2).

⁶ Remote areas includes the ABS categories of 'remote' and 'very remote'.

Figure 5.3.2 Selected types of barriers to accessing services for Aboriginal and Torres Strait Islander people aged 15 years and over, by remoteness areas, 2014-15^a

^a Error bars represent 95 per cent confidence intervals around each proportion.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15; table 5A.3.3.

Cultural barriers, including lack of cultural awareness on the part of service providers, racism, social inequality and social exclusion, may also lead to reduced access to services (NMHC 2012; PC 2011; Reilly et al 2008; Scrimgeour and Scrimgeour 2008; Zubrick et al 2010). In 2014-15, 1.4 per cent of Aboriginal and Torres Strait Islander Australians reported 'services not culturally appropriate' as a barrier for accessing selected services (table 5A.3.1).

Data by State and Territory are reported in tables 5A.3.1-2.

Communication with service providers

Difficulties in communicating with service providers can create barriers to accessing available services. These barriers may be minimised by effective use of Indigenous language interpreters to improve communication between Aboriginal and Torres Strait Islander Australians and service providers (Commonwealth Ombudsman 2011; HoRSCoATSIA 2012). Effective communication is not limited to language difficulties, but extends to issues including (but not limited to) knowledge of the subject matter, emotional response, body language, and cultural and linguistic nuances. Difficulties can be compounded, as miscommunications may not always be recognised (Cass et al. 2002).

The 2014-15 NATSISS asked people aged 15 years and over whose main language was an Aboriginal or Torres Strait Islander language about communication difficulties. Of those that spoke an Indigenous language as their main language (10.5 per cent), over one-third (37.9 per cent) reported that they had experienced communication difficulties — an increase from about one-quarter in 2008 and 2002 (27.7 per cent and 25.0 per cent, respectively) (table 5A.3.5). Aboriginal and Torres Strait Islander Australians who lived in remote areas were more likely to speak an Indigenous language as their main language (43.6 per cent of males and 38.5 per cent of females), than those living in non-remote areas (0.9 per cent of males and 3.3 per cent of females) (table 5A.3.6).

Indigenous language interpreter services can be useful to ensure Aboriginal and Torres Strait Islander Australians and service providers are engaged with, and have equal access to government services.

Discharges against medical advice

According to the Aboriginal and Torres Strait Islander Health Performance Framework (AHMAC 2015), this measure ‘provides indirect evidence of the extent to which hospital services are responsive to Indigenous patients’ needs’.

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for ‘other’ which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander Indigenous identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander Australians and other Australians.

Between 2004-05 and 2014-15, the proportion of Aboriginal and Torres Strait Islander Australians who left hospital against medical advice or discharged themselves at their own risk decreased slightly (from 2.6 per cent to 2.2 per cent), while the proportion for other Australians increased slightly (from 0.3 per cent to 0.4 per cent) (table 5A.3.7).

The differences in the proportions between Aboriginal and Torres Strait Islander and non-Indigenous Australians may reflect cost and access to healthcare (including continuity of care), particularly for people living in remote areas (Humphreys and Wakerman 2008). In 2014-15, the proportion of Aboriginal and Torres Strait Islander Australian s leaving hospital against medical advice or discharging themselves at their own risk increased as remoteness increased (1.9 per cent in major cities and regional areas compared to 2.7 per cent in remote and very remote areas). A similar pattern was observed for non-Indigenous Australians (0.4 per cent in major cities and regional areas compared to 0.6 per cent in remote and very remote areas) (table 5A.3.8).

Future directions in data

The 2008 and 2014-15 NATSISS only asked people who spoke an Indigenous language as their main language about problems communicating with service providers. Data on communication problems amongst all Aboriginal and Torres Strait Islander Australians would be beneficial, as communication problems are not limited to those whose main language is an Indigenous language.

5.4 Case studies in governance⁷

Box 5.4.1 Key messages

Research over many years has identified the following six determinants of good Aboriginal and Torres Strait Islander and government governance:

- governing institutions
- leadership
- self-determination
- capacity building
- cultural match
- resources.

The existence of these determinants contributes to the success of organisations, and leads to improved health, wellbeing and prosperity of Aboriginal and Torres Strait Islander communities.

Many successful Aboriginal and Torres Strait Islander organisations contribute to improving the social and economic outcomes for Aboriginal and Torres Strait Islander Australians (ORIC 2013; RA 2006, 2013). Good government governance is particularly important to ‘drive real change on the ground’ (CGRIS 2011).

Defining governance

What does ‘governance’ mean? A five year (2004–08) Indigenous Community Governance Project (ICGP) defined governance as:

... the evolving processes, relationships, institutions and structures by which a group of people, community or society organise themselves collectively to achieve the things that matter to them. To do this they need to make decisions about:

- their group membership and identity (who is the ‘self’ in their governance)
- who has authority within the group, and over what
- their agreed rules to ensure authority is exercised properly and decision-makers are held accountable
- how decisions are enforced
- how they negotiate their rights and interests with others
- what arrangements will best enable them to achieve their goals (Hunt et al. 2008).

Identifying common principles or determinants that underpin governance, and encouraging the application of these determinants, are the keys to strengthening governance.

⁷ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, and to Reconciliation Australia for reviewing a draft of this section of the report.

Determinants of good governance

Drawing on the Harvard Project on American Indian Economic Development in the US (Harvard Project on American Indian Economic Development 2010), the ICGP and broad consultations with Aboriginal and Torres Strait Islander communities and organisations, as well as governments and service providers, the Steering Committee has identified the following six determinants of good governance — relevant to both Aboriginal and Torres Strait Islander communities and organisations and government itself:

- *governing institutions* — the way structures of governance are created, leaders chosen, and the extent of constituents' confidence and support
- *leadership* — the process for which an individual influences group members to attain group or organisational goals
- *self-determination* — for Aboriginal and Torres Strait Islander Australians, having the right and ability to determine their own priorities and design their own instruments of governance, within broad governing institutions
- *capacity building* — having the capabilities (such as knowledge and skills) to get things done
- *cultural match* — respecting processes within different communities to work towards a common ground between the governing structures wanted and the culture of the community
- *resources* — the economic, cultural, social and natural resources, and information technology necessary to underpin successful governance.

The determinants are inter-dependent. No one principle in isolation will lead to good governance — all determinants are necessary for sustained success.

Aboriginal and Torres Strait Islander governance

This section draws on four case studies of Aboriginal and Torres Strait Islander governance from the 2014 Reconciliation Australia (RA)/BHP Billiton Indigenous Governance Awards (IGAs): the two winners (boxes 5.4.2 and 5.4.3), and the two highly commended finalists (boxes 5.4.4 and 5.4.5). The winners of the latest round of the IGAs were announced in November 2016, too late for inclusion in this report. Case studies drawn from the 2016 awards will be featured in future reports. Additional research is drawn from the AIGI (formerly RA) Indigenous Governance Toolkit online resource, which is a key source of information for building the governance capacity of Aboriginal and Torres Strait Islander organisations (Indigenous Governance Toolkit 2014).

Box 5.4.2 Waltja Tjutangku Palyapayi Aboriginal Corporation
2014 Winner Category A: Incorporated organisations

Waltja has its origins in 1993 as a family resource centre and is an initiative of women leaders from Central Australian communities. It supports communities to address economic disadvantage and ensure local voices are heard.

Waltja provides services to help the community grow, including training and employment opportunities and projects to maintain family and culture and encourage greater economic independence as well as disability support care, emergency relief and a 'culture car' that can be hired by families to attend significant cultural events.

Waltja shows the influence and leadership of women in communities, and improves outcomes for families in 90 000 km² of very remote Central Australia.

Sources: RA 2014, *Indigenous Governance Awards | Waltja Tjutangku Palyapayi Aboriginal Corporation*, <http://www.reconciliation.org.au/iga/past-finalists/657/> (accessed 4 May 2016), Waltja 2016).

Box 5.4.3 The Marruk Project
2014 Winner Category B: Non-incorporated projects and initiatives

The Marruk Project, which commenced in 2009, connects members of its local community in the northern Victorian town of Swan Hill, using performing arts to strengthen culture and create opportunities for elders, young people, artists and cultural leaders to get to know each other by sharing their histories.

The Project uses acting, puppetry, dance, live music and video to raise cross-cultural awareness and develop the skills of performers. The group started with Aboriginal performers and now involves non-Indigenous people from the Swan Hill community, including Afghan and Sudanese refugees.

Marruk connects people to culture through creative productions, empowers individuals and keeps age-old dreaming stories alive.

Source: (RA 2016).

Box 5.4.4 Girringun Aboriginal Corporation
2014 Highly commended Category A: Incorporated organisations

Girringun Aboriginal Corporation represents traditional owners in part of coastal north Queensland. It works to promote traditional cultures, support traditional owners and has social and economic programs including land and biodiversity management and an art centre.

Girringun is widely respected in the community and all members have an opportunity to participate in major collective decisions. Culture and heritage are fundamental parts of its governance.

Source(s): Girringun Aboriginal Corporation 2016, *Girringun Aboriginal Corporation | Strong Aboriginal People, Strong Culture, Strong Country*, <http://girringun.com.au> (accessed 4 July 2016); Reconciliation Australia 2014, *Indigenous Governance Awards: Girringun Aboriginal Corporation*, <https://www.reconciliation.org.au/iga/past-finalists/girringun-aboriginal-corporation/> (accessed 4 July 2016).

Box 5.4.5 Muntjiltjarra Wurrugumu Group**2014 Highly commended Category B: Non-incorporated projects**

The Muntjiltjarra Wurrugumu Group based in Wiluna, WA, provides a voice at the decision making table and aims to address barriers to communication between the Aboriginal community, government agencies and industry. The group's work is based on the results of a survey of the views of local community members.

The group has been 'designed, created and delivered with complete ownership of local Aboriginal people, giving local people greater control over how external agencies and industry work with the local community'.

Sources: Reconciliation Australia 2014, Indigenous Governance Awards: Muntjiltjarra Wurrugumu Group, <https://www.reconciliation.org.au/iga/past-finalists/muntjiltjarra-wurrugumu-group/> (accessed 4 July 2016).

Governing institutions

Governing institutions are made up of both formal mechanisms (such as policies, rules, regulations, constitutions, legal and judicial systems) and informal ways of doing things (such as taboos, gender norms, religious beliefs, values, kinship and marriage systems) (Hunt and Smith 2006). The Australian Institute of Health and Welfare (AIHW) analysis of the shortlisted 2012 IGA applications showed that 95 per cent of organisations held board meetings, and all organisations had their accounts audited, held annual general meetings and produced annual financial reports (if required). They also had clearly outlined and documented internal dispute resolution processes ... [and] 'all organisations outlined mechanisms and processes for resolving external complaints' (RA 2013).

Waltja comprises Aboriginal women who are permanent residents of remote Central Australian communities. A board of directors is elected at the annual general meeting. The annual general meeting and board meetings are conducted using several languages. Directors are careful to avoid conflicts of interest. An important role for directors and staff is communication both within the organisation and with members and communities face-to-face, in a regular newsletter and via the organisation's website (Indigenous Governance Toolkit 2014).

Good corporate governance that is coupled with Aboriginal and Torres Strait Islander cultural values, relationships and systems of authority produces governing order and good outcomes (Hunt et al. 2008; Hunt and Smith 2007). An assessment of the 2012 IGA shortlisted organisations found they were flexible in their approaches to dispute resolution and decision making, but were supported with clearly outlined and established processes. Approaches included 'mediation, traditional law and cultural practices, codes of conduct and informal discussions' for internal disputes, with external disputes primarily addressed via formal processes' (RA 2013).

Good governing institutions do not just spontaneously arise. They are the result of often lengthy processes of developing capacity and leadership, and ongoing training and development (see ‘Capacity building’ below). Good governing institutions support ‘board and staff training and development ... [and] compulsory governance training for board members’ (RA 2006).

Leadership

Aboriginal and Torres Strait Islander leaders are critical to the development of a strong governance culture. While there is a specific cultural aspect to Aboriginal and Torres Strait Islander leadership, leadership often requires people to walk confidently and with influence in two worlds — Aboriginal and Torres Strait Islander and non-Indigenous leadership (AILC 2013).

Leadership needs to be nurtured and leaders require training and support to help them fulfil their responsibilities. Sustained leadership requires succession planning, so new people can take over from current leaders over time. The AIHW analysis of shortlisted applicants in 2012 noted that all organisations had ‘internal development and training programs, whether for staff, board members, or young people in the community’ (RA 2013).

Drawing on the IGA examples and research by the Indigenous Community Governance Project, some lessons for developing leadership and succession planning can be identified:

- training, leadership, personal and professional development, including cultural training builds competent and highly skilled staff (RA 2006, 2013)
- board election processes adapted to cultural, social, local conditions (RA 2013)
- staggering elections and mentoring new board members
- developing potential board members and board succession planning to ensure board continuity, skill retention and organisational stability (RA 2006, 2013)
- developing the communication skills and self-confidence of young people by providing role models, mentoring and experience to nurture future leaders (RA 2013).

Self-determination

A critical element of governance is self-determination. Self-determination is a fundamental human right contained in articles of the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights (AHRC 2013). Self-determination as a human right is also reaffirmed in the United Nations Declaration on the Rights of Indigenous Peoples. The Declaration was adopted by the UN General Assembly in 2007, and endorsed by the Australian Government in 2009 (AHRC 2012).

Self-determination has also been given different definitions by different researchers (Calma 2006; Hunt et al. 2008; Hunt and Smith 2006; RA 2006) but, put simply, ‘self-determined people are actors in their own lives instead of being acted upon by others’ (Wehmeyer 2002). An important aspect of self-determination is ‘cultural legitimacy’ — the extent to which there is:

- culturally legitimate participation and control of decision-making (participation in decision making is discussed in section 5.2)
- community participation in community governance institutions (RA 2013).

A key feature of success is that ‘culture is at the very core of what Waltja does. It responds to the needs of its community by being inclusive and doing things the Waltja way’ (Reconciliation Australia 2014). Communication with members and communities is also an essential part of how Waltja operates (Waltja 2016).

A related concept to self-determination is empowerment. The *Empowered Communities: Empowered Peoples Design Report* (2015) defined empowerment:

Empowerment, in our meaning, has two aspects. It means Indigenous people empowering ourselves by taking all appropriate and necessary powers and responsibilities for our own lives and futures. It also means Commonwealth, state and territory governments sharing, and in some cases relinquishing, certain powers and responsibilities, and supporting Indigenous people with resources and capability building.

Capacity building

There are two important aspects to capacity building. The ‘public management’ approach emphasises the need to develop a community’s ability to meet accountability requirements, and has strong links with the ‘governing institutions’ and ‘leadership’ determinants of good governance. The ‘community development’ approach emphasises empowering communities to take responsibility and control over their own futures, and is closely linked with the ‘self-determination’ aspect of good governance (Gerritson 2001; Hunt and Smith 2007).

Capacity building for good governance can take many forms. Individuals, groups and organisations can build on their strengths through both formal and informal governance training, for example through governance courses run by the Australian Indigenous Leadership Centre. Waltja Tjutanku Palyapayi has consistently funded and supported staff professional development since incorporation. New staff members undertake a three-month probation period with induction, training and supervision by a senior worker. All staff have yearly performance appraisals. Together these processes make sure Waltja staff are performing at the best level possible and quickly identify any potential problems (Indigenous Governance Toolkit 2014).

Cultural match

Cultural match refers to the match between the governance structures a group wants to develop and the culture of the community that is the development target (CAEPR and RA 2004; Sullivan 2007).

Aboriginal and Torres Strait Islander Australians live with two systems of governance, their own and that of non-Indigenous Australia. The Indigenous Governance toolkit (2014) describes this as ‘two-way governance’, where Aboriginal and Torres Strait Islander Australians balance and negotiate dual ‘culture, laws, rules and forms of accountability’ and support bringing ‘two ways together’. Box 5.4.6 provides an example of integrating culture into project governance.

Box 5.4.6 **Kimberley Aboriginal Law and Cultural Centre Cultural Governance Programme**

A recent evaluation of the Kimberley Aboriginal Law and Cultural Centre’s Cultural Governance Programme in the Ardyaloon community in WA showed the importance of working in cooperation with local Aboriginal law and culture to successfully achieve the repatriation of sacred objects and remains in a way that met the cultural needs of elders while also working cooperatively with the institutions that had been holding the objects and remains.

Sources: Sullivan, P. and Kinnane, S. nd, *An Evaluation of the Kimberley Aboriginal Law and Culture Centre (KALACC) Cultural Governance Programme 2013–2015. Repatriation of Sacred Objects and Ancestral Remains to the Ardyaloon (One Arm Point) Community*, Nulungu Research Institute, the University of Notre Dame Australia, Broome, <http://www.kalacc.org.au/docs/default-source/statements/kalacc-cultural-governance-evaluation-2016.pdf?sfvrsn=2> (accessed 16 August 2016).

For IGA finalists, culture is the foundation of their success: it is ‘embedded in every aspect of their organisation—from program delivery and board arrangements, to decision making and community consultation processes’ and means both being true and responsive to their community, and also being accountable ‘externally to stakeholders, funding sources, and government’ (RA 2013).

‘One of the unique things about [the Marruk Project] is its ability to bring the whole town together. It’s what we should be seeing across the world. We need things like this to co-exist — to build understanding. To actually witness it bringing the town together is something that’s almost beyond belief.’ — Mick Dodson, IGA Chair (RA 2016)

Resources

The ‘resources’ determinant focuses on the economic factors necessary to underpin successful governance arrangements. Hunt et al. (2008) noted that, as Aboriginal and Torres Strait Islander community service organisations have increasingly taken on service delivery responsibilities from government, these have come with multiple, complex and costly reporting and accountability requirements. Chaney (2013) argued that these onerous approaches to service contracts often contribute to organisational failure, as resource

uncertainty, particularly insecure and ad hoc funding, makes it difficult to recruit and retain staff or to build capacity. More recent research with successful Aboriginal controlled organisations confirms the importance of sustained funding (Hunt 2016).

Financial diversity can give Aboriginal and Torres Strait Islander organisations a degree of independence to run programs as Aboriginal and Torres Strait Islander people want them to be run (RA 2006). Flexible funding that facilitates the development of appropriate programs at the community level, and clarity about the roles and responsibilities of both funding agencies and service providers is vital for success (Hunt 2013).

Table 5.4.1 Sources of income of the top 20 Aboriginal and Torres Strait Islander corporations, 2007-08 to 2014-15 (per cent)^a

<i>Financial year</i>	<i>2007-08</i>	<i>2008-09</i>	<i>2009-10</i>	<i>2010-11</i>	<i>2011-12</i>	<i>2012-13</i>	<i>2013-14</i>	<i>2014-15</i>
Government funding	46.9	44.5	45.8	38.2	39.9	36.9	39.5	39.3
Self-generated income	38.2	38.8	39.0	39.6	39.8	40.1	44.8	43.0
Other income sources	14.9	19.7	15.2	22.2	20.3	23.0	15.7	17.4
Philanthropic gifts	<0.1	<0.1	<0.1	<0.1	–	<0.1	–	0.3

^a Percentages are of funding against the total income for each financial year. – Nil or rounded to zero.

Source: ORIC (Office of the Registrar of Indigenous Corporations) 2016, *The Top 500 Aboriginal and Torres Strait Islander Corporations 2014-15*, Canberra, ACT.

Data from the Office of the Registrar of Indigenous Corporations (ORIC) shows a cautiously positive story — self-generated income increased from 38.2 to 44.8 per cent of the total income of the top 20 Aboriginal and Torres Strait Islander organisations from 2007-08 to 2013-14, with a slight decrease to 43.0 per cent for 2014-15 (table 5.4.1), with ORIC noting that ‘the amount of self-generated income has steadily taken over from government-derived income and the leading source of income’ (ORIC 2016).

Government governance

Government governance refers to governments’ engagement with Aboriginal and Torres Strait Islander Australians. This section examines formal arrangements for ‘high level’ engagement between governments and Aboriginal and Torres Strait Islander communities and organisations, in the light of the determinants of good governance.

Aboriginal and Torres Strait Islander advisory bodies

The National Congress of Australia’s First Peoples (National Congress) was established in April 2010. The National Congress is an independent company limited by guarantee and registered under the Corporations Act (National Congress 2016). National Congress advocates and represents its members, but does not engage in service delivery (Calma and

Dick 2011). Congress members include Aboriginal and Torres Strait Islander peak bodies, and national and local organisations, as well as Aboriginal and Torres Strait Islander individuals. The National Congress board's co-chairs and directors are member-elected (National Congress 2016). The National Congress was represented on the working group that advised the Steering Committee on the production of this report.

Some jurisdictions have also established Aboriginal and Torres Strait Islander advisory bodies to provide advice to governments on Indigenous policy issues (box 5.4.7).

Box 5.4.7 Aboriginal and Torres Strait Islander advisory bodies

The Australian Government's Prime Minister's Indigenous Advisory Council was established in November 2013, and comprises both Aboriginal and Torres Strait Islander and non-Indigenous members. Council members were appointed jointly by the Prime Minister, the Minister for Indigenous Affairs, and the Parliamentary Secretary to the Prime Minister. The Council's brief includes a focus on schooling, employment and justice in Aboriginal and Torres Strait Islander communities (Australian Government 2013)

In WA, key advisory bodies include the WA Aboriginal Advisory Committee, the Aboriginal Lands Trust, the Aboriginal Cultural Material Committee and the WA Aboriginal Education and Training Council. These bodies provide relevant advice to the portfolio ministers on matters relating to the interests and wellbeing of Aboriginal people, management of land held in trust, heritage protection and education and training. (Department of Aboriginal Affairs 2016, WA Government unpublished.)

The South Australian Aboriginal Advisory Council (SAAAC) was established under a policy decision by the Premier in December 2005. The SAAAC is the peak advisory body to the State Government on Aboriginal affairs policy, programs and service delivery. (SA Government unpublished.)

This ACT Aboriginal and Torres Strait Islander Elected Body was established by legislation in 2008. It comprises seven members representing the interests and aspirations of the local Aboriginal and Torres Strait Islander community and provides advice to the ACT Government (ACT Aboriginal and Torres Strait Islander Elected Body 2016)

Determinants of government governance

Good government governance, such as improved coordination among agencies, removing duplication of services, adapting to change, a stable policy environment and effective processes, and learning from evidence drawn from past evaluations, affect the governance of Aboriginal and Torres Strait Islander organisations and outcomes for Aboriginal and Torres Strait Islander Australians (Henry 2007; Howse cited in Hunt 2013; Phillips-Brown, Reddel and Gleeson 2013).

Several major reports have identified the lack of robust evaluations of government programs for Aboriginal and Torres Strait Islander Australians and encouraged a much greater investment in evaluation (Australian Government 2010, PC 2015, Productivity Commission 2013). Accountability through evaluation is an important part of government

governance. A key element for good government governance is to ensure that where evaluations are conducted, the findings and lessons from these are made available to Aboriginal and Torres Strait Islander communities and governments (Cobb-Clark 2013; Phillips-Brown, Reddel and Gleeson 2013).

Australian governments have made several collective commitments to improve government governance, including: commissioning this report (COAG 2002); agreeing to the ‘Service Delivery Principles for Programs and Services for Indigenous Australians’ (COAG 2012), which drew upon the ‘National Framework of Principles for Government Service Delivery to Indigenous Australians’ (COAG 2004); and establishing a national framework for reporting expenditure on services to Aboriginal and Torres Strait Islander Australians (IERSC 2009, 2010, SCRGSP 2012, 2014).

At the program level, Australian governments have committed to sharing their learning about what works to close the gap on Indigenous disadvantage. The Closing the Gap Clearinghouse, although no longer funded, maintains the existing collection of evidence-based research on what works to overcome Indigenous disadvantage (AIHW and AIFS nd).

There is information on the use of mainstream services by Aboriginal and Torres Strait Islander peoples (see the Indigenous Expenditure Report (SCRGSP 2014) and the Report on Government Services (SCRGSP 2016) but limited information on the barriers to access and use of services faced by Aboriginal and Torres Strait Islander Australians (see section 5.3 on engagement with services, which contains data on access and barriers and section 5.1 which includes information on discrimination and racism).

There are similarities between the determinants of good government governance, the ‘things that work’ success factors in this report (see chapter 3), the international community development principles that Hunt (2010) identified as important in the way non-government organisations work with Aboriginal and Torres Strait Islander communities and the factors behind the success of Aboriginal controlled organisations (Hunt 2016). They all reflect the ‘bottom-up’ approach and the self-determination and capacity building determinants of good governance.

Moran (2016) suggested that poor development practice and the failure of good governance and by governments is the reason why many programs aimed at improving the lives of Aboriginal and Torres Strait Islander Australians fail to make an impact. Moran pointed out that despite good intentions and carefully thought out policies, actual practice on the ground in communities determines whether programs achieve improvements in wellbeing and outcomes for people. Key characteristics of government Aboriginal and Torres Strait Islander policy pointed out by Moran include:

- continual purging of previous policies as new policies are implemented often without evaluation or learning from what has gone before
- periodic swings in policy, such as from more decentralised to more centralised approaches without consideration of what would work best in a particular place

-
- mimicking of a policy that may have worked in one place and implementing it elsewhere without consideration of local contexts
 - contradictions in policy between one program, agency or level of government and another so that what one policy aims to achieve is undermined by another program or policy.

A series of case studies presented by Moran (2016) demonstrate these characteristics and illustrate the importance of the determinants of good governance. Moran observes that governments often make decisions on policies and programs with little input from the Aboriginal and Torres Strait Islander Australians on programs and policies designed for them, and often suddenly cut funding to programs without any assessment of their effectiveness — aspects of the governing institutions, self-determination and resources determinants of good governance used in this report. Moran also discusses the challenges and importance of the intersection of Aboriginal and non-Indigenous cultures, and how those successfully implementing programs must navigate the differences.

Governance is also at the centre of the *Empowered Communities: Empowered Peoples Design Report* ((Empowered Communities 2015). The Report prepared by a consortium of Aboriginal and Torres Strait Islander leaders and organisations from eight regions across Australia, makes recommendations to governments across the spectrum of the determinants of good community, organisational, and government governance, particularly self-determination and leadership. The Report called for empowerment of Aboriginal and Torres Strait Islander Australians and changes in the relationship between governments and Aboriginal and Torres Strait Islander people and organisations and proposes reforms for achieving this.

A recent Senate Committee report (Senate Standing Committee on Finance and Administration 2016) made recommendations for improving the process of funding Aboriginal and Torres Strait Islander specific services (that are often provided by Aboriginal and Torres Strait Islander organisations) that are particularly relevant to the resources and self-determination determinants of governance and the ‘things that work’ success factors identified in chapter 3 — specifically ongoing government support, community involvement in program design and decision-making and cooperative approaches.

Future directions in data

There has been significant progress in examining Aboriginal and Torres Strait Islander governance since the first report in 2003. The introduction of the Indigenous Governance Awards has helped identify and highlight many examples of good practice. The Indigenous Community Governance Project by the Centre for Aboriginal Economic Policy Research and Reconciliation Australia has provided academic rigour to the examination of governance practices. Among governments, evaluations and studies of Aboriginal and Torres Strait Islander reform initiatives (Dwyer et al. 2009; FaHCSIA 2012; OIPC 2006;

Yu, Duncan and Gray 2008) have helped identify aspects of government governance that can assist or impede Aboriginal and Torres Strait Islander governance. That said, there is still more to be done before future reports can include an objective measure of governance.

5.5 Indigenous language revitalisation and maintenance⁸

Box 5.5.1 Key messages

- Language is an important cultural signifier for many Aboriginal and Torres Strait Islander Australians, and plays a significant role in the promotion of resilient communities.
- From 2005 to 2012, the number of spoken Indigenous languages decreased from 145 to 120, while the number of languages spoken by all generations decreased from 18 to 13 (Marmion, Obata and Troy 2014).
- In 2014-15, similar to 2008, for Aboriginal and Torres Strait Islander Australians aged 3 years and over:
 - 10.5 per cent were learning an Indigenous language, with the proportion highest for younger age groups (19.3 per cent for those aged 3–14 years) (figure 5.5.2)
 - 16.0 per cent spoke an Indigenous language (table 5A.5.1), with this proportion highest in remote and very remote areas (50.2 per cent) (table 5A.5.3).
- From 2002 to 2014-15, there was a decrease in the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who could speak an Indigenous language, from 21.1 per cent to 18.3 per cent (figure 5.5.3).

Box 5.5.2 Measures of Indigenous language revitalisation and maintenance

There are two main measures for this indicator.

- *Indigenous language revitalisation* is defined as the proportion of Aboriginal and Torres Strait Islander Australians who are *learning* an Indigenous language (national; by geographic location [location as proxy for individual languages]).
- *Indigenous language maintenance* is defined as the number and proportion of Aboriginal and Torres Strait Islander Australians who are Indigenous language speakers (national; age; geographic location [location as proxy for individual languages]).

The main data source is the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2014-15. Supplementary data are available from the Australian Institute of Aboriginal and Torres Strait Islander Studies (AIATSIS) National Indigenous Languages Survey (NILS), with the most recent available data collected in 2012. See box 5.5.3 for further information on these data sources.

Aboriginal and Torres Strait Islander languages, as with all languages, transmit cultural practices and beliefs, and strengthen a sense of identity and belonging (DEEWR 2009; McLeod, Verdon and Sturt 2015). In particular, Aboriginal and Torres Strait Islander languages are closely linked to culture, land and law, and all are connected to wellbeing (Dockery 2011; HoRSCoATSIA 2012). Language also plays a meaningful role in the

⁸ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

continuation of culture and promotion of resilient communities (AHRC 2010), and is an important cultural signifier for many Aboriginal and Torres Strait Islander Australians, even for those who do not speak an Indigenous language or who are not actively engaged in language programs (Marmion, Obata and Troy 2014). (Section 11.5 has additional information on community functioning). An analysis of the NILS survey conducted in 2012 found that of the 288 respondents:

- 98 per cent agreed that the use of traditional languages improves the wellbeing of Aboriginal and Torres Strait Islander Australians
- 95 per cent agreed that it was important for their children to learn and use traditional language, and when asked why, 46 per cent said that they wanted the languages to be passed to the next generation
- 74 per cent ‘expressed a desire for traditional languages to be strong, widely spoken, used or known in communities and passed on to younger generations’ (Marmion, Obata and Troy 2014).

The United Nations Declaration on the Rights of Indigenous Peoples includes the right to:

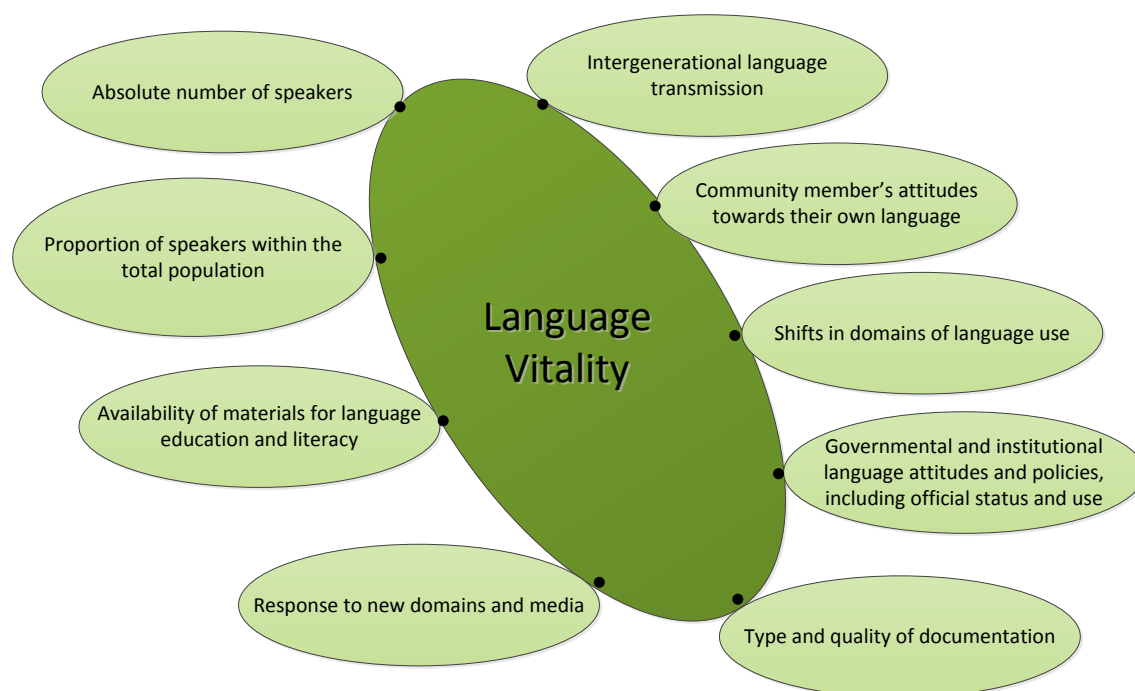

‘... revitalise, use, develop and transmit to future generations their histories, languages, oral traditions, philosophies, writing systems and literatures, and to designate and retain their own names for communities, places and persons.’ (UN 2008)

The Declaration was adopted by the UN General Assembly in 2007, and endorsed by the Australian Government in 2009 (AHRC 2012). Projects aiming to maintain and revive Aboriginal and Torres Strait Islander languages are being supported and implemented by Aboriginal and Torres Strait Islander Australians, language professionals, governments and community organisations in urban, regional and remote locations across Australia (Hobson et al. 2010; HoRSCoATSIA 2012).

Language revitalisation and maintenance is crucial to preserving and strengthening culture. Culturally appropriate services can address difficulties in communication (such as through the use of Indigenous languages or interpreters), as communication difficulties may magnify barriers to education (section 4.5, 4.8 and 7.2), employment (section 4.7) and access to services (section 8.1 on primary health care). The indicator on engagement with services (section 5.3) includes information on difficulty understanding, or being understood by, service providers.

Schneirer et al. (2011), in their literature review of Aboriginal and Torres Strait Islander cultural heritage, state that evidence is compelling about the endangered state of traditional languages, and highlights the need to *revitalise* languages and to *maintain*, using an assessment of ‘language vitality’. The assessment of language vitality was developed by the United Nations Educational, Scientific and Cultural Organization (UNESCO) Ad Hoc Expert Group on Endangered Languages, and adopted in 2003, and comprises several interrelated factors (figure 5.5.1).

Figure 5.5.1 Nine factors for assessing language vitality^a

^a Diagram reproduced from the *Endangered Languages*, 2009 – 2014 website, which summarises the UNESCO document on Language vitality and Endangerment, adopted at the International Expert Meeting on the UNESCO Programme of Safeguarding of Endangered Languages, in Paris on 10-12 March 2003.

Source: UNESCO (2003).

The UNESCO document (2003) cautions that the factors are not prescriptive, but rather provide a guide and scales to be adapted to local contexts. Due to a lack of robust Australian data for the majority of items in the language vitality assessment, two main measures were distilled and adopted by the Steering Committee for this indicator: the *revitalisation* and *maintenance* of Aboriginal and Torres Strait Islander languages.

The NILS report estimates that, in 2012, around 120 languages were spoken by Aboriginal and Torres Strait Islander Australians, a reduction from the 145 languages reported in 2005 (and the estimated 250 languages before European settlement) (AIATSIS and FATSIL 2005; Marmion, Obata and Troy 2014). However, whilst some languages have been lost, some Aboriginal and Torres Strait Islander children are learning Indigenous languages. An analysis of wave one and three of the Longitudinal Study of Indigenous Children (LSIC) found that most Aboriginal and Torres Strait Islander children have rich language learning opportunities (including through oral storytelling and social activities such as swimming) among a number of languages including English, Aboriginal and Torres Strait Islander languages and other languages (McLeod, Verdon and Kneebone 2014). Analysis of wave five of the same longitudinal study indicated that 16 per cent of Aboriginal and Torres Strait Islander children spoke traditional Aboriginal

and Torres Strait Islander languages (close to 25 per cent with Kriol⁹), including 37 languages that are classified as no longer being spoken, critically endangered or having very few speakers (Kikkawa 2015).

Box 5.5.3 **Aboriginal and Torres Strait Islander language data sources**

Two sources of data on Aboriginal and Torres Strait Islander language are used to report against this indicator: the NILS and the NATSISS. Whilst the Census provides some data on speakers of Aboriginal and Torres Strait Islander languages, the question is only asked in relation to the main language spoken at home, and so does not include people whose main language is English but who also speak an Indigenous language (see appendix 2 for more information).

The 2012 **NILS** had two components:

- the *Language Activity Survey*, which asked organisations about community-based Australian language activities — 75 organisations responded (primarily Aboriginal and Torres Strait Islander but also some universities and other non-Indigenous bodies)
- the *Language Attitude Survey*, which asked Aboriginal and Torres Strait Islander Australians about their thoughts about their languages — a total of 288 Aboriginal and Torres Strait Islander Australians responded.

Due to different methodologies and survey instruments, unless otherwise noted, data from the 2012 NILS are not directly comparable to the 2005 NILS.

The 2014-15 **NATSISS** collected information from respondents about the main language spoken at home (for those aged 3–5 years, an additional response category was available for those ‘not yet speaking’). Respondents whose main language was not an Aboriginal or Torres Strait Islander language were asked whether they spoke any of these languages, and if not, whether they would understand what was being said if someone were to speak an Aboriginal or Torres Strait Islander language to them. All respondents were also asked whether they were currently learning any Aboriginal and Torres Strait Islander languages and, if so, how they were being taught. For children aged 3–14 years, responses were provided by their proxy.

Sources: ABS 2016, *National Aboriginal and Torres Strait Islander Social Survey: Users Guide*, Cat. no. 4720.0; Marmion, D., Obata, K. and Troy, J. 2014, *Community, Identity and Wellbeing: the Report of the Second National Indigenous Languages Survey*, Australian Institute of Aboriginal and Torres Strait Islander Studies.

Revitalisation of Aboriginal and Torres Strait Islander languages

In 2014-15, 10.5 per cent of Aboriginal and Torres Strait Islander Australians aged 3 years and over indicated they were learning an Indigenous language. The proportion was higher in WA (19.2 per cent) and SA (16.3 per cent) compared to other states and territories

⁹ Kriol is an Australian creole language. Creoles are classified as separate languages, and in the Australian context evolved following white settlement, and mixing of traditional Aboriginal languages with the English language. Creoles are mainly used in Australia by Aboriginal and Torres Strait Islander peoples and have been described as a modern Indigenous language — however, creole is also regarded negatively by some, and seen as diluting traditional Indigenous languages (Dickson 2016; Kikkawa 2015).

(table 5A.5.1), and in remote areas (15.0 per cent) compared to non-remote areas (9.3 per cent) (table 5A.5.3).

The proportion of Aboriginal and Torres Strait Islander Australians learning an Indigenous language was higher for younger age groups, with the largest proportion aged 3–14 years (19.3 per cent) and the lowest proportion for those aged 55 years and over (3.0 per cent) (figure 5.5.2).

Proportions for 2014–15 are similar to those for 2008 for all age and remoteness categories (figure 5.5.2, tables 5A.5.1–6).

Figure 5.5.2 Proportion of Aboriginal and Torres Strait Islander people aged 3 years and over learning an Indigenous language, by age group, 2008 and 2014–15^{a,b}

^a People whose main language spoken at home was an Indigenous language were not asked whether they were learning an Indigenous language. ^b Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014–15; tables 5A.5.5–6.

Aboriginal and Torres Strait Islander Australians aged 3 years and older who were learning an Indigenous language were most likely to be learning from a relative (62.1 per cent), followed by a learning institution (27.5 per cent), and from a community elder or another person in the community (22.9 per cent) (table 5A.5.9).

Data on where Indigenous language was being learnt are also available for states and territories in tables 5A.5.1–2, for remoteness in tables 5A.5.3–4 and 5A.5.7–8, and by age in tables 5A.5.5–6 and 5A.5.9–10.

Maintenance of Aboriginal and Torres Strait Islander languages

Nationally in 2014-15, 16.0 per cent of Aboriginal and Torres Strait Islander Australians aged 3 years and over spoke an Indigenous language (with 9.6 per cent speaking it as their main language at home) — similar to 17.2 per cent in 2008 (data for those under 15 years are not available prior to 2008). At the state and territory level, the NT had the highest proportion of Aboriginal and Torres Strait Islander speakers of Indigenous languages (63.0 per cent), followed by SA (20.8 per cent), WA (20.7 per cent) and Queensland (15.8 per cent) (table 5A.5.1).

People living in remote and very remote areas were more likely to speak an Indigenous language (50.2 per cent), than those living in non-remote areas (6.8 per cent) (table 5A.5.3). The proportion of Indigenous language speakers was also higher in older age groups (between 19.0 and 21.5 per cent for people aged 25 years and over) compared to younger age groups (10.7 per cent for those aged 3–14, and 14.1 per cent for those aged 15–24) (table 5A.5.5). This difference may be because younger people are still learning language (see figure 5.5.2).

Comparable time series data on language speakers are available for Aboriginal and Torres Strait Islander Australians aged 15 years and over. Nationally from 2002 to 2014-15, there was a decrease in the proportion of Indigenous language speakers (from 21.1 per cent to 18.3 per cent), with decreases in the following age groups:

- 15–24 years, from 18.2 per cent in 2002 to 14.1 per cent in 2014-15
- 25–34 years, from 22.3 per cent in 2002 to 19.0 per cent in 2014-15
- 55 years and over, from 26.1 per cent in 2002 to 19.8 per cent in 2014-15 (figure 5.5.3).

Analysis of the 2012 NILS data are presented in the 2014 *Overcoming Indigenous Disadvantage: Key Indicators 2014* report (SCRGSP 2014).

Figure 5.5.3 Proportion of Aboriginal and Torres Strait Islander people aged 15 years and over speaking an Indigenous language, by age group, 2002, 2008 and 2014-15^{a,b}

^a People whose main language spoken at home was an Indigenous language were not asked whether they were learning an Indigenous language. ^b Error bars represent 95 per cent confidence intervals around each estimate.

Future directions in data

Data on Aboriginal and Torres Strait Islander language use are limited. Consistent and comparable collection of data on learners and speakers of Aboriginal and Torres Strait Islander languages is important to enable meaningful analysis of change over time.

5.6 Indigenous cultural studies¹⁰

Box 5.6.1 Key messages

- Culturally appropriate education does not mean that different standards should apply to academic outcomes. Rather, cultural studies can enhance educational achievement for Aboriginal and Torres Strait Islander Australians, as well as educate all students about Indigenous peoples and cultures, and a shared national identity.
- In 2014-15, and consistent with 2008, over two-thirds (68.4 per cent) of Aboriginal and Torres Strait Islander Australians aged 5–14 years who attended school, stated that they were taught Indigenous culture at school, and a similar proportion (64.1) per cent of those aged 15–24 years indicated they had been taught, or were currently studying Indigenous culture as part of further studies (figure 5.6.1).
- Having been taught Indigenous culture decreased as age increased, with the lowest proportion for Aboriginal and Torres Strait Islander Australians aged 45 years and over (26.3 per cent) (figure 5.6.1).
- In 2013, Aboriginal and Torres Strait Islander Australians made up a much lower proportion of teachers and leaders (primary 2.2 per cent and secondary 1.0 per cent) than students (primary 5.7 per cent and secondary 4.9 per cent) (table 5A.6.1).

Box 5.6.2 Measures of Indigenous cultural studies

There is no main measure for this indicator.

Information in this section includes qualitative examples of culturally inclusive curricula, and two supplementary measures:

- *Teaching Indigenous cultures* is defined as the proportion of Aboriginal and Torres Strait Islander Australians taught Indigenous culture in school or as part of further studies (national; state and territory; remoteness; age). The most recent available data are from the 2014-15 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS). Data are not available to provide a comparator for non-Indigenous people
- *Indigenous employment in schools* is defined as the proportion of Aboriginal and Torres Strait Islander school staff. The most recent available data are from the national 2013 Staff in Australia's Schools survey (SiAS).

Student outcomes are influenced by many factors, including student attendance (section 4.5), teacher quality (section 7.1), school engagement (section 7.2) and the home environment (chapter 10). Research shows that learning about Indigenous cultures in school and being taught by Indigenous teachers can improve Aboriginal and Torres Strait Islander students' educational achievement (Rahman 2009). Where cultural perspectives are incorporated into the school curriculum and culture, Aboriginal and Torres Strait

¹⁰ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report

Islander students' performances have been found to be better than those of Aboriginal and Torres Strait Islander students in other schools (Munns, O'Rourke and Bodkin-Andrews 2013).

A four year longitudinal study of growth in literacy and numeracy among Aboriginal and Torres Strait Islander students found the following key factors led to improved educational attainment:

- quality teaching (with appropriate professional development in strategies for working with Indigenous students and promoting understanding of cultural issues)
- developing a school culture in which Indigenous students feel included and supported to learn (incorporating the perspectives of Indigenous and other cultures in the curriculum) (Purdie et al. 2011).

More information on some of these key factors can be found in section 13.2 - Factors related to primary education achievement, and Productivity Commission (2016).

Indigenous cultural studies are also important in their own right, educating all Australian students about Aboriginal and Torres Strait Islander peoples and cultures. In 2014, the Reconciliation Australia Barometer found that 92 per cent of the Aboriginal and Torres Strait Islander sample and 85 per cent of the general community sample believed it was important to learn about Aboriginal and Torres Strait Islander histories and culture (Polity Research & Consulting 2015).

Numerous studies have also emphasised the importance of Aboriginal studies as part of pre-service teacher training (Craven 2012; DEEWR 2009; Mooney, Halse and Craven 2003; Pridham et al. 2015). The 2013 Staff in Australia's Schools (SiAS) survey found around 26 per cent of primary and secondary teachers with 5 or fewer years of experience, and around 18 per cent with more than 5 years of experience, indicated a need in the area of teaching Aboriginal and Torres Strait Islander children. The survey also reported that participation in professional learning for the category 'teaching Aboriginal and Torres Strait Islander students' was comparatively lower than for other professional development activities for both primary and secondary teachers (McKenzie et al. 2014).

Yunkaporta (2009) found that there is little information on how to teach using Aboriginal perspectives, rather than simply teaching Aboriginal content from a western perspective. A research study over the period 2009 to 2012, of 201 schools in all states and territories except NSW, found that for teachers, everyday face-to-face engagement with the local Aboriginal and Torres Strait Islander community was a more significant driver of reform of curriculum and teaching than a general knowledge of Indigenous cultures (Luke et al. 2013).

Culturally inclusive curricula

The Australian Government established a review of the Australian Curriculum in early 2014, with the final review report and initial Australian Government response released in October of the same year. The review report included recommendations on the teaching of cross-curriculum priorities, which are embedded in all learning areas (DoE 2014).

An Australian curriculum spanning subjects from foundation to year 10, developed by the Australian Curriculum, Assessment and Reporting Authority (ACARA), was endorsed by Australian Education Ministers in September 2015, and is being progressively implemented by states and territories. Aboriginal and Torres Strait Islander histories and cultures is identified as one of three ‘cross-curriculum priorities’. The organising ideas behind this priority include the underlying elements of identity and living communities, and the key concepts of country/place, culture and people (ACARA 2015).

Teaching Indigenous cultures

Schools exist in different contexts and have varying numbers of Aboriginal and Torres Strait Islander students. Aboriginal and Torres Strait Islander children often attend schools where they are the minority¹¹, and there are benefits for all students (and local communities) to receive an education that acknowledges and incorporates Aboriginal and Torres Strait Islander history and culture (Biddle 2010; Wilson 2016).

In 2014-15, 68.4 per cent of Aboriginal and Torres Strait Islander Australians aged 5–14 years who attended school, stated that they were taught Indigenous culture at school, and 64.1 per cent of those aged 15–24 years indicated they had been taught, or were currently studying, Indigenous culture as part of further studies tables (table 5A.6.2). Proportions decreased as age increased, with about 1 in 4 people (26.3 per cent) aged 45 years and over stating that they were taught Indigenous culture at school or as part of further studies. These data are consistent with 2008 NATSISS data (figure 5.6.1).

Data for 2014-15 and 2008 on Aboriginal and Torres Strait Islander Australians taught Indigenous culture in schools are also reported by State and Territory in tables 5A.6.2-3, and by remoteness in tables 5A.6.4-5. In 2014-15, across all age groups, there were no significant differences in the proportion taught Indigenous culture between remote and non-remote areas (table 5A.6.4).

¹¹ Though Aboriginal and Torres Strait Islander students make up 5 per cent of all students across Australia, 77 per cent of all schools with primary school students have at least one Aboriginal and Torres Strait Islander student. That is, most schools have at least some Aboriginal and Torres Strait Islander students, but few have a large number. Of schools with at least one Aboriginal and Torres Strait Islander student, 69 per cent have less than 20 in total and 70 per cent have less than 10 per cent Aboriginal and Torres Strait Islander students in their total student enrolment (Productivity Commission 2016).

Figure 5.6.1 Proportion of Aboriginal and Torres Strait Islander people who were taught Indigenous culture in school or as part of further studies, by age, 2008 and 2014-15^{a, b, c}

^a Proportions for Aboriginal and Torres Strait Islander children aged 2 to 14 years are calculated as a percentage of the number of children who usually attend school. Proportions for people aged 15 years and over are calculated as a percentage of the number of people who ever attended school or undertook further studies. ^b Responses to 'Whether taught Indigenous culture in schools' for Aboriginal and Torres Strait Islander children aged 2 to 14 and some Aboriginal and Torres Strait Islander people aged 15 to 17 years were provided by an adult proxy. ^c Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008 and 2014-15; tables 5A.6.2-3.

Aboriginal and Torres Strait Islander employment in schools

The employment of Aboriginal and Torres Strait Islander teachers and the presence of Aboriginal and Torres Strait Islander adults in schools act as a positive role model for students, and these staff may be 'better positioned to understand and respond to the experiences of marginalised students' (Purdie et al. 2011). These individuals are seen as a 'bridge' between the Aboriginal and Torres Strait Islander, and non-Indigenous school community (Santoro and Reid 2006). However, Santoro and Reid noted that that Aboriginal and Torres Strait Islander teachers are expected to know and teach all aspects of culture in all Aboriginal and Torres Strait Islander communities, and are often also responsible for Aboriginal education issues from curriculum to pastoral care. These high expectations, and increased workload, often leads to 'burn out' and stress, and they advocate that Aboriginal and Torres Strait Islander teachers, particularly at the early stage of their careers, be provided with professional development and support.

Data from the 2013 SiAS survey found that, nationally, 2.2 per cent of primary school teachers and leaders and 1.0 per cent of secondary school teachers and leaders identified as Aboriginal and/or Torres Strait Islander (table 5A.6.1). The proportion of primary school leaders identifying as Aboriginal and/or Torres Strait Islander were near zero in 2010 and 1.1 per cent in 2013 (McKenzie et al. 2014). Around 2.1 per cent of students commencing teacher education programs in 2013 identified as Aboriginal and/or Torres Strait Islander, a higher proportion than the average across other fields of higher education (1.6 per cent) (AITSL 2015). By comparison, in the same year, 5.4 per cent of primary school students and 4.5 per cent of secondary school students were identified as Aboriginal and Torres Strait Islander (table 5A.6.1).

Things that work

While government-directed initiatives, such as culturally inclusive curricula, can influence the cultural awareness and inclusiveness of education systems, other important factors include: management structures in schools (through the school philosophy and involvement in the community), and the actions of individual teachers (via their teaching methods and attitudes to Indigenous cultures). Box 5.6.3 describes one promising program that aims support schools and early learning services to develop a higher level of knowledge and pride in Aboriginal and Torres Strait Islander cultures.

Box 5.6.3 Things that work – Indigenous cultural studies

Although the final evaluation is yet to be completed, the Steering Committee has identified Reconciliation Australia's Narragunnawali: Reconciliation in Schools and Early Learning (Narragunnawali) as a promising program worth further examination.

Launched in 2015, Narragunnawali aims to support schools and early learning services to develop environments that foster greater knowledge and pride in Aboriginal and Torres Strait Islander histories, cultures and contributions. To evaluate the program's effectiveness and impact, Reconciliation Australia contracted the Centre for Aboriginal Economic Policy Research (CAEPR) to conduct an independent evaluation of Narragunnawali during the first four years of funding (2014–2017).

CAEPR has completed two of an anticipated seven reports to date. These first two reports focused on identifying the engagement levels across schools in relation to reconciliation and factors that affect levels of reconciliation. Subsequent reports will evaluate the impact of Narragunnawali on increasing engagement with reconciliation.

The first report focused on identification of schools and early learning services less engaged than other schools with reconciliation (based on whether a school had commenced a Reconciliation Action Plan (RAP)). Those less engaged schools will be the focus of the expansion of Narragunnawali.

(continued next page)

Box 5.6.3 (continued)

The second report focused on those schools/early learning services that had commenced a RAP, and found that different aspects of reconciliation in services are reinforcing (for example, services that display a flag were more likely to have teachers that had completed cultural competency, proficiency or awareness training and are more likely to Acknowledge Country at events).

Future directions in data

Indigenous culture in schools

Data on the proportion of Aboriginal and Torres Strait Islander Australians taught culture in schools or as part of further studies are only available every six years from the ABS NATSISS. More frequent data are desirable, as are comparable data for the non-Indigenous population.

For students that are being taught Indigenous culture at schools, data on the quantity of lessons, and the content being taught, is also desirable as this may vary between schools.

Aboriginal and Torres Strait Islander workforce employed in schools

Only limited data are currently available on the Aboriginal and Torres Strait Islander workforce employed in schools:

- National data on the school workforce were available from the three-yearly SiAS survey, run by Australian Council for Educational Research on behalf of the Department of Education in 2007, 2010 and 2013. However, due to the small sample size, data on the Aboriginal and Torres Strait Islander workforce are not available below the national level.
- The initial National Teaching Workforce Dataset, produced on behalf of the Australian Education, Early Childhood Development and Youth Affairs Senior Official's Committee, collected data in 2012 on the Australian teaching workforce including qualifications, registration and employment status (data on professional development was generally not available). However, Indigenous status was unknown for just under half the workforce covered by the dataset.

-
- The Longitudinal Teacher Education Workforce study tracked a national cohort of teacher education graduates from 2011 to 2013. However, data were not available by Indigenous status, due to the small number of Aboriginal and Torres Strait Islander teachers in the sample.
 - Limited annual data on the number of Aboriginal and Torres Strait Islander principals, teachers and education workers (Aboriginal and Islander Education Workers [AIEW] and equivalents) were reported by individual jurisdictions for 2010, 2011, and 2012 as part of the Ministerial Council for Education, Early Childhood Development and Youth Affairs' Aboriginal and Torres Strait Islander Education Action Plan 2010–14 (SCSEEC 2013). The renamed Education Council endorsed the National Aboriginal and Torres Strait Islander Education Strategy 2015 in late 2015, noting the importance of a well-qualified Aboriginal and Torres Strait Islander education workforce, however reporting requirements remain unclear.

5.7 Participation in community activities¹²

Box 5.7.1 Key messages

- Involvement in community activities can lead to improvement in Aboriginal and Torres Strait Islander Australians' long-term health and physical and mental wellbeing, as well as improved social cohesion in communities.
- In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15 years and over, nearly two in three (62.6 per cent) had attended at least one cultural event in the last 12 months, down from 68.1 per cent in 2002 (table 5A.7.1). Whilst attendance decreased across all remoteness areas over this period, it remained higher as remoteness increased (ranging from 53.2 per cent in inner regional areas to 85.7 per cent in very remote areas in 2014-15) (table 5A.7.2).
- International research identified that the participation of Indigenous children and young people in traditional activities can lead to positive emotions, cultural identity and aspirations. In 2014-15, just over two in three (67.6 per cent) Aboriginal and Torres Strait Islander 3-24 year olds participated in at least one cultural activity — compared to 63.1 per cent in 2008 (table 5A.7.4).
- Nationally in 2014-15, 58.8 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over had participated in sporting and physical recreation activities in the previous year, an increase from 49.3 per cent in 2002 (table 5A.7.3).
- Playing in, or training for, organised sport was higher for all Australian children compared to Aboriginal and Torres Strait Islander children (60.2 per cent compared to 48.9 per cent). This pattern was observed across all remoteness areas except major cities, where there was no significant difference (figure 5.7.2).

Box 5.7.2 Measures of participation in community activities

There are two main measures for this indicator.

- *Involvement in arts and cultural events and activities*, defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who participated in/attended an Aboriginal and Torres Strait Islander community, social or cultural activity.
- *Participation in sport and recreational activities*, defined as proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who participated in sporting and physical recreation activities.

The most recent data for both measures are from the 2014-15 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) (all jurisdictions; age; remoteness).

Supplementary measures on Aboriginal and Torres Strait Islander children's and young people's participation in organised sport and selected art and cultural activities are also presented. The most recent available data are from the 2014-15 NATSISS for Aboriginal and Torres Strait Islander children and the 2012 ABS Children's Participation in Cultural and Leisure Activities Survey (CPiCLAS) for all children (all jurisdictions: age; sex; remoteness). These data are for non-overlapping periods but are comparable.

¹² The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

Measuring participation in sport, arts or community group activities gives an indication of how connected an individual is to their local community, by mapping formal networks of social relations (Stone 2001).

For all Australian children and young people, participation in sport and cultural activities provides opportunities to develop physically, socially, emotionally and cognitively (The Smith Family 2013; Vella et al. 2015). An analysis of the Australian Youth in Focus Project conducted by Le (2013) found that participation in extracurricular activity such as organised or other sports, arts, or other activities including volunteer work or cultural activities, reduced risky behaviours such as smoking, drinking and marijuana use. Further to this, the Youth Activity Participation Study of Western Australia found that Australian students ‘at risk’ or from disadvantaged backgrounds benefited most from participation in extracurricular activities, whether it was sport, music, dance or drama (Annear 2010).

Involvement in arts and cultural events and activities

Aboriginal and Torres Strait Islander Australians’ involvement in cultural events and activities has been shown to relate to a range of positive socioeconomic indicators, such as higher educational attainment, and higher probability of being employed, as well as better mental health, and to a lesser degree, increased happiness (Dockery 2011). Analysis of the 2008 NATSISS suggested that, in remote areas, feeling happy was associated with participating in cultural activities – with 83 per cent of Aboriginal and Torres Strait Islander Australians who were involved in art, craft, dance, music or story-telling reporting that they felt happy some or most of the time. Of those who attended cultural activities at least once per week, 81 per cent were happy some or most of the time, compared with 71 per cent among those who rarely or never attended cultural events (ABS 2010b).

In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15 years and over, nearly two in three (62.6 per cent) had attended at least one cultural event in the last 12 months (table 5A.7.1). This varied across states and territories, and by remoteness. For example:

- attendance at cultural events in the NT (83.3 per cent) was significantly higher than for other states and territories (table 5A.7.1)
- attendance at cultural events increased with remoteness, from 53.2 per cent in inner regional areas to 85.7 per cent in very remote areas (table 5A.7.2).

Between 2002 and 2008, for Aboriginal and Torres Strait Islander Australians aged 15 years and over, attendance at cultural events decreased nationally from 68.1 per cent to 62.9 per cent. Attendance rates were similar between 2008 and 2014-15 (62.9 per cent and 62.6 per cent respectively) (table 5A.7.1).

Data on attendance at cultural events are also reported by age (table 5A.7.3).

In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15 years and over, close to two in three (64.5 per cent) had participated in (rather than attended) at least one cultural activity, including, fishing, hunting or making Aboriginal and Torres Strait Islander arts and crafts, in the last 12 months (table 5A.7.4).

Children and young people's participation in cultural activities

International literature shows that there is an association between Indigenous children's participation in traditional activities and positive emotions, cultural identity and aspirations (Smith, Findlay and Crompton 2010). There is also a strong link between engagement in Indigenous culture and young people's wellbeing and resilience (Wexler 2009).

In 2014-15, just over two in three (67.6 per cent) Aboriginal and Torres Strait Islander children and young people aged 3–24 years had participated in at least one of the selected cultural activities in the previous 12 months:

- 52.8 per cent had fished and 21.0 per cent had hunted
- 22.0 per cent had made Aboriginal and Torres Strait Islander arts or crafts
- 15.3 per cent had performed Aboriginal and Torres Strait Islander music, dance or theatre
- 10.6 per cent had written or told Aboriginal and Torres Strait Islander stories (table 5A.7.4).

Participation in sport and recreational activities

Participation in sport and recreational activities has the potential to widely benefit individuals and communities by contributing not only to physical fitness, but also to improved mental wellbeing and social interaction (United Nations Sport for Development and Peace 2016). Sport and recreational activities can lead to (amongst other benefits) improved community bonds and cohesion (Cunningham and Beneforti 2005; Stronach, Maxwell and Taylor 2016), and increased validation of and connection to culture (Ware and Meredith 2013).

A parliamentary report on the contribution of sport to Aboriginal and Torres Strait Islander wellbeing acknowledged that skills learnt in sport and physical activity include 'life skills' such as: teamwork, problem solving, resilience building, communication and social skills and responsibility. The report concluded that sport could be a positive force in achieving Closing the Gap targets in broad areas such as health, education and employment (HoRSCoATSIA 2013).

Participation in sport and recreation is more than being a player or participant, and includes being a coach, referee and committee member. Volunteering in supporting roles gives non-playing participants an opportunity to develop their skills, self-esteem and purpose,

and also improves community cohesion (Cunningham and Beneforti 2002; Dinan-Thompson, Sellwood and Carless 2008).

Whilst there are positive benefits to sport and recreation, Ware and Meredith (2013) note that participation relies on interest, ability and skills, and that some sporting and recreation activities may be too expensive, and conversely, may contribute to social exclusion.

Figure 5.7.1 Participation in sport and recreational activities in the previous 12 months, Aboriginal and Torres Strait Islander people aged 3 years and over, 2002, 2008 and 2014-15^{a,b,c}

^a Children aged 3-14 years were not included in the ABS NATSISS 2002. Responses for children aged 3-14 years were provided by an adult proxy. ^b Some responses for 15-17 year olds were provided by an adult proxy. ^c Error bars represent 95 per cent confidence intervals.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002, ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15; table 5A.7.3.

Nationally in 2014-15, the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over participating in sporting and physical recreation activities was 58.8 per cent, an increase from 49.3 per cent in 2002 (figure 5.7.1). Participation rates were similar in remote and non-remote areas (58.2 and 60.8 per cent, respectively) (tables 5A.7.2).

The proportion of Aboriginal and Torres Strait Islander Australians participating in sporting and recreation activities increased for those aged 25 years and over from 2002 to 2008 (no significant change from 2008 to 2014-15), though the pattern of decreasing participation with increasing age remained (figure 5.7.1).

Children's participation in sport

Studies of all Australian adolescents have demonstrated an association between participation in structured sport and leisure activities and psychological wellbeing (Trainor et al. 2010) and increased school attendance (Blomfield and Barber 2010).

Aboriginal and Torres Strait Islander students surveyed by (Lonsdale et al. 2011) found that participation in sport was also linked to pride in their Aboriginal and Torres Strait Islander identities. A 2009 study of urban Aboriginal and Torres Strait Islander young people highlighted that many sporting and recreational activities were spoken of as points of connection with family, community and culture (Nelson 2009). Participating in organised sport and recreational activities also reduces unsupervised leisure time, and may divert young people from inappropriate or antisocial behaviour (Le 2013; Ware and Meredith 2013).

In 2014-15, around half of Aboriginal and Torres Strait Islander children aged 5–14 years (48.9 per cent) spent time playing or training for organised sports outside school hours, and nearly three-quarters (74.6 per cent) were physically active for at least one hour every day in the previous week (table 5A.7.7).

Nationally in 2014-15, participation in organised sport was higher for all Australian children than Aboriginal and Torres Strait Islander children (60.2 per cent compared to 48.9 per cent). This pattern was observed across all remoteness areas except major cities, where there was no significant difference (figure 5.7.2).

In 2014-15, the main factors stopping Aboriginal and Torres Strait Islander children aged 5–14 years from playing organised sport were: did not want to play sport (25.7 per cent); cost too much (21.6 per cent); not enough time (14.4 per cent) and organised sport was unavailable (10.4 per cent) (table 5A.7.7). There are no comparable data for non-Indigenous children. Data on children participating in physical activities and organised sport are also available by State and Territory (tables 5A.7.7–8) and sex (tables 5A.7.11–12). Further data on participation in sporting, community and social activities are in tables 5A.7.13–16.

Figure 5.7.2 **Participation in organised sport in the last 12 months, children aged 5–14 years, 2014-15^{a,b}**

^a Includes participation in sports organised through a school or a club, outside school hours. ^b Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15, ABS (unpublished) Children's Participation in Cultural and Leisure Activities 2012; table 5A.7.9.

Access to sporting facilities (including parks and reserves) may affect participation in sport and recreation (ABS 2012). Among Aboriginal and Torres Strait Islander households in 2008, over 90 per cent had access to outdoor playing fields and play areas (ABS 2010a). There was reduced access to swimming pools (63.5 per cent) and indoor sporting facilities (58.9 per cent) in remote areas (ABS 2010a).

Future directions in data

Data on participation in sport and physical activity (levels of exercise undertaken for fitness, recreation and sport) are available from the National Aboriginal and Torres Strait Islander Nutrition and Physical Activity Survey component of the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey. However, these data are not comparable to other data presented in this section. Where possible comparability across ABS surveys is recommended to enable comparative assessment of change over time.

Data on involvement in arts, cultural events and activities are only available every six years from the ABS National Aboriginal and Torres Strait Islander Social Survey. More frequent data are desirable. Inclusion of comparable questions in the ABS National Aboriginal and Torres Strait Islander Health Survey would increase the frequency to three-yearly.

5.8 Access to traditional lands and waters¹³

Box 5.8.1 Key messages

- Access to traditional lands and waters gives an indication of Aboriginal and Torres Strait Islander Australians' connection to country and, for some, is associated with improved health outcomes.
- Among Aboriginal and Torres Strait Islander Australians aged 15 years and older:
 - nearly three out of four recognised traditional homelands in 2014-15 (table 5A.8.1), with recognition higher in remote areas (88.5 per cent) than non remote areas (70.2 per cent). Since 2002, the proportion of those living in non-remote areas who recognise homelands has increased by about 7 percentage points, from 63.4 per cent (table 5A.8.2)
 - around half of those living in remote and very remote areas who recognised traditional homelands, also lived on their traditional land, compared to about one in four for those living in non-remote areas (figure 5.8.2)
 - the proportion who identified with a clan, tribal or language group increased from 54.1 per cent in 2002 to 62.3 per cent in 2014-15 (table 5A.8.1), with the proportion increasing as remoteness increased (from 55.6 per cent in major cities to 83.4 per cent in very remote areas in 2014-15) (table 5A.8.2).

Box 5.8.2 Measures of access to traditional lands and waters

There is one main measure for this indicator. *Recognition and access to homelands and traditional country* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who recognise areas as their homelands or traditional country.

A supplementary measure on the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who identified with a clan, tribal or language group is also reported.

The most recent available data are from the 2014-15 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) (national: age; remoteness). Data for those aged 14 years and younger are available for the first time, with limited data included in this report. Historical data for 2014-15, 2008 and 2002 are directly comparable, but historical data for 1994, 2004-05 and 2012-13 are only available for people aged 18 years and over, and for 1994 and 2004-05 are only available for non-remote areas.

There are currently no data specifically on access to traditional waters.

Aboriginal and Torres Strait Islander Australians report that they derive physical, spiritual, emotional and cultural benefits from their connection to country (Burgess and Morrison 2007; Dockery 2011). 'Country' refers to a specific clan, tribal group or nation of Aboriginal and Torres Strait Islander Australians and incorporates all the knowledge,

¹³ The Steering Committee notes its appreciation to Mr Jason Glanville, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

stories and resources within a particular area, including land, air and water (Fredericks 2013). Notion of country is central to self-identity for Aboriginal and Torres Strait Islander Australians (Kingsley et al. 2013).

Bishop et al. (2012) states that, as country is intrinsically linked to self-identity, the wellness of the people reflects the wellness of the country, while maintenance of country is important for maintenance of health (section 8.7 discusses the interaction with mental health).

The data in this section focus on recognition of, and access to country. The data do not show whether Aboriginal and Torres Strait Islander Australians have control or ownership, rights to resources found on their homelands or access to particular sites that may be of cultural significance. Information on ownership and control of land is discussed in section 9.2.

The reported data are based on Aboriginal and Torres Strait Islander Australians' own understanding of what constitutes their homelands or traditional country. Some Aboriginal and Torres Strait Islander Australians may live on or visit Indigenous owned or controlled land but they may not consider it to be their own homelands or traditional country. Movement from traditional country may have been either voluntary or involuntary, with many people who were removed from their families (such as the Stolen Generations) not being able to find their families or to identify their traditional country (NMHC 2012).

Recognition and access to homelands and traditional country

Access to traditional lands is conceptualised as a determinant of health (AHMAC 2015). Weir, Stacey and Youngetob (2011) summarised the literature on some of the positive associations with Aboriginal and Torres Strait Islander Australians living and accessing their traditional country, which included: positive health behaviours (increased exercise and physical activity, more nutritious diet, reduction in substance abuse) and a lesser burden on the health care system (savings in preventing disease, reduced hospital costs) as well as the overall economic benefits of a healthier population. Chapter 8 provides further information on health risk factors and outcomes.

Morphy's (2008) work with Aboriginal Australians from North-East Arnhem Land suggests that traditional homelands communities, where individuals are interconnected through multiple bonds, exhibit 'an orderly system of leadership and succession' according to established systems of governance. The stability and longevity of these governance systems were perceived by the Aboriginal Australians in the study as protective factors against 'social breakdown and loss of culture and the loss of many of the younger generations to drugs and alcohol'.

However, living on homelands/traditional country, particularly in remote or very remote regions of Australia, sometimes equates to reduced or restricted access to services such as health, housing and education, with people from these communities temporarily relocating

to larger centres to access these services (AHMAC 2015; AHRC 2010; AIHW 2014; Kerins 2010).

In 2014-15, among Aboriginal and Torres Strait Islander Australians aged 15 years and over:

- 74.1 per cent recognised homelands/traditional country — an increase from 69.6 per cent in 2002 (table 5A.8.1)
- recognition of homelands/traditional country was higher in remote and very remote areas (88.5 per cent) than non-remote areas (70.2 per cent), though the proportion in non-remote areas has increased significantly since 2002 (from 63.4 per cent) (table 5A.8.2)
- generally, as age increased, so did the proportion who indicated they recognised homelands/traditional country (from 49.3 per cent for those aged 14 years or less, to 85.2 per cent for those aged 45–54 years — those aged 55 years and over were slightly lower at 77.6 per cent), similar to the pattern seen in 2002 and 2008. Since 2002, there has been an increase in the proportion that recognised homelands/traditional country for those aged 35–44 and 45–54 years (figure 5.8.1).

Figure 5.8.1 Proportion of Aboriginal and Torres Strait Islander Australians who recognise homelands/traditional country, by age, 2002, 2008 and 2014-15^{a,b,c,d}

^a Includes respondents who recognised their homelands, but did not know if they were allowed to visit homelands or not. ^b Includes people who refused to answer, or who provided 'do not know' or 'not stated' responses. ^c Data for those aged 14 years and younger are only available in 2014-15. ^d Error bars represent 95 per cent confidence intervals around each proportion.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2002, 2008 and 2014-15; table 5A.8.4.

Recognition of homelands/traditional country is not restricted to those Aboriginal and Torres Strait Islander Australians who live on their recognised land. In 2014-15, 88.5 per

cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over in remote areas recognised homelands (and around half of those lived on homelands), while 70.2 per cent of those in non-remote areas recognised homelands (and around one in four of those lived on homelands) (figure 5.8.2). Whilst a return to country in the traditional sense is no longer an option for some Aboriginal Australians (AHMAC 2012), Fredericks (2013) argues that Aboriginal and Torres Strait Islander Australians still maintain strong connections to their country even if they live on lands that belong to other Aboriginal Australians, or if they recognise lands where large urban centres have grown in post-settlement Australia.

Figure 5.8.2 Proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who recognise and live on homelands/traditional country, by remoteness areas, 2014-15^{a,b,c}

^a 'Recognises but does not live' includes respondents that did not know if they were allowed to visit homelands or not. ^b Includes people who refused to answer, or who provided 'do not know' or 'not stated' responses. ^c Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 5A.8.2.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15; table 5A.8.2.

Traditional waters

For many Aboriginal and Torres Strait Islander Australians, water is an essential part of identity, culture and country (Birckhead et al. 2011; O'Bryan 2012). The Expert Panel on Constitutional Recognition of Indigenous Australians recommended that there should be an acknowledgment of the continuing relationship of Aboriginal and Torres Strait Islander Australians with both their traditional lands and waters (FAHCSIA 2012).

The National Water Initiative (NWI), agreed by COAG in 2004, is currently the primary vehicle in Australia for recognising the relationship of Aboriginal and Torres Strait Islander Australians with water (O'Bryan 2012). Until its abolition in 2014¹⁴, assessment of progress of the NWI was undertaken by the National Water Commission (NWC), which published a review of Aboriginal and Torres Strait Islander Australians' involvement in water planning in May 2014. The review found that:

... while approaches are variable across Australia, most governments have made significant advances in recognising the need to address Indigenous water issues ... However, challenges remain and little progress has been observed in the allocation or licensing of water for Indigenous social, economic, spiritual or cultural purposes (NWC 2014).

Identification with a clan, tribal or language group

Identification with a clan, tribal or language group is one aspect of connection to country (Fredericks 2013).

In 2014-15, 62.3 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over identified with a clan, tribal or language group, an increase from 54.1 per cent in 2002. Across remoteness areas, the proportion increased as remoteness increased from 57.6 per cent in non-remote areas to 78.9 per cent in remote areas. The proportion identifying in with a clan, tribal or language group in non-remote areas has increased since 2002 (from 45.7 per cent) (tables 5A.8.1-2).

Future directions in data

Data on Aboriginal and Torres Strait Islander Australians recognising and living on their homelands or traditional country is provided three-yearly through the ABS Indigenous survey program. Ongoing collection of these data, particularly in remote areas (for which data are only collected every six years), is desirable.

Given the importance of connection to country to the health of Aboriginal and Torres Strait Islander Australians, the collection of information on the reasons why a person does not identify with clan, tribal or language group or recognise homeland could assist in developing culturally appropriate responses.

The collection of additional information around recognition of traditional waters would complement the qualitative information formerly published in the National Water Commission assessments.

¹⁴ The NWC was abolished in 2014. Assessment of progress under the NWI is split between a number of government agencies, with the Productivity Commission responsible for triennial assessments of progress toward achieving the NWI objectives. For more information, see <http://www.nwc.gov.au/organisation/closure-in-2014>

- (a) Participants were asked to describe their level of their perception of knowledge on a scale ranging from 'very high, fairly high, fairly low, very low or no knowledge'. Participants from both groups completed the survey questionnaires online.
- (b) Due to extensive revision to the Barometer, including the measurement instrument and sampling design, data from 2014 onwards are not directly comparable to earlier data.
- (c) The Aboriginal and Torres Strait Islander sample was drawn from a professional market and social research panel. Participants were self-identified as Aboriginal and/or Torres Strait Islander. The sample consisted of 502 Aboriginal and Torres Strait Islander Australians.
- (d) The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. The general community sample consisted of 1100 Australians in 2014 and included 16 Aboriginal and Torres Strait Islander Australians (1.5 per cent).

				Proportion				
2012	%	5.5	26.4	31.9	51.2	13.5	64.7	3.4
2010	%	2.7	24.6	27.3	48.3	19.0	67.3	5.5
2008	%	3.4	28.5	31.9	51.0	13.7	64.7	3.4
				Relative standard error				
2012	%	13.1	5.2	4.6	3.1	8.0	2.3	16.8
2010	%	17.2	5.0	4.7	3.0	5.9	2.0	11.9
2008	%	16.8	5.0	4.6	3.1	7.9	2.3	16.7
				95 per cent confidence intervals				
2012	±	1.4	2.7	2.9	3.1	2.1	2.9	1.1
2010	±	0.9	2.4	2.5	2.8	2.2	2.6	1.3
2008	±	1.1	2.8	2.9	3.1	2.1	3.0	1.1

- (a) Participants were asked to describe their level of their perception of knowledge on a scale ranging from 'very high, fairly high, fairly low, very low or no knowledge'. Participants from both groups completed the survey questionnaires online.
- (b) Due to extensive revision for the 2014 Barometer, including the measurement instrument and sampling design, data from 2014 onwards are not directly comparable to earlier data.
- (c) The surveys among Aboriginal and Torres Strait Islander respondents involved recruitment through Aboriginal and Torres Strait Islander networks across Australia, with an open invitation distributed by email. The sample of Aboriginal and Torres Strait Islander people, recruited via these networks, may not be truly representative of the overall Aboriginal and Torres Strait Islander population. The survey sample consisted of 516 Aboriginal and Torres Strait Islander respondents in 2012, 704 in 2010 and 617 in 2008.
- (d) The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. The general community sample consisted of 1012 Australians in 2012, 1220 in 2010 and 1007 in 2008. Reconciliation Australia advised that whilst the general community sample was selected to be representative of the general community, given the small sample size is unlikely to have many (if any) Aboriginal and Torres Strait Islander Australians.
- Nil or rounded to zero.

- (a) Participants were asked to describe their level of their perception on a scale ranging from 'very high, fairly high, fairly low, very low or no knowledge'. Participants from both groups completed the survey questionnaires online.
- (b) Due to extensive revision for the 2014 Barometer, including the measurement instrument and sampling design, data from 2014 onwards are not directly comparable to earlier data.
- (c) The surveys among Indigenous respondents involved recruitment through Indigenous networks across Australia, with an open invitation distributed by email. The sample of Aboriginal and Torres Strait Islander people, recruited via these networks, may not be truly representative of the overall Indigenous population. The survey sample consisted of 516 Indigenous respondents in 2012, 704 in 2010 and 617 in 2008.
- (d) The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. The general community sample consisted of 1012 Australians in 2012, 1220 in 2010 and 1007 in 2008. Reconciliation Australia advised that whilst the general community sample was selected to be representative of the general community, given the small sample size is unlikely to have many (if any) Indigenous Australians.

- (a) Participants were asked to describe their level of their perception on a scale ranging from 'very high, fairly high, fairly low, very low or no knowledge'. Participants from both groups completed the survey questionnaires online.
- (b) Due to extensive revision to the Barometer, including the measurement instrument and sampling design, data from 2014 onwards are not directly comparable to earlier data.
- (c) The Aboriginal and Torres Strait Islander sample was drawn from a professional market and social research panel. Participants were self-identified as Aboriginal and/or Torres Strait Islander. The sample consisted of 502 Aboriginal and Torres Strait Islander Australians.
- (d) The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. The general community sample consisted of 1100 Australians in 2014 and included 16 Aboriginal and Torres Strait Islander Australians (1.5 per cent).

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Proportions with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Proportions with relative standard errors over 50 per cent are considered too unreliable for general use.

(c) Sum of components may be more than total as people may have reported having experienced discrimination in more than one situation.

(d) Refers to those who did not know if they had been treated unfairly.

- Nil or rounded to zero. **np** Not published.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Proportions with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Proportions with relative standard errors over 50 per cent are considered too unreliable for general use.

(c) Sum of components may be more than total as people may have reported having experienced discrimination in more than one situation.

(d) Refers to those who did not know if they had been treated unfairly.

- Nil or rounded to zero. **np** Not published.

TABLE 5A.1.21

Table 5A.1.21 **Whether treated unfairly at school because Aboriginal and/or Torres Strait Islander, by state/territory, people aged 2 to 14 years, 2008 (a), (b), (c), (d)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
Has not been treated unfairly at school	%	3.4	3.7	4.1	4.7	4.6	5.5	9.0	3.6	1.7
Total population aged 2 to 14 years (e)	%	–	–	–	–	–	–	–	–	–

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Proportions with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Proportions with relative standard errors over 50 per cent are considered too unreliable for general use.
- (c) Excludes approximately 33,000 children who do not usually attend school or are home schooled.
- (d) These data are not directly comparable with 2008 data due to differences in question methodology between the 2014-15 and 2008 NATSISS. In 2008, survey respondents were asked about bullying and unfair treatment in a single question. In 2014-15 the respondent was asked about bullying and unfair treatment in separate questions.
- (e) Includes children where it was not known if they had been treated unfairly at school.
- Nil or rounded to zero. **np** Not published.

TABLE 5A.2.7

Table 5A.2.7 Proportion of people in Commonwealth and State and Territory parliaments who are Aboriginal and Torres Strait Islander, relative to the Proportion of Aboriginal and Torres Strait Islander people in the population, as at 30 June 2016

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Commonwealth</i>
Aboriginal and Torres Strait Islander members of parliament (a)	no.	1	–	2	2	–	–	1	6	4
All members of parliament (b)	no.	135	128	89	95	69	40	17	25	226
Proportion of all members	%	0.7	–	2.2	2.1	–	–	5.9	24.0	1.8
Aboriginal and Torres Strait Islander population 18 years and over (c)	no.	137 095	32 200	124 125	60 123	25 193	16 176	4 633	47 812	447 540
Eligible Australian population (d), (e)	no.	5 305 013	4 132 904	3 282 943	1 712 824	1 234 717	388 456	283 456	164 012	16 504 325
Proportion of the Aboriginal and Torres Strait Islander population 18 years and over	%	2.6	0.8	3.8	3.5	2.0	4.2	1.6	29.2	2.7

(a) Aboriginal and Torres Strait Islander members of parliament were counted in the jurisdiction of the parliament. Current as at 30 June 2016.

(b) Includes members of both chambers for the Parliament of Australia and the states of NSW, Victoria, WA, SA and Tasmania. The remaining jurisdictions are uni-cameral. Sourced from jurisdictional parliamentary and electoral commission websites.

(c) ABS 2014 projected Aboriginal and Torres Strait Islander population as at 30 June 2016 (series B).

(d) Australian Electoral Commission (AEC) estimates of 'eligible Australians' as at 31 December 2016 (used as a proxy by the Steering Committee for the Review of Government Service Provision for Australian citizens eligible to nominate as candidates to stand for federal and state elections).

(e) The 'eligible Australians' category is based on estimates the AEC receives from the ABS of Australian citizens who are resident in Australia. As these estimates have a lag of several quarters, AEC extrapolates them to the reference date. The AEC then make adjustments in order to incorporate those groups which are captured by the ABS, but not eligible, or not captured, but are eligible. This includes additions for: eligible British subjects, those who have acquired citizenship since the last census, and overseas electors. The AEC then remove from that list people who have been removed from the roll on the basis of being 'unable to understand the nature and significance of voting'. These people, while Australian citizens, are not eligible to vote.

- Nil or rounded to zero.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) Sum of components may be more than total as people may have reported having problems accessing more than more service and/or having more than one barrier to accessing services.

Table 5A.3.1 Whether Aboriginal and Torres Strait Islander people aged 15 years and over had problems accessing services, by service and type of barrier, by State and Territory, 2014-15 (a)

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust.</i>
(c)	Includes people who reported having problems accessing 'other' services not further defined.									
(d)	These data are not directly comparable with 2008 data due to differences in question methodology between the 2014-15 and 2008 NATSISS. In 2008, survey respondents were asked about the types of services and associated barriers, and chose whichever of the multi-response items applied. In 2014-15 the respondent was asked about the barriers to the top three services they most had problem accessing.									
(e)	Includes people who reported having experienced 'other' barriers not further defined.									
(f)	Includes those who reported that they had not tried to access services.

TABLE 5A.3.3

Table 5A.3.3 Whether Aboriginal and Torres Strait Islander people aged 15 years and over had problems accessing services, by service and type of barrier, by remoteness, 2014-15 (a)

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remote</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>
--	-------------	---------------------	-----------------------	-----------------------	-------------------------	---------------	--------------------	---------------------

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) Difference between rate for total non-remote and total remote is statistically significant.
- (c) Sum of components may be more than total as people may have reported having problems accessing more than more service and/or having more than one barrier to accessing services.
- (d) Includes people who reported having problems accessing 'other' services not further defined.
- (e) These data are not directly comparable with 2008 data due to differences in question methodology between the 2014-15 and 2008 NATSISS. In 2008, survey respondents were asked about the types of services and associated barriers, and chose whichever of the multi-response items applied. In 2014-15 the respondent was asked about the barriers to the top three services they most had problem accessing.
- (f) Includes people who reported having experienced 'other' barriers not further defined.
- (g) Includes those who reported that they had not tried to access services.
- .. Not applicable.

- (a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) Difference between rate for total non-remote and total remote is statistically significant.
- (c) Sum of components may be more than total as people may have reported having problems accessing more than one service and/or having more than one barrier to accessing services.
- (d) Includes people who reported having problems accessing 'other' services not further defined.
- (e) Includes people who reported having experienced 'other' barriers not further defined.
- .. Not applicable.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) In 2002, all people aged 15 years and over were asked if they had experienced difficulties when communicating with service providers. In 2008 and 2014-15, only those aged 15 years and over who reported that they spoke an Indigenous language as their main language at home were asked about difficulties when communicating in places where only English is spoken. The response categories for the set of questions about communicating with service providers/places where only English is spoken were also slightly different between the three surveys, however, they are still comparable once the 2002 data are limited to only those who spoke an Indigenous language as their main language at home.

(c) Includes not stated responses.

(a)	Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.					
(b)	In 2002, all people aged 15 years and over were asked if they had experienced difficulties when communicating with service providers. In 2008 and 2014-15, only those aged 15 years and over who reported that they spoke an Indigenous language as their main language at home were asked about difficulties when communicating in places where only English is spoken. The response categories for the set of questions about communicating with service providers/places where only English is spoken were also slightly different between the three surveys, however, they are still comparable once the 2002 data are limited to only those who spoke an Indigenous language as their main language at home.					
(c)	Includes not stated responses.					
	.. Not applicable. np Not published.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Excludes separations with a principal diagnosis of 'Mental and behavioural disorders' (ICD-10AM codes 'F00-F99').

(c) Percentage of hospitalisations for which patients left hospital at own risk or were discharged against medical advice in the period.

(e) 'Other' includes hospitalisations of non- Aboriginal and Torres Strait Islander people and those for whom Aboriginal and Torres Strait Islander status was not stated.

(d) Data are reported for public and private hospitals in all jurisdictions.

(e) Data are reported for public and private hospitals in NSW, Victoria, Queensland, WA and SA and public hospitals in the NT, for residents of these jurisdictions.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) People whose main language spoken at home was an Aboriginal or Torres Strait Islander language were not asked whether they were learning an Indigenous language.
- (c) Components may not add to total as people may have provided more than one response.
- (d) Includes brother; sister; partner; husband; wife; and other relative.
- (e) Includes community elder; neighbour; friend; other community member; volunteer organisation; and community group.
- (f) Includes school; TAFE; university; adult learning centre; community centre; and library.
- .. Not applicable. - Nil or rounded to zero. **np** Not published.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(c) Includes children who usually attend school where it is not known if they are being taught Aboriginal and Torres Strait Islander culture at school.

(d) Proportions and relative standard errors for 'Culture taught in school' are calculated as a percentage of the children who usually attend school in each of the respective age groups.

Table 5A.6.2 Teaching of Indigenous cultures in schools to Aboriginal and Torres Strait Islander children, by State and Territory, 2014-15 (a), (b)

--	------------	------------	------------	-----------	-----------	------------	------------	-----------	-------------

(e) Proportions and relative standard errors are calculated as a percentage of the total population of children aged 2 to 14 years.

(f) Proportions and relative standard errors for 'Taught Aboriginal and Torres Strait Islander culture at school or as part of further studies' are calculated as a percentage of the 'Total that attended school or undertook further studies'.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(c) Includes children who usually attend school where it is not known if they are being taught Indigenous cultures at school.

Table 5A.6.4 Teaching of Indigenous cultures in schools to Aboriginal and Torres Strait Islander children, by remoteness areas, 2014-15 (a), (b)

	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remot</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>	<i>Australia</i>
(d) Proportions and relative standard errors for 'Culture taught in school' are calculated as a percentage of the children who usually attend school in each of the respective age groups.								
(e) Proportions and relative standard errors are calculated as a percentage of the total population of children aged 2 to 14 years.								
(f) Proportions and relative standard errors for 'Taught Indigenous cultures at school or as part of further studies' are calculated as a percentage of the 'Total that attended school or undertook further studies'.

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.

(b) Proportions and relative standard errors for 'Culture taught in school' are calculated as a percentage of the children who usually attend school in each of the respective age groups.

(c) Proportions and relative standard errors for 'Children aged 2 to 14 years that usually attend school' are calculated as a percentage of the total population of children aged 2 to 14 years. Total who usually attend school includes 'not known'.

Table 5A.6.5 Teaching of Indigenous cultures in schools to Aboriginal and Torres Strait Islander children, by remoteness areas, 2008 (a)

	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remot</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>	<i>Australia</i>
(d) Proportions and relative standard errors for 'Children aged 2 to 14 years that don't usually attend school' are calculated as a percentage of the total population of children aged 2 to 14 years.								
(e) Proportions and relative standard errors for 'Taught Indigenous cultures at school or as part of further studies' are calculated as a percentage of the 'Total that attended school or undertook further studies'.								
(f) Difference between rate for total non-remote areas and total remote areas is statistically significant.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) Participation in selected social activities in last 3 months was not collected in the 2014-15 survey. In the 2014-15 survey, respondents were asked about participation in selected sporting, social or community activities in the last 12 months, and is presented in table 5A.5.17 by remoteness, by age.
- (c) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by a proxy.
- (d) 'Player or participant' includes 'Played sport or took part in physical activities' and 'Attended sporting event as a spectator'.
- (e) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.
- (g) In 2002, NAIDOC week activities were not listed as a separate event.
- (h) Includes church or religious activities; went to a cafe, restaurant or bar; took part in or attended sport or physical activities; participated in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', or 'other sporting activity'; attended a native title meeting; participated in community or special interest group activities; attended funerals/sorry business, ceremonies or Aboriginal and/or Torres Strait Islander festivals; visited a library, museum art gallery, park, botanic gardens, zoo or theme park; attending movies, theatre or concert; and watched Indigenous TV or listened to Indigenous radio.
- (i) In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.
- .. Not applicable.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) Participation in selected social activities in last 3 months was not collected in the 2014-15 survey. In the 2014-15 survey, respondents were asked about participation in selected sporting, social or community activities in the last 12 months, and is presented in table 5A.5.17 by remoteness, by age.
- (c) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by a proxy.
- (d) 'Player or participant' includes 'Played sport or took part in physical activities' and 'Attended sporting event as a spectator'.
- (e) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.
- (g) In 2002, NAIDOC week activities were not listed as a separate event.

TABLE 5A.7.2

Table 5A.7.2 Aboriginal and Torres Strait Islander people aged 15 years and over: participation in selected social activities, participation in selected sporting and physical recreation activities, and attendance at Indigenous cultural events, by remoteness, 2002, 2008 and 2014-15 (a), (b), (c)

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remote</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>	<i>Australia</i>
(h)	Includes church or religious activities; went to a cafe, restaurant or bar; took part in or attended sport or physical activities; participated in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', or 'other sporting activity'; attended a native title meeting; participated in community or special interest group activities; attended funerals/sorry business, ceremonies or Aboriginal and/or Torres Strait Islander festivals; visited a library, museum art gallery, park, botanic gardens, zoo or theme park; attending movies, theatre or concert; and watched Indigenous TV or listened to Indigenous radio.								
(i)	In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.								
	.. Not applicable. - Nil or rounded to zero.

Total Aboriginal and Torres Strait Islander people aged 15 years and over (including not stated responses)	±

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) Participation in selected social activities in last 3 months was not collected in the 2014-15 survey. In the 2014-15 survey, respondents were asked about participation in selected sporting, social or community activities in the last 12 months, and is presented in table 5A.5.17 by remoteness, by age.
- (c) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by a proxy. In 2008 and 2014-15, responses for children aged 3-14 years were provided by an adult proxy.
- (d) 'Player or participant' includes 'Played sport or took part in physical activities' and 'Attended sporting event as a spectator'.
- (e) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.
- (g) In 2002, NAIDOC week activities were not listed as a separate event.
- (h) Includes church or religious activities; went to a cafe, restaurant or bar; took part in or attended sport or physical activities; participated in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', or 'other sporting activity'; attended a native title meeting; participated in community or special interest group activities; attended funerals/sorry business, ceremonies or Aboriginal and/or Torres Strait Islander festivals; visited a library, museum art gallery, park, botanic gardens, zoo or theme park; attending movies, theatre or concert; and watched Indigenous TV or listened to Indigenous radio.
- (i) In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.

(b) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.

(c) Includes participating in 'recreational or cultural group activities', 'attended native title meeting', 'community or special interest group activities', 'church or religious activities' or 'attended funerals/sorry business, ceremonies or Indigenous festivals'.

Table 5A.7.5 Aboriginal and Torres Strait Islander people aged 15 years and over: participation in sporting, community and social activities, and involvement in Indigenous cultural events, by State and Territory, 2014-15 (a)

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
(d)	Includes participating in social activities such as 'went to a café, restaurant or bar', 'visited a library, museum or art gallery', 'attended movies, theatre or concert', 'visited park, botanic gardens, zoo, theme park', 'watched Indigenous TV' or 'listened to Indigenous radio'. 'Has been involved in social activities' in last twelve months is slightly different between the 2002 and 2008 surveys. The 2002 question included the option 'fishing or hunting in a group', this wasn't asked about in 2008. In 2008 'watched Indigenous TV', and 'listened to Indigenous radio' was asked about, these were not asked about in 2002.									
(e)	Sum of components may exceed total as people may have participated in more than one of the selected activities.									
(f)	'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.

- (a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by an adult proxy.
- (c) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.
- (d) Includes participating in 'recreational or cultural group activities', 'attended native title meeting', 'community or special interest group activities', 'church or religious activities' or 'attended funerals/sorry business, ceremonies or Indigenous festivals'.
- (e) Includes participating in social activities such as 'went to a café, restaurant or bar', 'visited a library, museum or art gallery', 'attended movies, theatre or concert', 'visited park, botanic gardens, zoo, theme park', 'watched Indigenous TV' or 'listened to Indigenous radio'. 'Has been involved in social activities' in last twelve months is slightly different between the 2002 and 2008 surveys. The 2002 question included the option 'fishing or hunting in a group', this wasn't asked about in 2008. In 2008 'watched Indigenous TV', and 'listened to Indigenous radio' was asked about, these were not asked about in 2002.
- (f) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (g) 'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.
- .. Not applicable.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) The physical activity recommendations by the Department of Health for children aged 5 to 12 years are that children need at least 60 minutes a day (and up to several hours) of moderate to vigorous physical activity every day.

(c) Outside of school hours.

(d) Includes lack of appropriate training or equipment, too young for preferred sport, transport problems/too far and other reasons.

Table 5A.7.7 **Participation of children aged 5–14 years in physical activities and organised sport, by State/Territory, 2014-15**

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) The physical activity recommendations by the Department of Health and Ageing for children aged 5 to 12 years are that children need at least 60 minutes a day (and up to several hours) of moderate to vigorous physical activity every day.

(c) Outside of school hours.

Table 5A.7.8 **Participation of children aged 5–14 years in physical activities and organised sport, by State/Territory, 2008 (a)**

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) The physical activity recommendations by the Department of Health for children aged 5 to 12 years are that children need at least 60 minutes a day (and up to several hours) of moderate to vigorous physical activity every day.

(c) Outside of school hours.

(d) Includes lack of appropriate training or equipment, too young for preferred sport, transport problems/too far and other reasons.

(e) Sum of components may exceed total as people may have provided more than one response.

Total Aboriginal and Torres Strait Islander people aged 3 to 14 years (including not stated responses)	±

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.

(b) Responses for people aged 3 to 14 years were provided by an adult proxy.

(c) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.

(d) Includes participating in 'recreational or cultural group activities', 'attended native title meeting', 'community or special interest group activities', 'church or religious activities' or 'attended funerals/sorry business, ceremonies or Indigenous festivals'.

(e) Includes participating in social activities such as 'went to a café, restaurant or bar', 'visited a library, museum or art gallery', 'attended movies, theatre or concert', 'visited park, botanic gardens, zoo, theme park', 'watched indigenous TV' or 'listened to Indigenous radio'.

(f) Sum of components may exceed total as people may have participated in more than one of the selected activities.

(g) Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.

.. Not applicable.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) Includes respondents that didn't know if they were allowed to visit homelands or not.

(c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.

(d) Asked of persons who visit their homelands at least once per year.

(e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.

(f) Includes people who recognised their homelands but did not know, if they were-allowed to visit.

(g) Total includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. For 2014-15, this applies to responses for: 'Length of longest visit to homelands', 'How often allowed to visit Homelands', or 'Whether allowed to visit Homelands'.

.. Not applicable. - Nil or rounded to zero. **np** Not published.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.
- (b) Includes respondents that didn't know if they were allowed to visit homelands or not.
- (c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.
- (d) Asked of persons who visit their homelands at least once per year.
- (e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.
- (f) Includes people who recognised their homelands but did not know, if they were-allowed to visit.
- (g) Total includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. For 2014-15, this applies to responses for: 'Length of longest visit to homelands', 'How often allowed to visit Homelands', or 'Whether allowed to visit Homelands'.
- .. Not applicable. - Nil or rounded to zero. **np** Not published.

Total (f)	±

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.
- (b) Includes respondents that didn't know if they were allowed to visit homelands or not.
- (c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.
- (d) Asked of persons who visit their homelands at least once per year.
- (e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.
- (f) Includes people who recognised their homelands but did not know, if they were-allowed to visit.
- (g) Total includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. For 2014-15, this applies to responses for: 'Length of longest visit to homelands', 'How often allowed to visit Homelands', or 'Whether allowed to visit Homelands'.

6 Early child development

Strategic areas for action

Providing children with a good start can have a long lasting effect on the rest of their lives, opening up opportunities for the future. However, problems at this early stage can create barriers that prevent children achieving their full potential.

The indicators in the early child development strategic area focus on the drivers of long term advantage or disadvantage:

- antenatal care (section 6.1) — the health of women during pregnancy, childbirth and the period following birth is important for the wellbeing of both women and children
- health behaviours during pregnancy (section 6.2) — the health behaviours of women during pregnancy, including the consumption of tobacco and other drugs affects the wellbeing of both mothers and children
- teenage birth rate (section 6.3) — teenage births are associated with lower incomes and poorer educational attainment and employment prospects for young parents
- birthweight (section 6.4) — low birthweight babies require longer periods of hospitalisation after birth and are more likely to have poor health, or even die in infancy and childhood. Low birthweight is also correlated with poorer health outcomes later in life
- early childhood hospitalisations (section 6.5) — the hospitalisation rate provides a broad indicator of serious health issues experienced by children
- injury and preventable disease (section 6.6) — most childhood diseases and injuries can be successfully prevented or treated without hospitalisation
- ear health (section 6.7) — Aboriginal and Torres Strait Islander children tend to have high rates of recurring ear infections that, if not treated early, can become chronic and

lead to hearing impairment, which in turn can affect children's capacity to learn and socialise

- basic skills for life and learning (section 6.8) — the early social and cognitive development of children provides the foundations upon which later relationships and formal learning depend.

Several COAG targets and headline indicators reflect the importance of early child development:

- young child mortality (section 4.2)
- early childhood education (section 4.3)
- substantiated child abuse and neglect (section 4.11).

Other headline indicators are important influences on early childhood outcomes:

- household and individual income (section 4.10)
- family and community violence (section 4.12).

Outcomes in the early child development area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- healthy lives (access to primary health, obesity and nutrition) (chapter 8)
- economic participation (income support) (chapter 9)
- home environment (overcrowding, access to functioning water, sewerage and electricity services) (chapter 10)
- safe and supportive communities (alcohol/drug misuse and harm) (chapter 11).

Attachment tables for this chapter are identified in references throughout this chapter by an 'A' suffix (for example, table 6A.1.1). These tables can be found on the web page (www.pc.gov.au/oid2016).

6.1 Antenatal care¹

Box 6.1.1 Key messages

- Antenatal care provides expectant mothers with information and early screening that can identify and help manage issues that may affect birth outcomes. Fifty-two per cent of Aboriginal and Torres Strait Islander women who gave birth in 2013 attended at least one antenatal visit in the first trimester (table 6A.1.1), an increase from 50.0 per cent in 2011 (table 6A.1.3), and 86.1 per cent attended five or more antenatal visits (table 6A.1.33).
- In 2013, after adjusting for population age structure, Aboriginal and Torres Strait Islander mothers attended their first antenatal visit later in pregnancy than non-Indigenous mothers and attended less frequently (attended five or more visits at 0.9 times the rate for non-Indigenous mothers) (tables 6A.1.9 and 6A.1.16).
- Trends varied across the jurisdictions for which time series data were available but:
 - nationally from 2011 to 2013, the proportion of Aboriginal and Torres Strait Islander mothers attending antenatal care in the first trimester in very remote areas increased from 46.8 per cent to 58.1 per cent. The trend was reversed in major cities with a decrease from 46.6 per cent to 43.1 per cent (table 6A.1.8). These changes should be interpreted with caution due to changes in definitions and methods
 - for Queensland, SA and the NT combined, from 2011 to 2013, the gap in mothers attending five or more visits narrowed in the very remote and inner regional areas, increased in major cities and remained constant in other areas (tables 6A.1.26–28).

Box 6.1.2 Measures of antenatal care

There are two main measures for this indicator (aligned with the associated NIRA indicator).

- *Antenatal visits in the first trimester* is defined as the proportion of women who gave birth who attended at least one antenatal visit in the first trimester.
- *Five or more antenatal visits* is defined as the proportion of women who gave birth who attended five or more antenatal visits.

The most recent available data for both main measures are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- nationally standardised data on *gestation at first antenatal visit* are only available from July 2010, and nationally standardised data on *number of antenatal visits* are only available from July 2012 (caution should be used making jurisdictional comparisons prior to these dates)
- data by remoteness area are provided from 2011. Data for prior years are not directly comparable and are not included in this report.

A supplementary measure on health and nutrition during pregnancy is also reported.

¹ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

Although many Aboriginal and Torres Strait Islander women experience healthy pregnancies, some experience complications of pregnancy and childbirth, resulting in poorer birth outcomes than those experienced by non-Indigenous women.

Antenatal care provides expectant mothers with information and early screening that can identify and help manage issues that may affect birth outcomes. Inadequate or late access to quality antenatal care has been associated with poor pregnancy outcomes, such as prematurity, low birthweight and increased delivery intervention (AHMAC 2012a). Low birthweight infants are prone to ill health and at greater risk of dying during the first year of life (section 6.4, Birthweight).

Antenatal care may be especially important for Aboriginal and Torres Strait Islander women, as they are at higher risk of giving birth to low birthweight babies and have greater exposure to other risk factors such as anaemia, poor nutritional status, hypertension, diabetes, genital and urinary tract infections and smoking (AHMAC 2012a). Antenatal care is an indicator in the National Indigenous Reform Agreement (NIRA) (COAG 2012), and improved access to antenatal care was a focus of the National Partnership Agreement on Indigenous Early Childhood Development (Australian Government 2009)².

The optimal number of antenatal care visits is the subject of some debate (Gausia et al. 2013; Hunt and Lumley 2002). National evidence-based antenatal care guidelines have been developed by the Department of Health in collaboration with State and Territory governments, and approved by the National Health and Medical Research Council (AHMAC 2012b). These guidelines include a recommended first visit within the first 10 weeks of gestation, with the subsequent schedule of antenatal visits to be based on the individual woman's needs (for uncomplicated pregnancies — 10 visits for the first pregnancy and 7 visits for subsequent pregnancies). However, the indicator in this report is defined against a lower standard of five or more visits to align with the NIRA.

Antenatal visits in the first trimester

Nationally in 2013, 51.9 per cent of Aboriginal and Torres Strait Islander women who gave birth attended at least one antenatal visit in the first trimester (table 6A.1.1), an increase from 50.0 per cent in 2011 (the earliest period for which data are available for all jurisdictions) (table 6A.1.3). Historical data prior to 2011 are available for selected jurisdictions and reported in tables 6A.1.4–7.

After adjusting for differences in population age structures, the rate for Aboriginal and Torres Strait Islander women was 0.9 times the rate for non-Indigenous women

² The National Partnership Agreement on Indigenous Early Childhood Development expired on 30 June 2014. The antenatal and reproductive healthcare provisions were funded for an additional 12 months to 30 June 2015 under the Project Agreement for Indigenous teenage sexual and reproductive health and young parent support.

(table 6A.1.9). Nationally from 2011 to 2013, the gap narrowed from 14.1 to 8.4 percentage points (tables 6A.1.9 and 6A.1.11).

Comparable data are available for three jurisdictions (NSW, SA and the NT) from 2007 to 2013. For these three jurisdictions, the gap between Aboriginal and Strait Islander women and non-Indigenous women in 2013 is narrower than the gap in 2007 (figure 6.1.1).

Figure 6.1.1 Mothers who attended at least one antenatal visit in the first trimester, NSW, SA and the NT, 2007 to 2013^{a, b}

^a Data are by place of usual residence of the mother. ^b Data are age standardised.

Source: AIHW (National Perinatal Data Collection), cited in (SCRGSP 2014, 2015); tables 6A.1.9-15.

Nationally from 2011 to 2013, the proportion of Aboriginal and Torres Strait Islander mothers attending antenatal care in the first trimester in very remote areas increased from 46.8 per cent to 58.1 per cent. The trend was reversed in major cities: 43.1 per cent in 2013 compared to 46.6 per cent in 2011 (table 6A.1.8). These changes should be interpreted with caution due to changes in definitions and methods. Age standardised data are provided for comparisons with non-Indigenous women (tables 6A.1.23–25).

Five or more antenatal visits

In 2013, 86.1 per cent of Aboriginal and Torres Strait Islander mothers attended five or more antenatal visits (NSW, Queensland, WA, SA, Tasmania, ACT and the NT combined) (table 6A.1.33). Data for selected jurisdictions for 2012 and 2011 are reported in tables 6A.34 and 35 respectively.

After adjusting for differences in population age structures, the rate for Aboriginal and Torres Strait Islander women was 0.9 times the rate for non-Indigenous women (table 6A.1.16). Data were not available for all jurisdictions in all years, but there are comparable data available for three jurisdictions (Queensland, SA and the NT) from 2007 to 2013. When taking into account differences in population age structures, the gap between Aboriginal and Torres Strait Islander women and non-Indigenous women halved from 16.6 to 8.3 percentage points (tables 6A.1.16–22). Across remoteness areas for these three jurisdictions the gap narrowed in the very remote and inner regional areas, increased in major cities and remained constant in other areas (tables 6A.1.26–28).

Health and nutrition during pregnancy

Antenatal care provides an opportunity to identify maternal health issues. Nutrition and diet are important for the health of the mother and baby during pregnancy. Pregnant women and women considering pregnancy are advised to have a balanced diet and in particular to maintain adequate folate levels to decrease the risk of neural tube defects such as spina bifida.³ A number of studies have reported poor nutrition for Aboriginal and Torres Strait Islander women of childbearing age and during pregnancy (McDermott et al. 2009; Wen et al. 2010). In 2014-15, for Aboriginal and Torres Strait Islander children aged 0–3 years, 3 in 5 mothers took folate prior to or during pregnancy (table 6A.1.29), an increase from 50.7 per cent in 2008 (table 6A.1.30).

Aboriginal and Torres Strait Islander women are at higher risk of having Type 2 diabetes and gestational diabetes than non-Indigenous mothers, and these conditions pose a heightened risk of pre-term birth, delivery with no labour, caesarean section, hypertension and longer stay in hospital. In 2014-15, for Aboriginal and Torres Strait Islander children aged 0–3 years, 9.7 per cent of mothers had diabetes or sugar problems during pregnancy (table 6A.1.29) similar to 2008 (8.4 per cent) (table 6A.1.30).

Things that work

Culturally safe service provision, involvement of Aboriginal and Torres Strait Islander elders and the community in developing services, and incorporation of traditional midwifery knowledge and skills have been found to encourage Aboriginal and Torres Strait Islander women to access maternity health services, and to lead to better maternal outcomes (Kildea and Van Wagner 2013; Kildea et al. 2012; Murphy and Best 2012; Reibel and Walker 2010; Wilson 2009). In a 2013 South Australian study, women with Aboriginal babies who attended Aboriginal Family Birthing Program services were almost

³ Neural tube defects are where an opening in the spinal cord or brain occurs during early fetal development. Spina bifida is one form of neural tube defect that affects spine development.

five times as likely as women attending mainstream public care to say that their antenatal care was ‘very good’ (Glover et al. 2013)⁴.

Programs after birth also play an important part in health outcomes for mothers and their children (Bar-Zeev et al. 2012). Sivak, Arney and Lewig (2008) found that a family home visiting program for Aboriginal and Torres Strait Islander babies after birth had positive outcomes for the health and wellbeing of both mothers and babies.

Box 6.1.3 includes case studies of some things that are working to improve antenatal care for Aboriginal and Torres Strait Islander women.

Box 6.1.3 ‘Things that work’ – Antenatal care

The **Winnunga Nimmityjah Aboriginal Health Service** (ACT) is an Aboriginal community controlled primary health care service which provides culturally safe and holistic health services to the Aboriginal and Torres Strait Islander people of the ACT and surrounding areas. An independent evaluation in 2011 found that the **Aboriginal Midwifery Access Program** provided by the service was a benchmark program for the delivery of culturally appropriate midwifery services to parents and new-borns. It encouraged women to access treatment at an early stage in pregnancy, and provided comprehensive antenatal and postnatal services, including: home visits; assistance with appointments for antenatal investigations and specialist care; transport; birth support; postnatal follow-up; and immunisations (Wong et al 2011).

The **Aboriginal Maternity Group Practice Program** (WA) commenced in 2011 and aimed to improve timely access to existing antenatal and maternity services in south metropolitan Perth, and thereby increase the number of women giving birth safely in a local hospital. The program employed Aboriginal Health Officers (AHOs), Aboriginal grandmothers and midwives in each district to work with the existing services. The program model was culturally secure, with a focus on early access to antenatal care, employment of Aboriginal staff, and holistic care, including awareness of the social determinants of health. An independent evaluation covering the 18 month period to 31 December 2012 found that babies born to AMGPP participants were significantly less likely to be born pre-term, to require resuscitation at birth or to require a hospital stay of more than five days, compared to those not in the program (Bertilone and McEvoy 2015).

Sources: Winnunga Nimmityjah Aboriginal Health Service 2013, *2012-13 Annual Report*, <http://www.winnunga.org.au/index.php?page=AR>; Wong, R., Herceg, A., Patterson, C., Freebairn, L., Baker, A., Sharp, P., Pinnington, P. and Tongs, J. 2011, *Positive impact of a long-running urban Aboriginal medical service midwifery program*, Australian and New Zealand Journal of Obstetrics and Gynaecology, vol. 51, no. 6, pp. 518–522; Bertilone, C and McEvoy, S. 2015, *Success in Closing the Gap: favourable neonatal outcomes in a metropolitan Aboriginal Maternity Group Practice Program*, Medical Journal of Australia 2015; 203 (6), pp. 262e1-e7.

⁴ The questionnaire was undertaken by women living in Adelaide (44 per cent) and regional areas including Ceduna, Port Lincoln, Whyalla, Port August, Murray Bridge and Mt Gambier (56 per cent).

Future directions in data

The data for both primary measures are from the National Perinatal Data Collection (NPDC) managed by the AIHW. It includes data items specified in the Perinatal National Minimum Dataset (NMDS) plus additional items collected by the states and territories.

The usefulness of NPDC data has historically been affected by some gaps in reporting, lack of national consistency and low response rates. Under schedule F of the National Indigenous Reform Agreement, the AIHW has improved the quality of NPDC data items related to antenatal care, which are now nationally comparable and available for this report.

Data on the nutrition and health of Aboriginal and Torres Strait Islander mothers and young children are only available every six years (from the ABS NATSISS). More regular data and comparative data for non-Indigenous mothers and children are required.

6.2 Health behaviours during pregnancy⁵

Box 6.2.1 Key messages

- Tobacco smoking, alcohol and illicit substance use during pregnancy can lead to miscarriage, stillbirth, fetal growth restriction, congenital anomalies, premature birth and low birthweight.
- Nationally (excluding Victoria), the proportion of Aboriginal and Torres Strait Islander mothers who smoked during pregnancy declined by 6.5 percentage points from 2005 to 2013 (tables 6A.2.1–6A.2.9).
- Nationally in 2013, just under half of Aboriginal and Torres Strait Islander mothers (48.0 per cent) smoked during pregnancy (table 6A.2.1), with the proportion lower in major cities and inner regional areas (47.8 per cent and 43.3 per cent respectively) compared with more remote areas (49.0–55.1 per cent) (table 6A.2.10).
- After adjusting for differences in population age structures, the rate of smoking during pregnancy for Aboriginal and Torres Strait Islander mothers in 2013 was almost four times the rate for non-Indigenous mothers (table 6A.2.11). This ratio was highest in major cities and very remote areas (3.7 and 3.5 times as high, respectively) and lower in other areas (2.7–2.9 times as high) (table 6A.2.20).
- Self-reported consumption of alcohol during pregnancy by mothers of Aboriginal and Torres Strait Islander children has halved from 2008 to 2014-15 (19.6 per cent to 9.8 per cent) (table 6A.2.23).

Box 6.2.2 Measuring of health behaviours during pregnancy

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Tobacco smoking during pregnancy* is defined as the number of women who smoked during pregnancy as a proportion of the total number of women who have given birth.

The most recent available data are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- nationally standardised data items on tobacco smoking are available from July 2010. Caution should be used in making jurisdictional comparisons prior to this date
- nationally comparable time series data, excluding Victoria, are available from 2005
- remoteness data are presented from 2011 onwards (not comparable with previous years).

Data are also provided for three supplementary measures: The proportion of mothers, with Aboriginal and Torres Strait Islander children aged 0–3 years, who: used tobacco during pregnancy; consumed alcohol during pregnancy; used illicit drugs during pregnancy.

(continued next page)

⁵ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

Box 6.2.2 (continued)

The most recent available data for these measures are from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2014-15 (data available every six years) (all jurisdictions; remoteness).

Data on tobacco use during pregnancy from the NPDC and the NATSISS are not directly comparable.

Smoking in pregnancy can lead to miscarriage, stillbirth or premature birth and low birthweight (Gilligan et al. 2007; Samper et al. 2012; Walters 2009), with similar perinatal outcomes reported for cannabis use during pregnancy (Brown et al. 2016). When a pregnant woman smokes, fetal levels of nicotine have been found to be 15 per cent higher than maternal levels, and fetal nicotine exposure can damage the brain, leading to health, behavioural and cognitive problems that emerge later in life (Behl et al. 2013; Hutchinson et al. 2010; Pickett et al. 2008; Stone KC et al. 2010; Stroud et al. 2009). A retrospective cohort study of births in SA found that smoking cessation in the first trimester reduced the risks of adverse perinatal outcomes to levels comparable with non-smokers (Hodgyl et al. 2014).

Negative health effects of maternal tobacco smoking may continue after birth via nicotine in breast milk and via passive (or second-hand) smoking (Johnston et al. 2011; Julvez et al. 2007). Passive smoking has been linked with higher rates of respiratory illness, sudden infant death syndrome (SIDS), vascular dysfunction, asthma and effects on hearing in children (Durante 2012; Ferrence 2010; Jones et al. 2011).

A study comparing tobacco, alcohol and cannabis use amongst pregnant Aboriginal and Torres Strait Islander women in NSW and the NT found that women using any one substance were more likely to also use others (Passey et al. 2014).

Tobacco consumption during pregnancy

Nationally in 2013, the proportion of Aboriginal and Torres Strait Islander females who smoked during pregnancy was 48.0 per cent (table 6A.2.1). The proportion was lower in major cities (47.8 per cent) and inner regional areas (43.3 per cent) compared with other areas (49.0–55.1 per cent), though the pattern varied across jurisdictions (table 6A.2.10).

Nationally (excluding Victoria), the proportion of Aboriginal and Torres Strait Islander females smoking during pregnancy decreased from 54.8 per cent in 2005 to 48.3 per cent in 2013 — a decrease of 6.5 percentage points (figure 6.2.1).

Figure 6.2.1 Rates of tobacco smoking during pregnancy for Aboriginal and Torres Strait Islander females, 2005 to 2013^{a, b, c}

^a Excludes births where the mother's Indigenous status was not stated. ^b Data are not available for Victoria prior to 2009. Total excludes women who gave birth in Victoria. Due to small numbers, the total also excludes women who were Victorian residents who gave birth elsewhere in Australia. ^c Excludes mothers for whom smoking status was not stated.

Source: AIHW (unpublished) National Perinatal Data Collection; tables 6A.2.1—6A.2.9.

After adjusting for differences in population age structures, the rate of smoking during pregnancy for Aboriginal and Torres Strait Islander women was 3.6 times the rate for non-Indigenous women (table 6A.2.11). This ratio was highest in major cities and very remote areas (3.7 and 3.5 times as high, respectively) and lower in other areas (2.7–2.9 times as high) (table 6A.2.20).

Survey data on smoking by mothers of Aboriginal and Torres Strait Islander children aged 0–3 years in 2014–15 show slightly lower proportions compared to the 2013 NPDC data, although the survey data should be used with caution due to differences in collection methodology and high relative standard errors for some survey results (tables 6A.2.23–24).

Alcohol consumption during pregnancy

Heavy alcohol consumption during pregnancy may cause physical and neurocognitive disorders termed ‘fetal alcohol spectrum disorders’ (FASD) (Fitzpatrick et al. 2012; O’Leary et al. 2007). FASD are characterised by various combinations of growth restriction of the fetus, facial anomalies and impaired brain structure and function, including memory, cognition, gross and fine motor control, intellectual disability, language and behaviour problems (Fitzpatrick et al. 2012; O’Leary et al. 2007).

Measured prevalence of FASD varies depending on the method of identification, and the true prevalence of FASD in Australia unknown (Burns et al. 2013; Elliott 2013; Fitzpatrick et al. 2012; House of Representatives 2012). The House of Representatives' Inquiry into FASD estimates the prevalence in Australia to be between 0.06 and 0.68 per 1000 live births, and for Aboriginal and Torres Strait Islander Australians between 2.76 and 4.7 per 1000 births (House of Representatives 2012). A recent study in WA provided the first population-based estimates of birth prevalence of FASD, which identified the prevalence rate of FAS and partial FAS in the Fitzroy Valley to be 120 per 1000 children (born between 2002 and 2003) (Fitzpatrick et al. 2015).

In 2013, the National Drug Strategy Household Survey found that, of all women surveyed who had been pregnant in the previous twelve months, 56 per cent consumed alcohol while pregnant before knowledge of their pregnancy, and 26 per cent consumed alcohol while pregnant after knowledge of their pregnancy (AIHW 2014).

In 2014-15, around 9.8 per cent of mothers of Aboriginal and Torres Strait Islander children aged 0-3 years reported that they consumed alcohol during pregnancy, significantly lower than in 2008 (19.6 per cent) (table 6A.2.23).

Illicit drug use during pregnancy

Illicit drug use during pregnancy has detrimental effects on the fetus and the mother's health. Effects on the mother and baby differ according to the drugs used, and can range from fetal drug dependency (neonatal abstinence syndrome), intra-uterine growth retardation, prematurity, mortality, problems with normal brain development, low birthweight, and problems with behaviour such as sleeping patterns, mood, attention and cognitive deficits later in life (Brown et al. 2016; Derauf et al. 2009; Kennare, Heard and Chan 2005; Ludlow, Evans and Hulse 2004).

In 2013, 2.2 per cent of all women aged 14-49 years used illicit drugs while pregnant and/or breastfeeding (AIHW 2014). In 2014-15, 4.1 per cent of mothers of Aboriginal and Torres Strait Islander children aged 0-3 years reported using illicit drugs or substances during pregnancy, similar to 2008 (5.0 per cent) (table 6A.2.23). There were no significant differences between jurisdictions or remoteness areas (tables 6A.2.23-24).

Things that work

There are currently no evaluated programs on things that work to reduce smoking or alcohol consumption during pregnancy. Research on programs that support Aboriginal and Torres Strait Islander pregnant women and parents of young children to stop smoking is increasing, but researchers note the need for more evidence of strategies that work (Eades et al. 2012; Gould et al. 2013; Hefler and Thomas 2013; Marley et al. 2012; Wood et al. 2008).

Passey et al. (2012) found that knowledge of antenatal smoking risks was an insufficient strategy to stop smoking for Aboriginal and Torres Strait Islander women, whose social environment and daily stressors may be exacerbated by pregnancy. Glover et al. (2013) found that over half the women participating in a study of the antenatal experiences of Aboriginal women and families reported having to deal with three or more social health issues (e.g., housing problems, drug and alcohol issue, family violence, death of a family member) when they were pregnant.

Future directions in data

Limited information is available about the prevalence of Fetal Alcohol Spectrum Disorders (FASD) in Australia, due to factors including a low level of awareness by clinicians, complexity of diagnosis and until May 2016 the absence of nationally agreed and consistent diagnostic criteria and definitions. The Australian FASD Diagnostic Tool was released in May 2016 and may impact data reporting in the future. In 2016, the University of Sydney was funded to develop a national FASD Register to complement the FASD Diagnostic Tool and will improve the ability to monitor prevalence trends over time. It is anticipated the Register will be finalised in 2017.

The AIHW is continuing to pursue the collection of data on alcohol use during pregnancy. Its National Maternity Data Development project (NMDDP) is developing nationally consistent perinatal data. Through the project, a list of high priority data items for national standardisation and addition to the Perinatal National Minimum Data Set (NMDS) has been developed, including data on Alcohol consumption in pregnancy. In June 2012, the AIHW sought agreement from states and territories to pilot the data item alcohol use in pregnancy for potential implementation. As at the time of preparing this report full agreement had not been received from the states and territories to commence the pilot.

6.3 Teenage birth rate⁶

Box 6.3.1 Key messages

- Giving birth as a teenager can pose additional risks for both the mother and the baby.
- The Aboriginal and Torres Strait Islander teenage birth rate is at its lowest level since reporting began in 2004, with a rate of 57.2 births per 1000 women aged 15–19 years in 2014. This was also the same for the non-Indigenous teenage birth rate, with a rate of 10.1 births per 1000 women aged 15–19 years in 2014 (table 6A.3.1).
- Over time, there has been a change in the age profile of Aboriginal and Torres Strait Islander mothers, with a decrease in the proportion of mothers aged under 18 years from 9.5 per cent in 1998 to 5.8 per cent in 2014 (table 6A.3.3).
- In 2014, 30.6 per cent of fathers of children of Aboriginal and Torres Strait Islander teenage mothers were aged less than 20 years, similar to the proportion of fathers of children of non-Indigenous teenage mothers (27.7 per cent) (table 6A.3.7).

Box 6.3.2 Measures of teenage birth rate

The main measure for this indicator is *Teenage birth rate*, defined as the number of live births per 1000 female population aged 15–19 years.

Data are also provided for two supplementary measures:

- Births to teenage mothers, by age of mother
- Births to teenage mothers, by age of father.

The most recent available data for all measures are from the ABS Birth Registrations Collection (all jurisdictions; age; remoteness). Births are reported according to the date of registration (which may occur in a different year to the birth itself).

Another potential source of data on teenage births is the AIHW's National Perinatal Data Collection (NPDC), which records births reported by State and Territory health authorities to the National Perinatal Data Unit (a collaborating unit of the AIHW). However, data from the ABS Birth Registrations Collection are not directly comparable to data from the NPDC due to differences in methods, timing and reporting. Also, the NPDC has a shorter time series than the ABS birth data, with nationally comparable NPDC data on Indigenous status of the mother only available from 2005, and data on Indigenous status of the baby was only available for selected jurisdictions from 2012.

Giving birth as a teenager can pose a greater risk of adverse pregnancy outcomes (Shrim et al. 2011). A Western Australian study of pregnancies between 2004 and 2006 found that, compared to adults, teenagers had an increased risk of stillbirth (Lewis et al. 2009).

⁶ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

Many studies have measured the association between teenage pregnancy and the likelihood that the mother or child will experience socioeconomic disadvantage both at the time of birth and later in the mother's or child's life. Jeon, Kalb and Vu (2011) examined welfare participation among Australian teenage mothers and found a strong association between welfare participation and being a teenage mother. In Australia, teenage mothers are overrepresented among recipients of the main income support payment for single mothers (Morehead and Soriano 2005), and are overrepresented among disability support payment recipients (Jeon, Kalb and Vu 2011). Teenage mothers are less likely than older mothers to have completed year 12, be employed or to have a post-school qualification (Kalb, Le and Leung 2012).

For some young women, motherhood can have transformative potential (Brand 2013; Keys 2007; Smith, Skinner and Fenwick 2012). Larkins et al (2011) found that teenage women in their Townsville study of 186 young Aboriginal and Torres Strait Islander women took motherhood very seriously and spoke about how becoming a mother gave meaning to their lives. Those who had supportive families that provided emotional and practical support found the transition to motherhood easier than those who did not (Larkins et al. 2011). Unfortunately, Larkins et al (2011) found the young mothers in their study were highly mobile and generally had poor relationships with their mothers, distrust of men and a family history of early parenting. Some of these women also had experienced sexual or physical abuse or domestic violence in their families.

The Aboriginal and Torres Strait Islander population has a younger age structure than the non-Indigenous population. The median age of the Aboriginal and Torres Strait Islander population at 30 June 2011 was 21.8 years, compared to 37.6 years for the non-Indigenous population (ABS 2013b). This difference in age structure contributes to the relatively high fertility of Aboriginal and Torres Strait Islander women. In 2014, the median age of Aboriginal and Torres Strait Islander mothers was 25.1 years and the fertility rate was 2.71 babies per woman, compared to a median age of 30.9 years for all mothers and a fertility rate of 1.80 babies per woman (ABS 2015).

Teenage birth rate

Aboriginal and Torres Strait Islander teenagers have a much higher birth rate and poorer outcomes compared to their non-Indigenous counterparts. Similar results have been found for other indigenous peoples internationally. Luong (2008) noted that, for Canadian Aboriginals, teenage pregnancy is much more common than for other Canadians. Teenage pregnancy is also much more common for Māori than other New Zealanders (Lawton et al. 2013).

The Aboriginal and Torres Strait Islander teenage birth rate is at its lowest level since reporting began in 2004. From a rate of 64.6 births per 1000 women aged 15–19 years, it increased to 77.0 births per 1000 women aged 15–19 years in 2009, before declining to 57.2 births per 1000 women aged 15–19 years in 2014. The non-Indigenous teenage birth

rate recorded a similar pattern, with its lowest recorded rate in 2014 with 10.1 births per 1000 women aged 15–19 years (table 6A.3.1).

Figure 6.3.1 Teenage birth rate for Aboriginal and Torres Strait Islander females, by age, 2004 to 2014

Sources: ABS (unpublished) Births, Australia, 2014; ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; Table 6A.3.1.

For Aboriginal and Torres Strait Islander females, the year at which the decrease in rates occurred differed by age. For those aged 17 years or younger, the decrease occurred from 2008, and for those aged 18 and 19 years, the decrease occurred from 2009 (figure 6.3.1).

These data are also available by State and Territory (table 6A.3.1).

Teenage birth by age of mother

Younger teenage mothers have higher risks than older teenage mothers, because their bodies have not had time to fully develop (Roth et al. 1998).

The age profile of Aboriginal and Torres Strait Islander teenage mothers has changed over time. From 1998 to 2014, the proportion of babies born to Aboriginal and Torres Strait Islander mothers aged 17 years or younger declined from 9.5 per cent in 1998 to 5.8 per cent in 2014, while the proportions of babies born to Aboriginal and Torres Strait Islander mothers aged 18 and 19 years remained relatively stable around 5 and 6 per cent respectively (table 6A.3.3). The proportions of babies born to non-Indigenous teenage mothers for most age groups decreased from 1998 to 2014 (table 6A.3.4). These data are also reported by Indigenous status of the baby (table 6A.3.2) and by State and Territory

(tables 6A.3.2–4). The number of births to teenage mothers, by age of mother between 1998 and 2014 is provided in table 6A.3.6.

The proportion of babies born to Aboriginal and Torres Strait Islander teenage mothers increases with remoteness (from 14.3 per cent in major cities, to 19.5 per cent in remote areas and 21.9 per cent in very remote areas in 2014). The proportion of babies born to non-Indigenous teenage mothers is highest in regional areas (7.8 per cent), followed by remote areas (4.5 per cent) and major cities (1.7 per cent). This pattern is consistent over time (table 6A.3.5).

Teenage birth by age of father

International research indicates that children of young and teenage fathers also have an increased risk of adverse birth outcomes such as preterm birth, low birthweight, small for gestational age births, low Apgar Score⁷ and infant mortality (Chen et al. 2008; Doamekpor, Amutah and Ramos 2013), congenital malformations (Archer et al. 2007) and schizophrenia (Wohl and Gorwood 2007).

Information about the age of fathers of babies born to teenage females can assist in developing age appropriate programs to reduce teenage birth rates. Lohan et al. (2010) suggest that greater understanding of teenage fathers' perspectives could re-frame the idea that adolescent pregnancy is solely a women's issue. Larkins et al. (2011) found that young Aboriginal and Torres Strait Islander men who had not yet become parents had idealised perceptions about teenage pregnancy and parenthood.

Nationally in 2014, 30.6 per cent of fathers of children of Aboriginal and Torres Strait Islander teenage mothers were aged less than 20 years, similar to the proportion of fathers of children of non-Indigenous teenage mothers (27.7 per cent) (table 6A.3.7). However, the age of the father is unknown in a large proportion of records (29.7 per cent where the mother is Aboriginal and Torres Strait Islander and 14.4 per cent where the mother is non-Indigenous), which makes interpretation of these data difficult (table 6A.3.7). These data are also reported by State and Territory (table 6A.3.7) and remoteness (table 6A.3.8).

Things that work

Programs have been developed to assist teenage and young mothers to care for their children. Box 6.3.3 provides an example of programs designed to assist young Aboriginal and Torres Strait Islander mothers.

⁷ The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability.

Box 6.3.3 Things that work — Teenage birth rate

The **Ngala Nanga Mai pARenT Group** Program is a small scale program operating in La Perouse, Sydney. The aims of the program are to: improve the health of young Aboriginal parents and their children; facilitate parents' return to educational opportunities; and improve social connectedness (ARCHI 2014). The program provides: twice-weekly art sessions for young parents; regular health talks; cultural events; exhibiting artwork; childcare and transport; and, TAFE enrolments and tutoring services. The program is supported by an Aboriginal Health Education Officer, early childhood nurse, social worker and paediatric doctors.

A 2011-2012 evaluation found that, between 2009 and 2012, 92 parents (of 133 children) attended the group at least once, with 31 parents identified as regular attendees. Participation in the group led to improved access to paediatric health care services with a resulting increase in early detection of treatable childhood conditions, support for parents in accessing educational and employment opportunities, and a detectable increase in empowerment and social connectedness. There was evidence of an improvement in maternal and child wellbeing, as well as parenting confidence. (Jersky et al 2015). However, it should be noted that participation in the evaluation was voluntary, and there was no control group.

The Closing the Gap Clearinghouse has found that effective parenting support programs for Aboriginal and Torres Strait Islander families generally include the following:

- use of cultural consultants in conjunction with professional parent education facilitators and home visitors
- long-term rather than short-term programs
- a focus on the needs of both parents/carers and the child
- a supportive approach that focuses on family strengths
- use of structured early intervention program content while also responding flexibly to families (AIHW 2012).

Sources: ARCHI (Australian Resource Centre for Healthcare Innovations) 2014; Jersky, M., Titmuss, A., Haswell, M., Freeman, N., Osborne, P., Callaghan, L., Winters, J., Fitzpatrick, S. and Zwi, K. 2015, Improving health service access and wellbeing of young Aboriginal Parents in an urban setting: mixed methods evaluation of an arts-based program, Australian and New Zealand Journal of Public Health AIHW 2012, *Parenting in the early years: effectiveness of parenting support programs for Indigenous families*, Resource sheet no. 16 produced for the Closing the Gap Clearinghouse.

Future directions in data

There are limited data on teenage mothers' and fathers' access to sexual or reproductive health services, apart from contraception use (for women aged 18–49 years from ABS Aboriginal and Torres Strait Islander health surveys) and the number of antenatal check-ups (from the AIHW National Perinatal Data Collection and included in section 6.1 of this report).

Births, Australia (ABS 2013a) is published annually by the ABS. While this collection includes the age of the father, for a high proportion of births by teenage mothers the age of the father is unknown. Identification of the father is currently not compulsory on birth registrations.

A complete estimation of teenage *pregnancy* rates would combine abortion figures with numbers of births and perinatal deaths. However, it is not currently possible to gain a precise figure for the number of abortions performed, for all women, including Aboriginal and Torres Strait Islander teenage women.

6.4 Birthweight⁸

Box 6.4.1 Key messages

- Birthweight is a key indicator of the health status of babies and a predictor of their health outcomes later in life.
- For available jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT), the proportion of low birthweight babies born to Aboriginal and Torres Islander mothers decreased from 11.8 per cent in 2000 to 10.9 per cent in 2013 (figure 6.4.1).
- Nationally in 2013 for all jurisdictions, 10.9 per cent of babies born to Aboriginal and Torres Strait Islander mothers had low birthweight, compared to 4.6 per cent of babies born to non-Indigenous mothers (table 6A.4.2).
- For the combined years 2011–2013, the proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers increased with remoteness, whilst the proportion of low birthweight babies born to non-Indigenous mothers decreased as remoteness increased (excluding major cities) (table 6A.4.11).

Box 6.4.2 Measures of birthweight

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Incidence of low birthweight among live-born babies* is defined as the number of low birthweight (less than 2500 grams) live-born singleton infants as a proportion of the total number of live-born singleton infants with known birthweight.

The most recent available data for this measure are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- since 2011, data are available by the Indigenous status of the baby. Historical data are only available by the Indigenous status of the mother
- data disaggregated by remoteness are presented for 2011 onwards as remoteness data are not directly comparable for previous years.

Children with a low birthweight require longer periods of hospitalisation after birth and are more likely to have poor health, or even die in infancy (AIHW 2011). Data on birthweight for Aboriginal and Torres Strait Islander and non-Indigenous fetal deaths shows similar proportions of low birthweight babies (table 6A.4.25). Low birthweight can also affect brain development and increase the likelihood of developing chronic diseases in adulthood, including cardiovascular disease, kidney disease and diabetes mellitus (Arnold, Hoy and Wang 2015, Barker 2012; DeKieviet et al. 2012; Khalidi et al. 2012; Luyckx et al. 2013; Singh 2011).

Low birthweight can be a result of pre-term birth (although the infant may be within the expected weight range for its gestational age) or being born at the normal time (after

⁸ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

37 weeks) but of low birthweight (indicating fetal growth retardation) (ABS and AIHW 2008). In 2011, 65.5 per cent of Aboriginal and Torres Strait Islander pre-term births were of low birthweight and 4.8 per cent of full term births were of low birthweight, compared with 56.4 per cent pre-term births and 1.9 per cent full term births for non-Indigenous mothers (AIHW 2015).

For Aboriginal and Torres Strait Islander babies, the evidence is mixed on whether fetal growth retardation or pre-term birth is the main cause of low birthweight (Mackerras 1998; Rousham and Gracey 2002; Sayers and Powers 1997). Predictors of fetal growth retardation and pre-term birth are listed in table 6.4.1. Of these predictors, information on tobacco and alcohol consumption during pregnancy (section 6.2) is available in this report. A multivariate analysis for the period 2009–2011 indicated that, excluding pre-term and multiple births, 51 per cent of low birthweight births to Aboriginal and Torres Strait Islander mothers can be attributed to smoking during pregnancy, compared with 19 per cent for other mothers (AHMAC 2015). If the smoking rate during pregnancy among Aboriginal and Torres Strait Islander mothers were the same as for other mothers, after accounting for other factors, the proportion of babies with low birthweight among the Aboriginal and Torres Strait Islander population could be reduced by 26 per cent (AIHW 2015). Increasing the number of antenatal visits (section 6.1) has also been identified as having a positive impact on the birthweight of babies (Khalidi et al. 2012; Taylor et al. 2013). Antenatal visits enable education and monitoring of risk factors.

Table 6.4.1 Predictors of fetal growth retardation and pre-term birth

<i>Fetal growth retardation</i>	<i>Pre-term birth</i>
Maternal pre-pregnancy weight	Maternal anaemia
Prior low birthweight infant	Infections
Gestational weight gain (maternal nutrition)	Maternal cigarette smoking
Maternal cigarette smoking	Maternal diabetes
Alcohol consumption	Pregnancy induced hypertension

Sources: Mackerras, D (2001) 'Birthweight changes in the pilot phase of the Strong Women Strong Babies Strong Culture Program in the Northern Territory', *Australian and New Zealand Journal of Public Health*, vol. 25, no. 1, pp34–40; Algert et al 1993 cited in Bambrick, H. J. 2003, 'Dying fast and young': Contemporary Aboriginal Health, Chapter 3' in *Child Growth and Type 2 Diabetes Mellitus in a Queensland Aboriginal Community*, April 2003, thesis submitted for the degree of Doctor of Philosophy, Australian National University, https://digitalcollections.anu.edu.au/bitstream/1885/46071/30/04_chapter3.pdf (accessed 10 February 2014).

Results from the Gudaga study (a birth cohort study of Aboriginal infants in an urban area of NSW) found that when all risk and protective factors were accounted for, there was no statistically significant difference in birthweight between Aboriginal and non-Aboriginal infants (Comino et al. 2012). This reinforces that Indigeneity itself is not a factor for low birthweight, but rather the prevalence of individual risk and protective factors.

Low birthweight

For available jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT), the proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers decreased from 11.8 per cent in 2000 to 10.9 per cent in 2013 (figure 6.4.1). Over the same period, the proportion for non-Indigenous mothers remained relatively constant around 4.5 per cent (table 6A.4.1).

Figure 6.4.1 Proportion of low birthweight babies born in NSW, Victoria, Queensland, WA, SA and the NT, to Aboriginal and Torres Strait Islander mothers, 2000 to 2013^{a, b, c}

^a Data exclude stillbirths, multiple births and births both less than 20 weeks gestation and less than 400 grams birthweight. ^b Data are by place of usual residence of the mother. Table excludes non-residents, residents of external territories and not stated State/Territory of residence. Babies born to mothers residing in Tasmania and the ACT are excluded. ^c Data were obtained from the most recent version of the NPDC and may differ slightly from that used for previously published data which are incorporated in other tables in this section.

Source: AIHW (unpublished) National Perinatal Data Collection; table 6A.4.1.

Nationally in 2013 for all jurisdictions, 10.9 per cent of babies born to Aboriginal and Torres Strait Islander mothers had low birthweight, compared to 4.6 per cent of babies born to non-Indigenous mothers (table 6A.4.2).

The proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers varies across remoteness areas — in 2013, the proportion was lowest in major cities and outer regional areas (9.8 per cent) followed by inner regional areas (10.4 per cent), remote areas (11.4 per cent) and very remote areas (13.7 per cent). Proportions decreased for non-Indigenous mothers as remoteness increased (excluding major cities) (tables 6A.4.8–10). Aggregating three years of data enables year

to year volatility to be smoothed out. For 2011–2013, the proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers increased as remoteness increased (table 6A.4.11).

Aggregating three years of data enables disaggregation of low birthweight into very low and extremely low birthweights. For 2011–13, the ratio of proportions for Aboriginal and Torres Strait Islander mothers compared to non-Indigenous mothers for very low birthweight was around 2:1, but for extremely low birthweights this ratio was reversed (for the first time in the 15 years of data reported) at around 0.4:1 (table 6A.4.14).

From 2011, data were available by Indigenous status of the infant (that is, where the mother and/or the father are Aboriginal or Torres Strait Islander), and for all jurisdictions except WA and SA for whom data were available from 2012 (table 6A.4.13–14). Nationally in 2013 for all jurisdictions, 9.8 per cent of babies born to Aboriginal and Torres Strait Islander mothers had low birthweight, compared to 4.5 per cent of babies born to non-Indigenous mothers (table 6A.4.12). The number of births for whom the Indigenous status of the infant could not be determined has decreased over time which makes comparisons over time difficult. Trends by remoteness areas for proportions of low birthweight babies by Indigenous status of the baby (tables 6A.4.15–17) are similar to those for babies by Indigenous status of the mother (tables 6A.4.8–10).

Additional data on selected birth outcomes for women are reported in tables 6A.4.20–22. Associations between birthweight and maternal health for Aboriginal and Torres Strait Islander children are reported in table 6A.4.23 (in 2014–15, the only significant difference was for mothers who had regular check-ups whilst pregnant — 83.9 per cent of those with a child born with low birthweight, compared to 97.8 per cent for those with a child not of low birthweight).

Things that work

Box 6.4.3 includes a case study of some things that are working to improve neonatal outcomes around birthweight of babies for Aboriginal and Torres Strait Islander women.

Box 6.4.3 Things that work — Birthweight

The national **Healthy for Life (HfL) program**, funded by the Office for Aboriginal and Torres Strait Islander Health, commenced in 2005–06 and includes a formal objective of improving child and maternal health care services.

The HfL program is available to established primary health-care providers in Aboriginal Community Controlled Health Services (ACCHS), State and Territory health services and Divisions of General Practice.

(continued next page)

Box 6.4.3 (continued)

An independent evaluation found over the year to June 2008 there was a decrease in the proportion of low birthweight babies, but also an increase in the proportion of high birthweight babies (Urbis 2009). More recent data from the HfL Report Card found that the number of Aboriginal and Torres Strait Islander babies with normal birthweight increased from 583 (81.5 per cent) in 2007–08 to 850 (84.2 per cent) in 2010–11 (AIHW 2013). The Healthy for Life data collection conducted by the AIHW ceased in June 2011.

6.5 Early childhood hospitalisations⁹

Box 6.5.1 Key messages

- Nationally in 2014-15, for children aged 0–4 years:
 - 31 005 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised, compared with 23 747 per 100 000 non-Indigenous children (table 6A.5.1)
 - hospitalisation rates for Aboriginal and Torres Strait Islander children were similar in major cities and regional areas (27 092 and 27 575 per 100 000 population, respectively) but were almost twice as high in remote areas (46 816 per 100 000 population), whilst for non-Indigenous children the rates decreased slightly as remoteness increased (from 23 976 to 20 762 per 100 000 population respectively) (table 6A.5.5)
 - from 2004-05 to 2014-15, for NSW, Victoria, Queensland, WA, SA and the NT combined, hospitalisation rates for Aboriginal and Torres Strait Islander children increased from 23 725 to 31 736 per 100 000 population. Rates for other children fluctuated over the period with no clear trend, leading to a widening of the gap (figure 6.5.1).

Box 6.5.2 Measures of early childhood hospitalisations

The main measure for this indicator is the *hospitalisation rate*, which is defined as the hospital separation rate per 100 000 Aboriginal and Torres Strait Islander children aged 0–4 years, by principal diagnoses. Data are sourced from the National Hospital Morbidity Database (NHMD) (all jurisdictions; remoteness), with the most recent data available for 2014-15.

This section and the next section (section 6.6 Injury and preventable diseases) should be read together. Section 6.6 provides data on a subset of hospitalisations that are potentially preventable. Related data on young child mortality are included in section 4.2.

Early childhood hospitalisation rates are an indicator of the health of young children. However, hospitalisations represent the most serious cases and are not a measure of the actual prevalence of injury and disease. Many children suffering disease and injury do not require hospital treatment — most do not require formal medical treatment or are treated by doctors, nurses and other primary health care providers outside of hospital. A high rate of hospitalisation may also indicate differential access and use of primary health care, as many hospital admissions could be prevented if more effective non-hospital care were available and used (AIHW 2014; AHMAC 2011).

Monitoring the leading causes of hospitalisations can uncover emerging health risks, as well as highlight where there may be a need for more effective primary health care. The types of major diseases children present with, the number of multiple diagnoses and the

⁹ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

duration and frequency of children's hospitalisations are all important measures of the health of Aboriginal and Torres Strait Islander children.

The stage of a child's development affects the types and seriousness of injuries requiring hospitalisation; for example, as children's mobility increases, the hazards they are exposed to change. Steenkamp and Cripps identified that the risk of hospitalisation for falls increases with age but, for other conditions such as poisoning, children under five years have the highest risk of hospitalisation (AIHW 2014).

A Telethon Institute of Child Health study in Western Australia found that the most common reason for hospitalisation before the age of two years was infection (mainly respiratory and gastrointestinal), accounting for 34 per cent of all admissions. Aboriginal children had significantly higher admission and comorbidity rates, stayed longer and were more likely than non-Indigenous children to die in hospital. Hospitalisation rates for Aboriginal children for infections were more than four times as high as those for non-Indigenous children — although, over time, admission rates had declined for Aboriginal children and increased for non-Indigenous children (Carville et al. 2007). Another Western Australian study indicates that hospitalisation rates for Aboriginal and Torres Strait Islander children under five for burn injury were three times as high as those for non-Indigenous children for 1983 to 2008 (Duke et al. 2011).

O'Grady et al. (2010) found that Aboriginal and Torres Strait Islander infants (aged less than 12 months) in the Central Australian region were hospitalised for pneumonia at among the highest rates reported in the world, with 78.4 episodes per 1000 child-years.

Hospitalisation rate

Nationally in 2014-15, 31 005 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised, whilst the rate for non-Indigenous children was 23 747 per 100 000 population (table 6A.5.1). Rates for Aboriginal and Torres Strait Islander children were similar in major cities and regional areas (27 092 and 27 575 per 100 000 population, respectively) but were almost twice as high in remote areas (46 816 per 100 000 population), whilst for non-Indigenous children the rates decreased slightly as remoteness increased (from 23 976 to 20 762 per 100 000 population respectively) (table 6A.5.5).

In 2014-15, diseases of the respiratory system were the most common cause of hospitalisation for Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0-4 years, accounting for 1 in 4 hospitalisations and 1 in 5 hospitalisations respectively (table 6A.5.1). Aboriginal and Torres Strait Islander children aged 0-4 years were twice as likely as other children to be hospitalised due to infectious and parasitic diseases (table 6A.5.1).

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for 'other' which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not

stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres Strait Islander and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander and other Australians.

Figure 6.5.1 Hospitalisation rates for children aged 0–4 years, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2014-15^{a, b}

^a Data includes six jurisdictions for which the quality of Indigenous identification in hospitalisation data is considered acceptable (NSW, Victoria, Queensland, WA, SA and the NT only). ^b 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.5.4.

From 2004-05 to 2014-15, hospitalisation rates for NSW, Victoria, Queensland, WA, SA and the NT combined for Aboriginal and Torres Strait Islander children increased from 23 725 to 31 736 per 100 000 population. Rates for other children fluctuated over the period with no clear trend, leading to a widening of the gap (figure 6.5.1). For Aboriginal and Torres Strait Islander children, hospitalisation rates for five of the six top diagnoses increased, while hospitalisations for 'certain infectious and parasitic diseases' decreased from 3086 to 2537 per 100 000 population (but remains twice the rate for other children) (table 6A.5.4).

6.6 Injury and preventable disease¹⁰

Box 6.6.1 Key messages

- For children aged 0–4 years:
 - nationally in 2014–15, 16 102 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised for potentially preventable diseases and injuries, while the rate for non-Indigenous children was 9991 per 100 000 population. Diseases of the respiratory system accounted for almost half of all hospitalisations for both Aboriginal and Torres Strait Islander and non-Indigenous children (table 6A.6.1)
 - from 2004–05 to 2014–15, potentially preventable hospitalisation rates (for NSW, Victoria, Queensland, WA, SA and the NT combined) increased by 13 per cent for Aboriginal and Torres Strait Islander children (with the largest increases for respiratory diseases and external causes including accidental injuries) and decreased by 6 per cent for other children (table 6A.6.15)
 - in 2010–2014, for NSW, Queensland, WA, SA and the NT combined, the death rate from injury and preventable diseases for Aboriginal and Torres Strait Islander children was 32.1 deaths per 100 000 population, a decrease from 41.7 per 100 000 population in 2003–2007 (figure 6.6.1). The rate for non-Indigenous children also decreased over this period (from 15.8 to 10.1 deaths per 100 000 population) (tables 6A.6.16–17).

Box 6.6.2 Measures of injury and preventable disease

There are two main measures for this indicator:

- *Potentially preventable hospitalisations* is defined as the number of hospital separations for injury and potentially preventable disease for children aged 0–4 years as a rate per 100 000 children aged 0–4 years. The main data source is the AIHW National Hospital Morbidity Database (NHMD), with the most recent available data for 2014–15 (all jurisdictions: remoteness)
- *Potentially avoidable deaths* is defined as the number of deaths from potentially preventable and treatable injury and disease for children aged 0–4 years as a rate per 100 000 children aged 0–4 years. The main data source is the ABS Causes of Death collection with the most recent available data for 2014 (NSW, Queensland, WA, SA and the NT).

In Australia, many childhood diseases are generally prevented or successfully treated without hospitalisation. The main focus of this indicator is on the most serious cases of disease and injury that result in a hospital admission. Some infections that may appear minor can have serious longer term health effects. Recurring skin and throat infections (caused by group A streptococcal bacteria) in some Aboriginal communities are associated with the highest worldwide rates of acute rheumatic fever, which can lead to rheumatic heart disease (Currie and Carapetis 2000 in Zubrick et al. 2004). The major pathogen of

¹⁰ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University who reviewed a draft of this section of the report.

skin infection, group A streptococcus, is also associated with chronic renal failure — a prevalent and highly burdensome condition among Aboriginal adults (Zubrick et al. 2004).

Aboriginal and Torres Strait Islander children have substantially higher respiratory morbidity than non-Indigenous children, which can have life-long impacts on lung function (Chang et al. 2014). A study of Aboriginal and Torres Strait Islander infants hospitalised in Darwin between 2008 and 2013 (McCallum et al. 2016) found that the main factors associated with respiratory readmissions were previous respiratory hospitalisation and household smoke (section 6.2 includes information on smoking during pregnancy and section 8.4 includes information on current smoking rates). Further chronic respiratory disease is a risk factor for cardiovascular disease, one of the most common chronic diseases in the adult population (section 4.9 includes information on chronic diseases).

A wide range of social, cultural, physical and economic factors, influence the health of children. Communities and governments can assist in preventing disease and promote the health of children through improved access to quality medical care, disease registers to improve follow up care, free vaccination programs, the provision of adequate housing, education on the benefits of good nutrition and sanitation, and policies and promotion to reduce the risk of injury. Breastfeeding can reduce the risk of hospitalisation for a range of acute childhood illnesses, including gastrointestinal diseases and infections, and prevent the development of infections and chronic diseases such as diabetes and obesity in later life (FaHCSIA 2013; Queensland Health 2014).

Access to effective and appropriate health care services (including dental and immunisation services) can influence the health of children in the short and long term. More information on immunisation rates in children and the prevalence of vaccine preventable diseases as well as access to primary health care in general, is included in section 8.1. Section 6.7 includes information on ear infections in children and section 8.6 covers tooth decay in children (and adults). See section 10.2 for more information on diseases associated with poor environmental health.

Potentially preventable hospitalisations

Hospitalisation rates are not a measure of the prevalence of a condition in the community, but they do provide an indication of the extent to which serious illnesses are being treated in hospitals. Potentially preventable hospitalisations include conditions that potentially could have been prevented by the provision of appropriate non-hospital health services, and injuries that potentially could have been prevented (usually outside the health system in broader society).

These data should be interpreted with care — research suggests that parents of Aboriginal and Torres Strait Islander infants use health services differently to parents of non-Indigenous infants. Ou et. al (2010), using the Longitudinal Study of Australian Children, found that the health status of Aboriginal and Torres Strait Islander infants in the study was poorer than that of non-Indigenous infants, and that parents of Aboriginal and

Torres Strait Islander infants accessed certain health services less frequently than non-Indigenous parents. The parents of Aboriginal and Torres Strait Islander infants were less likely to have used maternal and child health centres, help lines, maternal and child health nurse visits, general practitioners and paediatricians. However, Aboriginal and Torres Strait Islander infants were more likely than other Australian children to have received treatment at hospital outpatient clinics or to have been hospitalised (Ou et al. 2010).

Nationally in 2014-15, the rate of hospitalisation of Aboriginal and Torres Strait Islander children aged 0–4 years for potentially preventable diseases was 16 102 per 100 000 population (table 6A.6.1), with the rate almost twice as high in remote areas (30 646 per 100 000 population) (figure 6.6.1). The national rate for non-Indigenous children was 9991 per 100 000 population (table 6A.6.1).

Figure 6.6.1 Potentially preventable hospitalisations for children aged 0–4 years, by Indigenous status by remoteness area, 2014-15^a

^a Includes public and private hospitals in all jurisdictions.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.6.12.

Diseases of the respiratory system were the most common cause of hospitalisation for both Aboriginal and Torres Strait Islander children and non-Indigenous children (around half of all hospitalisations for both) with the rate for Aboriginal and Torres Strait Islander children almost double that of non-Indigenous children (table 6A.6.1).

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for ‘other’ which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not

stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres Strait Islander and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander and other Australians.

From 2004-05 to 2014-15 in NSW, Victoria, Queensland, SA, WA and the NT combined, potentially preventable hospitalisation rates increased by 13 per cent for Aboriginal and Torres Strait Islander children (from 14 652 to 16 567 per 100 000 population — with the largest increases for respiratory diseases and external causes including accidental injuries) and decreased by 6 per cent for other children (from 10 835 to 10 201 per 100 000 population) (table 6A.6.15).

Potentially preventable deaths of Aboriginal and Torres Strait Islander children

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

For 2010–2014, around one in five deaths (19.3 per cent) of Aboriginal and Torres Strait Islander children aged 0–4 years was attributable to external causes and preventable diseases, a rate of 32.1 per 100 000 population (table 6A.6.16).

There has been an overall decrease in the death rate from external causes and preventable diseases for Aboriginal and Torres Strait Islander children aged 0–4 years, from 41.7 per 100 000 population in 2003–2007 to 32.1 per 100 000 population in 2010–2014 (figure 6.6.1). Over the same period the rate also decreased for non-Indigenous children, from 15.8 deaths per 100 000 population to 10.1 deaths per 100 000 population (tables 6A.6.16–17).

Figure 6.6.2 Deaths from external causes and preventable diseases, Aboriginal and Torres Strait Islander children aged 0–4 years, NSW, Queensland, WA, SA and the NT, 2003–2007 and 2010–2014^a

^a Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Aboriginal and Torres Strait Islander across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.

6.7 Ear Health

Box 6.7.1 Key messages

- The proportion of Aboriginal and Torres Strait Islander children aged 0–14 years with a hearing condition decreased from 11.2 per cent in 2001 (2.4 times the rate for non-Indigenous children) to 8.4 per cent in 2014-15 (2.9 times the rate for non-Indigenous children in 2014-15) (figure 6.7.1). In remote areas, the proportion decreased from 17.7 per cent in 2001 to 11.4 per cent in 2014-15 (figure 6.7.2).
- Across age ranges for Aboriginal and Torres Strait Islander children in 2014-15, there was a greater proportion aged 4–14 years with a hearing condition compared to those aged 0–3 years (10.4 per cent compared to 3.2 per cent). There was no statistically significant trend across age ranges for non-Indigenous children (figure 6.7.1).
- In 2014-15, the hospitalisation rate for diseases of the ear and mastoid process for Aboriginal and Torres Strait Islander children aged 0–14 years was 7.5 per 1000 population, similar to the rate for non-Indigenous children (7.1 per 1000 population) (table 6A.7.5). The rate varied by remoteness — for Aboriginal and Torres Strait Islander children the rate in remote areas was more than twice that in non-remote areas, whilst for non-Indigenous children the rate decreased as remoteness increased (table 6A.7.7).
- Rates of hospitalisation for diseases of the ear and mastoid process for younger children (0–3 years) were lower for Aboriginal and Torres Strait Islander children compared to non-Indigenous children (9.5 and 12.7 per 1000 population respectively), with the direction reversed for older children (4–14 years) (table 6A.7.5).

Box 6.7.2 Measures of ear health

There are two main measures for this indicator:

- *Prevalence of hearing conditions in children* is defined as the proportion of children aged 0–14 years with a reported hearing condition. Data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available from the 2014-15 NATSISS. Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with the most recent data available from the 2014-15 NHS. Data are self-reported by proxies of children.
- *Hospitalisation rates for ear and hearing problems in children* is defined as the proportion of hospital separations for children aged 0–14 years where the principal diagnosis was diseases of the ear and mastoid. Data are sourced from the National Hospital Morbidity Database (NHMD) with the most recent data available for 2014-15 (all jurisdictions; by age; remoteness).

Ear disease and associated hearing loss are highly prevalent across Aboriginal and Torres Strait Islander children and much more common than in the broader Australian population (Burns and Thomson 2013; DoHA 2015). Aboriginal and Torres Strait Islander Australians, particularly in remote areas, experience some of the highest levels of ear disease and hearing loss in the world (Senate Community Affairs References Committee 2010).

Conditions affecting ear health are classified by the part of the ear (external, middle or inner) in which the condition occurs. The ear condition with the most significant impact on hearing for Aboriginal and Torres Strait Islander Australians is otitis media (inflammation and/or infection of the middle ear), which is primarily caused by bacterial or viral infections.

There are different levels of severity of otitis media, and complications, particularly if not monitored and treated where necessary, can result in hearing loss. Some forms of otitis media are treatable either through antibiotics or surgery, but public health strategies focus on prevention, awareness and early identification for best results (Burns and Thomson 2013; DoHA 2015).

Generally, the incidence of otitis media peaks in two age groups: between 6 and 24 months (when many infants are weaned and exposed to environmental conditions); and at 4-5 years (when children start kindergarten) (Kong and Coates 2009; Burns and Thomson 2013). Aboriginal and Torres Strait Islander children under three years of age are at the highest risk of ear disease — this is the most critical development period for speech development, underpinning communication, learning, and social and emotional development (Aithal, Yonovitz and Aithal 2008; Brouwer et al. 2005; Couzos, Metcalf and Murray 2007; Williams and Jacobs 2009).

Severe cases of otitis media can lead to ongoing medical complications that negatively affect a child's early acquisition of language, intellectual development, social skills and educational attainment, and employment outcomes later in life. Hearing loss can have long term effects on overall wellbeing (AIHW 2014; WHO 2016).

Factors identified as increasing the risk of ear health issues include: social disadvantage; limited access to primary health care and treatment (see section 8.1); nutritional problems (see section 8.5); crowded housing conditions (see section 10.1); inadequate access to water, functioning sewerage and waste removal systems (see section 10.3); and passive smoking (see section 8.4). Breastfeeding is associated with a reduced risk of otitis media (Bowatte et al. 2015; Burns and Thomson 2013).

Prevalence of hearing conditions in children

Figure 6.7.1 Prevalence of hearing conditions in children aged 0-14 years, by age, 2001 to 2014-15^a

^a 95 per cent confidence intervals around each estimate are available in attachment table 6A.7.1.

Source: ABS (unpublished) National Health Survey (NHS) 2001; ABS (unpublished) NHS 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2008; ABS (unpublished) NHS 2007-08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (2012-13 NATSIHS component); ABS (unpublished) Australian Health Survey (AHS) 2011-13 (2011-12 NHS component); ABS (unpublished) 2014-15 NATSISS; ABS (unpublished) 2014-15 NHS; table 6A.7.1.

Nationally in 2014-15, 8.4 per cent of Aboriginal and Torres Strait Islander children aged 0-14 years had a hearing condition¹¹ (2.9 times the rate for non-Indigenous children), a decrease from 11.2 per cent in 2001 (table 6A.7.1).

Across age ranges for Aboriginal and Torres Strait Islander children in 2014-15, there was a greater proportion aged 4-14 years with a hearing condition compared to those aged 0-3 years (10.4 per cent compared to 3.2 per cent). There was no statistically significant trend across these two age ranges for non-Indigenous children (figure 6.7.1).

In remote areas, the proportion of Aboriginal and Torres Strait Islander children aged 0-14 years with a hearing condition decreased from 17.7 per cent in 2001 to 11.4 per cent in 2014-15. There was no statistically significant difference in the equivalent rates for

¹¹ Includes partial hearing loss and deafness in one ear, otitis media, tinnitus, Meniere's disease/vertiginous syndrome and type of hearing problem not known.

non-remote areas over this period (8.5 per cent in 2001 compared to 7.5 per cent in 2014-15) (figure 6.7.2).

Data specifically for otitis media are available in table 6A.7.2. Prevalence rates for this condition for Aboriginal and Torres Strait Islander children aged 0–14 years is 2.9 per cent in 2014-15, compared to 1.1 per cent for non-Indigenous children. For Aboriginal and Torres Strait Islander children, the prevalence rate for 5–9 year olds (4.6 per cent) is more than twice the rate for children of other ages (1.9-2.0 per cent for 0–4 year old and 10–14 year olds) (table 6A.7.2).

Figure 6.7.2 Prevalence of hearing conditions in Aboriginal and Torres Strait Islander children aged 0–14 years, by remoteness, 2001 to 2014-15^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Health Survey 2001; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (2012-13 NATSIHS component); ABS (unpublished) 2014-15 NATSISS; table 6A.7.3.

Data for types of treatment for hearing conditions for Aboriginal and Torres Strait Islander children in 2014-15 are available in table 6A.7.4.

Hospitalisations for ear and hearing problems in children

Hospitalisations data only include those who have accessed medical services, and have been diagnosed and admitted to hospital for the specified conditions. Cases that result in a

visit to a general practitioner or to an emergency department, but do not lead to hospitalisation, are excluded. There may also be a large share of 0–3 year olds whose parents may not be aware that their children have an ear or hearing problem or where access to hospitals may be limited.

The following analysis focusses on diseases of the middle ear and mastoid (including otitis media), which are the most common reasons for hospitalisation related to ear and hearing problems. The attachment tables include additional information on hospitalisations for diseases of the external and inner ear, and other disorders of the ear.

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for ‘other’ which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander Australians and other Australians.

Nationally in 2014-15, the hospitalisation rate for children aged 0–14 years for diseases of the ear and mastoid process was similar for Aboriginal and Torres Strait Islander children (7.5 per 1000 population) and non-Indigenous children (7.1 per 1000 population), with the highest rates for both relating to diseases of the middle ear and mastoid (table 6A.7.5).

For younger children (0–3 years), the hospitalisation rate for Aboriginal and Torres Strait Islander children was lower than the rate for non-Indigenous children (9.5 and 12.7 per 1000 population respectively), whilst for older children (4–14 years) the direction was reversed (6.8 and 4.9 per 1000 population respectively) (table 6A.7.5).

The hospitalisation rate for children aged 0–14 years varied by remoteness area. For Aboriginal and Torres Strait Islander children, the rate in remote areas (13.6 per 1000 population) was more than double the rate in non-remote areas (5.9–6.3 per 1000 population), whilst for non-Indigenous children the rate decreased slightly as remoteness increased (from 7.2 to 6.2 per 1000 population) (table 6A.7.7).

Over time (from 2004-05 to 2014-15) hospitalisation rates for both Aboriginal and Torres Strait Islander and other children have fluctuated with no clear trend (table 6A.7.6).

Things that work

An effective approach for ear health for Aboriginal and Torres Strait Islander children needs to be part of a comprehensive approach to family, maternal and child health and be embedded in coordinated primary care systems (AIHW 2014).

Outlined below is an example of an initiative that has worked to improve ear health for Aboriginal and Torres Strait Islander children (box 6.7.3).

Box 6.7.3 Things that work – Ear health

The national **Care for Kids' Ears** Campaign, launched on 1 July 2011, was designed and produced by the Australian Government to increase awareness of ear disease and hearing loss in Aboriginal and Torres Strait Islander communities, particularly for families and carers of children aged 0–5 years. The goal was to increase awareness of ear disease and highlight the importance of seeking and following treatment to prevent hearing loss. A website was developed to include resources for parents and carers; early childhood groups; teachers; and health professionals. The website includes talking books in 22 Indigenous languages, and resources continue to be available (DoH 2015).

An independent evaluation conducted from July 2011 to June 2013 by the Cultural and Indigenous Research Centre Australia (CIRCA) found that the Campaign had a positive impact on awareness of ear disease among Aboriginal and Torres Strait Islander communities, including increased knowledge of symptoms and prevention, and increased help-seeking behaviours. A follow-up survey of 200 mothers/female carers was conducted around 18 months after the campaign launch in urban and rural locations nationally. The survey found that those exposed to the Campaign were more likely than those who weren't to identify at least one prevention action unprompted (74.1 per cent compared to 51.3 per cent) and were also more likely to say they had taken their child to have their ears checked in the last 12 months when they did not have any signs or symptoms (70.4 per cent compared to 43.7 per cent of those not exposed) (CIRCA 2013).

Future directions in data

Only limited data are available on the burden of poor ear health in Aboriginal and Torres Strait Islander children, with current survey data limited due to the difficulty in obtaining reliable estimates for small populations. More comprehensive and reliable data are required to enable the assessment of the type and severity of ear infections in Aboriginal and Torres Strait Islander children and any resulting hearing loss.

6.8 Basic skills for life and learning¹²

Box 6.8.1 Key messages

- Basic skills for life and learning focuses on the development and learning of children in their early years (up to 8 years of age). In 2015, 59–63 per cent of Aboriginal and Torres Strait Islander children were classified as developmentally ‘on track’ in all of the five Australian Early Development Census domains, compared to 76–86 per cent of non-Indigenous children (table 6A.8.1).
- Between 2009 and 2015 the proportions of Aboriginal and Torres Strait Islander children ‘on track’ increased across all domains, with the largest increase for language and cognitive skills (from 48.0 per cent to 62.8 per cent) (tables 6A.8.1 and 6A.8.3).
- The proportion of children receiving a fourth year Aboriginal and Torres Strait Islander Health Assessment has increased from around 1 in 5 children in 2007-08 to 4 in 5 children in 2014-15 (table 6A.8.8), with rates increasing with remoteness (table 6A.8.8).
- In 2014-15, 98.8 per cent of Aboriginal and Torres Strait Islander children aged 3–8 years did some form of informal learning activity with their main carer in the previous week (table 6A.8.11).

Box 6.8.2 Measures of basic skills for life and learning

There are four main measures for this indicator. Data are available for all jurisdictions.

- *Children on track on Australian Early Development Census (AEDC) domains* is defined as the proportion of children entering their first year of full time school who are on track (top 75 per cent) in the five AEDC domains: physical health and wellbeing; social competence; emotional maturity; language and cognitive skills (school-based); and communication skills and general knowledge. The most recent available data are for 2015.
- *Language background* is defined as the proportion of Aboriginal and Torres Strait Islander children entering their first year of school with a language background other than English. The most recent available data are for 2015 from the AEDC.
- *Health checks* is defined as the proportion of children aged 4 years receiving a fourth year developmental health check. The most recent available data are for 2014-15 from the Australian Government Department of Health.
- *Informal learning activities* is defined as the proportion of children aged 3–8 years who undertook informal learning activities with their main carer in the last week. The most recent available data are for 2014-15 from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) for Aboriginal and Torres Strait Islander children and for 2014 from the ABS Childhood Education and Care Survey (CEaCS) for non-Indigenous children.

This indicator, basic skills for life and learning focuses on the development and learning of children in their early years (up to 8 years of age). The early years are important as skill

¹² The Steering Committee notes its appreciation to Associate Professor, Karen Martin, Griffith University, who reviewed a draft of this section of the report.

attainment at one stage of life raises skill attainment at later stages of the life. With birth to school age the period of greatest growth and development, these first skills are very important as they form the foundations for children's ongoing development and affect their mental health and wellbeing, now and into the future (G. Kalb and van Ours 2012). When children transition to school already equipped with basic skills for life and learning, they have higher levels of social competence and academic achievement, which in turn increases the likelihood of achieving their potential (AIHW 2012).

Children on track on Australian Early Development Census¹³ (AEDC) domains

The AEDC is a population measure of children's development as they enter full time school. The AEDC assists communities to understand the development of local children compared to other children nationally. In 2015, the Australian version of the Early Development Instrument (tool that collects AEDC data) was completed for 302 003 children in their first year of full-time school (96.5 per cent of all children enrolled to begin school in 2015), including 17 351 Aboriginal and Torres Strait Islander children (5.7 per cent of all children surveyed) (Australian Government 2016). The five developmental domains of the AEDC are presented in table 6.8.1.

Table 6.8.1 AEDC domains of children's development

<i>Domain</i>	<i>Domain description</i>
Physical health and wellbeing	Children's physical readiness for the school day, physical independence and gross and fine motor skills.
Social competence	Children's overall social competence, responsibility and respect, approach to learning and readiness to explore new things.
Emotional maturity	Children's pro-social and helping behaviours and absence of anxious and fearful behaviour, aggressive behaviour and hyperactivity and inattention.
Language and cognitive skills	Children's basic literacy, interest in literacy, numeracy and memory, advanced literacy and basic numeracy.
Communication skills and general knowledge	Children's communication skills and general knowledge based on broad developmental competencies and skills.

Source: Australian Government 2016, *Australian Early Development Census National Report 2015: A Snapshot of Early Child Development in Australia*, Canberra.

In 2015:

- Across all domains between 59–63 per cent of Aboriginal and Torres Strait Islander children were 'on track', compared to 76–86 per cent of non-Indigenous children

¹³ Prior to 1 July 2014 the Australian Early Development Census (AEDC) was known as the Australian Early Development Index (AEDI).

(table 6A.8.1), with the highest proportion of Aboriginal and Torres Strait Islander children on track for ‘language and cognitive skills’ (62.8 per cent) (table 6A.8.1).

- The proportion of Aboriginal and Torres Strait Islander children classified as ‘on track’ decreased in all domains as remoteness increased (table 6A.8.4), with Aboriginal and Torres Strait Islander children showing the greatest difference between major cities and very remote areas for language and cognitive skills (figure 6.8.1).

Figure 6.8.1 Proportion children classified ‘on track’ in the language and cognitive skills domain, 2015^a

^a ‘On track’ children score in the highest 26 to 100th percentile of the AEDC

Source: Australian Early Development Census 2015 (unpublished), Social Research Centre; table 6A.8.4

From 2009 to 2015:

- Across all domains the proportion of Aboriginal and Torres Strait Islander children classified as ‘on track’ increased, with the gap between Aboriginal and Torres Strait Islander and non-Indigenous children narrowing between 0.5 and 7.4 percentage points (tables 6A.8.1–3)
- The largest percentage point increase for Aboriginal and Torres Strait Islander children was for ‘language and cognitive skills’ (from 48.0 to 62.8 per cent), which also had the greatest narrowing of the gap to non-Indigenous children (from 30.4 to 23.0 percentage points) (tables 6A.8.1–3).

Data for all three collection years are also reported by State and Territory (tables 6A.8.1–3) and by remoteness (tables 6A.8.4–6).

Language background

Language development is one of the dimensions that determines a child's readiness for school (Dockett et al. 2008). A child whose first language is not English may be disadvantaged in an English learning environment (Dockett, Perry and Kearney 2010; Fogarty and Schwab 2012).

Language is also important for life. Research indicates that a person's primary language — the first language learnt, or the mother tongue — is used to gain knowledge of the world and is inextricably linked with how people become social beings and form their earliest memories. Language forms a significant component of a person's cultural identity (Kral and Morphy 2006; LoBianco and Slaughter 2009).

The AEDC collects data on language background other than English, encompassing children who speak languages other than, or in addition to, English at home, or are reported by teachers to have English as a second language. In 2015, 15.0 per cent of Aboriginal and Torres Strait Islander children entering their first year of school had a language background other than English (a decrease from 19.6 per cent in 2009). The proportion of Aboriginal and Torres Strait Islander children whose first language was not English was lowest in inner regional and metropolitan areas (3.2 and 8.0 per cent) and highest in very remote areas (55.8 per cent) (table 6A.8.7).

Health checks

This section provides data on the proportion of Aboriginal and Torres Strait Islander and non-Indigenous children receiving a fourth year developmental health check. The aim of the checks is to improve the health and wellbeing of Australian children by promoting early detection of lifestyle risk factors and delayed development.

Two types of Medicare Benefits Schedule checks are reported in this section:

- The Aboriginal and Torres Strait Islander Health Assessment, which is available to 0–14 year old Aboriginal and Torres Strait Islander children¹⁴. (Data for the Aboriginal and Torres Strait Islander Health Assessments are restricted to children aged 3–5 years, to align with the age scope for the Health Assessments)
- The Health Assessment, which is available to all children (Aboriginal and Torres Strait Islander children and non-Indigenous children) aged 3–5 years¹⁵.

This section does not report on developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres.

¹⁴ Prior to 1 May 2010 this was called the Aboriginal and Torres Strait Islander Child Health Check

¹⁵ Prior to 1 May 2010 this was called the Healthy Kids Check.

In 2014-15 79.6 per cent of Aboriginal and Torres Strait Islander children received a fourth year developmental health assessment, compared to 54.5 per cent of non-Indigenous children (table 6A.8.8). Assessment rates increased with remoteness for Aboriginal and Torres Strait Islander children (from 61.2 per cent in major cities to 94.1 per cent in remote/very remote areas) (table 6A.8.9).

Figure 6.8.2 Proportion of children receiving a fourth year developmental health check, 2007-08 to 2014-15^a

^a The Health Assessment commenced in 2008 therefore non-Indigenous data are not available for 2007-08.

Sources: DoH (unpublished) Medicare Benefits Schedule (MBS) data collection; ABS (2014) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026*, Cat. no. 3238.0; ABS (various years) *Australian Demographic Statistics, June 30* Cat. no. 3101.0; ABS (2012) *Population Projections, Australia*, Cat. no. 3222.0 table 6A.8.8

The proportion of children receiving developmental health checks has increased over time for both Aboriginal and Torres Strait Islander and non-Indigenous children. The proportion of Aboriginal and Torres Strait Islander children receiving fourth year developmental health checks increased from 17.8 per cent in 2007-08 to 79.6 per cent in 2014-15. The rate for non-Indigenous children increased from 15.7 per cent in 2008-09 to 54.5 per cent in 2014-15 (figure 6.8.2).

These data are also reported by State and Territory in table 6A.8.8.

Informal learning activities

Informal learning, particularly from a carer, is important to Aboriginal and Torres Strait Islander children because it builds resilience and cultural knowledge, both of which are

recognised in a strengths based approach to school readiness (Armstrong et al. 2012; Biddle 2013).

In 2014-15, almost all Australian children aged 3–8 years did some form of informal learning activity with their main carer in the previous week, with the proportion of Aboriginal and Torres Strait Islander children (98.8 per cent) similar to the Australian total.

The most common activities for both Aboriginal and Torres Strait Islander children and all Australian children, with their main carers, were telling stories, reading or listening to the child read (88.6 per cent and 95.9 per cent, respectively) and watching television, a video or DVD (89.9 per cent and 84.8 per cent, respectively) (table 6A.8.12).

Data are also reported by State and Territory in table 6A.8.10 and by remoteness in table 6A.8.13.

Things that work

The Closing the Gap Clearinghouse identified that preschool programs with the following characteristics can contribute to positive educational outcomes:

- extensive involvement and consultation with local Aboriginal and Torres Strait Islander communities and a culturally appropriate approach
- connections with services and organisations in the local community
- flexibility to adapt to the needs of the local community (especially where mainstream education programs are being provided)
- well-trained staff, using a mix of home and childcare-centre-based activities, with an explicit focus on child development (Osbourne, Baum and Brown 2013).

Box 6.8.3 Things that work — Basic skills for life and learning

Home Interaction Program for Parents and Youngsters (HIPPY)

After its initial introduction by the Brotherhood of St Laurence, the Australian Government rolled out the HIPPY program nationally from 2008. As at April 2016, 100 HIPPY communities were fully operational including in 50 Aboriginal and Torres Strait Islander communities.

Home tutors (usually parents participating in the program in the community) deliver a two-year structured learning and parent support program for children from disadvantaged communities to transition to school.

In 2015, 26.7 per cent of the 4500 children enrolled in HIPPY were identified as Aboriginal and/or Torres Strait Islander and 57 per cent of the 599 Aboriginal and Torres Strait Islander children enrolled in the Age 5 cohort graduated from the program. HIPPY employed 112 local Aboriginal and Torres Strait Islander staff in 2015, around 29 per cent of all staff employed at that time (HIPPY Australia unpublished).

A 2011 evaluation found that the HIPPY program provided significant benefits for parents including: increased confidence to teach their child and to talk to the child's teacher; improved parenting skills; better relationships between parents and children; social connectedness with other parents; increased knowledge about the school's requirements; improved awareness of the child's skills and abilities; and pride in the child's learning achievement. Benefits for the children included improved familiarity and confidence with school work.

The evaluation noted that HIPPY was more successful where the local Aboriginal and Torres Strait Islander leaders and community were closely involved and where there were strong relationships between the agency delivering HIPPY and other child and family services (Liddell et al. 2011; AIHW 2013). The evaluation did not collect data on cognitive abilities and school readiness (such as AEDC data) or literacy and numeracy once children were at school, to compare outcomes of children participating in HIPPY with those from similarly disadvantaged communities who did not participate. Such data would be useful for future evaluations.

HIPPY Australia commissioned the Brotherhood of St Laurence, in partnership with the University of Melbourne, to undertake an independent evaluation for families who enrol children in HIPPY at 4 years. Cohorts will be surveyed in 2016 and 2017, with the survey to provide data on participating Aboriginal and Torres Strait Islander families to assist in determining outcomes (Brotherhood of St Laurence unpublished).

Sources: Liddell et al (2011) *Investing in our future: an evaluation of the national rollout of the Home Interaction Program for Parents and Youngsters (HIPPY)* final report to the Department of Education, Employment and Workplace Relations, August 2011; HIPPY Australia (unpublished) *Quarter 4 2015 Community Progress Report*, report to Department of Social Services.

Future directions in data

Data on fourth year developmental health checks are sourced from the Medicare Benefits Schedule data collection. The relevant health checks include a Health Assessment (available to all children aged 3, 4 and 5 years) and the Aboriginal and Torres Strait Islander Health Assessment (available to all Aboriginal and Torres Strait Islander children aged 0–14 years). Data are not currently able to be disaggregated by Indigenous status for the Health Assessment, due to data quality issues. This disaggregation is important to

provide a more accurate assessment of the number of Aboriginal and Torres Strait Islander children receiving fourth year developmental health checks.

Babies and young children may also receive regular developmental health checks from maternal and child health nurses employed by State, Territory or local governments. Data for health checks provided by maternal and child health nurses are currently not available.

Table 6A.1.1 Aboriginal and Torres Strait Islander women who gave birth who attended at least one antenatal visit in the first trimester (crude rates), 2013 (a), (b), (c)

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT (d)</i>	<i>NT</i>	<i>Total</i>	<i>3-state total (e)</i>
Number who attended at least one antenatal visit in the first trimester	no.	1 791	315	1 936	860	366	227	55	746	6 296	2 903
Number of women who gave birth	no.	3 574	904	3 689	1 670	679	277	94	1 241	12 128	5 494
Proportion who attended at least one antenatal visit in the first trimester	%	50.1	34.8	52.5	51.5	53.9	81.9	58.5	60.1	51.9	52.8

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Gestation at first antenatal visit is part of the Perinatal NMDS from July 2010.

(d) For ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.

(e) Total includes NSW, SA, and the NT only to allow comparison with historical data.

Number of women who gave birth (f)	no.	3 008	821	3 572	1 333	630	265	75	1 351	11 055	4 989
Proportion who attended at least one antenatal visit in the first trimester	%	62.0	38.7	46.1	34.7	54.4	69.1	49.3	49.9	50.0	57.7

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Data are by place of usual residence of the mother.

(c) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

(d) Total includes data for Tas for the first time and is not comparable with totals from previous years.

(e) Total includes NSW, SA, and the NT only.

(f) Excludes women whose gestation at first antenatal visit was not stated.

Source: AIHW National Perinatal Data Collection, cited in SCRGSP (2013) NIRA performance information 2012-13, PC, Canberra.

TABLE 6A.1.4

Table 6A.1.4 **Aboriginal and Torres Strait Islander women who gave birth who attended at least one antenatal visit in the first trimester, NSW, Vic, Qld, WA, SA, ACT, NT, 2010 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (c)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>ACT</i>	<i>NT</i>	<i>Total (d), (e)</i>
Number who attended at least one antenatal visit in the first trimester	no.	2 250	376	1 267	307	342	36	686	5 264
Number of women who gave birth (f)	no.	3 139	779	3 321	1 032	603	63	1 313	10 250
Proportion who attended at least one antenatal visit in the first trimester	%	71.7	48.3	38.2	29.7	56.7	57.1	52.2	51.4

- (a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published. Data are by place of usual residence of the mother. Women who gave birth in NSW, Victoria, Qld, WA, SA, the ACT or the NT but reside in another jurisdiction are not reported due to small numbers.
- (c) Due to data system reforms the Victorian Perinatal Data Collection for 2009 and 2010 are provisional pending further quality assurance work.
- (d) Total includes data for Vic, WA, and the ACT for the first time and is not comparable with totals from previous years.
- (e) Total includes NSW, Vic, Qld, WA, SA, ACT and the NT only. These data are not generalisable to Australia.
- (f) Excludes women whose gestation at first antenatal visit was not stated.

Source: AIHW National Perinatal Data Collection, cited in SCRGSP (2013) NIRA performance information 2012-13, PC, Canberra.

TABLE 6A.1.5

Table 6A.1.5 **Aboriginal and Torres Strait Islander women who gave birth who attended at least one antenatal visit in the first trimester, NSW, Qld, SA and NT, 2009 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (c)</i>	<i>SA</i>	<i>NT</i>	<i>Total (d), (e)</i>
Number who attended at least one antenatal visit in the first trimester	no.	1991	578	294	668	3531
Number of women who gave birth (f)	no.	2831	1600	553	1390	6374
Proportion who attended at least one antenatal visit in the first trimester	%	70.3	36.1	53.2	48.1	55.4

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for WA and Tasmania. Data are available in Victoria and the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in NSW, Qld, SA or the NT but reside in another jurisdiction are not reported due to small numbers.

(c) For Queensland, antenatal visit in the first trimester data were collected from 1 July 2009.

(d) Total includes NSW, Qld, SA and the NT only. These data are not generalisable to Australia.

(e) Total includes data for Queensland for the first time and is not comparable with totals from previous years.

(f) Excludes women whose gestation at first antenatal visit was not stated.

Source: AIHW National Perinatal Data Collection, cited in SCRGSP (2013) NIRA performance information 2012-13, PC, Canberra.

TABLE 6A.1.7

Table 6A.1.7 Aboriginal and Torres Strait Islander women who gave birth who attended at least one antenatal visit in the first trimester, NSW, SA and NT, 2007 (a), (b)

	<i>Unit</i>	<i>NSW</i>	<i>SA</i>	<i>NT</i>	<i>Total (c)</i>
Number who attended at least one antenatal visit in the first trimester	no.	1 828	171	561	2 560
Number of women who gave birth (d)	no.	2 748	407	1 340	4 495
Proportion who attended at least one antenatal visit in the first trimester	%	66.5	42.0	41.9	57.0
Rate ratio (e)	no.	0.9	0.6	0.8	0.8
Rate difference (f)	no.	- 10.5	- 31.8	- 12.4	- 17.5

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria, Queensland, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in NSW, SA or the NT but reside in another jurisdiction are not reported due to small numbers.

(c) Total includes NSW, SA and the NT only. These data are not generalisable to Australia.

(d) Excludes women whose gestation at first antenatal visit was not stated.

(e) Rate ratio is the directly age standardised Aboriginal and Torres Strait Islander proportion divided by the directly age standardised non-Aboriginal and Torres Strait Islander proportion using the Australian female population who gave birth in 2007 as the standard population.

(f) Rate difference is the directly age standardised Aboriginal and Torres Strait Islander proportion less the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2007 as the standard population.

(a) The denominator is the total number of women who identified as Aboriginal and Torres Strait Islander who gave birth in the period in each remoteness classification, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy. A small number of births were missing the remoteness classification and hence excluded from the totals.

Table 6A.1.8 **Aboriginal and Torres Strait Islander women who gave birth who attended at least one antenatal visit in the first trimester, by State and Territory, by remoteness (crude rates) 2011 to 2013 (a), (b)**

<i>Unit</i>	<i>NSW</i>	<i>Vic (c)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT (d)</i>	<i>NT</i>	<i>Total</i>	<i>3-state total (e)</i>
-------------	------------	----------------	------------	-----------	-----------	------------	----------------	-----------	--------------	--------------------------

(b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are by place of usual residence of the mother. Women who gave birth in jurisdictions where data on gestation at first antenatal visit was available but reside in another jurisdiction are not reported due to small numbers.

(c) Due to data system reforms the Victorian Perinatal Data Collection for 2010 and 2011 are provisional pending further quality assurance work.

(d) For ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.

(e) Total includes NSW, SA, and the NT only.

(a) With the exception of WA, this includes women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. In WA, it includes women who gave birth, whether resulting in a live or still birth, if the gestational age is 20 weeks or more or, if gestation is unknown, the birthweight is at least 400grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.

(d) For ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.

(e) Total includes NSW, SA and the NT only to allow comparison with historical data.

(f) Rate ratio is the directly age standardised Aboriginal and Torres Strait Islander proportion divided by the directly age standardised non-Indigenous proportion.

(g) Rate difference is the directly age standardised Aboriginal and Torres Strait Islander proportion less the directly age standardised non-Indigenous proportion.

Rate difference (h)	no.	- 6.7	- 9.9	- 16.9	- 13.2	np	np	- 7.6	- 9.8	- 8.3

(a) Women who gave birth at 32 weeks or more gestation. Excludes mothers whose Indigenous status was not stated and mothers whose number of antenatal visits were not stated. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Number of antenatal visits is part of the Perinatal NMDS from July 2012. Data are not available for Victoria.

(c) Data are by place of usual residence of the mother. Women who resided in Victoria and gave birth in another state or territory are not reported due to small numbers.

(d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.

(e) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only. These data are not generalisable to Australia.

(f) Total includes Qld, SA, and the NT only to allow comparison with historical data.

(g) Rate ratio is the directly age standardised Aboriginal and Torres Strait Islander proportion divided by the directly age standardised non-Indigenous proportion.

(h) Rate difference is the directly age standardised Aboriginal and Torres Strait Islander proportion less the directly age standardised non-Indigenous proportion.

np Not published.

TABLE 6A.1.25

Table 6A.1.25 **Age standardised rate of women who gave birth and attended at least one antenatal visit in the first trimester, by Indigenous status and remoteness, 2011, (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT (d)</i>	<i>NT</i>	<i>Total (e)</i>	<i>3-state total total (f)</i>
Remote	±	np	np	5.6	np	np	np	..	np	3.3	6.1
Very remote	±	np	..	np	np	np	np	..	np	5.7	12.3

- (a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Data are by place of usual residence of the mother.
- (c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with Data Principle 2, age standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.
- (d) For ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.
- (e) Total includes data for Tas for the first time and is not comparable with totals from previous years.
- (f) Total includes NSW, SA, and the NT only.
- .. Not applicable. **np** Not published.

Table 6A.1.26 **Age standardised rate of women who gave birth who attended five or more antenatal visits, NSW, Qld, WA, SA, Tas, ACT, NT, by Indigenous status, by remoteness, 2013 (a), (b), (c)**

<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA (d)</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Total (e)</i>	<i>3-state total (f)</i>
(a) Women who gave birth at 32 week or more gestation to a live birth or stillbirth. Excludes births where mother's Indigenous status was not stated. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.									
(b) Number of antenatal visits is part of the Perinatal NMDS from July 2012. Data are not available for Victoria. Data are by place of usual residence of the mother. Women who gave birth in NSW, Qld, SA, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers.									
(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.									
(d) Total Includes WA for the first time and is not comparable with totals from previous years.									
(e) Total includes NSW, Qld, WA, SA, Tas, ACT and NT only.									
(f) Total includes Qld, SA, and the NT only to allow comparison with historical data.

Table 6A.1.31 **Antenatal care and childbirth, Aboriginal and Torres Strait Islander children aged 0–3 years, by remoteness, 2014-15 (a)**

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remote</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>	<i>Australia</i>
(a)	Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.								
(b)	Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population.								
(c)	Child born late (42 weeks or more). Child born on time (37–41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33–36 weeks).								
(d)	This information was only collected from birth mothers (excludes other child proxies) so proportions are based on this population (67666).								
(e)	Other includes 'At a birthing centre', 'At a general medical clinic or facility', 'At home' and 'Other'.								
(f)	Comprises: had regular check-ups while pregnant, had check-ups while pregnant but not regular and had check-ups while pregnant but not known if regular.								
(g)	Comprises: Took folate prior to and during pregnancy, took folate prior to pregnancy only and took folate during pregnancy only.

- (a) Aboriginal and Torres Strait Islander women who gave birth at 32 weeks or more gestation to a live birth or stillbirth. Excludes mothers whose Indigenous status was not stated and mothers whose number of antenatal visits were not stated. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Number of antenatal visits is part of the Perinatal NMDS from July 2012. Data are not available for Victoria. Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence. Women who resided in Victoria and gave birth in another state or territory are not reported due to small numbers.
- (c) Total includes NSW, Queensland, WA, SA, Tasmania, ACT and NT. These data are not generalisable to Australia.
- (d) Total (at least one) includes specified number of visits and does not include women with an unknown number of antenatal visits.

Did not smoke	%	49.2	56.3	46.9	48.9	41.9	48.1	48.8	46.0	48.1	47.6
Total (g)	%	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

(a) Excludes births where the mother's Indigenous status was not stated.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Smoking status during pregnancy was not part of the Perinatal NMDS for the 2009 collection period. The question used is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers.

(d) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(e) For women who gave birth in SA and the NT, smoking status was recorded at the first antenatal visit.

(f) The proportion of Aboriginal and Torres Strait Islander women smoked during pregnancy in NT is underestimated and will be increased when smoking status is assigned for the 'not stated' group. Caution should be used when interpreting these rates. In 2009, when 'not stated' smoking status is excluded from analysis, the proportion of Aboriginal and Torres Strait Islander mothers who smoked during pregnancy in NT is 54 per cent.

(g) Excludes mothers for whom smoking status was not stated.

– Nil or rounded to zero.

(c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. Standardised data were implemented by NSW, Vic, Qld, WA, SA, the ACT and the NT and partially implemented by Tas. Data from non-standard smoking items made available as part of the National Perinatal Data Collection (NPDC) have been used, therefore, caution should be used when interpreting these numbers.

(d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.

(e) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(f) For women who gave birth in the NT, smoking status was recorded at the first antenatal visit.

(g) Rate ratio is the directly age standardised Aboriginal and Torres Strait Islander proportion divided by the directly age standardised non-Indigenous proportion.

Outer regional	±	1.4	2.3	1.2	2.3	2.6	2.7	..	2.7	0.7	0.7
Remote	±	np	np	3.6	3.4	np	np	..	np	2.0	2.0
Very remote	±	np	..	np	np	np	np	..	np	3.3	3.3

- (a) Excludes women whose Indigenous status was not stated, non-residents and those with a not stated State/Territory of usual residence.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.
- (c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. Standardised data were implemented by NSW, Vic, Qld, WA, SA, the ACT and the NT and partially implemented by Tas. Data from non-standard smoking items made available as part of the National Perinatal Data Collection (NPDC) have been used, therefore, caution should be used when interpreting these numbers.
- (d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with Data Principle 2, age standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.
- (e) Excludes mothers for whom smoking status was not stated.
- (f) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.
- (g) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.
- (h) In accordance with NIRAPIMG data principles, age standardised rates have not been produced for Tasmania and the ACT, as denominators for some age groups are less than 30.
- (i) For women who gave birth in the NT, smoking status was recorded at the first antenatal visit.
- .. Not applicable. **np** Not published.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval (CI) is also reported for each estimate.

(b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions for use of alcohol, tobacco and illicit substances during pregnancy have therefore been calculated on the responding population.

(a) Aboriginal and Torres Strait Islander births to teenage mothers comprise births where either parent identifies as being of Aboriginal and Torres Strait Islander origin.

(b) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(c) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

– Nil or rounded to zero. **np** Not published.

(a) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(b) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

– Nil or rounded to zero. **np** Not published.

Table 6A.3.5 Proportion of babies born to teenage mothers, by age of mother by remoteness, 2001–2014 (a), (b), (c)

	<i>Less than 16 years</i>	<i>16 years</i>	<i>17 years</i>	<i>18 years</i>	<i>19 years</i>	<i>Less than 20 years</i>
(a)	From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.					
(b)	Remoteness Area data for 2001 to 2012 are based on the Statistical Area Level 2 boundaries. From 2013 onwards, Remoteness Areas have been concorded from Meshblocks. For more details see Australian Statistical Geography Standard (ASGS), 2011 (cat. no. 1270.0.55.001).					
(c)	Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014 which may impact national trends.					
(d)	Aboriginal and Torres Strait Islander births to teenage mothers comprise births where either parent identifies as being of Aboriginal and Torres Strait Islander origin.					
	– Nil or rounded to zero.

(a) Teenage mothers comprise women aged less than 20 who have given birth.

(b) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(c) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

(d) Father can be Aboriginal and Torres Strait Islander or non-Indigenous.

– Nil or rounded to zero. **np** Not published.

Total births to non-Indigenous teenage mothers	no.	5 165	2 207	1 236	154	54

- (a) Teenage mothers comprise women aged less than 20 who have given birth.
- (b) Remoteness Area data for 2001 to 2012 are based on the Statistical Area Level 2 boundaries. From 2013 onwards, Remoteness Areas have been concorded from Meshblocks. For more details see Australian Statistical Geography Standard (ASGS), 2011 (cat. no. 1270.0.55.001).
- (c) Births which could not be assigned to an Statistical Area Level 2 cannot be allocated to a Remoteness Area and have been excluded from this table. Therefore Remoteness Area totals will differ from state level totals.
- (d) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.
- (e) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014 which may affect national trends.
- (f) Father can be Aboriginal and Torres Strait Islander or non-Indigenous.
– Nil or rounded to zero.

(a) Data exclude stillbirths and multiple births. The NPDC does not include births both less than 20 weeks gestation and less than 400 grams birthweight.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, residents of external territories and not stated State/Territory of residence. Babies born to mothers residing in Tasmania and the ACT are excluded.

(c) Births with not stated maternal Indigenous status were excluded. Data on Aboriginal and Torres Strait Islander births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(d) Data were obtained from the most recent version of the NPDC and may differ slightly from that used for previously published data which are incorporated in other tables in this section.

(e) Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.

(f) Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) and less than 400 grams birthweight; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

Table 6A.4.2 **Incidence of low birthweight among live born singleton babies, by State and Territory, by Indigenous status of mother, 2007 to 2013 (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas (e)</i>	<i>ACT (e)</i>	<i>NT</i>	<i>Aust</i>
(c)	Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.									
(d)	Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.									
(e)	Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.									
(f)	Data on Indigenous births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.									
(g)	Includes births to mothers whose Indigenous status was not stated.									
(h)	Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.									
(i)	Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.

Table 6A.4.4 **Incidence of low birthweight among live born singleton babies, by Indigenous status of mothers, 2010-2012 (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas (d)</i>	<i>ACT (d)</i>	<i>NT</i>	<i>Aust</i>
(a)	Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.									
(b)	Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.									
(c)	Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.									
(d)	Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.									
(e)	Indigenous status of the baby is included in the Perinatal NMDS from July 2012. Date of implementation varies across jurisdictions. Caution should be used when interpreting these numbers.									
(f)	Includes births to mothers whose Indigenous status was not stated.									
(g)	Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.									
(h)	Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.									
	– Nil or rounded to zero.

(a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded from the totals.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Results based on very small numbers (fewer than 5 events) are not published (np).

(e) birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania are based on small numbers of births and should be viewed with caution.

(f) Data on Indigenous births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(g) Includes births to mothers whose Indigenous status was not stated.

.. Not applicable. – Nil or rounded to zero. **np** Not published.

- (a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.
- (c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.
- (d) Results based on very small numbers (fewer than 5 events) are not published.
- (e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania are based on small numbers of births and should be viewed with caution.
- (f) Data on Indigenous births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded from the totals.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Results based on very small numbers (fewer than 5 events) are not published (np).

(e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.

(f) Data on Indigenous births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(g) Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.

(h) Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.

– Nil or rounded to zero. .. Not applicable. np Not published.

Rate difference (i)	no.	5.3	5.9	4.7	3.1	8.8	8.3	5.5

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

Table 6A.4.14 Incidence of low birthweight among live born singleton babies, by Indigenous status of the infant, 2011 (a), (b), (c)

	<i>Unit</i>	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>Tas (e)</i>	<i>ACT (e)</i>	<i>NT</i>	<i>Aust</i>
(c)	Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.							
(d)	Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.							
(e)	Birthweight data on babies born residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.							
(f)	Data on Indigenous status of the baby is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data on Indigenous status of the baby was available for NSW, Vic, Qld, Tas, the ACT and the NT only. Women who gave birth in NSW, Vic, Qld, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers. Table excludes women who gave birth in WA and SA where Indigenous status of the baby was not available.							
(g)	Includes births whose Indigenous status was not stated.							
(h)	Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.							
(i)	Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.

(a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded from the totals.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Results based on very small numbers (fewer than 5 events) are not published (np).

(e) Birthweight data on Aboriginal and Torres Strait Islander babies residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.

(f) Indigenous status of the baby is included in the Perinatal NMDS from July 2012. Date of implementation varies across jurisdictions. Caution should be used when interpreting these numbers.

(g) Includes births whose Indigenous status was not stated.

– Nil or rounded to zero. **np** Not published. .. Not applicable.

- (a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic; and multiple births.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.
- (c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.
- (d) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.
- (e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.
- (f) Data on Indigenous status of the baby is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data on Indigenous status of the baby was available for available for NSW, Vic, Qld, Tas, the ACT and the NT only. Women who gave birth in NSW, Vic, Qld, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers. Table excludes women who gave birth in WA and SA where Indigenous status of the baby was not available.

Responding population	4.8	100.0	35.3	100.0
Information not provided	1.2	10.3
Total aged 0–3 years	6.0	41.7

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate.

(b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions for use of alcohol, tobacco and illicit substances during pregnancy have therefore been calculated on the responding population.

.. Not applicable. **np** Not published. – Nil or rounded to zero.

(a) State and Territory data in this report relate to data from 2012-13 onwards and include all jurisdictions. State and territory data are reported prior to 2012-13 in the 2014 OID relating to the six jurisdiction total.

TABLE 6A.5.1

Table 6A.5.1 **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by State and Territory, 2014-15 (a), (b), (c), (d)**

	<i>Hospitalisations (no.)</i>		<i>Age specific rate (e)</i>		<i>Rate ratio (g)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	
(b)	Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.				
(c)	Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude hospitalisations from private hospitals in the NT, Tasmania and the ACT.				
(d)	Australia data include public and private hospitals in all jurisdictions.				
(e)	Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.				
(f)	'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.				
(g)	Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.				
(h)	Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.

(a) State and Territory data in this report relate to data from 2012-13 onwards and include all jurisdictions. State and territory data are reported prior to 2012-13 in the 2014 OID relating to the six jurisdiction total.

TABLE 6A.5.2

Table 6A.5.2 **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by State and Territory, 2013-14 (a), (b), (c), (d)**

	<i>Hospitalisations (no.)</i>		<i>Age specific rate (e)</i>		<i>Rate ratio (g)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	
(b)	Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.				
(c)	Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude hospitalisations from private hospitals in the NT, Tasmania and the ACT.				
(d)	Australia data include public and private hospitals in all jurisdictions.				
(e)	Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.				
(f)	'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.				
(g)	Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.				
(h)	Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.

(a) State and Territory data in this report relate to data from 2012-13 onwards and include all jurisdictions. State and territory data are reported prior to 2012-13 in the 2014 OID relating to the six jurisdiction total.

TABLE 6A.5.3

Table 6A.5.3 **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by State and Territory, 2012-13 (a), (b), (c), (d)**

	<i>Hospitalisations (no.)</i>		<i>Age specific rate (e)</i>		<i>Rate ratio (g)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous (f)</i>	
(b) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.					
(c) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude hospitalisations from private hospitals in the NT, Tasmania and the ACT.					
(d) Australia data include public and private hospitals in all jurisdictions.					
(e) Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.					
(f) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.					
(g) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.					
(h) Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

Table 6A.5.5 **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by remoteness, 2014-15 (a), (b), (c)**

	<i>Hospitalisations (no.)</i>		<i>Age specific rate (d)</i>		<i>Rate ratio (e)</i>
	<i>Aboriginal and Torres Strait Islander Non-Indigenous</i>		<i>Aboriginal and Torres Strait Islander Non-Indigenous</i>		

(b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of hospitalisations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(c) Includes public and private hospitals in all jurisdictions.

(d) Rate per 100 000 population of children aged 0–4 years.

(e) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

Source: AIHW (unpublished) National Hospital Morbidity Database.

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions and the six jurisdiction total exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(d) Non-Indigenous includes hospitalisations identified as not Indigenous except for WA which also includes hospitalisations for children for whom Indigenous status was not stated.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

(h) Data are for public and private hospitals in all jurisdictions.

np Not published. – Nil or rounded to zero. .. Not applicable.

TABLE 6A.6.4

Table 6A.6.4 **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by Indigenous status and State and Territory, 2011–12 (a), (b)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (c)</i>		<i>Rate ratio (e)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (d)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (d)</i>	
Complications of medical and surgical care (Y40–Y84) (f)	150	2 679	180.6	192.1	0.9
Other (X60–X84; Y10–Y39; Y85–Y98) (f)	18	132	21.7	9.5	2.3
Total potentially preventable hospitalisations	13 286	141 046	15 992.2	10 113.2	1.6

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions and the six jurisdiction total exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(d) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(e) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(f) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

(g) Data are for public and private hospitals in all jurisdictions.

np Not published. – Nil or rounded to zero. .. Not applicable.

Source: AIHW (unpublished) National Hospital Morbidity Database.

Total potentially preventable hospitalisations	12 808	141 423	15 424.9	10 296.6	1.5

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions and the six jurisdiction total exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(d) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

Table 6A.6.5 **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by Indigenous status and State and Territory, 2010-11 (a), (b)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (c)</i>		<i>Rate ratio (e)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (d)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (d)</i>	

(e) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(f) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

(g) Data are for public and private hospitals in all jurisdictions.

np Not published. – Nil or rounded to zero. .. Not applicable.

	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (e)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (e)</i>	
Injury, poisoning and certain other consequences of external causes (S00–T98)	10	227	1 520.9	1 000.4	1.5
Transport accidents (V00–V99) (g)	np	8	np	35.3	np
Other external causes of accidental injury (W00–X59) (g)	8	182	1 216.7	802.1	1.5
Assault (X85–Y09) (g)	np	np	np	np	np
Complications of medical and surgical care (Y40–Y84) (g)	–	32	–	141.0	..
Other (X60–X84; Y10–Y39; Y85–Y98) (g)	–	np	–	np	..
Total potentially preventable hospitalisations	34	1 137	5 171.1	5 011.1	1.0

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

np Not published. – Nil or rounded to zero. .. Not applicable.

Total potentially preventable hospitalisations	30	1 139	4 610.7	5 337.4	0.9

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

np Not published. – Nil or rounded to zero. .. Not applicable.

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

np Not published. – Nil or rounded to zero. .. Not applicable.

TABLE 6A.6.11

Table 6A.6.11 **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by Indigenous status and State and Territory, 2004-05 (a), (b)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (d)</i>		<i>Rate ratio (f)</i>
	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (e)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Other (e)</i>	
Other (X60–X84; Y10–Y39; Y85–Y98) (g)	–	–	–	–	..
Total potentially preventable hospitalisations	32	1 051	4 796.4	5 359.5	0.9

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude hospitalisations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

np Not published. – Nil or rounded to zero. .. Not applicable.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of hospitalisations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(c) Includes public and private hospitals in all jurisdictions.

Table 6A.6.14 **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by remoteness, 2012-13 (a), (b), (c)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (d)</i>		<i>Rate ratio (e)</i>
	<i>Aboriginal</i>	<i>Non-</i>	<i>Aboriginal</i>	<i>Non-</i>	
	<i>and Torres</i>	<i>Indigenous</i>	<i>and Torres</i>	<i>Indigenous</i>	
	<i>Strait</i>		<i>Strait</i>	<i>Indigenous</i>	
	<i>Islander</i>		<i>Islander</i>		

(d) Rate per 100 000 population of children aged 0–4 years. 2012 projected population by remoteness area used as denominator for the remoteness categories, as Australian data by remoteness for 2013 were not available at time of first publication in the 2014 OID report.

(e) Rate ratio is the Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

(f) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

np Not published. – Nil or rounded to zero.

Source: AIHW (unpublished) National Hospital Morbidity Database.

2010-2014 average ERP, 0–4 years	no.	26 111	25 143	10 437	4 519	7 373	73 584	452 994	285 113	152 048	94 453	11 454	996 062

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010-2012 (final), 2013 (revised), 2014 (preliminary).
- (b) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (c) Data based on reference year.
- (d) Some totals and figures may not compute due to the effects of rounding.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Aboriginal and Torres Strait Islander across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.
- (g) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (h) Deaths where the Indigenous status of the deceased was not stated are excluded.

TABLE 6A.6.16

Table 6A.6.16 **Deaths from external causes and preventable diseases for children aged 0–4 years, by Indigenous status, NSW, Queensland, WA, SA, NT 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

	Aboriginal and Torres Strait Islander						Non-Indigenous						
	Unit	NSW	Qld (i)	WA	SA	NT	Total (h)	NSW	Qld (i)	WA	SA	NT	Total (h)
(i)	Care should be taken when interpreting deaths data for Queensland as they were affected by changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.												
(j)	The ICD-10 codes included in 'External Causes and Preventable Diseases' are: Certain infectious and parasitic diseases (A00-B99); Nutritional anaemias (D50-D53) and malnutrition (E40-E46); Diseases of the ear and mastoid process (H60-H95); Diseases of the respiratory system (J00-J99); Diseases of the oral cavity, salivary glands and jaws (K00-K14); Diseases of the skin and subcutaneous tissue (L00-L99); Transport accidents (V01-V99); Other external causes of accidental injury (W00-X59); Assault (X85-Y09); Complications of medical and surgical care (Y40-Y84); Other (X60-X84, Y10-Y39, Y85-Y98).												
(k)	Crude rates calculated per 100 000 Estimated Resident Population for children aged less than 5 years for the average of the period 2010–2014.												
(l)	Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.												
(m)	Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals.												

Note: Deaths of those whose age was not stated have been pro-rated in the calculation of age-specific death rates.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006-2007 (final).

(b) Data are presented in five-year groupings due to the volatility of small numbers each year.

(c) Data based on reference year.

(d) Some totals and figures may not compute due to the effects of rounding.

(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(f) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Aboriginal and Torres Strait Islander across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.

(g) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(h) Deaths where the Indigenous status of the deceased was not stated are excluded.

Table 6A.6.17 **Deaths from external causes and preventable diseases for children aged 0–4 years, by Indigenous status, NSW, Queensland, WA, SA, NT, 2003–2007 (a), (b), (c), (d), (e), (f), (g)**

	Aboriginal and Torres Strait Islander						Non-Indigenous (h)						
	Unit	NSW	Qld	WA (i)	SA	NT	Total (j)	NSW	Qld	WA (i)	SA	NT	Total (j)
(i)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.												
(j)	Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.												
(k)	See table 6A.6.16 for ICD-10 codes included in 'External Causes and Preventable Diseases'.												
(l)	Crude rates calculated per 100 000 Estimated Resident Population for children aged less than 5 years for the average of the period 2003-2007.												
(m)	Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.												
(n)	Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals.

TABLE 6A.7.1

Table 6A.7.1 **Children aged 0–14 years with a long-term hearing problem: type of ear/hearing problem, by age and Indigenous status, 2001, 2004-05, 2008, 2011-13 and 2014-15 (a)**

<i>Age (years)</i>	<i>Deafness (b)</i>				<i>Other ear/hearing problems (c)</i>				<i>Total with ear/hearing problems (d)</i>			
	<i>Estimate (no.)</i>	<i>Proportion (%)</i>	<i>RSE (%)</i>	<i>95 per cent CI (±)</i>	<i>Estimate (no.)</i>	<i>Proportion (%)</i>	<i>RSE (%)</i>	<i>95 per cent CI (±)</i>	<i>Estimate (no.)</i>	<i>Proportion (%)</i>	<i>RSE (%)</i>	<i>95 per cent CI (±)</i>
Total 0–14	71 501	1.9	9.3	0.3	111 339	2.9	8.9	0.5	177 252	4.7	5.6	0.5
Rate ratio (e)												
0–3	..	1.4	2.1	2.0
4–14	..	3.8	1.9	2.6
Total 0–14	..	3.5	2.0	2.4

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate. Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Includes partial hearing loss and deafness in one ear.

(c) Includes otitis media, tinnitus, Meniere's disease/vertiginous syndrome and type of hearing problem not known. Data for 2008 also includes otitis externa.

(d) Components may not add to total as people may have reported more than one type of ear/hearing problem.

(e) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander children by the corresponding rate for non-Indigenous children.

(a) Data are for separations from public and private hospitals in all jurisdictions.

(b) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(c) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.

(d) Separations per 1000 population of children aged 0–3 years and 4–14 years. Denominators are 3-year rolling averages based on population backcast estimates and projections from the 2011 Census.

– Nil or rounded to zero. **np** Not published.

Total	804	535	29	17.0	8.0

(a) Data are from public and private hospitals in all jurisdictions.

(b) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). 'Suppurative and unspecified otitis media' is a subcategory of 'Diseases of middle ear and mastoid' and so categories should not be summed.

(c) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(d) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.

(e) Rates per 1000 population aged 0-14 years are calculated using ABS Estimated Resident Population and projections by remoteness classification based on the 2011 Census (as at 30 June 2011).

– Nil or rounded to zero.

Health Assessment (j)	no.
Target population (k)	no.
Proportion of target population assessed	%

(a) Financial year data is based on date of processing

(b) Location is based on patients' residential postcode for the last service during the period.

(c) Includes counts of all children aged 3-5 years receiving Aboriginal and Torres Strait Islander Child Health Assessment (formerly Child Health Check) and all children aged 3-5 years receiving the Health Assessment (formerly Healthy Kids Check).

Table 6A.8.8 Proportion of children receiving a fourth year developmental health check, by type of health check, by state and territory, 2007-08 to 2014-15 (a), (b), (c), (d), (e)

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas (f)</i>	<i>ACT (f)</i>	<i>NT</i>	<i>Aust (g)</i>
(d)	Children who received both a Health Assessment and an Aboriginal and Torres Strait Islander people's Health Assessment during the reference period were counted only against the Aboriginal and Torres Strait Islander Health Assessment.									
(e)	The patient count will be factored if the patient's postcode belongs to multiple states.									
(f)	Data for Aboriginal and Torres Strait Islander Child Health Assessment are not published for Tasmania or the ACT for 2007-08 to 2010-11 due to small numbers, but are included in the total for Australia.									
(g)	Australian total includes where location was unknown.									
(h)	Includes claims for Medicare Benefits Schedule (MBS) Item 708 (Aboriginal and Torres Strait Islander Child Health Check, available to 30 April 2010) and Item 715 (Aboriginal and Torres Strait Islander People's Health Assessment, available from 1 May 2010) for children aged 3-5 years in the reference period. Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander Australians. Data for Aboriginal and Torres Strait Islander Australians are therefore likely to understate the proportion who access health assessments.									
(i)	Aboriginal and Torres Strait Islander population denominator are series B population projections based on the 2011 Census using the average of two years of projections. For latest year 2014-15, average of 2014 and 2016 population have been used to account for the under-identification of infants on the 2011 Census, aged 4 years in 2015.									
(j)	Includes claims for MBS items 709 and 711 (Healthy Kids Check, available to 30 April 2010) and items 701, 703, 705, 707 and 10986 (Health Assessment, available from 1 May 2010) for children aged 3-5 years in the reference period. Data do not include developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres. This is known to be a particular issue for several jurisdictions. For example, in Victoria, the Victorian Maternal and Child Health Service provided a 3.5 year old Key Ages and Stages consultation to 47 638 children in the 2011-12 financial year. Data include Aboriginal and Torres Strait Islander children who received a Healthy Kids Check and did not also receive a health check under MBS items 708 or 715.									
(k)	Non-Indigenous population denominator for four year olds is derived by subtracting the Aboriginal and Torres Strait Islander population projections for June (average of two years) from the total resident Series B population projections for June. For latest year 2014-15, population projections for June use an average of 2014 and 2016 subtracted from the total resident series B population projection for June using an average of 2014 and 2016, to account for the under-identification of infants on the 2011 Census, aged 4 years in 2015.									
(l)	The Health Assessment (Healthy Kids Check) commenced in 2008 therefore there is no data available for 2007-08.

- (a) Financial year data is based on date of processing
- (b) Location is based on patients' residential postcode for the last service during the period.
- (c) Includes counts of all children aged 3-5 years receiving Aboriginal and Torres Strait Islander Health Assessment (formerly Child Health Check) and all children aged 3-5 years receiving the Health Assessment (formerly Healthy Kids Check).
- (d) Children who received both a Health Assessment and an Aboriginal and Torres Strait Islander people's Health Assessment during the reference period were counted only against the Aboriginal and Torres Strait Islander Health Assessment.
- (e) The patient count will be factored if the patient's postcode belongs to multiple states.
- (f) Remoteness areas have been collapsed due to the availability of Aboriginal and Torres Strait Islander population data for remoteness areas.
- (g) Includes claims for Medicare Benefits Schedule (MBS) Item 715 (Aboriginal and Torres Strait Islander People's Health Assessment) for children aged 3-5 years for the reference period. Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander Australians. Data for Aboriginal and Torres Strait Islander Australians are therefore likely to understate the proportion who access health assessments.

Table 6A.8.9 Proportion of Aboriginal and Torres Strait Islander children receiving a fourth year developmental health check, by type of health check, remoteness, 2012-13, 2013-14 and 2014-15 (a), (b), (c), (d), (e), (f)

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be interpreted with caution. Proportions with relative standard errors over 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate.

Table 6A.8.10 **Aboriginal and Torres Strait Islander children aged 3–8 years, informal learning activities, by State and Territory, 2014-15 (a)**

7 Education and training

Strategic areas for action

Education is a life-long activity, beginning with learning and development in the home through to the more formal settings of school education, vocational education and training (VET) and higher education. Education and training aims to develop the capacities and talents of students, so they have the necessary knowledge, understanding, skills and values for a productive and rewarding life. Actions in this strategic area can help strengthen communities and regions both economically and socially, and there are strong links between higher levels of education and improved health outcomes.

In September 2015, the COAG Education Council endorsed the Aboriginal and Torres Strait Islander Education Strategy which identifies policies and actions that require national collaboration to succeed and shared principles that governments commit to when working with communities (Education Council 2015).

The indicators in this chapter cover some of the key factors that contribute to positive education and training outcomes:

- teacher quality (section 7.1) — the quality of teaching is a key determinant of student outcomes. However, defining and measuring teacher quality is difficult. This section discusses research into the determinants of teacher quality and identifies data that could be used for future reporting
- school engagement (section 7.2) — although defining and measuring student engagement with schooling is complex, research suggests that relevant dimensions include positive self-identity, belonging, participation, and attendance
- transition from school to work (section 7.3) — the transition from school to work is a critical period. Young people who are actively engaged in education and training, or employed, are at a lower risk of long term disadvantage.

Several COAG targets and headline indicators reflect the importance of education and training:

- early childhood education (section 4.3)
- reading, writing and numeracy (section 4.4)
- year 1 to 10 attendance (section 4.5)
- year 12 attainment (section 4.6)
- post-secondary education — participation and attainment (section 4.8).

Other COAG targets and headline indicators can be directly influenced by education and training outcomes:

- employment (section 4.7)
- household and individual income (section 4.10).

Outcomes in the education and training area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- governance, leadership and culture (governance capacity and skills) (chapter 5)
- early child development (basic skills for life and learning, ear health) (chapter 6)
- healthy lives (access to primary health care and fewer potentially preventable hospitalisations will affect education outcomes, while education outcomes can influence tobacco consumption and harm, and obesity and nutrition) (chapter 8)
- economic participation (employment and occupation, and home ownership) (chapter 9).

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 7A.1.1). These tables can be found on the web page (www.pc.gov.au/oid2016).

7.1 Teacher quality¹

Box 7.1.1 Key message

- Teacher quality is considered the most important ‘in-school’ influence on student educational outcomes. However, there is currently no nationally agreed measure of teacher quality.

While a lack of systematic evaluation makes it difficult to identify the most effective combination of measures to address educational disadvantage (Lloyd et al. 2015), it is clear that improving teacher quality overall is an important precondition (PC 2012). Teachers are the single most important ‘in school’ influence on student achievement (Hattie 2009). A recent literature review by Lloyd et al (2015) found there is limited empirical evidence of the facets of teacher quality that positively influence the learning outcomes for Aboriginal and Torres Strait Islander students, particularly from the perspective of Aboriginal and Torres Strait Islander students.

Teacher quality can influence student educational outcomes both directly and indirectly, by fostering a positive, inclusive and safe learning environment (Boon 2011). However, student educational outcomes (including reading, writing and literacy, covered in section 4.4, and year 12 attainment, covered in section 4.6) are also affected by a range of other factors such as family life, student motivation and ability (Biddle and Cameron 2012), school resourcing (Sullivan, Perry and McConney 2013), cultural and language backgrounds (chapter 5) and health problems (such as hearing loss, see section 6.7) (PC 2016).

The Longitudinal Teacher Education and Workforce Study (LTEWS) tracked a national cohort of 2011 teacher education graduates and collected data on the impact of education and experiences on teacher quality. Findings of the study indicated only about half of the graduates believed that their teacher education program prepared them to teach ‘culturally, linguistically and socio-economically diverse learners’ (Mayer et al. 2014, p.215). The earlier Longitudinal Teacher Workforce Pilot Study was undertaken in 2011 with a cohort of 2007 teacher education graduates, and found that 77 per cent rated their teacher education program as either a little helpful (34 per cent), moderately helpful (26 per cent) or very/extremely helpful (17 per cent) with ‘teaching students from Indigenous backgrounds’ (Carroll 2014, p.32).

Schools with higher proportions of disadvantaged students often report persistent difficulties in attracting and retaining teachers, leaders and support staff who have the skills, knowledge and capabilities to appropriately meet the learning needs of these students (PC 2012). Schools in disadvantaged areas often have a high proportion of teachers who are recent graduates, as well as a high staff turnover, which can impede

¹ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

student learning. The low quantity and quality of housing in disadvantaged areas, as well as the unpredictability of the social environment can contribute to the difficulties in attracting and retaining teachers. Such problems are particularly severe in remote Indigenous schools (Brasche and Harrington 2012).

Quality teachers work closely with their peers and other school workers, recognise the diverse ways that students learn, challenge them by setting high expectations, provide them with continuous feedback and bring to the classroom a deep knowledge of the subject matter (box 7.1.2).

Box 7.1.2 What makes for quality teaching

Fully understanding what constitutes quality teaching remains an ongoing policy challenge. This is partly due to the diverse ways that individual students learn. Mapping the professional dimensions (content and pedagogy) and personal capability dimensions of teaching is also complex. Even so, there are some recurring themes in the available evidence.

In a synthesis of the research evidence, Professor Geoff Masters concluded that highly effective teachers are those who:

- create an environment where all students are expected to learn successfully
- have a deep understanding of the subjects they teach
- direct their teaching to student needs and readiness
- provide continuous feedback to students about their learning
- reflect on their own practice and strive for continuous improvement.

The particular characteristics of quality teachers of Indigenous students can include cultural awareness, awareness of individual student needs and setting ambitious learning goals.

Source: PC 2012, *Schools Workforce - Productivity Commission Research Report*, <http://www.pc.gov.au/projects/study/education-workforce/schools/report> (accessed 18 February 2014).

Quality teaching is a priority area in the *National Aboriginal and Torres Strait Islander Education Strategy 2015* to improve educational outcomes for Aboriginal and Torres Strait Islander children, with a focus on actions to ensure children are taught by skilled educators who are culturally competent in the local context (Education Council 2015).

The *Australian Professional Standards for Teachers*, provides a nationally consistent basis to recognise teacher quality levels. The standards outline what teachers should know and be able to do and are grouped into three domains of teaching: professional knowledge, professional practice, and professional engagement. The standards require that all teachers demonstrate professional expertise when teaching Aboriginal and Torres Strait Islander students (AITSL 2011).

In addition, the national approach to the Accreditation of Initial Teacher Education Programs in Australia: Standards and Procedures, which is based on the Graduate level of the Australian Professional Standards for Teachers, requires providers to deliver programs

that equip teacher graduates with skills and knowledge to meet the learning needs of a range of students across all abilities and socioeconomic backgrounds. Strengthened standards and procedures for accreditation of initial teacher education programs were released in 2016 (AITSL 2016), following a review of teacher preparation by the Teacher Education Ministerial Advisory Group in 2014 (TEMAG 2015).

Data on teacher accreditation against the professional standards are not currently available. However, subject to data availability in the future, measures of initial registration and then progression through career stages may be considered for future reports.

Aboriginal and Torres Strait Islander school teachers

The initial National Teacher Workforce Dataset (NTWD) collected data from mid-2012 to mid-2013, and provides baseline data on qualification, registration and employment status of teachers. The initial NTWD includes some basic data on teachers' Indigenous status, and found that Aboriginal and Torres Strait Islander teachers were less likely than non-Indigenous teachers to have postgraduate qualifications, and that the conversion from graduate to teaching or applying for teaching is lower for Aboriginal and Torres Strait Islander teachers than for non-Indigenous teachers (although the reasons for this are not currently known). However, for teachers with an education qualification (Bachelor, Graduate Diploma or Diploma in Education), the proportion going on to complete further qualifications is similar for Aboriginal and Torres Strait Islander teachers and non-Indigenous teachers (4 to 5 per cent). Aboriginal and Torres Strait Islander teachers were more likely to be teaching in schools in the lowest SES areas (39 per cent) than non-Indigenous teachers (23 per cent) (Ernst and Young 2014).

Increasing the number of Aboriginal and Torres Strait Islander teachers could help foster student engagement and improve educational outcomes for Aboriginal and Torres Strait Islander students.

In 2013, Aboriginal and Torres Strait Islander Australians made up a much lower proportion of teachers (primary 2.2 per cent and secondary 1.0 per cent) than students (primary 5.4 per cent and secondary 4.5 per cent)² (ABS 2013; MATSITI 2014; table 5A.6.1 in this report). A notable area of growth since 2010 was among primary school leaders, where the proportion who identified as being of Aboriginal and/or Torres Strait Islander origin increased from near zero to 1.1 per cent in 2013 (McKenzie et al. 2014). Section 5.6 on Indigenous cultural studies contains further information on the Aboriginal and Torres Strait Islander education workforce.

² The 2015 proportions of Aboriginal and Torres Strait Islander students in primary schools is 5.7 per cent and 4.9 per cent in secondary schools (ABS 2016). The 2015 proportions of teachers were not available at the time of writing for comparison with proportions of students.

Future directions in data

Under the National Partnership Agreement on Teacher Quality (which ceased on 31 December 2013), two new data collections related to the teacher workforce were established. It would be useful, as part of any future expansion of the collections, to include larger representative samples of Aboriginal and/or Torres Strait Islander teachers to enable trend analysis.

- The National Teaching Workforce Dataset (NTWD) collected data on the Australian teaching workforce including qualifications, registration and employment status. However, Indigenous status is unknown for over half the workforce covered by the dataset, largely driven by the extremely low proportion of teachers in Victoria declaring their Indigenous status (0.1 per cent)³.
- The Longitudinal Teacher Education and Workforce Study (LTEWS) tracked a national cohort of teacher education graduates from 2011, and in 2014 reported data on the impact of pre-service and in-service education and experiences on teacher quality. However, data were not available by Indigenous status, due to the small number of Aboriginal and Torres Strait Islander teachers in the sample (17 teachers — 1 per cent of the sample).

³ There is not an option in the Victorian data collection for ‘Neither Aboriginal or Torres Strait Islander’, therefore non-Indigenous status is not retained. This can make it harder to compare the Indigenous composition of the Victorian workforce with other States and Territories as missing responses are assumed to be non-Indigenous.

7.2 School engagement⁴

Box 7.2.1 Key messages

- Student engagement with school and learning is essential to achieving improved educational outcomes.
- There is currently no nationally agreed definition of school engagement.

There is growing interest nationally and internationally, in looking beyond students' physical presence at school to examine their relationships with school and learning (Fredricks and McCloskey 2012 (eds); Phan 2014; Social Inclusion Board 2007). Aboriginal and Torres Strait Islander students' engagement with schooling was a key outcome in the 2010–2014 Aboriginal and Torres Strait Islander Education Action Plan (MCEECDYA 2010), with the 2014 evaluation of the Action Plan finding that 'engagement and connection activities were crucial to the achievement of all Action Plan domains' (ACIL Allen Consulting 2014, p.86). The National Aboriginal and Torres Strait Islander Education Strategy 2015 reflects the importance of engagement with school education by students, as well as by parents and communities, and the importance of schools and services working with families and communities (Education Council 2015).

Although evidence suggests a link between school engagement and improved educational attainment, the strength of this link remains unclear and varies by school (Lonsdale et al. 2011; OECD 2003). In addition, the concept of school engagement has proven to be difficult to define and measure (Axelson and Flick 2011; Fredricks and McCloskey 2012 (eds)). In general, school engagement for the general population has been described using three main constructs:

- behavioural/participatory — such as following the rules and being present at school (attendance)
- emotional/affective — such as values and emotional responses toward school, subjects and learning (such as interest or anxiety)
- cognitive/academic — such as motivation and effort (Fredricks, Blumenfeld and Paris 2004; Lonsdale et al. 2011).

Research has shown that school engagement can be shaped by contextual factors such as:

- students' experiences, needs and characteristics, including self-identity and connectedness
- the school and classroom context, including teacher quality (see section 7.1), teacher support, school funding, attitudes of peers and culturally inclusive structures and practices in schools (see section 5.6)

⁴ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

-
- the wider environment, including socio-economic circumstances, and parental and community involvement (Fredricks, Blumenfeld and Paris 2004; Helme and Lamb 2011; Munns, O'Rourke and Bodkin-Andrews 2013; Social Inclusion Board 2007).

Research also shows engaging parents in their children's education improves the children's educational attainment and ongoing engagement in education (Higgins and Morley 2014).

Schools have been found to have higher levels of student engagement when there was a strong disciplinary climate, good student-teacher relations and high expectations for student success (OECD 2003).

School engagement and Aboriginal and Torres Strait Islander students

Relatively few studies have considered how the concept of school engagement relates to Aboriginal and Torres Strait Islander students. As part of its evaluation of the Sporting Chance Program, the Australian Council for Educational Research (ACER) completed a literature review of Aboriginal and Torres Strait Islander school engagement (Lonsdale et al. 2011). Four key components were identified:

- positive self-identity — including feelings about one's self and culture
- belonging — including both broad cultural connectedness, and group connectedness (with peers), which is closely linked to self-identity
- participation — including choosing to be actively involved in learning tasks
- attendance — including being present at school. However, merely being present did not mean that a student was engaged in school, and conversely, absenteeism did not mean that a student was not engaged (for example, cultural reasons for absences could mean a student is engaged in learning that is important to their self-identity and belonging).

A recent study by Mooney et al (2016) in metropolitan Sydney found that a positive sense of culture was positively related to school engagement.

De Bortoli and Thomson (2010) examined the influence of contextual factors on the results of Aboriginal and Torres Strait Islander students and non-Indigenous students in the 2000 and 2006 Programme for International Student Assessment (PISA) tests.⁵ For both Aboriginal and Torres Strait Islander and non-Indigenous students, performance in maths and science was strongly associated with self-efficacy, and positively correlated with self-concept. On average, Aboriginal and Torres Strait Islander students reported significantly lower levels of confidence in their abilities.

⁵ PISA is a triennial international survey which aims to evaluate education systems worldwide by testing the skills and knowledge of 15-year-old students. In Australia, PISA is a key part of the National Assessment Program (NAP) and complements other NAP assessments, such as the National Assessment Program — Literacy and Numeracy (NAPLAN).

Things that work

Whilst there is a lack of research and program evaluation on Aboriginal and Torres Strait Islander school engagement (Purdie and Buckley 2010), the ACER literature review (Lonsdale et al. 2011) identified several programs that use incentives and rewards to increase student attention and retention. Box 7.2.2 presents one program identified as increasing Aboriginal and Torres Strait Islander students' school engagement, and one promising program worth further consideration.

Box 7.2.2 Things that work – school engagement

The former **Sporting Chance Program (SCP)** was an Australian Government initiative that commenced operating in 2007. The Program aimed to improve educational outcomes for Aboriginal and Torres Strait Islander students through sport and recreation. In 2012, a total of 21 providers delivered 64 projects for up to 11 000 primary and secondary students across NSW, Victoria, WA and the NT.

The program ceased on 30 June 2015, with the introduction of the Indigenous Advancement Strategy (IAS). Most of the former SCP providers receive funding under the IAS to deliver similar projects to 31 December 2017.

The program and ongoing funded projects have two elements:

- School-based Sports Academies for secondary school students, which provide sports-focused learning and development opportunities to students before, during and after school
- Education Engagement Strategies (EES) for primary and secondary school students, which include school visits by high profile athletes at least twice per year. Visiting athletes stay in the community for 1–5 days and participate in mentoring and role-modelling activities.

In December 2010, ACER evaluated the program using a mix of surveys, interviews and small group discussions with Academy project providers, principals, staff, parents, students and community members and analysis of administrative data on enrolment, attendance and literacy and numeracy outcomes. Of the 143 schools contacted as part of the evaluation, 87 (61 per cent) participated.

The evaluation found that school staff in both the Academies and ESS projects consider that the Program is having a moderate (positive) impact on school engagement (although the degree and nature of improvement varied between schools). The sustainability of this engagement was more evident in the Academies than in the EES projects. The evaluation did not include comparison results for schools and students not in the Program.

Although it has not been formally evaluated, the Steering Committee has identified the **Students Hairdressing Integrating Education (SHINE) program** (Geraldton, WA) as a promising program worth further examination.

The SHINE program, established in 2010, targets year 9 Aboriginal female students who have a history of low attendance and are significantly at risk of not completing school. The program provides a workplace simulation in a college classroom refurbished into a hair salon, and is coordinated by a classroom teacher who is also a qualified hairdresser, beauty therapist and counsellor. Students attend the program in addition to completing normal school requirements.

(continued next page)

Box 7.2.2 (continued)

As at the end of 2015, over 200 students had participated in the program. The program has improved attendance and behaviours at school, as well as the uptake of traineeships among program participants (PHAA 2013).

The program has won a number of awards including:

- 2011 Milton Thorne Award for WA Outstanding School Initiative for Aboriginal Education
- 2012 National Australia Bank Schools First Awards — WA State Impact Award
- 2013 PHAA WA award — Aboriginal health award.

Sources: Lonsdale et al. 2011, *Evaluation of the Sporting Chance Program for Department of Education, Employment and Workplace Relations*, October, Australian Council for Educational Research, Camberwell, Victoria; WA Government (unpublished); PHAA (Population Health Association of Australia) 2013, *in touch in WA*, PHAA WA Branch Newsletter: December 2013.

Future directions in data

Further work is required to determine the definitions, appropriateness and method of collating and reporting data on Aboriginal and Torres Strait Islander students' engagement with school. The ACER evaluation proposed measures against the four dimensions it identified as important to Aboriginal and Torres Strait Islander students' school engagement (table 7A.2.1). The suitability of these measures for national reporting should be assessed and, if found suitable, appropriate data sources identified.

Further work is also required to investigate the factors affecting the link between school engagement and learning outcomes.

7.3 Transition from school to work⁶

Box 7.3.1 Key messages

- Young people who do not successfully make the transition from education to work are at risk of long-term disadvantage.
- Between 2002 and 2014-15, there was an increase in the proportion of Aboriginal and Torres Strait Islander 17–24 year olds who were participating in post-school education or training or were employed (from 32.4 per cent in 2002 to 42.4 per cent in 2014-15). The non-Indigenous rate remained around 74 per cent, leading to a narrowing of the gap (from 42.8 percentage points in 2002 to 31.4 percentage points in 2014-15) (figure 7.3.2).
- In 2014-15, the proportion of Aboriginal and Torres Strait Islander Australians aged 17–24 years fully engaged in work, study or training decreased as remoteness increased (from 58.2 per cent in major cities to 14.6 per cent in very remote areas) (figure 7.3.3).
- Among people aged 18–64 years with a Bachelor degree or above, labour force participation and employment-to-population ratios for Aboriginal and Torres Strait Islander Australians (86.7 per cent and 83.6 per cent respectively) were similar to those for non-Indigenous Australians. For those with other non-school qualifications at Certificate III or above, the ratios for Aboriginal and Torres Strait Islander Australians were lower than for non-Indigenous Australians (table 7.3.1).

Box 7.3.2 Measures of transition from school to work

There are two main measures for this indicator:

- *Successful transition from school* is defined as the proportion of young people aged 17–24 years who are participating in post-school education or training or are employed.
- *Labour force status and employment-to-population ratio of people aged 18 to 64 years who have achieved a qualification of Certificate level III or above* is defined as the proportion of people aged 18–64 years with a qualification of Certificate level III or above who are (a) in the labour force and (b) employed.

Data for both measures are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2014-15 (engagement by remoteness; employment status by sex; remoteness; jurisdiction). Comparable data for the non-Indigenous population are available from the ABS General Social Survey (GSS)/National Health Survey (NHS)/Australian Health Survey (AHS), with the most recent available data for 2014.

Supplementary data are also reported from the ABS Census of Population and Housing (Census), with the most recent available data for 2011 (remoteness; all jurisdictions). Survey and Census data are not directly comparable.

⁶ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

Educational achievement is linked to economic and social wellbeing, and positive health behaviours (for example, regular physical exercise) and contributes strongly to the formation of human capital (COAG National Reform Initiative Working Group 2006; Council for the Australian Federation 2007; Karmel et al. 2014; Osbourne, Baum and Brown 2013; OECD 2013). Young people who do not successfully make the transition from education to work are at risk of long-term disadvantage. Levels of education are key contributors to labour market success. School leavers without a formal school qualification may have few opportunities for work, and as time passes, their chances of gaining employment or re-entering full time education are likely to decline further (AIHW 2013; Marks 2008; McMillan and Marks 2003).

Low educational achievement and poor decisions about learning can particularly disadvantage young people entering the labour market. Due to the rapid transformation of traditional work through automation and globalisation, many lower-skilled entry-level jobs of today are likely to change dramatically or disappear from the Australian economy over the next 10 to 15 years (FYA 2015).

The transition from study to work is generally smoother for university and TAFE graduates, who also tend to earn more than those who enter the workforce directly from school (Lamb 2001; Lamb and McKenzie 2001). Data on employment and training outcomes for VET graduates are obtained from the National Centre for Vocational Education Research's Student Outcomes Survey, and are reported in the Report on Government Services on an annual basis (SCRGSP 2016). For university bachelor degree graduates, including Aboriginal and Torres Strait Islander graduates, work participation and salary outcomes have been shown to continue to improve for at least five years after graduation (Coates and Edwards 2009).

Section 4.6 contains more information on secondary school attainment for Aboriginal and Torres Strait Islander students. Unemployment and labour force participation for Aboriginal and Torres Strait Islander Australians aged 15–64 years are discussed in section 4.7. More information on employment undertaken by Aboriginal and Torres Strait Islander Australians — including employment by full time and part time status, sector, industry and skill level — is in section 9.1.

Additional factors that may affect Aboriginal and Torres Strait Islander school-leavers in the transition to employment include 'entrenched disadvantage', social exclusion factors such as labour market discrimination, and the relatively higher cost of education to those of lower socioeconomic status (Hunter 2010). Section 5.1 includes information on levels of trust, perceptions of prejudice and experience of discrimination.

Some people are not working or studying because of carer responsibilities. In 2014, the birth rate of Aboriginal and Torres Strait Islander females aged less than 20 years was nearly six times as high as that for non-Indigenous females (57 babies per 1000 females, and 10 babies per 1000 females, respectively) (table 6A.3.1). Teenage birth rates are examined in more detail in section 6.3.

Young people who have successfully transitioned from school

Young people who are participating in study benefit from additional returns to further education. Those participating in employment benefit from employment experience, the development of work skills and familiarity with new technologies.

Figure 7.3.1 Proportion of people aged 17–24 years who are fully engaged in post-school education, training or employment, 2014–15^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2014–15; ABS (unpublished) General Social Survey 2014; table 7A.3.1.

Nationally in 2014–15, 42.4 per cent of Aboriginal and Torres Strait Islander Australians aged 17–24 years were participating in post-school education or training or were employed, compared with 73.8 per cent of non-Indigenous 17–24 year olds (figure 7.3.1). These data are also reported by remoteness in table 7A.3.1.

Figure 7.3.2 Proportion of people aged 17–24 years who are fully engaged in post-school education, training or employment, 2002 to 2014-15^a

^a Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 7A.3.1.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS), 2002; ABS (unpublished) General Social Survey (GSS) 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004-05; ABS (unpublished) National Health Survey (NHS), 2004-05; ABS (unpublished) NATSISS 2008; ABS (unpublished) NHS 2007-08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (Core component); ABS (unpublished) Australian Health Survey 2011-13 (2011-12 Core component); ABS (unpublished) NATSISS 2014-15; ABS (unpublished) GSS 2014; table 7A.3.2.

Between 2002 and 2014-15, there was an increase in the proportion of Aboriginal and Torres Strait Islander Australians aged 17–24 years who were fully engaged in post-school education, training and/or employment (from 32.4 per cent in 2002 to 42.4 per cent in 2014-15). The rate for non-Indigenous Australians remained constant over this period (75.2 per cent in 2002 and 73.8 per cent in 2014-15), leading to a narrowing of the gap (from 42.8 percentage points in 2002 to 31.4 percentage points in 2014-15) (figure 7.3.2). These data are also reported by remoteness in table 7A.3.2.

Figure 7.3.3 Proportion of people aged 17–24 years who are fully engaged in post-school education, training or employment, by remoteness, 2014–15^{a, b}

^a Data were not collected for non-Indigenous Australians in very remote areas. ^b Error bars represent 95 per cent confidence intervals around the estimates.

Sources: ABS (unpublished) 2014–15 National Aboriginal and Torres Strait Islander Social Survey, ABS (unpublished) 2014 General Social Survey; table 7A.3.2.

Nationally in 2014–15, the proportion of Aboriginal and Torres Strait Islander Australians aged 17–24 years fully engaged in work, study or training decreased as remoteness increased (from 58.2 per cent in major cities to 14.6 per cent in very remote areas). For non-Indigenous Australians, relatively small survey samples made assessment more difficult, though Census data (most recent for 2011) indicates that proportions for non-Indigenous Australians are highest in major cities and very remote areas (figure 7.3.3; table 7A.3.6).

Although not directly comparable, data from the Census show similar trends to the survey data. Census data disaggregated by State and Territory, and remoteness area for people aged 17–24 years who were not employed or studying for 2001, 2006 and 2011 are included in tables 7A.3.6–7.

Outcomes from education — labour force participation and employment status by educational attainment

This measure examines the labour force status of people with different levels of educational qualifications. Certificate level III is usually considered the minimum qualification necessary to substantially improve a person's employment outcomes (see

section 4.8 for more information on post-secondary education, participation and attainment).

Table 7.3.1 Level of highest non-school qualification and employment status, 2002 and 2014-15^a

	2002		2014-15	
	Aboriginal and Torres Strait Islander	Non-Indigenous	Aboriginal and Torres Strait Islander	Non-Indigenous
<i>Labour force participation as a proportion of the population aged 18–64 years (%)</i>				
Certificate III and higher	83.9	87.2	78.8	87.2
Certificate III to advanced diploma	81.9	85.6	77.7	85.5
Bachelor degree or higher	90.8	89.2	86.7	89.4
Total^b	64.5	79.1	62.6	81.3
<i>Employed people as a proportion of the population aged 18–64 years (%)</i>				
Certificate III and higher	74.3	84.4	69.4	83.4
Certificate III to advanced diploma	72.6	82.4	67.1	81.3
Bachelor degree or higher	80.4	86.9	83.6	85.7
Total^b	51.4	74.5	50.8	76.9

^a Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 7A.3.3. ^b Total includes those with no non-school qualification or with a qualification below Certificate III.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002; ABS (unpublished) General Social Survey 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2014-15; ABS (unpublished) General Social Survey, 2014; table 7A.3.3.

Nationally in 2014-15, for people aged 18–64 years:

- among Aboriginal and Torres Strait Islander Australians, those with a bachelor degree or higher had the highest labour force participation rate (86.7 per cent) and employment-to-population ratio (83.6 per cent), similar to that for non-Indigenous Australians with the same level of qualifications
- Aboriginal and Torres Strait Islander Australians with a certificate III to advanced diploma qualification had a lower labour force participation rate and employment-to-population ratio than non-Indigenous Australians. This reflects a decrease since 2002 in the proportions for Aboriginal and Torres Strait Islander Australians (table 7.3.1).

Tables 7A3.3–5 provide data on the level of highest non-school qualification and labour force status by sex, remoteness, and jurisdiction.

(a) Estimates with a RSE of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(c) Data on Aboriginal and Torres Strait Islander people exclude people enrolled in a school institution. Data on non-Indigenous people exclude people who were in school-level education.

(d) Excludes people who did not state their Indigenous status.

RSE = Relative Standard Error. CI = Confidence Interval.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.
- (c) The number of employed people expressed as a percentage of the total population in the same group.
- (d) The number of employed and unemployed people expressed as a percentage of the total population in the same group.
- (e) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.
- (f) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate.
- (g) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification (includes secondary school educational attainment and no non-school qualification).
- (h) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

RSE = Relative Standard Error. CI = Confidence Interval.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.
- (c) The number of employed people expressed as a percentage of the total population in the same group.
- (d) The number of employed and unemployed people expressed as a percentage of the total population in the same group.
- (e) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.
- (f) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate.
- (g) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification.
- (h) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

RSE = Relative Standard Error. CI = Confidence Interval.

- (a) Estimates with a RSE of 25 per cent to 50 per cent should be used with caution.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.
- (d) The number of employed people expressed as a percentage of the total population in the same group.
- (e) The number of employed and unemployed people expressed as a percentage of the total population in the same group.
- (f) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.
- (g) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate.
- (h) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification (includes secondary school educational attainment and no non-school qualification).
- (i) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

np Not published. – Nil or rounded to zero.

(a) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.

Table 7A.3.6 Proportion of persons aged 17–24 years who are fully engaged in post-school education, training or employment, by Indigenous status and remoteness, 2001, 2006 and 2011 (Census) (a), (b), (c), (d), (e)

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Remote</i>	<i>Very remote</i>	<i>Aust (f)</i>
(b)	The Census does not collect level of current study, but does collect institution attended, therefore all people identified as studying (excluding those studying at a school institution) are included in the calculations for this indicator. This may include some people in non-formal education or school level education not at school institutions.						
(c)	People whose labour force status was not stated and who were not identified as studying full-time, are excluded. People whose student status was not stated and who were not identified as employed full-time, are also excluded.						
(d)	People whose labour force status could not be determined between full time or part time employed and who were not identified as studying are excluded. People who had stated attending an educational institution (but whose student status was not stated) and who were identified as not employed are excluded.						
(e)	People who did not state their labour force status and did not state their student status are excluded.						
(f)	Australia includes 'Other territories'.						
(g)	Excludes people who did not state their Indigenous status.						
(h)	People who were engaged in a combination of education or training and employment, but whose full-time/part-time student status or their full-time/part-time employment status was not identified are included in 'Total Fully Engaged'.

(a) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.

Table 7A.3.7 Proportion of persons aged 17–24 years who are fully engaged in post-school education, training or employment, by state and territory and Indigenous status, 2001, 2006 and 2011 (Census) (a), (b), (c), (d), (e)

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust (f)</i>
(b)	The Census does not collect level of current study, but does collect institution attended, therefore all people identified as studying (excluding those studying at a school institution) are included in the calculations for this indicator. This may include some people in non-formal education or school level education not at school institutions.									
(c)	People whose labour force status was not stated and who were not identified as studying full-time, are excluded. People whose student status was not stated and who were not identified as employed full-time, are also excluded.									
(d)	People whose labour force status could not be determined between full time or part time employed and who were not identified as studying are excluded. People who had stated attending an educational institution (but whose student status was not stated) and who were identified as not employed are excluded.									
(e)	People who did not state their labour force status and did not state their student status are excluded.									
(f)	Australia includes 'Other territories'.									
(g)	Excludes people who did not state their Indigenous status.									
(h)	People who were engaged in a combination of education or training and employment, but whose full-time/part-time student status or their full-time/part-time employment status was not identified are included in 'Total Fully Engaged'.

8 Healthy lives

Strategic areas for action

Health outcomes directly affect the quality of people's lives, including their ability to socialise with family and friends, to participate in the community and to work and earn an income. Physical health outcomes reflect a healthy living environment, access to and use of health services, and lifestyle choices. Mental health issues are related to a complex range of medical issues, historical factors, lifestyle factors and the stressors associated with entrenched disadvantage and drug and substance misuse.

In 2015, the Australian Government released the *Implementation Plan for the National Aboriginal and Torres Strait Islander Health Plan 2013–2023*, which outlines the actions and strategies to be taken by the Australian Government and other key stakeholders to give effect to the priorities and strategies of the Health Plan (Department of Health 2015).

The following indicators are included in the 'Healthy lives' strategic area:

- access to primary health care (section 8.1) — the first point of contact with the health system enables prevention, early intervention, case management and ongoing care. It can also help address health risk behaviours
- potentially preventable hospitalisations (section 8.2) — many hospital admissions could be prevented if more effective non-hospital care were available, either at an earlier stage in disease progression or as an alternative to hospital care
- potentially avoidable deaths (section 8.3) — some deaths could be prevented if effective public health, medical and other interventions were available
- tobacco consumption and harm (section 8.4) — tobacco consumption is a significant contributor to premature death and ill health, and can divert scarce family resources
- obesity and nutrition (section 8.5) — obesity and poor nutrition are significant contributors to poor health outcomes

-
- oral health (section 8.5) — healthy teeth are important for overall health. Levels of oral health reflect changes in diet, dental hygiene and access to dental services
 - mental health (section 8.7) — mental health plays an important role in social and emotional wellbeing and includes mental illness and the overall mental wellbeing of an individual, with the latter influenced by a range of factors including domestic violence, substance misuse, imprisonment and family breakdown
 - suicide and self-harm (section 8.8) — suicide and self-harm cause great grief, with mental illness the largest risk factor for suicide.

Several COAG targets and headline indicators reflect the importance of healthy lives:

- life expectancy (section 4.1)
- young child mortality (section 4.2)
- disability and chronic disease (section 4.9).

Other headline indicators can be directly influenced by health outcomes:

- employment (section 4.7)
- household and individual income (section 4.10).

Outcomes in the healthy lives area can be affected by outcomes in all other strategic areas, and can influence outcomes in other areas.

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 8A.1.1). These tables can be found on the web page (www.pc.gov.au/oid2016).

8.1 Access to primary health care¹

Box 8.1.1 Key messages

- In 2014-15, 39.7 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported their health status as excellent or very good. This was a decrease from 43.7 per cent in 2008 (table 8A.1.1).
- In 2012-13, a smaller proportion of Aboriginal and Torres Strait Islander adults reported not seeing a GP/specialist in the previous 12 months (13.6 per cent) compared with 2001 (19.4 per cent) (table 8A.1.14). Time series data on GP/specialist visits are difficult to interpret as increases in usage rates could reflect improved access, or an increasing need.
- In 2012-13, 2 in 5 Aboriginal and Torres Strait Islander Australians aged 2 years and over either had not consulted a dentist in the previous two years (26.6 per cent) or had never consulted a dentist (13.9 per cent) (table 8A.1.17).
- In 2015, the vaccination coverage rate for 5 year old Aboriginal and Torres Strait Islander children (95.1 per cent) was higher than for other children of the same age (93.1 per cent). For children aged 1 year and 2 years, vaccination coverage rates were lower for Aboriginal and Torres Strait Islander children compared to other children (table 8A.1.25).
- In 2011, while Aboriginal and Torres Strait Islander Australians made up around 3 per cent of the Australian population, they made up only 1.3 per cent of the health workforce (table 8A.1.49).

Box 8.1.2 Measures of access to primary health care

Access to healthcare is a complex concept, involving sufficient supply of services, and the ability to utilise available services (which may be influenced by affordability, physical accessibility and acceptability of the services and need). There is no single measure of access that encompasses all these aspects. Five proxy measures are reported.

- *Self-assessed health status* is defined as the proportion of the population aged 15 years and over reporting their health status as very good or excellent (all jurisdictions; age; sex; remoteness; selected characteristics). Data for self-assessed health status are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2014-15 (data for the non-Indigenous population sourced from the ABS 2014-15 National Health Survey).
- *Aboriginal and Torres Strait Islander Australians' use of primary health care services* is defined as the proportion of the population not visiting a GP/specialist/dentist when they had a health problem (national; remoteness). Reported for those aged 18 years and over for GP/specialist visits and 2 years and over for dentist visits.

(continued next page)

¹ The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

Box 8.1.2 (continued)

Data for use of primary health care services are sourced from the AATSIHS, with the most recent available data for 2012-13 (data for the non-Indigenous population are sourced from the 2011-12 Australian Health Survey (AHS). AATSIHS and AHS data are presented together as covering the overall time period 2011–13). Additional data on children are reported from the 2014-15 NATSISS.

- *Immunisation* rates are defined as vaccination coverage rates for selected diseases for children (reported at 1, 2 and 5 years of age) and adult immunisation rates for those aged 50 years and over. Data for children are derived from the Australian Childhood Immunisation Register (ACIR), with the most recent data for 2015 (all jurisdictions; age). Data for Aboriginal and Torres Strait Islander adults are available from the 2012-13 AATSIHS (national; age). Data are not available for non-Indigenous adults.
- *Expenditure on health care services* is defined as total recurrent health expenditure and per person expenditure on primary and secondary/tertiary health care. Expenditure refers to funding from multiple government and non-government sources, including private health insurance. Data for this report are sourced from the AIHW Expenditure on Health for Aboriginal and Torres Strait Islander peoples publication, with the most recent available data for 2010-11 (national).
- *Aboriginal and Torres Strait Islander health workforce* is defined as the proportion of Aboriginal and Torres Strait Islander people aged 15 years and over employed in a health related occupation. Data for this report are sourced from the ABS Census of Population and Housing (the Census), with the most recent data for 2011 (national).

Access to primary health care services influences health status by detecting and treating illness, managing chronic conditions and providing prevention programs. Primary health care can affect outcomes in a range of headline indicators and strategic areas for action, including life expectancy (section 4.1), child mortality (section 4.2) and disability and chronic disease (section 4.9). Poor health can also affect people's educational attainment (sections 4.6 and 4.8) and ability to work (section 4.7). Section 5.3 (engagement with services) examines Aboriginal and Torres Strait Islander Australians' access to a range of services and some of the barriers they may face.

Health services can be divided into primary health care services provided by a range of health professionals (which include public and community health services, Aboriginal and Torres Strait Islander Community Controlled Primary Health Care Services, general practitioner consultations, hospital emergency attendances, general practitioner ordered investigations and prescriptions, and over the counter medicines) and secondary/tertiary health care services (which involve a referral within the health system or a hospital admission). Primary health care services can reduce the need for secondary/tertiary care services (section 8.2 reports on hospitalisations that may be potentially preventable with appropriate primary health care.)

Due to their poorer health, Aboriginal and Torres Strait Islander Australians could be expected to utilise health care services at a much higher rate than non-Indigenous Australians. However lack of services, lack of affordability and lack of social/cultural acceptability of services are all potential barriers to Aboriginal and Torres Strait Islander

Australians accessing primary health care (Ware 2013). Institutional and cultural barriers may also lead to adverse health outcomes (Paradies, Harris and Anderson 2008). Section 5.1 includes data on Aboriginal and Torres Strait Islander perceptions of discrimination based on their Indigenous status.

Self-assessed health status

In 2014-15, 39.7 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported their health status as excellent or very good, a decrease from 43.7 per cent in 2008 and 43.0 per cent in 2004-05 (table 8A.1.1). The decrease was similar for males and females (table 8A.1.3) and for people in remote and non-remote areas (table 8A.1.10).

In 2014-15, after adjusting for differences in population age structures, a lower proportion of Aboriginal and Torres Strait Islander Australians reported their health as excellent or very good, compared with non-Indigenous Australians — a gap of around 22 percentage points (similar to the gap for previous reporting periods over the last 10 years). The proportion of people reporting their health status as excellent or very good decreased with age for both Aboriginal and Torres Strait Islander and non-Indigenous Australians (table 8A.1.1).

In 2014-15, age-adjusted self-reported health status for both Aboriginal and Torres Strait Islander and non-Indigenous Australians varied according to a range of socioeconomic characteristics. The proportion of people aged 15 years and over rating their health status as excellent or very good was higher for those:

- with a highest year of schooling of year 12, compared with year 9 (15.9 percentage points higher for Aboriginal and Torres Strait Islander Australians and 21.3 percentage points higher for non-Indigenous Australians)
- in the highest income quintile compared with the lowest income quintile (around 28.5 percentage points higher for Aboriginal and Torres Strait Islander Australians and similar for non-Indigenous Australians) (table 8A.1.11).

Data on health status of Aboriginal and Torres Strait Islander Australians aged 15 years and over are also reported by State and Territory (tables 8A.1.4–9), by remoteness (table 8A.1.10) and by selected population characteristics (table 8A.1.11).

Data on health status of Aboriginal and Torres Strait Islander children aged 0–14 years as reported by the survey respondent are also available for 2008 and 2014-15. In 2014-15 82.7 per cent of Aboriginal and Torres Strait Islander Australians aged 0–14 years had reported health status as excellent or very good, an increase from 78.7 per cent in 2008 (table 8A.1.12).

Data on reported health status for Aboriginal and Torres Strait Islander children are also reported by sex in table 8A.1.12 and by remoteness in table 8A.1.13.

Aboriginal and Torres Strait Islander Australian's use of primary health care services

Use of primary health care services show how many people come into contact with services. Time series data on GP/specialist visits are difficult to interpret — increases in usage rates could reflect improved access, or an increasing need.

Survey data reported below asked people how long it had been since they had last consulted a GP/specialist or dentist, regardless of whether they had a health-related problem. Reasons for not consulting were only asked of people who identified that they had a health problem but had not consulted a GP/specialist or dentist in the previous 12 months.

No new data are available since the previous edition of this report. Summarising earlier results, in 2012-13:

- around one in seven (13.6 per cent) Aboriginal and Torres Strait Islander adults had not consulted a *GP/specialist* in the previous 12 months — a decrease from 19.4 per cent in 2001 (tables 8A.1.14). A variety of reasons were reported for not visiting a GP when people had a health problem, with 'personal reasons'² (49.6 per cent) most commonly reported, followed by 'logistical reasons' (33.9 per cent) and 'decided not to seek care' (33.7 per cent) (table 8A.1.16)
- around one-quarter (26.6 per cent) of Aboriginal and Torres Strait Islander Australians aged 2 years and over reported not having visited a *dentist* in the previous two years, and a further 13.9 per cent reported never having visited a dentist (tables 8A.1.17). The most commonly reported reason for not going to a dentist in the previous 12 months when they had an oral health-related problem was 'cost' (45.6 per cent), followed by 'personal reasons' (43.3 per cent) and 'logistical reasons' (32.9 per cent) (table 8A.1.19).

Data on healthcare sought by Aboriginal and Torres Strait Islander adults from other health professionals are in tables 8A.1.20–21.

Additional data for services used by Aboriginal and Torres Strait Islander children are also reported. In 2014-15 for Aboriginal and Torres Strait Islander children aged 0–14 years:

- visiting a GP or doctor was the most common health service utilised (57.9 per cent of services utilised), followed by an Aboriginal medical health service (24.6 per cent of contacts) (table 8A.1.22).
- in non-remote areas, GP's and doctors were more commonly utilised, and in remote areas, Aboriginal Medical Services and other community health clinics were more commonly utilised (table 8A.1.23).

² Personal reasons include: too busy (work, personal or family responsibilities), discrimination, service not culturally appropriate, language problems, dislikes service or health professional, afraid, embarrassed, or felt service would be inadequate.

Immunisation rates

Immunisation is effective in preventing sickness and death from vaccine preventable diseases. The Australian Childhood Immunisation Register (ACIR) assesses children for immunisation coverage at 12–15 months (1 year), 24–27 months (2 years) and 60–63 months (5 years), by Indigenous status, for all jurisdictions.

Nationally in 2015, the overall vaccination coverage rate for Aboriginal and Torres Strait Islander 5 year olds was 95.1 per cent — 2.0 percentage points higher than for other children (table 8A.1.25). For 1 year old and 2 year old Aboriginal and Torres Strait Islander children, the rates were around 3 percentage points below the rates for other children (89.5 per cent and 87.2 per cent, compared to 93.2 per cent and 90.4 per cent) (table 8A.1.25).
