Publications enquiries

The Productivity Commission acts as the Secretariat for the Steering Committee for the Review of Government Service Provision. This report and previous editions are available from the Productivity Commission website at www.pc.gov.au.

The Steering Committee welcomes enquiries and suggestions on the information contained in this report, contact the Secretariat by phone: (03) 9653 2100 or email: gsp@pc.gov.au.

Photographs

Aboriginal and Torres Strait Islander people should be aware that this publication may contain images of deceased people.

The Steering Committee thanks the Yiriman Project; Department of Agriculture and Food WA; Indigenous Landholder Services Organisation; the AIME Program; Mossman Gorge Centre; Victorian Aboriginal Child Care Agency; Care for Kids' Ears, Department of Health; Kimberley Aboriginal Law & Cultural Centre; and the Family Wellbeing Program for providing the photographs reproduced in this report. No inference is intended that the people or communities shown are the subject of any issues raised in the report.

This report generally uses the term 'Aboriginal and Torres Strait Islander Australians' to describe Australia's first peoples and 'non-Indigenous Australians' to refer to Australians of other backgrounds, except where quoting other sources.

Foreword

This is the seventh report in the Overcoming Indigenous Disadvantage (OID) series, which can trace its origins to the final report of the Council for Aboriginal Reconciliation in 2000. It measures the wellbeing of Aboriginal and Torres Strait Islander Australians.

The OID report provides a public report card on progress in overcoming Indigenous disadvantage. It can help governments assess the effectiveness of policies and inform the development of new approaches. It can assist Aboriginal and Torres Strait Islander Australians to hold governments to account, and to develop their own responses.

The extent of the challenge to improve Aboriginal and Torres Strait Islander wellbeing remains evident in the data presented in this report. While there have been improvements in some areas over time (particularly for indicators related to early child development), in many areas there have not, and in some areas outcomes have worsened (for mental health and imprisonment, this represents a continued regression from the previous OID report in 2014).

But data alone cannot tell the complete story of wellbeing for Aboriginal and Torres Strait Islander Australians, nor can it tell us why outcomes improve (or not). As in previous editions, this report includes case studies of programs that are making a difference as ‘things that work’, though only a relatively small number have been rigorously evaluated. There is a pressing need for more and better evaluation of Indigenous policies and programs nationally if we are to see improvements in outcomes for Aboriginal and Torres Strait Islander Australians. We need to understand better which policies and programs work better than others and why.

On behalf of the Steering Committee, I would like to thank the many Aboriginal and Torres Strait Islander organisations and individuals involved in the production of the report. Particular thanks go to the National Congress of Australia’s First Peoples, which participated on the working group that advised the Steering Committee on all aspects of the report. I also record our gratitude to all members of the working group. And I am very grateful for the support of staff in the Secretariat at the Productivity Commission, led by Catherine Andersson.

11 Mar 2009

Mr Gary Banks AO
Chairman
Steering Committee for the Review of Government Service Provision

Dear Mr Banks

I am writing in my capacity as Chair of the Council of Australian Governments (COAG) to convey to you updated Terms of Reference for the Overcoming Indigenous Disadvantage (OID) Report.

Since it was first published in 2003, the OID report has established itself as a source of high quality information on the progress being made in addressing Indigenous disadvantage across a range of key indicators. The OID report has been used by Governments and the broader community to understand the nature of Indigenous disadvantage and as a result has helped inform the development of policies to address Indigenous disadvantage. The OID report is highly regarded and I commend the Steering Committee for the Review of Government Services (the Steering Committee) for its efforts in preparing the report every two years.

In December 2007 and March 2008, COAG committed to six ambitious targets to close the gap in Indigenous disadvantage:

- closing the life expectancy gap within a generation;
- halving the gap in the mortality rate for Indigenous Children under five within a decade;
- ensuring all Indigenous four year olds in remote communities have access to quality early childhood programs within five years;
- halving the gap in reading, writing and numeracy achievements for children within a decade;

-
- halving the gap for Indigenous students in Year 12 attainment rates or equivalent attainment by 2020; and
 - halving the gap in employment outcomes within a decade.

Without high quality data, it is impossible to understand where we are headed in terms of overcoming Indigenous disadvantage. Through the National Indigenous Reform Agreement, all Governments have committed to ensuring their data is of high quality, and moreover, is available for reporting purposes. This undertaking has been made with specific reference to the need for data to be provided for the OID report.

In August 2008, the Chair of the COAG Working Group on Indigenous Reform (WGIR), the Hon Jenny Macklin MP, wrote to you requesting the Steering Committee work with the WGIR to align the OID framework to the Closing the Gap targets.

As a result, on 29 November 2008, COAG agreed a new framework for the OID report which takes account of the six ambitious targets to Close the Gap in Indigenous disadvantage. The Steering Committee should take account of this new framework in preparing future OID reports thereby ensuring the report continues to provide Governments and the broader community with an understanding of the progress being made to overcome Indigenous disadvantage.

I have copied this letter to the Treasurer, Ms Macklin and the Chair of MCATSIA the Deputy Premier of the Government of Western Australia and Minister for Indigenous Affairs, the Hon Dr Kim Hames MLA.

Yours sincerely

Kevin Rudd

Steering Committee

This report was produced under the direction of the Steering Committee for the Review of Government Service Provision (SCRGSP). The Steering Committee comprises the following current members:

Mr Peter Harris	Chairman	Productivity Commission
Mr Marty Robinson	Aust. Govt.	The Treasury
Ms Josephine Laduzko	Aust. Govt.	Department of the Prime Minister and Cabinet
Mr Nicholas Hunt	Aust. Govt.	Department of Finance
Mr Rick Sondalini	NSW	NSW Treasury
Ms Anita Truninger	NSW	Department of Premier and Cabinet
Ms Brigid Monagle	Vic	Department of Premier and Cabinet
Mr Jeremy Nott	Vic	Department of Treasury and Finance
Ms Nicole Tabb	Qld	Department of the Premier and Cabinet
Ms Janelle Thurlby	Qld	Queensland Treasury
Ms Melissa Rudez	WA	Department of the Premier and Cabinet
Mr Kurt Sibma	WA	Department of Treasury
Ms Tammie Pribanic	SA	Department of Treasury and Finance
Mr Chris McGowan	SA	Department of the Premier and Cabinet
Ms Ruth McArdle	Tas	Department of Premier and Cabinet
Mr Geoffrey Rutledge	ACT	Chief Minister, Treasury and Economic
Development Directorate		
Ms Jean Doherty	NT	Department of the Chief Minister
Ms Linda Weatherhead	NT	Department of the Chief Minister
Ms Nardia Harris	NT	Department of Treasury and Finance
Mr Barry Sandison		Australian Institute of Health and Welfare
Dr Paul Jelfs		Australian Bureau of Statistics

People who also served on the Steering Committee during the production of this report include:

Ms Emily Martin	Aust. Govt.	The Treasury
Mr Jonathan Rollings	Aust. Govt.	The Treasury
Ms Sam Reinhardt	Aust. Govt.	The Treasury
Mr Mark Thomann	Aust. Govt.	Department of Finance
Ms Michelle Dumazel	NSW	Department of Premier and Cabinet
Ms Bronwen FitzGerald	Vic	Department of Premier and Cabinet
Ms Katherine Whetton	Vic	Department of Premier and Cabinet
Mr Chris Chinn	Qld	Department of the Premier and Cabinet
Ms Marion Burchell	WA	Department of the Premier and Cabinet
Ms Lorissa Kelly	WA	Department of the Premier and Cabinet
Mr Barry Thomas	WA	Department of Treasury
Ms Katrina Ball	SA	Department of Treasury and Finance
Ms Nicole Hunter	SA	Department of the Premier and Cabinet
Ms Rebekah Burton	Tas	Department of Premier and Cabinet
Ms Tracey Scott	NT	Department of Treasury and Finance
Ms Kerry Flanagan		Australian Institute of Health and Welfare
Mr Andrew Kettle		Australian Institute of Health and Welfare
Mr Peter Harper		Australian Bureau of Statistics

Acknowledgments

The Overcoming Indigenous Disadvantage Working Group undertakes the development and production of the Overcoming Indigenous Disadvantage Report under the auspice of the Steering Committee. The Working Group comprises the following members:

Ms Nina Davidson	Acting Head of Office	Productivity Commission
Mr Matthew James	Aust. Govt.	Department of the Prime Minister and Cabinet
Mr Nathan Martin	NSW	Department of Premier and Cabinet
Ms Rachel Davis	Vic	Department of Premier and Cabinet
Ms Jackie Wallace	Qld	Department of the Premier and Cabinet
Mr Ben Halton	WA	Department of Aboriginal Affairs
Mr John Wright	SA	Department of State Development
Ms Kate Kent	Tas	Department of Premier and Cabinet
Ms Lisa Gooley	ACT	Community Services Directorate
Mr Nathan Evans	NT	Department of Local Government and Community Services
Mr Geoff Scott		National Congress of Australia's First Peoples
Dr Fadwa Al-Yaman		Australian Institute of Health and Welfare
Ms Sharon Pech		Australian Bureau of Statistics

People who also served on the Working Group during the production of this report include:

Ms Kristy Delaney	NSW	Aboriginal Affairs
Mr Trevor Fleming	Vic	Department of Premier and Cabinet
Ms Emma Ogilvie	Qld	Department of Premier and Cabinet
Ms Jocelyn Bell	Qld	Department of Premier and Cabinet
Mr Stephen Jones	WA	Department of Aboriginal Affairs
Mr Nick Evans	Tas	Department of Premier and Cabinet
Mr Craig Martin	Tas	Department of Premier and Cabinet
Mr Colin Farlow	ACT	Community Services Directorate
Ms Danielle Stiff	ACT	Community Services Directorate
Ms Linda Weatherhead	NT	Department of the Chief Minister
Ms Leeanne Caton	NT	Department of Local Government and Community Services

Ms Julie Nankervis
Ms Mary Jackson
Mr Simon Bartlett

Australian Bureau of Statistics
Australian Bureau of Statistics
Australian Bureau of Statistics

The Steering Committee acknowledges the contribution of the staff of the secretariat at the Productivity Commission who produced this report, and of the many organisations and individuals in consultations on this report. It particularly thanks the following organisations and individuals for reviewing sections of this report.

Dr Nicholas Biddle (Centre for Aboriginal Economic Policy Research, Australian National University)

Dr Kyllie Cripps (Indigenous Law Centre, University of New South Wales)

Mr Jason Glanville (Australian Indigenous Governance Institute)

Ms Heron Loban (Griffith University)

Dr Karen Martin (Griffith University)

National Health Leadership Forum

Reconciliation Australia

Ms Lynette Riley (University of Sydney)

Dr Felecia Watkin Lui (James Cook University)

Working Group on Aboriginal and Torres Strait Islander Environmental Health

WHO	World Health Organisation

Glossary

Aboriginal	A person who identifies as being of Aboriginal origin. May also include people who identify as being of both Aboriginal and Torres Strait Islander origin.
Age standardised rates	Age standardised rates enable comparisons to be made between populations that have different age structures. Age standardisation is often used when comparing the Aboriginal and Torres Strait Islander and non-Indigenous populations because the Aboriginal and Torres Strait Islander population is younger than the non-Indigenous population. Outcomes for some indicators are influenced by age, therefore, it is appropriate to age standardise the data when comparing the results. When comparisons are not being made between the two populations, the data are not age standardised.
CDEP	Community Development Employment Projects (CDEP) was an Australian Government funded program that provided activities for unemployed Aboriginal and Torres Strait Islander Australians to develop work skills and move into employment (see section 4.7).
Core activity limitation (ABS SDAC definition)	<p>Four levels of core activity limitation are determined based on whether a person needs help, has difficulty, or uses aids or equipment with any of the core activities (mobility, self-care and communication). A person's overall level of core activity limitation is determined by their highest level of limitation in these activities.</p> <p>The four levels of limitation are:</p> <ul style="list-style-type: none">• profound — the person is unable to do, or always needs help with, a core activity task.• severe — the person:<ul style="list-style-type: none">– sometimes needs help with a core activity task, and/or– has difficulty understanding or being understood by family or friends, or– can communicate more easily using sign language or other non-spoken forms of communication.• moderate — the person needs no help, but has difficulty with a

core activity task.

- mild — the person needs no help and has no difficulty with any of the core activity tasks, but:
 - uses aids or equipment, or has one or more of the following limitations
 - cannot easily walk 200 metres
 - cannot walk up and down stairs without a handrail
 - cannot easily bend to pick up an object from the floor
 - cannot use public transport
 - can use public transport, but needs help or supervision
 - needs no help or supervision, but has difficulty using public transport.

Confidence intervals

Survey data, for example data from the Australian Aboriginal and Torres Strait Islander Health Survey, are subject to sampling error because they are based on samples of the total population. Where survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals. There is a 95 per cent chance that the true value of the data item lies within the interval shown by the error bars. See ‘statistical significance’.

See also ‘Error bars’.

Disability (ABS SDAC definition)

A person has a disability if he or she has a limitation, restriction or impairment, which has lasted, or is likely to last, for at least six months and restricts everyday activities. These activities include: loss of sight (not corrected by glasses or contact lenses); loss of hearing where communication is restricted, or an aid to assist with, or substitute for, hearing is used; speech difficulties; shortness of breath or breathing difficulties causing restriction; chronic or recurrent pain or discomfort causing restriction; blackouts, seizures, or fits, or loss of consciousness; difficulty learning or understanding; incomplete use of arms or fingers; difficulty gripping or holding things; incomplete use of feet or legs; nervous or emotional condition causing restriction; restriction in physical activities or in doing physical work; disfigurement or deformity; mental illness or condition requiring help or supervision; long-term effects of head injury, stroke or other brain damage causing restriction; receiving treatment or medication for any other long-term conditions or ailments and still restricted; or any other long-term conditions resulting in a restriction.

ICD	ICD is the International Statistical Classification of Diseases and Related Health Problems, endorsed by the World Health Organization (WHO). It is primarily designed for the classification of diseases and injuries with a formal diagnosis. ICD-10-AM is the Australian modification of the tenth revision and was adopted for Australian use from 1 January 1999 (superseding ICD-9).
Equivalised household income	Equivalised household income adjusts the actual incomes of households to make households of different sizes and compositions comparable. It results in a measure of the economic resources available to members of a standardised household (see section 4.10).
Error bars	<p>Survey data, for example data from the Australian Aboriginal and Torres Strait Islander Social Survey, are subject to sampling error because they are based on samples of the total population. Where survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals. There is a 95 per cent chance that the true value of the data item lies within the interval shown by the error bars. See ‘statistical significance’.</p> <p>See also ‘Confidence intervals’.</p>
Hospitalisation	Hospitalisations recorded in this report refer to ‘hospital separations’. A ‘separation’ is an episode of care, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute to rehabilitation). It is also defined as the process by which an admitted patient completes an episode of care by being discharged, dying, transferring to another hospital or changing type of care. For measuring a hospital’s activity, separations are used in preference to admissions because diagnoses and procedures can be more accurately recorded at the end of a patient’s stay and patients may undergo more than one separation from the time of admission. Admitted patients who receive same day procedures are recorded in hospitalisation statistics.
Income ranges	See ‘quintiles’.
Indigenous	A person of Aboriginal and/or Torres Strait Islander origin who identifies as an Aboriginal and/or Torres Strait Islander Australian.
Indigenous status not stated/	Where a person’s Indigenous status has either not been asked or not recorded.

**Indigenous status
unknown**

Infant mortality Deaths of children between birth and exactly one year of age.

Inner regional See ‘remoteness areas’.

Jurisdiction The Australian Government or a State or Territory Government and areas that it has legal authority over.

Labour force The labour force is the most widely used measure of the economically active population or the formal supply of labour. It is a measure of the number of people contributing to, or willing to contribute to, the supply of labour and, as defined by the ABS, comprises two mutually exclusive categories of population: the employed (people who have worked for at least one hour in the reference week), and the unemployed (people who are without work, but had actively looked for work in the four weeks up to the end of the reference week and were available to start work in the reference week).

Major cities See ‘remoteness areas’.

**Mean and
median income
measures** A mean income value is the average value of a set of income data. It is calculated by adding up all the values in the set of data and dividing that sum by the number of values in the dataset. Median value is the middle point of a set of income data. Lining up the values in a set of income data from largest to smallest, the one in the centre is the median income value (if the centre point lies between two numbers, the median value is the average value of the two numbers).

Median value is a better measure for income than mean as mean income values are more influenced by extreme income values (including the lowest and highest incomes). Therefore, median income value is a more accurate measure of income for an average household or average individual income earner.

For example, the gross monthly incomes for 9 households are: \$10 000, \$5000, \$2500, \$1500, \$1500, \$1500, \$1000, \$450, \$450.

The mean income value among the 9 households is $(\$10\,000 + \$5\,000 + \$2500 + \$1500 + \$1500 + \$1500 + \$1000 + \$450 + \$450) / 9 = \2655.6 . The median income value is the fifth value (the mid point), \$1500.

Non-Indigenous A person who does not identify as Aboriginal and/or Torres Strait Islander.

Non-school qualification	Non-school qualifications include vocational or higher education qualifications.
Non-remote	See ‘remoteness areas’.
Outer regional	See ‘remoteness areas’.
Perinatal mortality	Fetuses delivered with a gestational age of 20 weeks or more, or weighing at least 400 grams, and all neonatal deaths – infant deaths within 28 days of birth.
Post-school qualification	Post-school qualifications include vocational or higher education qualifications.
Quintiles	Income quintiles are groups that result from ranking all people in the population in ascending order (from the lowest to the highest) according to their (as an example) incomes and then dividing the population into five equal groups, each comprising 20 per cent of the population.
Rate ratio	The rate ratio is the rate for the Aboriginal and Torres Strait Islander population divided by the rate for the non-Indigenous (or other) population.
Regional	See ‘remoteness areas’.
Relative standard error (RSE)	The relative standard error (RSE) of a survey data estimate is a measure of the reliability of the estimate and depends on both the number of people giving a particular answer in the survey and the size of the population. The RSE is expressed as a percentage of the estimate. The higher the RSE, the less reliable the estimate. Relative standard errors for survey estimates are included in the attachment tables. See also ‘statistical significance’.
Remote	See ‘remoteness areas’.
Remoteness	See ‘remoteness areas’.

Remoteness areas

Remoteness areas are defined in the Australian Statistical Geographical Standard (ASGS) developed by the ABS.¹ The ASGS remoteness classification identifies a place in Australia as having a particular degree of remoteness. The remoteness of each place is determined using the Accessibility/Remoteness Index of Australia (ARIA). The ABS generates an average ARIA score for each location based on its distance from population centres of various sizes. Locations are then added together to form the remoteness areas in each State and Territory. Remoteness areas comprise the following six categories:

- major cities of Australia
- inner regional Australia
- outer regional Australia
- remote Australia
- very remote Australia
- migratory regions (comprising off-shore, shipping and migratory places).

The aim of the ASGS remoteness structure is not to provide a measure of the remoteness of a particular location but to divide Australia into five broad categories (excluding migratory regions) of remoteness for comparative statistical purposes.

Statistical significance

Statistical significance is a measure of the degree of difference between survey data estimates. The potential for sampling error — that is, the error that occurs by chance because the data are obtained from only a sample and not the entire population — means that reported responses may not indicate the true responses.

Using the relative standard errors (RSE) of survey data estimates, it is possible to use a formula to test whether the difference is statistically significant. If there is an overlap between confidence intervals for different data items, it cannot be stated for certain that there is a statistically significant difference between the results. See ‘confidence intervals’ and ‘relative standard error’.

¹ The ASGS replaced the Australian Standard Geographical Classification (ASGC) from 1 July 2013.

Torres Strait Islander people	People who identify as being of Torres Strait Islander origin. May also include people who identify as being of both Torres Strait Islander and Aboriginal origin.
Unemployment rate	<p>The unemployment rate is defined as the proportion of people in the labour force who:</p> <ul style="list-style-type: none">• had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week, or• were waiting to start a new job within four weeks from the end of the reference week and could have started in the reference week if the job had been available then.
Very remote	See ‘remoteness areas’.

Key points

- This report measures the wellbeing of Aboriginal and Torres Strait Islander Australians, and was produced in consultation with governments and Aboriginal and Torres Strait Islander Australians. Around 3 per cent of the Australian population are estimated as being of Aboriginal or Torres Strait Islander origin (based on 2011 Census data).
- Outcomes have improved in a number of areas, including some COAG targets. For indicators with new data for this report:
 - Mortality rates for children improved between 1998 and 2014, particularly for 0<1 year olds, whose mortality rates more than halved (from 14 to 6 deaths per 1000 live births).
 - Education improvements included increases in the proportion of 20–24 year olds completing year 12 or above (from 2008 to 2014-15) and the proportion of 20–64 year olds with or working towards post-school qualifications (from 2002 to 2014-15).
 - The proportion of adults whose main income was from employment increased from 32 per cent in 2002 to 43 per cent in 2014-15, with household income increasing over this period.
 - The proportion of adults that recognised traditional lands increased from 70 per cent in 2002 to 74 per cent in 2014-15.
- However, there has been little or no change for some indicators.
 - Rates of family and community violence were unchanged between 2002 and 2014-15 (around 22 per cent), and risky long-term alcohol use in 2014-15 was similar to 2002 (though lower than 2008).
 - The proportions of people learning and speaking Indigenous languages remained unchanged from 2008 to 2014-15.
- Outcomes have worsened in some areas.
 - The proportion of adults reporting high levels of psychological distress increased from 27 per cent in 2004-05 to 33 per cent in 2014-15, and hospitalisations for self-harm increased by 56 per cent over this period.
 - The proportion of adults reporting substance misuse in the previous 12 months increased from 23 per cent in 2002 to 31 per cent in 2014-15.
 - The adult imprisonment rate increased 77 per cent between 2000 and 2015, and whilst the juvenile detention rate has decreased it is still 24 times the rate for non-Indigenous youth.
- Change over time cannot be assessed for all the indicators — some indicators have no trend data; some indicators report on service use, and change over time might be due to changing access rather than changes in the underlying outcome; and some indicators have related measures that moved in different directions.
- Finally, data alone cannot tell the complete story about the wellbeing of Aboriginal and Torres Strait Islander Australians, nor can it fully tell us why outcomes improve (or not) in different areas. To support the indicator reporting, case studies of ‘things that work’ are included in this report (a subset in this Overview). However, the relatively small number of case studies included reflects a lack of rigorously evaluated programs in the Indigenous policy area.

1 About this report

Aboriginal and Torres Strait Islander terminology

The Steering Committee acknowledges current debate around appropriate terminology to refer to the Indigenous peoples of Australia.

Following feedback on previous editions of the report, this report generally uses the term ‘Aboriginal and Torres Strait Islander Australians’ to describe Australia’s first peoples and ‘non-Indigenous Australians’ to refer to Australians of other backgrounds, except where quoting other sources.

This is the seventh report in the Overcoming Indigenous Disadvantage (OID) series. The OID report measures the wellbeing of Aboriginal and Torres Strait Islander Australians, and Aboriginal and Torres Strait Islander Australians have been actively involved in the development and production of the report.

Section 1.1 describes the origins of the report, and section 1.2 describes its key objectives. Section 1.3 provides contextual information on the Aboriginal and Torres Strait Islander population. Section 1.4 includes a brief historical narrative to help put the information in the report into context. Section 1.5 summarises some recent developments in government policy that have influenced the report and section 1.6 provides further information on the Steering Committee and the OID Working Group that advises it.

1.1 Origins of the OID report

The origins of this report can be traced back to the Council for Aboriginal Reconciliation’s final report, *National Strategies to Advance Reconciliation* (CAR 2000), which called on all governments to report against measurable program performance benchmarks.

In December 2000, the (then) Prime Minister wrote to the (then) Ministerial Council for Aboriginal and Torres Strait Islander Affairs (MCATSIA), requesting it to develop performance reporting strategies and benchmarks. When the Council of Australian Governments (COAG) commissioned the OID report in 2002, the MCATSIA work formed the basis of extensive consultations to develop the framework for the first report.

The original terms of reference for the OID report requested the Steering Committee for the Review of Government Service Provision to:

... produce a regular report against key indicators of Indigenous disadvantage. This report will help to measure the impact of changes to policy settings and service delivery and provide a

concrete way to measure the effect of the Council's commitment to reconciliation through a jointly agreed set of indicators (COAG 2002, appendix 1).

The report's terms of reference were updated in 2009. The new terms of reference noted the report's significance as:

... a source of high quality information on the progress being made in addressing Indigenous disadvantage across a range of key indicators. The OID report has been used by governments and the broader community to understand the nature of Indigenous disadvantage and, as a result, has helped inform the development of policies to address Indigenous disadvantage. (p. iv)

Following an independent review of the report in 2012, the Steering Committee adopted suggestions from Aboriginal and Torres Strait Islander Australians that the focus of the report be expanded to incorporate more strengths-based reporting (see section 2.2 in chapter 2). In September 2014, COAG Senior Officials endorsed the Steering Committee's proposed changes to the framework, including the addition of several new indicators that measure outcomes that Aboriginal and Torres Strait Islander Australians said are important to them.

1.2 Role and purpose of the OID report

COAG nominated two core objectives for the OID report:

- to inform Australian governments about whether policy programs and interventions are achieving improved outcomes for Aboriginal and Torres Strait Islander Australians
- to be meaningful to Aboriginal and Torres Strait Islander Australians.

The report therefore aims to be more than a collection of data; it aims to provide a practical tool for both government agencies and Aboriginal and Torres Strait Islander people and organisations. Other national reports covering individual areas of expenditure, health and the COAG Closing the Gap targets are outlined in box 1.2.1.

The information in this report provides a high level view of the wellbeing of Aboriginal and Torres Strait Islander Australians. It identifies where progress is being made and draws attention to where more change is needed. The report's framework of indicators focuses on some of the factors that ultimately cause disadvantage and the factors that can contribute to wellbeing — those areas where evidence, logic and experience suggest that targeted policies will have the greatest impact.

Box 1.2.1 National reports on Aboriginal and Torres Strait Islander Australians^a

Indigenous Expenditure Report

Requested by **COAG**

Produced by **SCRGSP**

Frequency **2-3 yearly**

Purpose: Assist governments to understand levels and patterns of expenditure on services that relate to Aboriginal and Torres Strait Islander Australians.

The Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples: an overview

Requested by **AIHW**

Produced by **AIHW**

Frequency **2-3 yearly**

Purpose: A comprehensive statistical overview of topics important to the health and welfare of Aboriginal and Torres Strait Islander Australians.

Overcoming Indigenous Disadvantage

Requested by **COAG**

Produced by **SCRGSP**

Frequency **2-3 yearly**

Purpose

The nationally recognised set of indicators on the wellbeing of Australia's Indigenous peoples.

Content

Strategic framework of outcome indicators, whole of government perspective to achievement of agreed priority outcomes.

Aboriginal and Torres Strait Islander Health Performance Framework Report

Requested by **AHMAC**

Produced by **AHMAC** (summary policy report) & **AIHW** (detailed analysis)

Frequency **Biennial**

Purpose: Measures health outcomes, determinants of health and health system performance.

National Indigenous Reform Agreement Performance Report

Requested by **COAG**

Produced by **CRC/PC^b**

Frequency **To be determined**

Purpose: Independent assessment of Australian Government and State and Territory government progress toward the seven Closing the Gap targets, and associated performance indicators.

Closing the Gap – Prime Minister's Report

Requested by **Prime Minister**

Produced by: **PM&C**

Frequency **Annual**

Purpose: Prime Minister's report to Parliament on progress against the seven Closing the Gap targets and developments in Australian Government Indigenous policies and programs.

Abbreviations: **AHMAC** Australian Health Ministers Advisory Council. **AIHW** Australian Institute of Health and Welfare. **COAG** Council of Australian Governments. **CRC** COAG Reform Council. **PC** Productivity Commission. **PM&C** Department of the Prime Minister and Cabinet. **SCRGSP** Steering Committee for the Review of Government Service Provision.

^a Includes ongoing report series as at November 2016. ^b The CRC was responsible for producing this report until its cessation on 30 June 2014. COAG requested the PC to complete the assessment report in respect of the 2013-14 reference year.

The information in the report can help inform the design of policies, by illustrating the nature of the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians, and identifying some of the significant sources of their wellbeing.

The report draws on many examples of evaluated programs to identify some of the factors behind policies and programs that have been successful in addressing Indigenous disadvantage. However, while this report draws on evaluations conducted by other bodies, this report does not attempt to evaluate specific policies or programs — rigorous

evaluations require detailed information about the aims, costs and benefits of individual programs and are beyond the scope of this report.

Similarly, the report does not include targets for most of its indicators (the COAG targets, which have been agreed by all governments, are an exception, but the report does not specifically assess performance against these targets). While the aim is to close the gap in outcomes, more information about the policies and programs of all governments would be necessary to set meaningful targets.

Data limitations, and a desire to keep the report to a manageable size, mean that much of this report concentrates on outcomes at the national and State and Territory level. A focus on what is happening at the aggregate level is important, to help ensure the underlying causes of disadvantage and foundations of wellbeing are being addressed.

However, the Steering Committee recognises the diversity of Aboriginal and Torres Strait Islander cultures and experiences and acknowledges that the outcomes measured in this report can vary markedly by geography, age, sex, employment status and other factors. Some Aboriginal and Torres Strait Islander Australians experience little or no disadvantage compared to non-Indigenous Australians, while some Aboriginal and Torres Strait Islander Australians are highly disadvantaged. Throughout the report, outcomes are presented by remoteness and other characteristics wherever possible. In addition, the analysis in chapter 13 explores some of the complex factors that contribute to improving outcomes.

In particular, there are significant differences within and between Aboriginal Australians and Torres Strait Islander Australians. The relatively small number of Torres Strait Islander people makes it difficult to report about them separately, but available data are summarised in chapter 12.

It is important to have an overall picture of outcomes for Aboriginal and Torres Strait Islander Australians, because they are overrepresented among Australians facing disadvantage, and this disadvantage appears more persistent over time and across generations. The Indigenous peoples of countries with similar colonial histories to Australia, such as Canada, the United States of America and New Zealand, also experience high rates of disadvantage (Jackson Pulver et al. 2010; Cooke et al. 2007; King, Smith and Gracey 2009; Armitage 1995 cited in Cornell 2006).

This report tracks progress against the COAG targets, plus a number of other indicators of disadvantage and wellbeing, to provide accountability for overcoming Indigenous disadvantage.¹ In this report, a number of indicators show improvements, particularly some early childhood, health and education measures. However, significant gaps in outcomes remain. Particularly concerning, it appears that family/community violence outcomes have stalled, while involvement with the child protection system remains high,

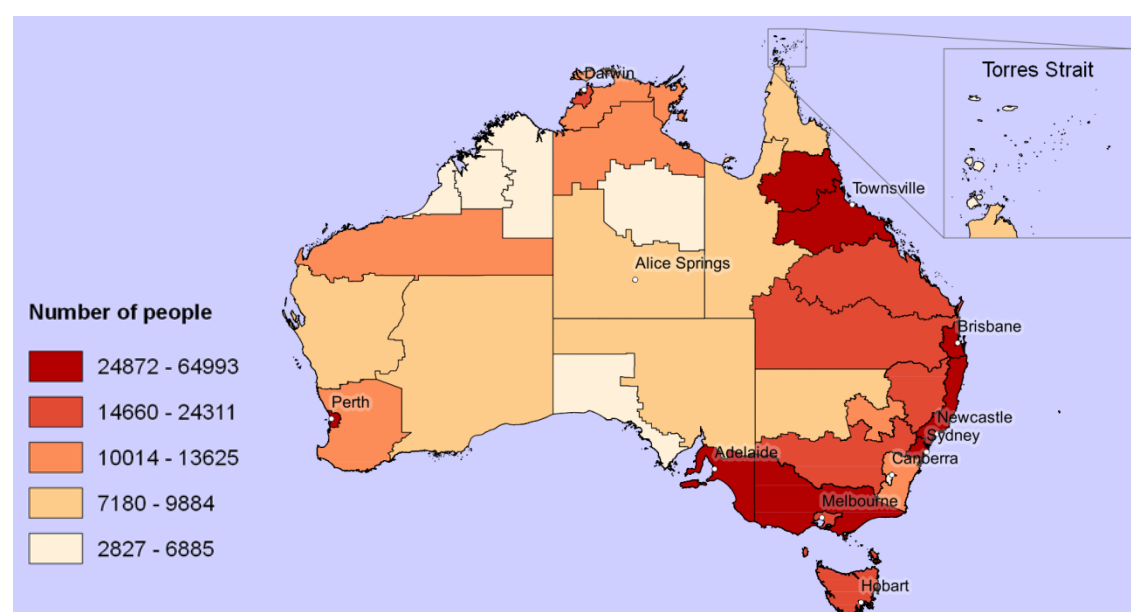

¹ A number of other reports include information on outcomes for Aboriginal and Torres Strait Islander people. A diagram of the key national reports is in box 1.2.1 in this chapter.

and mental health, drug and alcohol, and youth and adult criminal justice outcomes appear to be worsening.

1.3 Putting the OID report into context

Following the 2011 Census,² there were an estimated 670 000 Aboriginal and/or Torres Strait Islander Australians. This Aboriginal and Torres Strait Islander population is diverse — made up of many different nations, clans and skin groups with different cultures, languages, histories and perspectives (Flood 2006, p. 17; Broome 2010, p. 12). Overall, the Aboriginal and Torres Strait Islander population is relatively young, largely urbanised and fast-growing. Figure 1.3.1 shows the estimated distribution of Aboriginal and Torres Strait Islander people in Australia in 2011 — the heavier shades indicate higher numbers of Indigenous people living in those areas.

Figure 1.3.1 **Where do Aboriginal and Torres Strait Islander Australians live?**^{a, b}

^a The estimated number of Aboriginal and Torres Strait Islander Australians in the 37 ABS Indigenous regions as at 30 June 2011. ^b The legend is not continuous as there were no regions with numbers in between the five categories derived.

Source: ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0, Canberra.

² The most recent Census was conducted in August 2016. Data from the 2016 Census were not available for this report. The ABS will release these data progressively from 2017 onwards.

Torres Strait Islander people continue to maintain a unique cultural identity. They are a separate people in origin, history and way of life, with many cultural connections to New Guinea and nearby islands (Shnukel 2001; AIATSIS 2008, pp. 2, 6, 24, 30). In 2011, 38 100 people identified as being of Torres Strait Islander origin only, and 25 600 as both Aboriginal and Torres Strait Islander, with around 10 per cent living in the Torres Strait and the remainder on the Australian mainland (see chapter 12 for more information).

This report focusses on aggregated data (although behind the figures there is great diversity in the lives of Aboriginal and Torres Strait Islander Australians). On average, Aboriginal and Torres Strait Islander Australians experience poorer outcomes than non-Indigenous people wherever they live. For many indicators in the report, the level of disadvantage tends to increase with remoteness (figure 1.3.2), although for some important cultural indicators, such as connection with country and language maintenance and revitalisation, outcomes are better in remote areas.

Figure 1.3.2 Selected outcomes for Aboriginal and Torres Strait Islander Australians vary by remoteness, 2014-15^{a,b,c}

^a Fully engaged includes full time employment and/or education and training. ^b More detail on all of these outcomes can be found in the relevant sections of the report. ^c Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2014-15; tables 4A.6.2, 4A.8.12, 7A.3.1, 9A.3.1 and 10A.1.2.

Over time, community and individual attitudes toward Aboriginal and Torres Strait Islander people have changed, and recent surveys indicate high levels of recognition of the importance of Aboriginal and Torres Strait Islander cultures to Australia's identity as a nation (Polity Research & Consulting 2015). Similarly, over time there has been an encouraging increase in the willingness of Aboriginal and Torres Strait Islander

Australians to identify in official data collections. The ABS found that this was at least partly driven by a sense of pride and confidence in their identity, and the perception that identification can promote recognition of issues and lead to benefits for Aboriginal and Torres Strait Islander peoples (ABS 2013, pp. 10, 11). Section 3.1 provides information on the impact of this change in identification on population counts.

1.4 The historical context

Disadvantage may have both immediate social, economic and cultural determinants, and deeper underlying causes. For example, the relatively high rates of violence in Aboriginal and Torres Strait Island communities are influenced by immediate factors such as alcohol and illicit drug use, mental health issues and childhood experience of violence. However, a number of researchers also suggest that deeper underlying causes include ‘intergenerational trauma’ resulting from the ongoing and cumulative effects of colonisation, loss of land, language and culture, the erosion of cultural and spiritual identity, forced removal of children, and racism and discrimination (Bryant 2009; Clapham, Stevenson and Lo 2006; HREOC 1997).

Many readers will be familiar with much of the history of Aboriginal and Torres Strait Islander Australians since European settlement, and will be conscious of the importance of seeing the information in this report in the context of that history. For other readers, the following material provides a very brief introduction to a complex and sometimes contentious subject. For readers interested in exploring the historical context further, the reference list provides a range of views on the impact of past events on Aboriginal and Torres Strait Islander Australians living now.

Aboriginal people have lived in Australia for some 40 000 to 60 000 years, with the Torres Strait Islands settled some 10 000 years ago (AIATSIS 2008). It is estimated that, prior to European settlement, there were some 250 distinct nations, with different languages and social systems. Much diversity remains today, with many distinct Aboriginal and Torres Strait Islander peoples of Australia.

Attachment to the land was, and still is, a central element of traditional (and ongoing) Aboriginal and Torres Strait cultures, customs and laws. Yet, when the British established the penal colony of New South Wales in January 1788, the legal system operated as if Australia belonged to no one, and denied that Aboriginal and Torres Strait Islander people had sovereignty or property rights over the land.

The colonisation period resulted in many Aboriginal and Torres Strait Islander people being dispossessed of their traditional lands, at times through violence and murder. Aboriginal people began resisting European occupation within months of the founding of the colony of NSW, and there are accounts of fighting as late as the early 1930s (Egan 1996; Elder 2003; Expert Panel 2012, p. 23; Read 2007; Reynolds 2006).

Dispossession, violence and the introduction of new diseases had a devastating effect on the local populations. Although it is difficult to estimate the size of pre-settlement populations, researchers suggest that, in different locations across mainland Australia, the number of Aboriginal people declined by between 30 and 80 per cent from the time of European settlement to the early 1900s (Madden and Pulver 2009; (eds) Briscoe and Smith 2002; Smith 1980; Department of Aboriginal Affairs 1981; Butlin 1983, pp. 119–148; Diamond 1998, p. 320).

From 1860, ‘protective’ legislation (known as the ‘Aborigines Acts’) required many Aboriginal people to live on reserves. In practice, these laws placed almost unlimited discretion in the hands of reserve superintendents and police protectors — lives on the reserves were highly regulated and basic human rights were suppressed (Chesterman and Galligan 1997, p. 41; Cunneen 2001, pp. 57–58; Morris 1988, p. 50). Aboriginal people living outside reserves were spared the worst of the reserve regime, but their rights were still limited (AIATSIS 2008; Blake 1998, p. 53). Torres Strait Islander people faced special laws, including segregated cinemas, schools, churches and housing, travel restrictions and poorer health and educational opportunities (AIATSIS 2008).

From the late 1800s through much of the twentieth century, governments in several jurisdictions controlled many Aboriginal people’s wages, pensions and endowments, with much of the money mismanaged or diverted — a practice now called ‘stolen wages’ (AIATSIS 2008, p. 122; Thornton and Luker 2009, p. 647). Some governments have since put in place reparation schemes, most recently Queensland in 2015 (Queensland Government 2016), although the passage of time and lack of records have made it very difficult to determine the full impact of ‘stolen wages’ or to determine the true value of any compensation (Western Australia Stolen Wages Taskforce 2008).

In the 1900s, governments adopted a more assimilationist approach, with explicit goals of integrating Aboriginal and Torres Strait Islander people into ‘mainstream’ society, initially focused on ‘the natives of Aboriginal origin but not of the full blood’ and later extended to all Aboriginal (and Torres Strait Islander) people (Rowley 1978, pp. 320–321). The policy was defined at the 1961 Native Welfare Conference of Federal and State Ministers in these terms:

The policy of assimilation means that all Aborigines [sic] and part-Aborigines [sic] are expected to attain the same manner of living as other Australians and to live as members of a single Australian community, enjoying the same rights and privileges, accepting the same customs and influenced by the same beliefs as other Australians. (Reynolds 1972, p. 175)

Removal of Aboriginal and Torres Strait Islander children from their families became common. Between 10 and 30 per cent of Aboriginal and Torres Strait Islander children were forcibly removed from their families and communities between 1910 and 1970, now referred to as ‘the stolen generations’ (HREOC 1997, p. 31).

Aboriginal and Torres Strait Islander people did not passively accept these experiences. Some directly petitioned governments — in 1935 and 1937, petitions were presented to the

Commonwealth Government seeking representation in the Parliament and the establishment of a national department of native affairs and state advisory councils. Following the lack of a response, in 1938 Aborigines from around Australia established a National Aboriginal Day Observance Committee (NADOC).³ In August 1963, a further petition was presented as a pair of bark paintings, signed by 131 clan leaders of the Yolngu region (Gove Peninsula) of the Northern Territory. The bark petitions are considered ‘founding documents’ of Australia’s democracy (Australian Government nd).

Other Aboriginal and Torres Strait Islander people took more direct action, such as the ‘Gurindji Walk-Off’ in 1966, when about 250 Aboriginal pastoral workers and their families walked off the Wave Hill Station in response to the low rates of pay and poor living conditions. The action developed as a wholesale rejection of the governmental and industrial framework applying to Aboriginal pastoral populations and included a demand for the return of traditional lands (Australian Heritage Database nd).

This activism led to increasing community concern about Indigenous policy. By 1967, there was widespread support to make two amendments to the Australian constitution — to allow the Commonwealth Government to legislate with respect to Aboriginal people, and to include Aboriginal people in the Census.⁴ The referendum, commonly regarded as a watershed in relations between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, was supported by over 90 per cent of voters, the largest majority for any Australian referendum (Expert Panel 2012, p. 32).

Rights to vote varied across states and territories (and there were often differences between legal entitlements and the practical exercise of those entitlements). The Commonwealth Electoral Act 1962 gave Aboriginal and Torres Strait Islander Australians the right to register and vote in federal elections, but voting was not made compulsory until 1984.

Land rights were, and continue to be, a prominent focus of Aboriginal and Torres Strait Islander activism. In the 1970s, these efforts led to governments passing various forms of land rights legislation. In the 1992 Mabo case, the High Court recognised native title, overturning the previous legal fiction that the land had belonged to no one at the time of European settlement (Expert Panel 2012, p. 35). This decision led to the Commonwealth Native Title Act 1993, which provides a court process for determining native title claims. However, in many circumstances, native title is found to have been extinguished.

In the late 1960s and early 1970s, overtly paternalistic policies were formally abandoned (including the Aboriginal Acts) and a new policy of self-determination introduced. The Commonwealth Racial Discrimination Act was introduced in 1975, as a result of Australia becoming a signatory to the International Covenant on the Elimination of All Forms of Racial Discrimination.

³ NADOC later became NAIDOC to include Torres Strait Islander Australians.

⁴ In all censuses up until 1966, the Bureau of Census and Statistics (now the ABS) included ‘aboriginal natives’ in the Census count but published them in attachments to the official population count (Expert Panel 2012, p. 21).

However, actions that sought to establish equal rights for Aboriginal and Torres Strait Islander Australians sometimes had perverse effects. The successful 1966 equal pay case for Aboriginal pastoral workers led to many workers and their families being forced off the land and, over time, onto welfare (ABC Radio National 2003; Chaney 2013, p. 54; Flood 2006, p. 215). Extensive lobbying by the Federal Council for Aboriginal Advancement (later the Federal Council for the Advancement of Aborigines and Torres Strait Islanders) led to different groups of Aboriginal and Torres Strait Islander people receiving access to social security benefits at different times (Chesterman 2005). In 1959, legislation was amended to provide access to social security benefits to Aboriginal people who were not ‘nomadic’ (Chesterman 2005), with the legislation further amended in 1966 so that all Aboriginal people were eligible. However, in practice, many Aboriginal people living on government and mission stations were excluded from some welfare payments (particularly unemployment benefits) until 1976 (HREOC 1997). In 1977, the Community Development Employment Projects (CDEP) program was introduced, pooling unemployment benefits to create local employment opportunities in remote communities where the labour market might not otherwise offer employment. The program was later extended to all areas (including non-remote) then again restructured in 2007 when it was restricted to remote areas. From 1 July 2013, remote CDEP was rolled into the Australian Government’s Remote Jobs and Communities Program, which was reformed to create the Community Development Programme on 1 July 2015.⁵

Over the 1970s and 1980s, increasing desires for self-determination saw the establishment of many community controlled services, particularly primary health and legal services, many of which continue to operate today. In 1990, an elected Aboriginal and Torres Strait Islander Commission (ATSIC) was established, both to provide advice to the government and to deliver some services (although it never had responsibility for any mainstream services delivered to Aboriginal and Torres Strait Islander people, and its level of responsibility for Indigenous-specific services declined over time) (Australia 2003).

A 2003 review of ATSIC found that it was in urgent need of structural change. While the regional council structure was considered to be working well, major changes were recommended to the governing body. The review recommended that any changes to ATSIC’s program delivery role be considered as part of a Commonwealth/State examination of the most effective delivery of services and programs of significance to Aboriginal and Torres Strait Islander Australians (Australia 2003, pp. 5-6). However, following a series of national board scandals, ATSIC was abolished with bipartisan support in 2004 (AIATSIS 2008), and responsibility for services delivered by ATSIC returned to line departments. At the time, it was emphasised that ‘mainstreaming’ was not intended to reduce funding of services to Aboriginal and Torres Strait Islander Australians (Howard 2004).

The emphasis placed on Indigenous-specific services versus mainstream services has varied over time and across jurisdictions (for example, the majority of clients of many

⁵ See box 4.7.3 in section 4.7 ‘Employment’ for further information on employment programs over time.

‘mainstream’ services in the NT are Aboriginal). Both pre- and post-ATSIC, there were widespread concerns around the provision of services to Aboriginal and Torres Strait Islander Australians (by both mainstream and Indigenous-controlled service providers). In many circumstances, lack of services or poorer quality services for Aboriginal and Torres Strait Islander people appeared to be tolerated (Chaney 2013, p. 57). These concerns led to an increasing focus on monitoring of expenditure on services provided to Aboriginal and Torres Strait Islander Australians. In 2001 the Commonwealth Grants Commission was requested to conduct an inquiry into Indigenous funding, to assist the Commonwealth Government to target resources to areas of greatest need (CGC 2001). For many years the AIHW has produced a report into Aboriginal and Torres Strait Islander health expenditure (AIHW 2013). In 2008, COAG commissioned the Indigenous Expenditure Report, to estimate government expenditures on both Indigenous specific and mainstream services to Aboriginal and Torres Strait Islander Australians (SCRGSP 2014). Indigenous-specific expenditure accounted for 18.6 per cent of direct government expenditure on Aboriginal and Torres Strait Islander Australians in 2012-13 (SCRGSP 2014).

In the late 1980s and early 1990s, two Royal Commissions helped promote a deeper understanding of the issues facing Aboriginal and Torres Strait Islander Australians, and led to the establishment of some of the current institutional arrangements.

The Royal Commission into Aboriginal Deaths in Custody reported on the complex effects of dispossession, colonisation and institutional racism on Aboriginal peoples (RCADIC 1991). Partly in response to the findings of the Royal Commission, the position of the Aboriginal and Torres Strait Islander Social Justice Commissioner was created (AHRC 2013) as well as the Council for Aboriginal Reconciliation. One of the final recommendations of the Council was the establishment of a regular report on outcomes for Indigenous Australians — the origins of the Overcoming Indigenous Disadvantage report (CAR 2000). In 2000, Reconciliation Australia was established to continue the national focus for reconciliation (RA nd).

A national inquiry into the separation of Indigenous children from their families resulted in the 1997 report on the Stolen Generations (HREOC 1997). In 2008, the Prime Minister of Australia, with bipartisan support, made a formal apology to the Stolen Generations (Rudd 2008; Nelson 2008).

Following the ‘Little Children are Sacred’ report into the Protection of Aboriginal Children from Sexual Abuse in 2007 (Wild and Anderson 2007), the Commonwealth Government assumed a greater responsibility for Aboriginal affairs in the Northern Territory, under the Northern Territory Emergency Response (also known as the ‘Intervention’). The response has been the subject of controversy, particularly the (temporary) suspension of the Racial Discrimination Act, the initial involvement of the military, and mandatory income management for those on welfare payments (AHRC nd; FaHCSIA 2011, p. 3; Shaw and d’ Abbs 2011, p. 4). In late 2007, a change of government maintained a modified Northern Territory Emergency Response, and in 2012 a modified policy ‘Stronger Futures in the

Northern Territory’ was introduced under a 10 year funding agreement and retains many features of the Northern Territory Emergency Response.

The Close the Gap Campaign for Indigenous Health Equality commenced in 2006 with the goal of closing the health and life expectancy gap between Aboriginal and Torres Strait Islander peoples and non-Indigenous Australians within a generation (Close the Gap 2012). Since 2008, COAG has agreed and implemented the ‘closing the gap’ policy. COAG identified Indigenous issues as one of seven priority areas of national reform, set six targets for closing the gaps in outcomes between Indigenous and non-Indigenous Australians, and identified seven ‘building blocks’ that underpinned a National Indigenous Reform Agreement (NIRA). At its May 2014 meeting, COAG agreed to a new target — to close the gap in school attendance within five years (COAG 2014). The OID report framework is aligned with the NIRA, but has a much broader focus, with the indicator framework extending beyond the NIRA indicators and targets.

In 2009, Australia adopted the UN Declaration on the Rights of Indigenous Peoples, which recognises Indigenous peoples’ rights to the full enjoyment of all human rights, plus non-discrimination, self-determination and autonomy, maintenance of Indigenous institutions, and the right to a nationality (AHRC 2010).

In 2010, the National Congress of Australia’s First Peoples was established. Made up of Aboriginal and Torres Strait Islander individuals and organisations, it provides independent advocacy on behalf of First Nation peoples in Australia (National Congress of Australia’s First Peoples nd). Originally funded by the Australian Government, this support was withdrawn in the May 2014 budget.

Over several decades, there have been calls for recognition of Aboriginal and Torres Strait Islander peoples in the Australian Constitution. In December 2010, the Australian Government appointed an Expert Panel on Constitutional Recognition of Aboriginal and Torres Strait Islander Peoples (the Expert Panel) to consult on options for a constitutional amendment on recognition of Aboriginal and Torres Strait Islander peoples. The Expert Panel found that 88 per cent of non-Indigenous individuals and 80 per cent of Aboriginal and Torres Strait Islander Australians supported constitutional recognition (Expert Panel 2012, p. 264). The Aboriginal and Torres Strait Islander Peoples Recognition Act 2013 formalised Commonwealth Parliament’s recognition of Aboriginal and Torres Strait Islander peoples and established a review of support for a referendum to amend the Constitution. Following the work of the Expert Panel, a parliamentary Joint Select Committee was appointed, which recommended that a referendum be held to make changes to the Australian Constitution to recognise Aboriginal and Torres Strait Islander people (Joint Select Committee on Constitutional Recognition of Aboriginal and Torres Strait Islander Peoples 2015). The Australian Government appointed a Referendum Council in December 2015 to consult on the best way to achieve constitutional recognition.

1.5 Recent COAG developments

In December 2007 and March 2008, COAG agreed to explicit targets for improving the lives of Aboriginal and Torres Strait Islander Australians (COAG 2007, 2008a).⁶ In November 2008, COAG established the National Indigenous Reform Agreement (NIRA), which was most recently revised in late 2012 (COAG 2012). The NIRA provides an integrated framework for the task of Closing the Gap, setting out the policy principles, objectives and performance indicators underpinning Closing the Gap and the specific steps governments are taking to meet the targets. At its May 2014 meeting, COAG agreed to a new target — to close the gap in school attendance within five years (COAG 2014). In December 2015, COAG agreed to renew and extend its early childhood education target to 2020 (the previous version of which had expired in 2013).

For the 2009 OID report, the Steering Committee liaised with jurisdictions and COAG committees to align the OID report framework with the COAG targets and the NIRA (box 1.5.1). COAG agreed to the new framework at its meeting in November 2008 (COAG 2008b) and the then Prime Minister wrote to the Chair of the Steering Committee with new terms of reference for the report in 2009. The report framework for the OID has been further amended since then to reflect changes to the NIRA over time.

Box 1.5.1 The Overcoming Indigenous Disadvantage (OID) report and the National Indigenous Reform Agreement (NIRA)

The COAG Reform Council reported annually to COAG on progress against the NIRA between 2010 and 2014 (CRC 2010).⁷ The COAG Reform Council was abolished in 2014 and COAG requested the Productivity Commission report against the NIRA in 2015 (PC 2015).

The OID report framework is aligned to the NIRA and consequently the data in the two reports overlap.

However, the NIRA reporting is specifically focused on progress against the targets in the agreement, and comparisons of outcomes by State and Territory. The OID report has a broader focus and covers more areas than the NIRA. The OID report also includes available time series data that predate the NIRA baseline of 2008, and, where State and Territory data are not available, reports available information at the national level.

⁶ In December 2007, three targets were agreed (closing the life expectancy gap within a generation, halving the mortality gap for children under five within a decade and halving the gap in reading, writing and numeracy within a decade). Three further targets were agreed in March 2008 (all four year olds in remote communities access early childhood education within five years, at least halve the gap for students in year 12 attainment or equivalent by 2020, and halve the gap in employment outcomes within a decade) (COAG 2007, 2008a).

⁷ The COAG Reform Council ceased operation on 30 June 2014.

1.6 The Review of Government Service Provision

The Steering Committee

The Review of Government Service Provision was an initiative of the Prime Minister, Premiers and Chief Ministers at the Premiers' Conference in July 1993 and now operates under the auspices of COAG. The Review is overseen by a Steering Committee, which comprises senior representatives from the Prime Minister's, Premiers' and Chief Ministers' departments, and Treasury and Finance departments in the Australian, State and Territory Governments, and observers from the Australian Bureau of Statistics (ABS) and the Australian Institute of Health and Welfare (AIHW). It is chaired by the Chairman of the Productivity Commission, which also provides the Secretariat. (A list of current members is provided as part of the preliminaries to this report).

The Overcoming Indigenous Disadvantage Working Group

The Steering Committee is advised on production of this report by a working group comprising representatives from the Australian, State and Territory governments, as well as observers from the National Congress of Australia's First Peoples and the ABS and the AIHW. The Working Group was convened by Nina Davidson, Acting Head of Office, Productivity Commission.

Other Steering Committee reports

The Steering Committee undertakes three other major exercises for COAG.

Report on Government Services

This annual report, now in its twenty-first edition, provides information on the efficiency and effectiveness of, and equity of access to, mainstream government services in the areas of education, justice, emergency management, health, community services and housing. Between 2003 and 2015, the Review published a separate Compendium of information from the Report on Government Services relating to the delivery of mainstream services to Aboriginal and Torres Strait Islander Australians (SCRGSP 2015b). For 2016 onwards, reference lists of performance data on services to Aboriginal and Torres Strait Islander Australians are available on the report's web pages.

National Agreement data collation

From 2008 to 2014, an annual collation of performance information was undertaken relating to the six National Agreements between the Australian Government and the State

and Territory governments, for analysis by the COAG Reform Council. The Steering Committee continues to compile performance information for the National Indigenous Reform Agreement (the most recent in August 2016 [SCRGSP 2015a]). (Collation of other National Agreement performance data was subsumed into the Report on Government Services in 2015).

Indigenous Expenditure Report

The *Indigenous Expenditure Report* (IER) reports on expenditure related to Aboriginal and Torres Strait Islander Australians.⁸ The IER estimates government expenditure on both Indigenous-specific and mainstream services provided to Aboriginal and Torres Strait Islander Australians. Three editions of the report have been published, with the next edition due for release in late 2017.

The report is aligned with the OID framework, with both aligned to the NIRA building blocks, but direct comparisons are difficult. The differing scope and timeframes precludes anything more than fairly superficial comparison of analysis across the two reports.

The OID report contains indicators of outcomes that may be the result of social influences and government programs, both recent and from years or even decades earlier. For example many health outcomes later in people's lives are the result of behaviours, environments and access to services many years earlier; similarly employment and economic outcomes reflect education and schooling earlier in life. However, the IER includes estimates of expenditure in specific financial years that are not directly attributable to outcomes in the OID report.

The OID report contains 39 indicators across the NIRA building blocks chosen for their importance to improving the overall wellbeing of Aboriginal and Torres Strait Islander Australians, whereas the IER includes estimates of all government expenditure for broad government functions and service areas aligned to each building block. Expenditure estimates are not separately available from government financial systems for some key groups of OID indicators such as those in maternal and child health and governance, leadership and culture. Other areas of expenditure in the IER are by necessity much broader than the key indicators in the OID report.

2 The framework

This chapter explains the *Overcoming Indigenous Disadvantage: Key Indicators* report framework. As noted in chapter 1, the report aims to be more than a compilation of statistics. The report is intended to provide meaningful information to Aboriginal and Torres Strait Islander Australians and governments to assist in targeting efforts to improve the wellbeing of Aboriginal and Torres Strait Islander Australians.

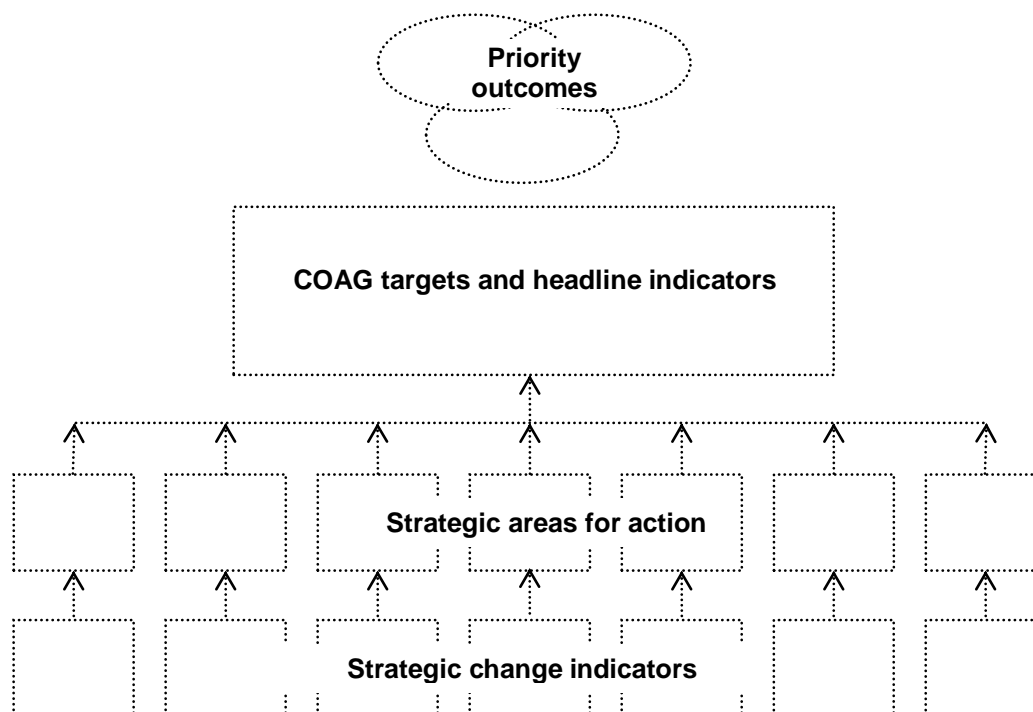

Section 2.1 describes how the key elements of the framework fit together. Section 2.2 summarises key concepts incorporated in the reporting framework including the focus on strengths-based reporting and Aboriginal and Torres Strait Islander wellbeing.

2.1 The framework

While there are many reports on the experiences of Aboriginal and Torres Strait Islander Australians, reports about the performance of governments often focus on specific programs or policies, and take a ‘silo’ approach — education is reported by departments of education, health by health departments — and tend to focus on service inputs (how budgets are spent) and outputs (the actual services delivered), rather than on the outcomes achieved. While information on inputs and outputs is valuable, particularly when evaluating the efficiency of a specific program or service, this report focuses on outcomes — the actual lived experiences of Aboriginal and Torres Strait Islander Australians. Information on outcomes is crucial to measure whether progress is actually being made in closing the gap, regardless of the level of inputs and outputs.

The key elements of the indicator framework are shown in a simplified form in figure 2.1.1. The framework is based on the best available evidence about the root causes of disadvantage, in order to ensure that policy attention is directed to prevention, as well as responding to existing disadvantage. Each of the framework elements is discussed briefly below.

Figure 2.1.1 **Framework elements**

Priority outcomes

Three interlinked priority outcomes sit at the top of the framework — no single aspect of the priority outcomes can be achieved in isolation:

- safe, healthy and supportive family environments with strong communities and cultural identity
- positive child development and prevention of violence, crime and self-harm
- improved wealth creation and economic sustainability for individuals, families and communities.

These outcomes reflect COAG's vision for Aboriginal and Torres Strait Islander Australians to have the same life opportunities as other Australians. Many Aboriginal and Torres Strait Islander Australians and their organisations have also expressed support for these outcomes, in extensive consultations over several years.

It is extremely difficult to measure progress in achieving such broadly stated, aspirational outcomes, and to hold governments and service providers accountable. Therefore, the framework includes two layers of quantifiable indicators. The logic of the framework is

that, over time, measurable improvement in these indicators will demonstrate progress toward achieving the priority outcomes.

COAG targets and headline indicators

The first layer of indicators is made up of the seven targets COAG has set for closing the gaps between outcomes for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, and a further six headline indicators selected by the Steering Committee to represent significant, high level outcomes.

In October 2008, COAG announced six closing the gaps targets (the name of the indicator as presented in the OID report framework is in italics, followed by the full text of the target, and the COAG-agreed target date in square brackets):

- *life expectancy* — close the life expectancy gap within a generation [by 2031]
- *young child mortality* — halve the gap in mortality rates for Indigenous children under five within a decade [by 2018]
- *early childhood education* — The original early childhood education target expired in 2013, unmet. In December 2015, COAG renewed the early childhood education target, aiming for 95 per cent of all Indigenous four-year-olds enrolled in early childhood education by 2025. The method for measuring the target is expected to be agreed by late 2016.
- *reading, writing and numeracy* — halve the gap for Indigenous students in reading, writing and numeracy within a decade [by 2018]
- *year 12 attainment* — halve the gap for Indigenous 20–24 year olds in year 12 or equivalent attainment rates [by 2020]
- *employment* — halve the gap in employment outcomes between Indigenous and non-Indigenous Australians within a decade [by 2018] (COAG 2008).

In May 2014 COAG agreed to a new target on student attendance — closing the gap between Indigenous and non-Indigenous school attendance within five years [by 2018]. Student attendance data, previously included in chapter 7 (Education and training) of this report, are now in chapter 4 (section 4.7).

These ambitious targets highlight specific outcomes in areas that are either significant in their own right (life expectancy and early childhood mortality) or are important preconditions or preventative factors for addressing long term disadvantage (access to preschool, learning outcomes, school attainment and attendance, and employment).

The Steering Committee has selected six headline indicators that sit alongside the COAG targets in the first layer of indicators. These headline indicators are all important outcomes in their own right, and will require whole-of-government action over the long term before significant progress can be seen:

-
- post-secondary education, participation and attainment
 - disability and chronic disease
 - household and individual income
 - substantiated child abuse and neglect
 - family and community violence
 - imprisonment and juvenile detention.

Together, the COAG targets and headline indicators provide an overview of progress in overcoming the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians, and act as proxy measures for the priority outcomes.

Chapter 4 includes a discussion of the evidence base supporting the selection of each indicator, the definitions of the specific measures used to report against each indicator, and the available data.

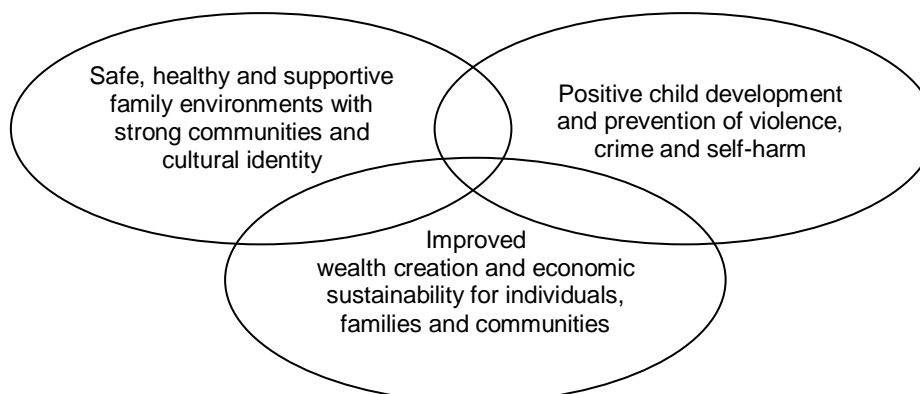

Strategic areas for action and strategic change indicators

The COAG targets and headline indicators, by their very nature, are extremely important, but their whole-of-government, long term nature can make it difficult to hold specific governments or agencies accountable for short to medium term outcomes. The second layer of the framework seeks to overcome this limitation by identifying ‘strategic areas for action’ — specific areas of policy where immediate action is needed to drive improvement in the COAG targets and headline indicators. Each strategic area for action has a small number of ‘strategic change indicators’ that measure short term progress.

The full strategic framework is presented in figure 2.1.2. Chapters 5 to 11 include the evidence base supporting the selection of each strategic area for action and its associated indicators, the definitions of the specific measures used to report against each indicator, and the available data.

Figure 2.1.2 Multi-level indicator framework

Priority outcomes

COAG targets and headline indicators

COAG targets	Headline indicators
4.1 Life expectancy	4.8 Post-secondary education — participation and attainment
4.2 Young child mortality	4.9 Disability and chronic disease
4.3 Early childhood education	4.10 Household and individual income
4.4 Reading, writing and numeracy	4.11 Substantiated child abuse and neglect
4.5 Year 1 to 10 attendance	4.12 Family and community violence
4.6 Year 12 attainment	4.13 Imprisonment and juvenile detention
4.7 Employment	

Strategic areas for action

Governance, leadership and culture	Early child development	Education and training	Healthy lives	Economic participation	Home environment	Safe and supportive communities
5.1 Valuing Indigenous Australians and their cultures 5.2 Participation in decision making 5.3 Engagement with services 5.4 Case studies in governance 5.5 Indigenous language revitalisation and maintenance 5.6 Indigenous cultural studies 5.7 Participation in community activities 5.8 Access to traditional lands and waters	6.1 Antenatal care 6.2 Health behaviours during pregnancy 6.3 Teenage birth rate 6.4 Birthweight 6.5 Early childhood hospitalisations 6.6 Injury and preventable disease 6.7 Ear health 6.8 Basic skills for life and learning	7.1 Teacher quality 7.2 School engagement 7.3 Transition from school to work	8.1 Access to primary health care 8.2 Potentially preventable hospitalisations 8.3 Potentially avoidable deaths 8.4 Tobacco consumption and harm 8.5 Obesity and nutrition 8.6 Oral health 8.7 Mental health 8.8 Suicide and self-harm	9.1 Employment by full time/part time status, sector and occupation 9.2 Indigenous owned or controlled land and business 9.3 Home ownership 9.4 Income support	10.1 Overcrowding in housing 10.2 Rates of disease associated with poor environmental health 10.3 Access to clean water and functional sewerage and electricity services	11.1 Alcohol consumption and harm 11.2 Drug and other substance use and harm 11.3 Juvenile diversions 11.4 Repeat offending 11.5 Community functioning

Note: Numbers beside indicator names refer to section numbers in the report.

Strategic areas for action

The seven strategic areas for action were chosen for their potential to have a significant and lasting impact in reducing disadvantage and improving wellbeing. Each strategic area represents a set of related activities that evidence suggests have the potential to drive improvement in the headline indicators and progress toward the COAG targets.

The strategic areas for action in this report are aligned with the seven ‘building blocks’ identified by COAG to support the reforms aimed at achieving the six COAG targets (COAG 2011). The seven strategic areas are:

- governance, leadership and culture (chapter 5)
- early child development (chapter 6)
- education and training (chapter 7)
- healthy lives (chapter 8)
- economic participation (chapter 9)
- home environment (chapter 10)
- safe and supportive communities (chapter 11).

The strategic areas do not mirror typical government service silos. Closing the gaps in outcomes will require the combined efforts of governments, Aboriginal and Torres Strait Islander Australians and the broader community. In some cases, a specific service area will logically play a major role, but in all strategic areas, more than one government agency will have to take action in order to achieve better outcomes. For example, in the area of ‘education and training’, the school system has an important role to play, but so do agencies dealing with transport, housing and health. Chapter 3 discusses in more detail the need for coordinated government action to address the complex interactions between different aspects of disadvantage, and chapter 13 provides some analysis of factors that improve outcomes.

During consultations, many people asked how governments’ progress in addressing the strategic areas for action would be monitored. The monitoring of specific government programs and services is beyond the scope of this report. Information about Aboriginal and Torres Strait Islander Australians’ access to a range of government services is included in the Steering Committee’s annual *Report on Government Services* (SCRGSP 2016). Estimates of government expenditure on Indigenous-specific and mainstream services to Aboriginal and Torres Strait Islander Australians are contained in the biennial *Indigenous Expenditure Report* (IER) (SCRGSP 2014a). Similarly to the OID framework, the estimates in the IER are based on the seven COAG ‘building blocks’, but are not directly comparable as the IER is based on services (which can influence multiple outcomes) and the OID report is based on outcomes (which can be influenced by multiple services).

Strategic change indicators

A small number of targeted, shorter term ‘strategic change indicators’ measure progress for each strategic area for action. These indicators make it easier to track short term progress, and improve accountability for outcomes. (The term ‘indicator’ has a particular meaning in this report, and is distinguished from the term ‘measure’ — see box 2.1.1).

Box 2.1.1 Indicators and measures

In this report, the term ‘indicator’ refers to a broad statement of the concept to be measured. Indicators are usually described in general terms, to allow for developments in the evidence base and changing data sets over time.

In this report, the term ‘measure’ refers to how an indicator will be measured. Data limitations mean that, sometimes, proxy measures must be used to report against indicators, and multiple measures may be required to illustrate a single indicator. Information on the measures reported for each indicator is provided at the beginning of each indicator section.

Linkages across the framework mean that some indicators potentially could be placed in more than one strategic area for action. Indicators have been placed in the strategic area where the evidence base suggests they will have greatest effect, but their potential to influence other outcomes is acknowledged by cross-references in the text.

Many indicators could have been included in this report. Potential strategic change indicators were assessed against the criteria listed in box 2.1.2 before they were added to the framework. Most of the indicators in the report meet all the criteria — but a few indicators are regarded as so important that they are included even though they do not meet some criteria.

Box 2.1.2 Criteria used to select strategic change indicators

1. Required by alignment with National Indigenous Reform Agreement indicators
2. Measures an outcome (rather than an input or output) or a close proxy for an outcome
3. Relevance to priority outcomes
4. Improvement in the strategic change indicator result in improvement over time in the COAG targets and headline indicators
5. Supported by strong logic or empirical evidence
6. Sensitive to policy interventions and changes in policy settings
7. Meaningful to stakeholders and principally to Aboriginal and Torres Strait Islander Australians
8. Unambiguous and clear in meaning and interpretation
9. The existence, or ease, of developing supporting data sets.

The first criterion notes the requirement to align relevant indicators in the OID report with indicators in the NIRA. The second criterion notes the OID report's emphasis on measurable *outcomes* (impacts on individuals or communities) rather than inputs (resources spent) or outputs (services provided). In some cases, where there is strong evidence that certain inputs or outputs are closely linked to an outcome, those inputs or outputs may be included as proxy indicators of that outcome (for example, access to primary health care and quality antenatal care).

The next three criteria are closely related — the whole framework is geared toward measuring progress toward the priority outcomes. The report draws its strength from the evidence base or underlying theory of causality that links improvement in a strategic change indicator to improvement in the COAG targets and headline indicators, and therefore progress toward the priority outcomes. For most indicators, empirical evidence provides the causal link. For some indicators, despite limited empirical evidence, persuasive logic and compelling feedback from consultations provide the link.

The sixth and seventh criteria are also closely linked. The terms of reference for the report require it to inform Australian governments about the impact of policy programs and interventions, and to be meaningful to Aboriginal and Torres Strait Islander Australians. All indicators have been formally agreed by all Australian governments, and accepted as meaningful by a broad range of Aboriginal and Torres Strait Islander organisations and individuals (see chapter 1 on engagement with Aboriginal and Torres Strait Islander Australians).

The eighth criterion recognises that, to be most useful, an indicator should be clear and unambiguous. Most indicators in this report are relatively easy to understand, and it is intuitively obvious whether progress is being made. However, in some cases, important indicators may yield ambiguous results; for example, an increase in notifications of child abuse or neglect might reflect declining child welfare but, alternatively, might reflect an increase in the proportion of incidents being reported, investigated and addressed. Where indicators are potentially ambiguous, the report includes explanatory text to assist interpretation.

The final criterion recognises the practical need for relevant data to report against an indicator. In some cases, proxy measures are reported and, in a few cases, important indicators have been included even though data are substantially qualified, not available for all jurisdictions or not available at all (and qualitative information is reported instead). Some of these indicators have been identified as high priorities by COAG (for example, 'teacher quality' and 'school engagement') and data strategies are being developed.

Relationships between the indicators

Causal relationships are at the heart of the indicator framework, linking strategic change indicators with the COAG targets and headline indicators, and therefore the priority outcomes. Chapter 3 looks at interactions across the framework and chapter 13 examines

interactions with a focus on education and employment. More information about relationships between indicators is provided in the evidence base for each indicator.

Much of the available information about links between indicators is at a fairly general level. More sophisticated statistical analysis is only possible where a range of information has been collected on a consistent basis for each individual or household, preferably over time. The AIHW and ABS, in partnership with states and territories, developed national best practice guidelines for data linkage relating to Aboriginal and Torres Strait Islander people along with a companion document of current and planned data linkage work (AIHW 2013, AIHW and ABS 2012).

At the jurisdictional level, WA has coordinated data linkage activities through a number of agencies and academia, which connects all available health and related information for the WA population. Since 1995, more than 900 projects have made use of WA linked data (see www.datalinkage-wa.org/projects). In 2006, NSW and the ACT established the Centre for Health Record Linkage (CHeReL) to expand access to linked health-related data, with more than 1300 users accessing data (see www.cherel.org.au/achievements). Building on the data linkage units in WA and NSW/ACT, the Population Health Research Network (PHRN) was established in 2009 to build a nationwide data linkage infrastructure, and has a network of data linkage units located in each State and Territory. Since 2009, PHRN has supported provision of linked data for more than 125 projects (see www.phrn.org.au/projects/). The SA-NT DataLink is part of the PHRN and supports health, social and economic research, education and policy in SA and the NT (SA-NT DataLink 2016).

Things that work

The Steering Committee recognises that data alone cannot tell the complete story about the wellbeing of Aboriginal and Torres Strait Islander Australians. Although there are gaps in reported outcomes, there are many examples of successful initiatives, often at the community level, that are acting to close those gaps. These successes are often not apparent from the aggregate data in this report.

For many indicators, the Steering Committee has included brief case studies of programs or services that are making a difference — examples of ‘things that work’. These case studies demonstrate that things can improve, and provide models that other governments or communities can draw upon and adapt for their own use.

Feedback from the review of the report in 2012 (covered in more detail in section 2.2) indicated that, although many readers of the report valued the ‘things that work’ case studies, there was a general desire to improve the rigour of the case studies, to ensure that highlighted programs and services really were making a difference. For the 2014 report, the Steering Committee agreed that, wherever possible, ‘things that work’ case studies will be drawn from the Closing the Gap Clearinghouse evidence based evaluations of specific programs (see AIHW and AIFS nd for further information on the Clearinghouse).

Commonwealth funding for the Clearinghouse ceased in 2014 with the final publication loaded in December 2015.

Where no relevant material has been available from the Clearinghouse, other potential ‘things that work’ case studies were provided by jurisdictions (through the Steering Committee and its advisory group, the OID working group) and were assessed against the criteria in box 2.1.3. A very high threshold was applied to ensure appropriate rigour, with independent evaluations of programs sought. For case studies where evaluations are relatively dated, these have been included where recent information indicates program outcomes have been maintained. In a few cases, the Steering Committee has included case studies of innovative reforms that appear worthwhile, but which have not been evaluated. In such cases, the Steering Committee has explicitly noted the desirability of formal evaluation.

Box 2.1.3 ‘Things that work’ criteria

‘Things that work’ case studies highlight programs or services that are successfully acting to improve outcomes for Aboriginal and Torres Strait Islander Australians. Case studies must:

- be relevant to a report indicator
- have measurable, up to date outcomes
- have a reasonable track record of success
- be supported by local Indigenous people who use or are affected by the case study
- be agreed for inclusion by all jurisdictions
- where possible, include an analysis of costs and benefits.

The rigour in the selection of case studies has resulted in a relatively small number included in this report (compared to the overall number of programs and policies in operation across Australia). This reflects a lack of rigorously evaluated programs in the Indigenous policy area. As noted by participants in the Productivity Commission’s Roundtable on Indigenous policy evaluation in 2013 ‘Significant gaps exist in the Australian evidence base, due to [the] lack of mandated evaluations’ (PC 2013, page 6, summary of roundtable discussions). This point was reiterated by the Productivity Commission in its NIRA assessment report (PC 2015), with the report stating that a much greater emphasis should be placed on policy evaluation if improvements are to be seen in outcomes for Aboriginal and Torres Strait Islander Australians.

2.2 Key concepts incorporated in the framework

The OID report’s strategic framework has changed over time, responding to changes in government priorities, developments in the evidence base and feedback from consultations with Aboriginal and Torres Strait Islander Australians and their organisations, academics, researchers and service providers.

In 2012, the Productivity Commission, on behalf of the Steering Committee, commissioned the Australian Council for Educational Research Ltd (ACER) to review the report. The ACER review found that most users considered the report to be a useful compendium of information on the wellbeing of Indigenous Australians. However, the review made a number of recommendations for changes to the report's production and content (ACER 2012). The Steering Committee developed a set of proposed responses to the ACER review (SCRGSP 2013), which formed the basis of national consultations. Following those consultations, the Steering Committee agreed a set of final responses, which were implemented for the 2014 report (SCRGSP 2014b).

The two major changes implemented with the 2014 report were:

- increased Aboriginal and Torres Strait Islander engagement in all phases of the reporting process
- a greater focus on 'strengths-based' reporting and Aboriginal and Torres Strait Islander Australians' conceptions of wellbeing.

Increased Aboriginal and Torres Strait Islander engagement

Aboriginal and Torres Strait Islander Australians have been actively involved with the OID report since its inception. The report had its origins in a recommendation of the Council for Aboriginal Reconciliation in 2000, and ATSIC was a member of the working group that advised the Steering Committee on the first edition of the report. The National Congress of Australia's First Peoples (established in 2010) is represented on the working group that advises the Steering Committee on this report. (The Congress has made clear to the Steering Committee that its involvement is not a substitute for engagement with the broader Aboriginal and Torres Strait Islander community.)

Each edition of the report has benefited from consultations with Aboriginal and Torres Strait Islander Australians in all states and territories, and in a range of remoteness areas. Commencing with the 2014 report, the previous practice of engaging a single Indigenous academic referee was expanded, with different Aboriginal and Torres Strait Islander organisations or experts reviewing each section of the report.

For this report, the name of the reviewer is noted in relevant sections and all reviewers are acknowledged on p. xiv, but the final content of the report remains the responsibility of the Steering Committee. The Steering Committee is extremely grateful to these organisations and individuals, and acknowledges the significant contributions they have made to the report.

Strengths-based reporting and wellbeing

The involvement of Aboriginal and Torres Strait Islander Australians contributed to a key development commencing with the 2014 report — a greater focus on strengths-based reporting with a reframing from ‘overcoming disadvantage’ to ‘improving wellbeing’.

Strengths-based reporting

The original terms of reference for this report called for ‘...a regular report to COAG against key indicators of disadvantage ... that are of relevance to all governments and Indigenous stakeholders ...’. In previous editions of the report until 2014, nearly all indicators compared outcomes for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, with a particular focus on the ‘gap’.

Following feedback from many Aboriginal and Torres Strait Islander people and organisations, the Steering Committee implemented a more strengths-based approach¹ for the 2014 report including:

- giving greater emphasis to previously reported strengths-based indicators (including indicators of culture), and including additional strengths-based indicators
- where relevant, noting positive outcomes for the majority of Aboriginal and Torres Strait Islander Australians before discussing the gap in outcomes between Aboriginal and Torres Strait Islander and non-Indigenous Australians
- expressing existing ‘negative’ indicators in the positive (for example, changing ‘tooth decay’ to ‘oral health’)
- retaining the ‘things that work’ examples of successful programs, with increased rigour to ensure that highlighted examples really are making a difference
- renaming the former ‘Governance and Leadership’ area as ‘Governance, leadership and culture’ (the most significant Aboriginal and Torres Strait Islander specific conceptions of wellbeing were around ‘culture’) and making it the first strategic area, to emphasise its significance as underpinning all other outcomes
- grouping the ‘cultural’ indicators together under this strategic area, to increase their prominence and allow for a discussion about the connections between culture and other outcomes.

For this report, the strengths-based approach has been implemented in chapter 13, with the previously titled chapter on ‘measuring multiple disadvantage’ re-framed to focus on interactions that improve outcomes for Aboriginal and Torres Strait Islander Australians, including recent quantitative analysis by the Productivity Commission on what works best to improve primary school outcomes.

¹ A strengths-based approach views situations realistically and looks for opportunities to build on existing strengths, as opposed to a deficit-based approach which focuses on the problem/s.

Measuring wellbeing

The broad term ‘wellbeing’ encompasses a number of related concepts, and there can be specific Indigenous conceptions of wellbeing. Table 2.2.1 sets out the broad elements of three Indigenous strengths-based frameworks:

- the ABS Indigenous wellbeing framework
- the Maori wellbeing framework
- Aboriginal and Torres Strait Islander Health Performance Framework.

There is a high degree of overlap between these frameworks and the indicators in this report — for example, all include measures of community safety, health, education and employment.

Table 2.2.1 Wellbeing framework elements

<i>ABS Indigenous wellbeing framework</i>	<i>Māori wellbeing framework</i>	<i>Aboriginal and Torres Strait Islander Health Performance Framework</i>
Culture, heritage and leisure	Subjective wellbeing (life satisfaction; sense of control; health status; connections)	Health status and outcomes (health conditions; human function; life expectancy and wellbeing; deaths)
Family, kinship and community	Social wellbeing (whānau ^a contact; access to help; voluntary work; trust; experience of crime and discrimination)	Determinants of health (environmental factors; socioeconomic factors; community capacity; health behaviours; person-related factors)
Health	Cultural wellbeing (knowledge of cultures and ability to access in time of need; use and proficiency in language)	Health system performance (effective/appropriate/efficient; responsive; accessible; continuous; capable; sustainable)
Education, learning and skills	Economic wellbeing (material standard of living; paid work; housing problems)	
Customary, voluntary and paid work		
Income and economic resources		
Housing, infrastructure and services		
Law and Justice		
Citizenship and governance		

^a There is no common definition of Whānau, but it is described as connection to a person, either through a common ancestor or through a common purpose or goal (Tibble, A and Ussher, S 2012, *Kei te pewhea to whānau? Exploring whānau using the Māori Social Survey*, Statistics New Zealand).

Sources: ABS 2010, *Framework for Measuring Wellbeing: Aboriginal and Torres Strait Islander Peoples*, 2010, Cat. no. 4703.0, Canberra, ACT; Statistics New Zealand 2014, *Te Kupenga 2013 data dictionary*, <http://www.stats.govt.nz/~media/Statistics/surveys-and-methods/our-surveys/te-kupenga-data-dictionary/te-kupenga-2013-data-dictionary-pdf> (accessed 20 May 2014); AHMAC 2015, *Aboriginal and Torres Strait Islander Health Performance Framework 2014*, AHMAC, Canberra.

For the 2014 report, additional indicators were included to reflect other outcomes that Aboriginal and Torres Strait Islander Australians themselves viewed as important, in the main related to culture, along with two clear messages from consultations:

- no single indicator can adequately reflect the importance of culture in the lives of Aboriginal and Torres Strait Islander Australians

-
- culture underpins many of the outcomes across the framework, and the links across the strategic areas for action, and between these areas and the COAG targets and headline indicators, are particularly strong.

The Steering Committee acknowledges the diversity of Aboriginal and Torres Strait Islander cultures. While there has been general endorsement of the cultural indicators in this report, they may not reflect the aspirations of all Aboriginal and Torres Strait Islander Australians. In addition, it can be very difficult to define aspects of culture in a way that can be measured for inclusion in a largely quantitative report such as this. Acknowledging these constraints, the Steering Committee significantly increased the number of indicators of culture and wellbeing in the 2014 report (for further details on indicators included from the 2014 report see chapter 2, SCRGSP 2014c).

Other potential culture and wellbeing indicators

Consultations suggested some other indicators that were highly meaningful to Aboriginal and Torres Strait Islander Australians. However, some of these potential indicators were in areas that Aboriginal and Torres Strait Islander Australians regarded as their own responsibility, not that of governments (for example, ‘spirituality’). For other potential indicators, there was no consensus on specific indicators or no supporting data which would allow reporting.

The Steering Committee is committed to ongoing research into other potential culture and wellbeing indicators for future reports, and welcomes suggestions of potential concepts, indicators and data sources that it should consider.

3 Key themes and interpretation

This chapter provides some background to assist readers to interpret the data in this report, and draws together some of the report's overarching issues and themes.

- Interpreting the data in this report requires an understanding of the difficulties associated with accurately estimating the number of Aboriginal and Torres Strait Islander Australians (section 3.1), and an awareness of other issues that may affect the quality of data used for reporting (section 3.2).
- As well as an awareness of the historical context that has influenced current outcomes (chapter 1, section 1.4), it is also important to be aware of the demographic characteristics of the Aboriginal and Torres Strait Islander population, which differ markedly from those of the non-Indigenous population (section 3.3).
- Although the majority of Aboriginal and Torres Strait Islander Australians live in cities or regional areas, a relatively high proportion live in remote areas, and there is a particular policy focus on improving outcomes for those living in remote areas (section 3.4).
- There are significant interactions across many of the outcomes measured in this report. Different aspects of disadvantage are often interrelated, and coordinated action by many areas of government may be needed to address the drivers of disadvantage (section 3.5).
- Not everything that matters can be captured in indicators. This report includes numerous case studies of projects and programs that are successfully addressing the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians. These 'things that work' have some common characteristics or 'success factors' (section 3.6).
- Finally, while this report focuses on Australia, it contains a small amount of information on comparisons with outcomes for indigenous peoples in other countries including the many challenges in making international comparisons (section 3.7).

3.1 Estimating the Aboriginal and Torres Strait Islander populations

How are Aboriginal and Torres Strait Islander Australians identified?

All the information in this report is based on self-identification by Aboriginal and Torres Strait Islander Australians and, therefore, relies on an individual's view of their Indigenous status. A small number of administrative data collections require people who identify as Aboriginal and Torres Strait Islander to provide proof of Indigenous descent or acceptance by an Indigenous community, but this is not necessary for most data collections. Therefore, the accuracy and reliability of the data in this report depend on the opportunities provided to identify as Aboriginal and Torres Strait Islander, and people's willingness to do so. In some collections, Indigenous status for a relatively large proportion of people may be recorded incorrectly — either as not stated or as non-Indigenous. The ABS and the AIHW are progressing work funded under Schedule F of the National Indigenous Reform Agreement (NIRA) to improve the quality of Indigenous identification in Census and administrative data collections.

The level of Aboriginal and Torres Strait Islander identification can vary over time and across data collections. Improvements over time in data collections (for example, the adoption or correct application of the standard ABS question on Indigenous status) will improve the accuracy of identification data but, in some cases, will also make trend analysis difficult — for example, it might be difficult to establish whether an increase in the recorded use of a service by Aboriginal and Torres Strait Islander Australians reflects an actual increase in use, or improved recording of existing Aboriginal and Torres Strait Islander service users.

How are Aboriginal and Torres Strait Islander and non-Indigenous populations estimated?

Estimates of the Aboriginal and Torres Strait Islander and non-Indigenous populations are used extensively in this report for calculating rates (for example, hospitalisations per 100 000 people) and percentages (for example, percentage of people aged 18 years and over). Using rates and percentages makes it easier to compare outcomes for Aboriginal and Torres Strait Islander Australians with outcomes for non-Indigenous Australians.

Estimating the Aboriginal and Torres Strait Islander population

The five-yearly Census provides the basis for estimates of the Aboriginal and Torres Strait Islander population. As a proportion of the population are not counted in the Census, the ABS adjusts the Census count to derive the estimated resident Aboriginal and Torres Strait Islander population (ABS 2012a). As explained in the section 'Interpreting data in the

report', the Census undercount may affect analysis of outcomes measured using the Census.

For non-Census years, the ABS calculates estimates and projections of the Aboriginal and Torres Strait Islander population. The most recent projections were based on adjusted 2011 Census data and a set of assumptions about likely trends in Aboriginal and Torres Strait Islander population growth (box 3.1.1).

Box 3.1.1 Aboriginal and Torres Strait Islander population estimates and projections

On 30 April 2014, the ABS published estimates of the Aboriginal and Torres Strait Islander population for 2001 to 2011, and projections for 2012 to 2026, for Australia and each State and Territory and by remoteness (ABS 2014). These estimates are adjusted to account for the undercount of Aboriginal and Torres Strait Islander people in the 2011 Census, but are not adjusted for the unexpected rise in Indigenous identification from the 2006 Census to the 2011 Census.

The Aboriginal and Torres Strait Islander population of Australia as at 30 June 2011 is used as the base for the projection series. Using assumptions about future fertility, paternity, life expectancy at birth and migration, the 2014 publication provided three main sets of projections:

- series A assumes a higher amount of growth
- series B assumes a moderate amount of growth
- series C assumes a smaller amount of growth.

The ABS suggests that series B will be the most appropriate choice for most users and, in this report, series B projections have been used.

Source: ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0, Canberra.

Between the 2006 and 2011 Censuses, there was a 21 per cent increase in the number of people identified as being of Aboriginal and Torres Strait Islander origin, with almost one-third of the increase (30 per cent) not explained by the standard assumptions about the likely population trends. After each Census, the ABS produces time series estimates of the Aboriginal and Torres Strait Islander population based on that Census count, by backcasting around this estimate. The backcast series shows what the currently identified Aboriginal and Torres Strait Islander population (based on the latest Census) would have been in previous periods, based purely on demographic change. As explained in the section 'Interpreting data in the report', the unexplained increase in the Aboriginal and Torres Strait Islander population between the 2006 and 2011 Census affects analysis of outcomes measured using the Census. This change is dealt with in this report by using revised 2011 Census based population estimates for historical rates.

Estimating the non-Indigenous population

The ABS only publishes official non-Indigenous population data for Census years. For other years, non-Indigenous population data are derived by subtracting Aboriginal and Torres Strait Islander population data from total population data. (Based on ABS advice, this report derives the non-Indigenous population by subtracting Aboriginal and Torres Strait Islander population projections from the total estimated resident population).¹ Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

3.2 Interpreting data in the report

The data used in this report, like all data, have limitations. Readers should bear the following issues in mind when interpreting the data. (Appendix 3 contains more information about data limitations.)

Timeliness

The data in this report are the most recent available. Many data collections are not updated annually (particularly surveys and the Census), and some administrative data collections require significant time for processing and validation between collection and publication (creating lags in reporting annual data).

There are often trade-offs between timeliness and cost, or timeliness and respondent burden. Where outcomes are not expected to change rapidly, the benefits of more timely reporting may not outweigh the costs. However, timeliness can be crucial for data that relate to quickly moving outcomes.

Census data

The 2011 ABS Census of Population and Housing was a major data source for this report. The Census is rich in information and has the potential for extensive disaggregation (for example, by State and Territory, remoteness and age group).

Indigenous undercount

The ABS estimates that the 2011 Census did not count around 17 per cent of Aboriginal and Torres Strait Islander Australians (ABS 2012b). This undercount may affect analysis of outcomes measured using the Census, as it cannot be assumed that those who were not

¹ Where preliminary ERP are used, the Steering Committee follows the approach endorsed for the NIRA of using the first release preliminary ERP. These data are only revised once final ERP are available.

counted in the Census share the same characteristics as those who were. This is particularly important where the undercount is concentrated among particular groups of people, such as those in particular geographic or remoteness areas, or in particular age cohorts.

Unexplained increase in estimated Aboriginal and Torres Strait Islander population

Nationally, almost one third of the 21 per cent increase between the 2006 and 2011 Censuses could not be explained by standard assumptions about natural increase — births, deaths and net migration. The unexplained increase in the Aboriginal and Torres Strait Islander population may affect analysis of outcomes over time measured using Census data.

- The unexplained increase implies that some people who were counted as non-Indigenous (or whose Indigenous status was recorded as unknown) in the 2006 Census were counted as Aboriginal and Torres Strait Islander in the 2011 Census (and ABS analysis indicates this change in identification moves in both directions). It is therefore not possible to say with certainty whether changes in measured outcomes across the two Censuses are due to changes in the outcome being measured, or whether they are due to a change in the group of people whose outcomes are being measured.
- Census-based population data are often used in combination with administrative data to calculate rates or percentages. It is not known whether the unexplained increase in Indigenous identification in the Census has been matched by a similar increase in identification of Aboriginal and Torres Strait Islander Australians in administrative data.

The impact of the unexplained increase in Indigenous identification in the Census is particularly important where the increase is concentrated among particular groups of people, such as those in particular geographic or remoteness areas, or in particular age cohorts. The unexplained increase in 2011 was mainly among children and people living in the eastern states. Of the 27 800 unexplained increase:

- 94 per cent (26 100 out of 27 800) were in NSW, Victoria and Queensland
- 34 per cent (9400 out of 27 800) was attributable to children aged 5–9 years in 2011. About 10 500 more people aged 20–54 years in 2011 identified as being of Aboriginal and/or Torres Strait Islander origin than people aged 15–49 years in 2006. Many of these people would have been parents and completed Census forms on behalf of their children, contributing to the increase in the count of Aboriginal and/or Torres Strait Islander children aged less than 15 years (ABS 2013b).²

² The distribution of the unexplained increase by remoteness area is not available.

Survey data

Surveys can provide a rich source of data, but are often only reliable at higher levels of aggregation, for example, national and State and Territory data, and sometimes remoteness area disaggregation. (The reliability of survey data at lower levels of disaggregation is limited by sampling error.)

The ABS has historically operated a three-yearly rolling program of Aboriginal and Torres Strait Islander household surveys, the most recent being the 2014-15 National Aboriginal and Torres Strait Islander Social Survey (NATSISS). Data from this survey were released from 28 April 2016, and form an important component of this report. The next survey in the program is yet to be determined.³

Sample size limits the extent to which data can be disaggregated by different factors such as geography, age and sex, particularly for characteristics that are not widespread across the population. The sample for the NATSISS was designed to provide reliable estimates for remote and non-remote areas, by State and Territory and for Torres Strait Islander Australians.

Data from other ABS surveys (for example, the General Social Survey and the National Health Survey) are included in this report, often to provide non-Indigenous comparators for NATSISS data. Currently, most general population surveys do not contain a large enough representative sample of Aboriginal and Torres Strait Islander Australians to allow for disaggregation by Indigenous status.

Confidence intervals and relative standard errors

Results from sample surveys are subject to sampling error because they are based on samples of the total population, rather than the whole population. (Data collections that seek to include the entire population, including the Census, are not subject to sampling error.)

Where sample survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals⁴. This means that there is a 95 per cent chance that the true value of the measure lies within the interval shown by the error bars. This report uses standard tests of statistical significance and only highlights differences if they are statistically significant (although it should be noted that, just because a difference is ‘statistically significant’, that does not mean the difference is necessarily material or important).

³ The ABS is currently developing the Australian Population Survey which is intended to consolidate and integrate its previous set of household surveys (which include the three-yearly Indigenous surveys). The timing for this survey is yet to be determined (ABS 2016).

⁴ Although not sample survey data, literacy and numeracy data include 95 per cent confidence intervals (section 4.5) and mortality data include variability bands (sections 4.1 and 4.2), which account for variability in results due to non-sampling error.

Relative standard errors (RSEs) are a statistical measure of the precision of a survey statistic. RSEs for all survey data included in the report are shown in the relevant attachment tables, which are available on the website (www.pc.gov.au/oid2016).

Administrative data

A range of administrative data is used across this report. These data are collected for different reasons, including for regulatory purposes or administration of government programs. The resulting administrative records can also be used for statistical purposes. These data are constantly updated and new data may be available annually or more frequently. However, Australia's federal system means that there are often differences across states and territories in the types of services provided, or the definitions used within data collections, which make it difficult to compare results across jurisdictions or to estimate national totals. Major differences in definitions or data collections are noted in this report as appropriate.

In some instances, administrative data can offer important advantages over direct collection of data from the population concerned (particularly in reducing respondent burden). However, administrative data may not represent all of the population of interest (for example, data related to the delivery of a government service will only include people who accessed the service).

Although there is general agreement on a 'standard Indigenous status question' to ensure consistency in data collections (ABS 2014b), there can be issues with the accuracy of Indigenous identification across jurisdictions and over time. Aboriginal and Torres Strait Islander Australians are not always asked the question, there are situations where they may choose not to identify, and there are also some inconsistencies in the recording of Indigenous status across jurisdictions and collections. Governments have committed to improve the identification of Aboriginal and Torres Strait Islander Australians in data collections as part of the National Indigenous Reform Agreement (NIRA).

Administrative data can also be affected by the availability or accessibility of services, and by Aboriginal and Torres Strait Islander Australians' willingness (or 'propensity') to access those services. For example, different rates of substantiated child abuse and neglect across jurisdictions or over time may be the result of differential access to services or different propensities to report child abuse, rather than differences in its occurrence (see section 4.10).

Rate ratios and rate differences

For some indicators, rate differences and rate ratios are calculated to compare rates between different groups, consistent with the approach in NIRA reporting. They are most commonly used when comparing age standardised rates.

-
- A *rate ratio* compares rates, to allow statements such as ‘the rate for Aboriginal and Torres Strait Islander Australians is three times the rate for non-Indigenous Australians’. For example, if the rate for Aboriginal and Torres Strait Islander Australians is 30 per cent and the rate for non-Indigenous Australians is 10 per cent, the rate ratio would be three to one (or 3:1).
 - A *rate difference* highlights the difference between rates, to allow statements such as ‘the rate for Aboriginal and Torres Strait Islander Australians is 20 percentage points higher than the rate for non-Indigenous Australians’. For example, if the rate for Aboriginal and Torres Strait Islander Australians is 30 per cent and the rate for non-Indigenous Australians is 10 per cent, the rate difference is 20 percentage points.

3.3 Demographics of the Aboriginal and Torres Strait Islander population

This section provides a brief introduction to some of the key Aboriginal and Torres Strait Islander demographics. More information is provided in appendix 2.

How many people?

At 30 June 2011, the estimated resident Aboriginal and Torres Strait Islander population of Australia was 670 000 people, out of a total population of 22.3 million people (approximately 3 per cent of the total Australian population, up from 2.9 per cent in 2006 using recast 2011 Census-based estimates). Within the Aboriginal and Torres Strait Islander population, an estimated 606 000 people (90 per cent) were of Aboriginal origin, 38 100 people (6 per cent) were of Torres Strait Islander origin and 25 600 people (4 per cent) were of both origins (ABS 2013c). The projected Aboriginal and Torres Strait Islander population at 30 June 2016 was 745 000 (ABS 2014a), which was 3.1 per cent of the projected total population of 24.4 million (ABS 2013d)⁵.

Population distribution

Service providers need to consider the geographic and age distribution of the Aboriginal and Torres Strait Islander population, and the requirements of different groups within that population if they are to meet people’s needs and address disadvantage. Services must also accommodate Aboriginal and Torres Strait Islander Australians’ relatively high rates of temporary mobility and anticipate medium to long term demographic trends.

Higher proportions of the estimated residential populations of both the Aboriginal and Torres Strait Islander Australians (31 per cent) and the non-Indigenous Australians (32 per cent) lived in NSW than in other states and territories in 2011. Other states and

⁵ Projections for both populations based on ABS series B.

territories with significant shares of the national Aboriginal and Torres Strait Islander population included Queensland (28 per cent), WA (13 per cent) and the NT (10 per cent) (figure 3.3.1).

Figure 3.3.1 Population distribution, June 2011

Proportion of national population in each State and Territory

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001; ABS 2014, *Estimates and projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026*, Cat. no. 3238.0. See appendix 2 for more information.

Mobility

A range of evidence suggests that Aboriginal and Torres Strait Islander Australians are more mobile than non-Indigenous Australians. Rather than living permanently in a single location, Aboriginal and Torres Strait Islander Australians may move between locations (including between remoteness areas) to access health, housing, employment and education services (Prout 2008) and for a range of cultural and family reasons (DEST et al. 2002). This mobility can make it difficult for governments to plan for the delivery of services, if shifting populations cause unexpected variations in the level of demand at different times in different places (Markham et al. 2013). However, Dockery (2014) states that mobility must be considered in light of its importance in maintaining Aboriginal and Torres Strait Islander culture and identity, and therefore more information is required about the reasons for temporary mobility, how it contributes to wellbeing and how it can be accommodated within models of service delivery (Dockery 2014).

Previous analyses of Censuses found that Aboriginal and Torres Strait Islander Australians were more mobile (i.e., temporary or permanent move either within a day or overnight) than non-Indigenous Australians (Biddle and Prout 2009), though when age was controlled for, this effect was reversed (Biddle and Yap 2010). Recent analysis drawing on the Australian Census Longitudinal Database found that after controlling for a limited set of

characteristics (including age and previous patterns of mobility) Aboriginal and Torres Strait Islander Australians were less likely to change usual residence than non-Indigenous Australians (Biddle and Crawford 2015). This recent analysis indicates that it is not being Aboriginal or Torres Strait Islander that predicts mobility, but other characteristics. Biddle and Crawford (2015) found that younger people and those who did not live in a house owned or being purchased by the usual residents were more mobile than those without these characteristics, and given that Aboriginal and Torres Strait Islander Australians are younger and more likely to live in a private rental compared to non-Indigenous Australians these are some of the factors influencing their higher rates of mobility.

Age profile of the Aboriginal and Torres Strait Islander population

The Aboriginal and Torres Strait Islander population has a much younger age structure than the non-Indigenous population. In 2011, more than one-third (35.9 per cent) of the estimated Aboriginal and Torres Strait Islander population was aged under 15 years, compared with 18.4 per cent of the estimated non-Indigenous population. At the other end of the life course, an estimated 1.0 per cent of the Aboriginal and Torres Strait Islander population was aged 75 years and over in 2011, compared with 6.5 per cent of the non-Indigenous population (figure 3.3.2).

Figure 3.3.2 Population distribution, Australia, by age, 30 June 2011^{a,b}

^a Includes other territories. ^b Estimates of the Aboriginal and Torres Strait Islander populations at 30 June 2011 are final based on the 2011 Census of Population and Housing.

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001; table A.1 in appendix 2.

The different age structures can make it difficult to compare outcomes across the two populations, especially where outcomes are closely associated with age. Therefore, a technique called ‘age standardisation’ is used to adjust relevant data for differences in population age structures. In this report, this includes data on disability, health and justice outcomes. Data in this report have been age standardised using the direct method, as it is best suited to comparisons over time.

3.4 Remoteness

Data on the population distribution of Aboriginal and Torres Strait Islander Australians by remoteness raise two contrasting points:

- the majority of Aboriginal and Torres Strait Islander Australians live in urban areas (57 per cent in major cities or inner regional areas) (figure 3.4.1)
- although they only make up 3 per cent of the total population, Aboriginal and Torres Strait Islander Australians make up relatively large proportions of the total population in remote (16 per cent) and very remote (45 per cent) areas (table A.2 in appendix 2).

Figure 3.4.1 Proportion of the population by remoteness area, 2011

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001, Canberra. See appendix 2 for more information.

An estimated 35 per cent of Aboriginal and Torres Strait Islander Australians (233 000 people) lived in major cities in 2011. A further 22 per cent (148 000 people) lived in inner regional areas, and another 22 per cent (146 000 people) in outer regional areas. An estimated 22 per cent (142 000 people) lived in remote or very remote areas. In comparison, almost 90 per cent of non-Indigenous Australians (over 19 million people) lived in major cities or inner regional areas (figure 3.4.1.)

Census data show that, over time, Aboriginal and Torres Strait Islander Australians are gradually becoming more urbanised, with a noticeable decrease in the number living in remote towns and settlements, and increasing numbers living in larger regional towns. At

the same time, the non-Indigenous population of some of these regional towns is declining, and so, Aboriginal and Torres Strait Islander Australians are becoming a larger proportion of the populations of those towns (Biddle and Markham 2013; Taylor and Biddle 2008).

In this report, relevant indicators are disaggregated by remoteness wherever possible (for some indicators, data are not available by remoteness or for all remoteness areas). For many indicators, remoteness data are only available at the national level, but disaggregation by remoteness at the national level can show patterns of disadvantage more clearly than disaggregation by State and Territory (but not remoteness). However, outcomes can vary across places with similar degrees of remoteness in different states and territories.

For many of the indicators in this report, average outcomes for Aboriginal and Torres Strait Islander Australians in major cities and regional areas are better than outcomes for Aboriginal and Torres Strait Islander Australians in remote and very remote areas, including for: health — life expectancy (section 4.1), health behaviours during pregnancy (section 6.2), birthweight (section 6.4), potentially preventable hospitalisations (section 8.2); education — reading, writing and numeracy (section 4.4), year 12 attainment (section 4.6), post-secondary education (section 4.8); employment — employment to population rate (section 4.7); income (section 4.10); and housing — home ownership (section 9.3) and overcrowding in housing (section 10.1).

However, it is important to note there is significant variation within location types. There are many relatively advantaged regional and remote areas and many disadvantaged urban areas (Biddle 2009, 2013). The majority of Aboriginal and Torres Strait Islander Australians do not live in remote areas, and wherever Aboriginal and Torres Strait Islander Australians live, on average, their outcomes are poorer than outcomes for non-Indigenous Australians in those same areas. Aboriginal and Torres Strait Islander Australians in cities and large regional towns are concentrated in neighbourhoods with low socioeconomic outcomes, and tend to have poorer outcomes than non-Indigenous Australians in those same neighbourhoods (Biddle 2009, 2013; Taylor 2006).

Measuring remoteness

For most indicators in this report, remoteness is measured according to the ABS Australian Statistical Geography Standard (ASGS). The ASGS identifies a location in Australia as having a particular degree of remoteness based on its distance from population centres of various sizes. Some indicators are disaggregated into five remoteness area categories (major cities, inner regional, outer regional, remote, and very remote). When data quality does not support disaggregation into five categories, indicators may be collapsed for some of these categories. For more information on how remoteness is defined see ABS (2013a).

As discussed in chapter 1, the primary focus of this report is on aggregate results at the national and State and Territory level, to help ensure the underlying causes of disadvantage and foundations of wellbeing are being addressed. However, the ability to disaggregate

data into finer geographic classifications is essential for planning and coordinating the delivery of services. Some approaches include:

- the ABS Australian Indigenous Geography Structure (AIGS), which provides a geographical standard for the publication of statistics about the Aboriginal and Torres Strait Islander population, with a three level hierarchy from very small Indigenous Locations up to larger Indigenous Areas and even larger Indigenous Regions (ABS 2011)
- Taylor and Biddle's alternative geographic classification based on structural settings (that is, the types of places people live) — city areas; large regional towns; small regional towns and localities; regional rural areas; remote towns; Indigenous towns; town camps; and remote dispersed settlements (Taylor and Biddle 2008).

At present, the lower levels of the ABS AIGS and Taylor and Biddle's structural settings approach can only be readily applied to Census data.

3.5 Interactions across the report

As noted in chapter 2, there are many interactions across the report's framework of indicators. A number of these are noted in the discussion of relevant indicators. However, in many areas, research on the underlying causal factors linking different outcomes is still thin.

Chapter 13 of this report presents information on the associations between different aspects of wellbeing. Section 13.1 presents information on the interactions between selected proxy measures of the COAG targets (with a focus on education and employment), using 2014-15 NATSISS data. Section 13.2 presents an overview of recent work by the Productivity Commission into what works best to improve primary school outcomes for Aboriginal and Torres Strait Islander children.

This section of the report looks at the potential for multiple causes to contribute to a single measured outcome, and the potential for some actions to affect multiple outcomes.

Multiple causes

Prevention and early intervention lie at the heart of the report framework. The focus is on encouraging action in the strategic areas that, over time, will lead to improvements in the COAG targets and headline outcomes, and progress toward the priority outcomes. However, in many cases, coordinated action is required across multiple areas if high level outcomes are to improve. Figures 3.5.1 and 3.5.2 illustrate just some of the many linked factors that can affect outcomes.

Figure 3.5.1 illustrates how the COAG targets of employment (section 4.7), year 12 or equivalent attainment (section 4.6), school attendance (section 4.5) and reading, writing

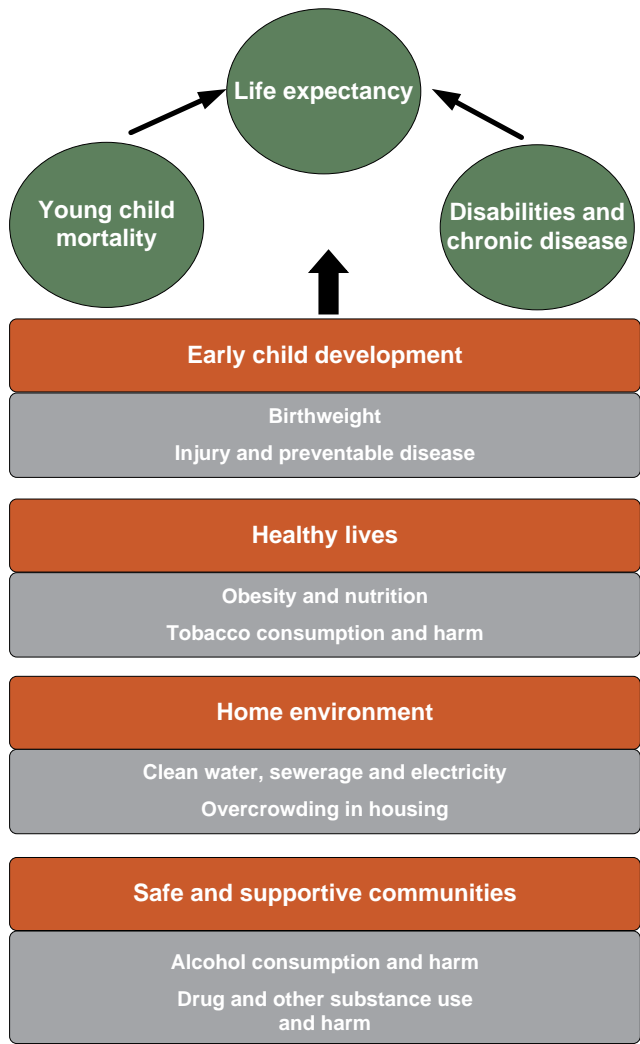

and numeracy (section 4.4), plus the headline indicator of post-secondary education (section 4.8), are influenced by outcomes across the framework. It is obvious that educational success will depend on outcomes in the ‘Education and training’ strategic area, which in turn depend on the achievement of outcomes in the ‘Early child development’ strategic area. However, social and environmental factors, such as those in the ‘Home environment’ and ‘Safe and supportive communities’ strategic areas affect all these outcomes. Of course, these are not the only factors at work — employment and education outcomes can also be influenced by the inter-generational effects of parental income, employment and education levels. The message from the framework is that, although educational services play an important role in achieving these COAG targets and headline indicators, many other services must also play a part.

Figure 3.5.1 Multiple causes — employment and education

In figure 3.5.2, the COAG targets of ‘Life expectancy’ (section 4.1) and Young child mortality’ (section 4.2) are clearly linked, and are closely related to the headline indicator of ‘Disability and chronic disease’ (section 4.9). In turn, these outcomes will be influenced by outcomes in the ‘Early child development’ and ‘Healthy lives’ strategic areas. But actions in these areas must be supported by actions to address outcomes in the ‘Home environment’ and ‘Safe and supportive communities’ strategic areas. Actions must also address other social determinants of health in the education and employment areas.

Figure 3.5.2 **Multiple causes — health**

Multiple effects

Although some high level outcomes may require actions across a range of areas, sometimes a single, well-targeted action can influence a range of outcomes. These

interactions emphasise the need for a whole-of-government approach to assessing the costs and benefits of such actions.

For example, housing typically is regarded as the responsibility of State and Territory departments of housing. But as illustrated in figure 3.5.3, reducing overcrowding can affect the COAG target of ‘Reading, writing and numeracy’ (section 4.4), and headline indicators of ‘Disability and chronic disease’ (section 4.8) and ‘Family and community violence’ (section 4.11) as well as outcomes in the ‘Education and training’, ‘Healthy lives’, ‘Home environment’ and ‘Safe and supportive communities’ strategic areas. Although other influences are also important in each of these areas, there is sufficient evidence for education, health and justice departments to be concerned about housing issues.

Figure 3.5.3 Multiple effects — overcrowding

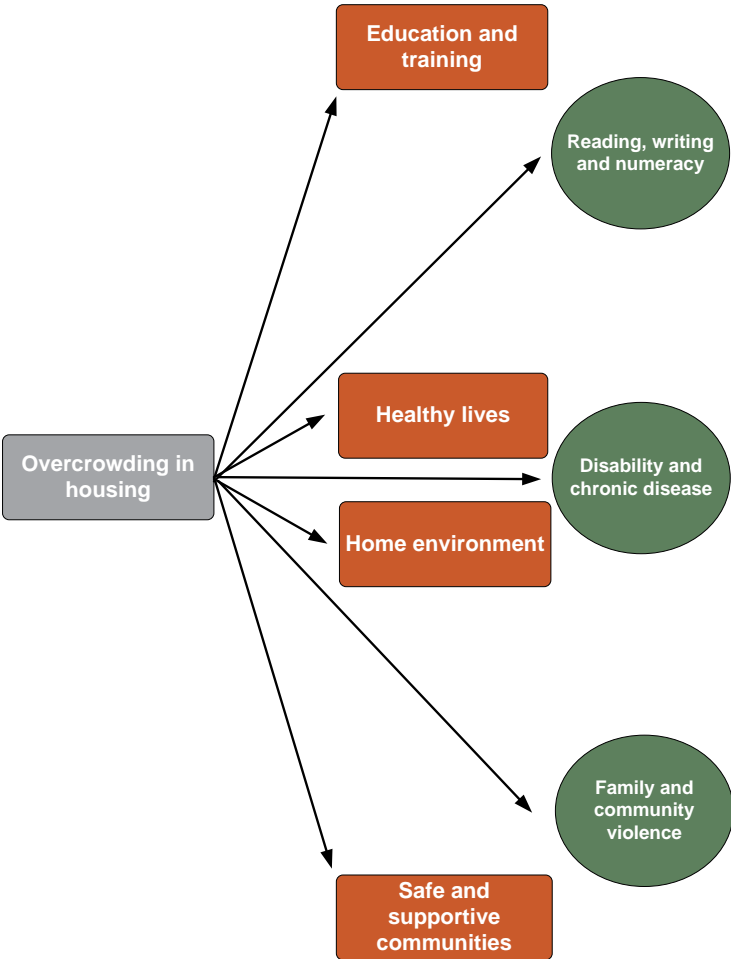

Figure 3.5.4 illustrates similar links for actions designed to address excessive alcohol consumption and associated harm. Misuse of alcohol can contribute to the COAG target of ‘Employment’ (section 4.7) and the headline indicators of ‘Disability and chronic disease’ (section 4.9) and ‘Family and community violence’ (section 4.12) and affect outcomes in

the ‘Early child development’, ‘Healthy lives’, ‘Economic participation’, and ‘Safe and supportive communities’ strategic areas, among others. Although alcohol misuse is not the only influence in these areas, a range of studies have identified the significant part this risk factor can play in a broad range of outcomes (section 11.1).

Figure 3.5.4 **Multiple effects — alcohol**

3.6 Things that work — success factors

Brief case studies of ‘thing that work’ in improving outcomes for Aboriginal and Torres Strait Islander Australians have been a part of this report since 2005. Not everything that matters can be captured in indicators, and some information is better presented in words, rather than numbers. In particular, community level change may not show up in State and Territory or national data.

As noted in chapter 2, ‘Things that work’ in this report were assessed against a broad set of criteria before they were included. However, formal evaluations of programs for Aboriginal and Torres Strait islander Australians are relatively scarce (PC 2013). In order to provide a range of examples to illustrate how things can change for the better, the Steering Committee has included case studies of some promising programs that have not undergone rigorous evaluation (noting the desirability of formal evaluation for these programs). There is an urgent need for more research and evaluation to identify successful programs and the reasons for their success (PC 2013, 2015).

The Closing the Gap Clearinghouse identified the following high level principles and practices that underpin successful programs for Aboriginal and Torres Strait Islander Australians:

- flexibility in design and delivery so that local needs and contexts can be taken into account
- community involvement and engagement in both the development and delivery of programs
- the importance of building trust and relationships
- a well-trained and well-resourced workforce, with an emphasis on retention of staff
- continuity and coordination of services (CTGCH 2013).

These success factors are closely related to the six determinants of good governance described in chapter 5, section 5.4 (governing institutions; leadership; self-determination; capacity building; cultural match; and resources) and the success factors identified by the Steering Committee in previous reports:

- cooperative approaches between Aboriginal and Torres Strait Islander Australians and government — often with the non-profit and private sectors as well
- community involvement in program design and decision-making — a ‘bottom-up’ rather than ‘top-down’ approach
- good governance — at organisation, community and government levels
- ongoing government support — including human, financial and physical resources.

Cooperative approaches

Cooperation between Aboriginal and Torres Strait Islander Australians and governments seems an obvious ingredient for successful programs. Nevertheless it does not always occur. Cooperative approaches require Aboriginal and Torres Strait Islander communities and organisations, governments, non-profit organisations and private businesses to work as partners. Hunt (2010) has explored some aspects of cooperative partnerships between non-government organisations, Aboriginal organisations and communities. Success is much more likely where each party acknowledges the value, and supports the contributions of, the other partners (Hunt 2010).

Most case studies in the report are based on cooperative approaches between governments, communities and other organisations. Examples include:

- the Aboriginal Maternity Group Practice Program in WA, under which Aboriginal Health Officers, Aboriginal grandmothers and midwives work with existing services to improve timely access to antenatal and maternity services (box 6.1.3)
- the Ngala Nanga Mai pARenT Group program in NSW, which operates in partnership with the NSW Department of Child Health to provide parenting support services to young Aboriginal parents and their children (box 6.3.3)
- the national Supply Nation program, which assists Indigenous businesses to enter into commercial relationships with large corporations and government agencies (box 9.2.4).

Cooperative approaches are closely related to the second success factor — community involvement in program design and decision making.

Community involvement

Community involvement in program design and decision-making is closely related to self-determination, one of the determinants of good Indigenous governance (see section 5.4). The Harvard Project on American Indian Economic Development found that self-determination led to improved outcomes for North American Indigenous people:

When [Indigenous people] make their own decisions about what development approaches to take, they consistently out-perform [non-Indigenous] decision makers. (Harvard Project nd)

The former Aboriginal and Torres Strait Islander Social Justice Commissioner, Tom Calma, considered that much of the failure of service delivery to Aboriginal and Torres Strait Islander Australians was a direct result of the failure to engage and to support and build the capacity of communities:

Put simply, governments risk failure if they develop and implement policies about Indigenous issues without engaging with the intended recipients of those services. Bureaucrats and governments can have the best intentions in the world, but if their ideas have not been subject to the ‘reality test’ of the life experience of the local Indigenous peoples who are intended to benefit from this, then government efforts will fail. (Calma 2006)

Community involvement is a key factor in the success of most case studies in this report. Some specific examples of successful community involvement include:

- the Families as First Teachers program in the NT, which involves parents and families in young children’s early learning and development (box 4.3.3)
- the Yiriman project in WA, under which elders take young people on trips back to country ‘to immerse them in the stories, songs and knowledge that are their cultural heritage’ (box 8.8.3)
- the Mossman Gorge Centre in Queensland, where the local people were involved in the development of, and providing the ongoing staffing for, the Centre (box 9.1.3).

Good governance

Good governance — at organisation, community and government levels — is closely related to several of the key determinants of good Indigenous governance (see section 5.4):

- governing institutions
- leadership
- capacity building
- cultural match.

Unless organisations, communities and governments demonstrate principles of good governance, programs are likely to fail.

Good governance is essential to all successful case studies in the report. Particular examples include:

- the Kimberley Aboriginal Law and Cultural Centre Cultural Governance Program in WA, which works in cooperation with local Aboriginal law and culture to successfully repatriate sacred objects and remains (box 5.4.6)
- the finalists and winners of the Reconciliation Australia/BHP Billiton Indigenous Governance Awards, including the Waltja Tjutangku Palyapayi Aboriginal Corporation in central Australia (box 5.4.2) and the Marruk Project in Victoria (box 5.4.3).

Ongoing government support

Virtually all the case studies in this report rely on government support to some extent — although many organisations are seeking greater financial diversity, to provide the independence to run programs as Aboriginal and Torres Strait Islander Australians want them to be run.

Resources is one of the key determinants of good governance (see section 5.4), and ongoing government support is closely related to this. Many programs for Aboriginal and Torres Strait Islander Australians are funded as short term pilots with no guaranteed continuity. Several successful programs included as ‘Things That Work’ in previous editions of this report no longer exist, because government support has been withdrawn.

In addition, many Aboriginal and Torres Strait Islander organisations, including successful organisations with long track records, are funded through multiple, short term government contracts that increase red tape and uncertainty, and place pressure on capacity and sustainability.

3.7 International comparisons

Comparisons of outcomes for Aboriginal and Torres Strait Islander Australians with outcomes for indigenous peoples in other countries could help identify areas where Australia could learn from other approaches to overcoming Indigenous disadvantage. However, such comparisons are not attempted in this report, due to lack of suitable current data.

The most meaningful comparisons of outcomes for Aboriginal and Torres Strait Islander Australians are likely to be with indigenous peoples from countries such as the United States, Canada, and New Zealand — developed countries with a history of relatively recent European colonisation, and a non-indigenous majority.

Many Latin American countries also have relatively recent European colonisation and indigenous minorities. However, most Latin American countries are less developed than Australia, have different economic, legal and social systems and typically have less developed statistical collections. In some other countries, particularly in Africa and Asia, groups of people may be identified as indigenous to specific areas where various ethnic groups have lived together for significant periods. In such cases, the distinction between indigenous and non-indigenous people can be less clear cut.

Comparability of international data

Very little internationally comparable data are available for outcomes for indigenous people. Although many countries have agreed to adopt international definitions for statistics such as life expectancy, disease codes for mortality and hospitals, international testing of learning outcomes, and labour force participation, data are often only available for each country's total population — comparable data on indigenous people are not commonly available (see Freemantle et al (2007) for example on health data).

Even where data are available, caution must be used in comparing data with other countries, due to:

- different definitions used to identify who is an indigenous person
- variations in estimation methods, data quality and scope
- different economic, social and political environments.

The United Nations prepared a comprehensive assessment of the state of the world's indigenous people (UNPFII 2009). The report is largely qualitative, and focuses on the human rights of indigenous peoples. The limited quantitative data on outcomes for indigenous people in different countries are significantly older than those available for Aboriginal and Torres Strait Islander Australians included in this report. Recent reporting has tended to focus on specific issues (for example, cancer incidence (Moore et al. 2015)).

4 COAG targets and headline indicators

Figure 4.1 **Priority outcomes**

Box 4.1 **COAG targets and headline indicators**

COAG targets	Headline indicators
4.1 Life expectancy	4.8 Post-secondary education — participation and attainment
4.2 Young child mortality	4.9 Disability and chronic disease
4.3 Early childhood education	4.10 Household and individual income
4.4 Reading, writing and numeracy	4.11 Substantiated child abuse and neglect
4.5 Year 1 to 10 attendance	4.12 Family and community violence
4.6 Year 12 attainment	4.13 Imprisonment and juvenile detention
4.7 Employment	

The three priority outcomes that sit at the top of the report’s framework (figure 4.1) reflect COAG’s vision for Aboriginal and Torres Strait Islander Australians to have the same life opportunities as other Australians. The priority outcomes are interlinked — no single aspect of the priority outcomes can be achieved in isolation. ‘Positive child development

and prevention of violence, crime and self-harm’ are key determinants in the achievement of ‘safe, healthy and supportive family environments with strong communities and cultural identity’. Without these conditions in place, it is very difficult to achieve ‘improved wealth creation and economic sustainability’.

Progress against the COAG targets and headline indicators (box 4.1) reflects the extent to which this vision is becoming a reality. Like the priority outcomes themselves, these indicators are strongly inter-dependent. Few of the COAG targets or headline indicators are likely to improve solely as the result of a single policy or a single agency — positive change will generally require action across a range of areas. In addition, most of these high level indicators are likely to take some time to improve, even if effective policies are implemented in the strategic areas for action.

The COAG targets and headline indicators are high level indicators:

- life expectancy — life expectancy is a broad indicator of the long-term health and wellbeing of a population
- young child mortality — young child mortality (particularly infant (<1 year old) mortality) is an indicator of the general health of a population
- early childhood education — children’s experiences in their early years influence lifelong learning, behaviour and health. High quality early childhood education can enhance the social and cognitive skills necessary for achievement at school and later in life
- reading, writing and numeracy — improved educational outcomes are key to overcoming many aspects of disadvantage
- year 1 to 10 attendance — there is a direct relationship between days attending school and academic performance (this was an indicator in chapter 7 in the 2014 report but has been moved to this chapter following the COAG decision in late 2014 to set an attendance target)
- year 12 attainment — a year 12 or equivalent qualification significantly increases the likelihood of a successful transition to post-school activities, including further education, training and employment
- employment — employment contributes to living standards, self-esteem and overall wellbeing. It is also important to families and communities
- post-secondary education — participation and attainment — education can affect employment prospects and incomes, and also health and the ability to make informed life decisions
- disability and chronic disease — high rates of disability and chronic disease affect the quality of life of many Aboriginal and Torres Strait Islander Australians. Disability and chronic disease can also affect other outcomes, by creating barriers to social interaction and reducing access to services, employment and education

-
- household and individual income — the economic wellbeing of families and individuals is largely determined by their income and wealth. Higher incomes can enable the purchase of better food, housing, recreation and health care. There may also be psychological benefits, such as a greater sense of personal control and self-esteem
 - substantiated child abuse and neglect — many Aboriginal and Torres Strait Islander families and communities live under severe social strain, caused by a range of social and economic factors. Alcohol and substance misuse, and overcrowded living conditions are just some of the factors that can contribute to child abuse and neglect
 - family and community violence — family and community violence problems are complex, and the impact of such violence may be felt from one generation to another
 - imprisonment and juvenile detention — Aboriginal and Torres Strait Islander Australians are over-represented in the criminal justice system, as both young people and adults. Poverty, unemployment, low levels of education and lack of access to social services are all associated with high crime rates and high levels of imprisonment.

Attachment tables

Attachment tables for this chapter are identified in references throughout this chapter by an 'A' suffix (for example, table 4A.2.3). These tables can be found on the web page (www.pc.gov.au/oid2016).

4.1 Life expectancy¹

Box 4.1.1 Key messages

Life expectancy is a broad indicator of a population's long-term health and wellbeing.

- Nationally for Aboriginal and Torres Strait Islander babies born in 2010–2012, estimated life expectancy was 69.1 years for males and 73.7 years for females (table 4A.1.1). From 2005–2007 to 2010–2012, the gap in life expectancy for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians narrowed for both males and females (from 11.4 to 10.6 years for males, and from 9.6 to 9.5 years for females) (tables 4A.1.1 and 4A.1.3).
- From 1998 to 2014, the Aboriginal and Torres Strait Islander mortality rate decreased from 448.7 to 433.5 deaths per 100 000 population (figure 4.1.1). In 2014, after adjusting for differences in population age structures, the Aboriginal and Torres Strait Islander mortality rate was 1.7 times the rate for non-Indigenous Australians (figure 4.1.2).
- From 1998 to 2014, after adjusting for differences in population age structures the gap between the Aboriginal and Torres Strait Islander and non-Indigenous mortality rates narrowed by 14 per cent (figure 4.1.2). Over this period, the leading causes of death for Aboriginal and Torres Strait Islander and non-Indigenous Australians were diseases of the circulatory system and neoplasms (cancers). The gap in rates narrowed for the former and widened for the latter (table 4A.1.19).

Box 4.1.2 Measures of life expectancy

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Estimated life expectancy at birth* is defined as the average number of years a person could expect to live, if they experienced the age/sex specific death rates that applied at their birth.

The most recent available data are from the ABS Aboriginal and Torres Strait Islander and non-Indigenous life tables for 2010–2012 (NSW, Queensland, WA, the NT and national; sex; remoteness). Life expectancy estimates for Victoria, SA, Tasmania and the ACT are not available by Indigenous status because of small Aboriginal and Torres Strait Islander populations in these jurisdictions (although data are included in national totals).

Data are also provided for one supplementary measure (aligned with the associated NIRA indicator). *Mortality rate by leading causes* is defined as the number of deaths per 100 000 population (considered a proxy annual measure for life expectancy). The most recent available data for mortality rates are from the ABS Deaths Collection (all cause totals) and the ABS Causes of Death Collection, with the most recent available data for 2014 (NSW, Queensland, WA, SA and the NT; age; sex; remoteness).

Life expectancy is an indicator of long-term health and wellbeing, and a key measure of the health of populations. Life expectancy is influenced by employment, education, housing, sanitation and access to healthcare (Becker, Philipson and Soares 2003; Carson et

¹ The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

al. 2007; Mariani, Perez-Barhona and Raffin 2010). The Council of Australian Governments (COAG) has committed to ‘closing the life expectancy gap [between Indigenous and non-Indigenous Australians] within a generation’ (COAG 2012).

Life expectancy can be increased by engagement in positive health behaviours (see sections 8.4, 8.5, and 11.1), improving access to high quality health services, greater levels of preventative care, early diagnosis of diseases and more effective treatment of chronic diseases (see sections 4.9, 8.1 and 8.2). Aboriginal and Torres Strait Islander Australians on average die earlier than non-Indigenous Australians and their death rates are 1.7 times as high as those for non-Indigenous Australians (figure 4.1.2). Social and economic factors such as poverty, disadvantage, racism and stress can lead to people engaging in unhealthy behaviours and affect access to the health system. On average, Aboriginal and Torres Strait Islander people also experience poorer health due to risk factors such as smoking, excessive alcohol consumption, illicit drug use, insufficient physical activity, and poor nutrition which, in turn, contribute to higher rates of chronic disease (AIHW 2012). On the other hand, positive cultural, social and economic factors all help to support positive health outcomes. There is a substantial body of evidence that influencing the social and economic determinants of Aboriginal and Torres Strait Islander health can contribute to closing the life expectancy gap between Aboriginal and Torres Strait Islander and non-Indigenous Australians (AHMAC 2015; AIHW 2015; Osborne, Baum and Brown 2013).

Life expectancy

Aboriginal and Torres Strait Islander males born between 2010 and 2012 have an estimated life expectancy of 69.1 years, 10.6 years less than non-Indigenous males. Aboriginal and Torres Strait Islander females have an estimated life expectancy of 73.7 years, 9.5 years less than non-Indigenous females (table 4A.1.1). (Females live longer than males in both the Aboriginal and Torres Strait Islander and non-Indigenous populations.) The life expectancy gap for both sexes has narrowed since 2005–2007 (from 11.4 to 10.6 years for males, and from 9.6 to 9.5 years for females) (tables 4A.1.3 and 4A.1.1).

An improvement has been made to the calculation of Aboriginal and Torres Strait Islander life expectancy at the national level for 2010–2012 (with comparable data produced for 2005–2007). However, this improved method (which takes age-specific identification rates into account) could not be used for individual jurisdictions and remoteness areas. Comparable, non-age-adjusted national level data are provided in tables 4A.1.1 and 4A.1.3 to enable jurisdictional and remoteness comparisons.

Life expectancy for Aboriginal and Torres Strait Islander Australians is available for the first time by remoteness. For 2010–2012, life expectancy for those living in major cities/inner regional areas was around 0.7 years longer for males and 0.8 years longer for females, than for those living in outer regional, remote and very remote areas (68.0 years

compared with 67.3 years for males, and 73.1 years compared with 72.3 years for females) (table 4A.1.2).

Mortality rates by leading causes

Mortality rates (defined as the number of deaths per 100 000 population) are considered an annual proxy measure for life expectancy. The following caveats apply:

- five-year aggregate data are used for current period analysis, due to the volatility of the small number of annual deaths. Single year data are presented for time series analysis only
- data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT only, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

All-cause mortality

From 1998 to 2014, Aboriginal and Torres Strait Islander mortality rates for NSW, Queensland, WA, SA and the NT combined declined by 3.4 per cent (from 448.7 to 433.5 deaths per 100 000 population) (figure 4.1.1).

Figure 4.1.1 **Aboriginal and Torres Strait Islander mortality rates, NSW, Queensland, WA, SA and the NT, by sex, 1998 to 2014^{a, b}**

^a Rates are crude rates. ^b Data for these five jurisdictions are not representative of rates in other jurisdictions.

Source: ABS (unpublished) Deaths, Australia; table 4A.1.5.

Mortality rates for Aboriginal and Torres Strait Islander females were consistently lower than those for males from 1998 to 2014, but the gap between males and females has

narrowed from 156.5 to 69.8 deaths per 100 000 population reflecting an overall rate increase for females and a corresponding decrease for males (figure 4.1.1).

For 2010–2014, after adjusting for differences in population age structures, the mortality rate for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians (table 4A.1.6).

For specific age groups for 2010–2014:

- the 35–44 year age group had the largest rate ratio, with the Aboriginal and Torres Strait Islander mortality rate around four times the non-Indigenous rate (398.3 compared with 96.6 deaths per 100 000 population).
- The 65–74 year age group had the largest absolute difference in mortality rates between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (2803.6 compared with 1252.6 deaths per 100 000 population — a difference of 1551.0 deaths per 100 000 population) (table 4A.1.4).

Figure 4.1.2 Mortality rates, NSW, Queensland, WA, SA and the NT 1998 to 2014^{a, b}

^a Rates have been directly age-standardised using the 2001 Australian standard population. ^b Data for these five jurisdictions are not representative of rates in other jurisdictions.

Source: ABS (unpublished) Deaths, Australia; table 4A.1.5

After adjusting for differences in population age structures, the gap between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians narrowed from 479.4 deaths per 100 000 population in 1998 to 410.3 deaths per 100 000 population in

2014. This represents a narrowing of the gap in mortality rates of 14 per cent over the period (figure 4.1.2).

Data for all-cause mortality rates reported for selected states and territories are also available in table 4A.1.6.

The ABS has published mortality data disaggregated by remoteness in *Deaths, Australia, 2014* (ABS Cat. no. 3302.0). These data are not included in this report, as they are not adjusted for the under-identification of Aboriginal and Torres Strait Islander Australians in death registrations. Under-identification of Indigenous status in deaths registrations increases as remoteness decreases, which makes interpretation of the results difficult.

Causes of death

Data by leading causes of death provide further context for understanding trends in mortality and life expectancy.²

For 2010–2014, the leading causes of death for Aboriginal and Torres Strait Islander Australians were: diseases of the circulatory system (24.5 per cent of all deaths); cancers (neoplasms) (20.8 per cent) and external causes (for example, suicide, transport accidents, falls and poisoning) (15.1 per cent) — these three causes combined accounted for 3 in 5 deaths (table 4A.1.9).

From 1998 to 2014, after adjusting for differences in population age structures, the gap in mortality rates between Aboriginal and Torres Strait Islander and non-Indigenous Australians (table 4A.1.19):

- narrowed where the leading causes were:
 - diseases of the circulatory system — from a gap of 169.4 deaths to 88.0 deaths per 100 000 population. Rates have decreased over time for Aboriginal and Torres Strait Islander and non-Indigenous Australians, but with a greater decrease for Aboriginal and Torres Strait Islander Australians.
 - diseases of the respiratory system — from a gap of 81.7 deaths to 59.8 deaths per 100 000 population. This decrease was predominately due to a relatively large decrease for Aboriginal and Torres Strait Islander Australians.
- widened where the leading cause was neoplasms (cancers) — from a gap of -5.0 deaths to 55.8 deaths per 100 000 population. This increase reflects consistently higher rates for Aboriginal and Torres Strait Islander Australians since 2006 compared to the period from 1998 to 2006, whilst for non-Indigenous Australians the trend was reversed.³

² Data are provided for selected causes of death according to the ICD-10 codes used for leading cause of death in the Aboriginal and Torres Strait Islander Health Performance Framework. This approach aligns with that used for the NIRA performance reporting.

³ Lung cancer is the most common leading cause of cancer death for both Aboriginal and Torres Strait Islander and non-Indigenous Australians (ABS 2016).

-
- remained similar where the leading cause was external causes of morbidity and mortality — from a gap of 47.2 per 100 000 population to 46.8 per 100 000 population.

Higher Aboriginal and Torres Strait Islander cancer mortality rates may be partly due to factors such as later diagnoses, lower likelihood of receiving treatment, and greater likelihood of being diagnosed with cancers for which the prospect of successful treatment and survival is poorer (AHMAC 2015).

Data for cause of death reported for selected state and territories are available in tables 4A.1.7–18 and from 2006 by sex in table 4A.1.20.

Future directions in data

The primary measure for this indicator, estimated life expectancy at birth, is based on a three-year average, published every five years (related to the availability of Census data). Currently, data are only able to be reported at the jurisdictional level for NSW, Queensland, WA and the NT. Further work is required to enable reporting of life expectancy estimates separately for all states and territories (subject to limitations imposed by the small number of Aboriginal and Torres Strait Islander deaths in some jurisdictions).

4.2 Young child mortality⁴

Box 4.2.1 Key messages

- From 1998 to 2014, there was a significant decline in mortality rates for Aboriginal and Torres Strait Islander children aged 0–4 years (from 216.8 to 159.1 deaths per 100 000 population). This decline was greater than that for non-Indigenous children (from 114.9 to 73.4 deaths per 100 000 population), resulting in a narrowing of the gap from 101.8 to 85.7 deaths per 100 000 population. In 2014, closing the gap would have been achieved if 64 Aboriginal and Torres Strait Islander child deaths had been prevented (table 4A.2.1).⁵
- The major contributor to the decrease in Aboriginal and Torres Strait Islander child mortality rates was a significant decrease in the infant (0–1 year) mortality rate (from 13.5 to 6.4 deaths per 1000 live births). The infant mortality gap narrowed from 9.0 to 3.1 deaths per 1000 live births (table 4A.2.1).
- Whilst the downward trend was visible from 1998 to 2012, volatility in the rates for Aboriginal and Torres Strait Islander child, infant and perinatal mortality in 2013 (due to a mix of small numbers and a lag in registration of perinatal deaths in 2012) make it difficult to ascertain trends in recent years.

Box 4.2.2 Measures for young child mortality

There is one main measure for this indicator (aligned with relevant NIRA indicator) *mortality rates for children aged less than five years, by leading cause of death*. The measure is reported for:

- *perinatal* — perinatal deaths as a rate of all live births
- *infant* — deaths among children under one year as a rate of live births
- *children aged 1–4 years* — deaths among children 1–4 years as a rate of the total population of children aged 1–4 years
- *children aged 0–4 years* — deaths among children 0–4 years as a rate of the total population of children aged 0–4 years.

Data are available for NSW, Queensland, WA, SA and the NT. Infant and child mortality data are sourced from the ABS Deaths Australia collection. Perinatal mortality data are sourced from the ABS Perinatal Deaths collection.

Causes of death are sourced from the ABS Causes of Death collection.

The mortality rate for children under five years is a key indicator of the general health and wellbeing of a population. The Council of Australian Governments (COAG) has committed to ‘halving the gap in mortality rates for Indigenous children under five within a

⁴ The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

⁵ This is calculated as the number of Aboriginal and Torres Strait Islander child deaths that would need to be prevented for the death rate per 100 000 population to be equivalent to the non-Indigenous death rate.

decade' (COAG 2012). Mortality rates are reported in this section for perinatal, infant, children aged 1–4 years and children aged 0–4 years (figure 4.2.1).

Figure 4.2.1 Young child mortality rates

Perinatal mortality is associated mainly with complications arising from pregnancy and childbirth, and rates may reflect access to antenatal services and health care in the neonatal period, as well as social determinants including maternal education, nutrition, smoking, alcohol use in pregnancy and socioeconomic disadvantage. Related information are presented in the early childhood development chapter of this report (6.1 (antenatal care); 6.2 (health behaviours during pregnancy); and 6.4 (birthweight)).

Most childhood deaths occur in the first year of life and are reflected in the infant mortality rates. In 2014, infant deaths comprised 0.7 per cent of all deaths, but almost three-quarters of deaths among children aged less than 12 years (derived from ABS 2015, table 21.1).

There was a dramatic decline in overall infant mortality rates in Australia over the 20th century. Infant death rates decreased from 103 deaths per 1000 live births in 1900 to 3.4 deaths per 1000 live births in 2014 (ABS 2002, 2015). During the first half of the 20th century, a significant share of this decline was associated with improvements in public sanitation and health education, followed by the development of immunisation programs. Improved neonatal and intensive care, education campaigns on immunisation and infant sleeping position have led to further modest declines in infant deaths (ABS 2000, 2010; AHMAC 2015; AIHW 2012; d' Espaignet et al. 2008). There have been significant reductions in perinatal mortality rates among Aboriginal and Torres Strait Islander Australians since the 1990s, but a gap still remains between these and the comparable rates for non-Indigenous Australians (AHMAC 2015).

The overall mortality rate for Australian children aged 1–4 years has declined over the 20th century, but not as significantly as infant and perinatal death rates. Once infancy has passed, injury emerges as one of the leading causes of death for all children (ABS 2005).

Mortality rates for children aged less than five years, by leading cause of death

Child mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis. Data are presented as five year aggregates to account for the volatility of small numbers.

For 2010–2014, the mortality rate for Aboriginal and Torres Strait Islander children aged 0–4 years was twice the rate for non-Indigenous children (166.0 deaths per 100 000 population, compared with 84.1 deaths per 100 000 population) (table 4A.2.5).

The majority of deaths occur in the first year of life. For the period 2010–2014, 83 per cent of Aboriginal and Torres Strait Islander child deaths and 85 per cent of non-Indigenous child deaths occurred during infancy (tables 4A.2.3 and 4A.2.5). The infant mortality rate for Aboriginal and Torres Strait Islander children was 6.2 per 1000 live births, compared with a rate of 3.5 per 1000 live births for non-Indigenous children (a rate ratio of 1.8:1) (table 4A.2.3).

The Aboriginal and Torres Strait Islander 1–4 year old mortality rate was 35.8 deaths per 100 000 population, 2.2 times the rate for non-Indigenous children (16.3 deaths per 100 000 population) (table 4A.2.4).

Perinatal mortality⁶ cannot be compared to the other child mortality measures, as rates are calculated based on the relevant births and include a subset of infant deaths. Due to timing of data release, latest year perinatal mortality data by leading cause of death is available for 2009–2013. The Aboriginal and Torres Strait Islander perinatal mortality rate was 9.9 per 1000 relevant births (comprising a fetal [pre-birth] mortality rate of 6.1 and neonatal [post-birth] mortality rate of 3.9 per 1000 relevant births). The non-Indigenous perinatal mortality rate was 8.1 per relevant live births (comprising a fetal mortality rate of 5.5 and neonatal mortality rate of 2.6 per 1000 relevant births) (table 4A.2.2).

For Aboriginal and Torres Strait Islander child, infant and perinatal mortality, there was a downward trend from 1998 to 2012, with volatility in numbers for 2013 and 2014 making it difficult to interpret the trend in recent years (in part due to a lag in registration of perinatal deaths that lead to reduction in the child mortality rate in 2012 and an increase in 2013). Due to small numbers, single year mortality data are volatile and should be interpreted with caution (table 4A.2.1).

⁶ Fetuses delivered with a gestational age of 20 weeks or more, or weighing at least 400 grams, and all neonatal deaths — infant deaths within 28 days of birth.

Figure 4.2.2 **Child mortality rates, NSW, Queensland, WA, SA and the NT, 1998 to 2014**

Source: ABS (unpublished) Deaths Australia, various years; table 4A.2.1.

From 1998 to 2014, Aboriginal and Torres Strait Islander mortality rates fluctuated but with no clear trend for children aged 1–4 years. For children aged 0–4 years, the rate decreased from 216.8 to 146.0 deaths per 100 000 population between 1998 and 2012 (due

to a strong decrease in infant mortality – see figure 4.2.3), and was 159.1 deaths per 100 000 population in 2014. The gap in mortality rates between Aboriginal and Torres Strait Islander and non-Indigenous children aged 0–4 years narrowed from 101.8 deaths per 100 000 population in 1998 to 66.8 deaths per 100 000 population in 2012, and was 85.7 deaths per 100 000 population in 2014 (figure 4.2.2). In 2014, closing the gap would have been achieved if 64 Aboriginal and Torres Strait Islander child deaths could have been prevented (table 4A.2.1)⁷.

Figure 4.2.3 Infant mortality rates (aged 0<1 year), NSW, Queensland, WA, SA and the NT, 1998 to 2014

Sources: ABS (unpublished) Causes of Death, Australia, various years; ABS (unpublished) Births, Australia, various years; table 4A.2.1

Infant mortality declined from 1998 to 2012 for Aboriginal and Torres Strait Islander children, from 13.5 to 5.0 deaths per 1000 live births, with the gap to non-Indigenous children narrowing from 9.0 to 1.7 deaths per 1000 live births over this period. In 2014, the infant mortality rate was 6.4 deaths per 1000 live births, with the gap to non-Indigenous children of 3.0 deaths per 1000 live births (figure 4.2.3).

Aboriginal and Torres Strait Islander perinatal mortality rates also decreased between 1998 and 2012, decreasing from 15.8 to 7.2 deaths per 1000 relevant births, with the gap to non-Indigenous mortality rates narrowing from 7.9 to -0.7 deaths per 1000 relevant births

⁷ This is calculated as the number of Aboriginal and Torres Strait Islander child deaths that would need to be prevented for the death rate per 100 000 population to be equivalent to the non-Indigenous death rate.

(ie, the perinatal mortality rate was higher for non-Indigenous children in 2012). In 2014, the Aboriginal and Torres Strait Islander perinatal mortality rate was 8.1 deaths per 1000 relevant births, with the gap to non-Indigenous children of 0.6 deaths per 1000 relevant births (table 4A.2.1).

Data on mortality rates for perinatal, infant, and children aged 0–4 years and 1–4 years are also available for selected states and territories in tables 4A.2.2, 4A.2.3, 4A.2.4 and 4A.2.5.

Mortality rates by leading causes

The leading cause of death for both Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0<1 year and 0–4 years for 2010–2014 was ‘certain conditions originating in the perinatal period’.⁸ This cause accounted for similar proportions of infant and child deaths for Aboriginal and Torres Strait Islander and non-Indigenous children:

- around half of all Aboriginal and Torres Strait Islander infant (0<1 year) deaths (3.2 deaths per 1000 live births) and non-Indigenous infant deaths (1.8 deaths per 1000 live births) (a rate ratio of 1.8:1) (table 4A.2.7)
- 43 per cent of all Aboriginal and Torres Strait Islander child (0–4 years) deaths (71.5 deaths per 100 000 population) and non-Indigenous child deaths (36.3 deaths per 100 000 population) (a rate ratio of 2.0:1) (table 4A.2.9).

Single year time series data are available for this leading cause for infants (table 4A.2.10) and children aged 0–4 years (table 4A.2.11), but due to the small numbers and the relatively short time period covered, the data are unlikely to reflect a statistically significant trend.

After deaths attributed to ‘other disorders originating in the perinatal period’, the major cause of death in the perinatal period was attributed to ‘disorders related to length of gestation and fetal growth’, which accounted for 31.6 per cent of Aboriginal and Torres Strait Islander perinatal deaths and 24.3 per cent of non-Indigenous perinatal deaths (table 4A.2.6).

Once the infancy period has passed, the leading cause of death for children aged 1–4 years is injury and poisoning. For 2010–2014, injury and poisoning accounted for 53.3 per cent of Aboriginal and Torres Strait Islander deaths of children aged 1–4 years (19.1 deaths per 100 000 population) and 33.0 per cent of deaths of non-Indigenous children (6.4 deaths per 100 000 population) (a rate ratio of 3.0:1) (table 4A.2.8).

⁸ Conditions originating in the perinatal period — such as birth trauma, disorders related to fetal growth, complications of pregnancy, labour and delivery, and respiratory and cardiovascular disorders specific to the perinatal period.

Future directions in data

There is limited information on the under-coverage of Aboriginal and Torres Strait Islander identification in mortality data. Following the release of the 2010-2012 life tables, the ABS examined the quality of Aboriginal and Torres Strait Islander identification in deaths data, including a national analysis by age, which showed that the identification rate for 0–14 year olds (0.83) was similar to the national all-age identification rate (0.82) (ABS 2013b).

Aboriginal and Torres Strait Islander child mortality rates are not available by remoteness. ABS has advised that further analysis is required to determine what adjustments are required for performance reporting purposes. The ABS has published some unadjusted data in *Deaths Australia, 2014*, but these data should be used with caution, as the under-identification of Indigenous status in deaths registrations increases as remoteness decreases (ABS 2013a).

4.3 Early childhood education⁹

Box 4.3.1 Key messages

- Early childhood education can provide children with a head start, and is associated with improved school completion and enhanced literacy, numeracy and social skills.
- Nationally in 2015, for Aboriginal and Torres Strait Islander children in the year before full time schooling, 87.0 per cent were enrolled in a preschool program and 79.8 per cent were attending a preschool program. This compares with 96.8 per cent (enrolment) and 93.0 per cent (attendance) for non-Indigenous children (tables 4A.3.2 and 4A.3.5).
- Preschool enrolment and attendance for Aboriginal and Torres Strait Islander children varies across remoteness areas. Nationally in 2015:
 - enrolment rates were 83.8 per cent in major cities, increasing to 90.9 per cent in remote/very remote areas (table 4A.3.8)
 - attendance rates were 79.8 per cent in major cities and 82.3 per cent in regional areas, decreasing to 73.4 per cent in remote/very remote areas (table 4A.3.11).
- In December 2015, COAG agreed to a new target for 95 per cent of Aboriginal and Torres Strait Islander four year olds to be enrolled in early childhood education by 2025 — extending beyond the expired 2013 target for remote communities. Calculations in this report should not be used for assessment against the new target.

Box 4.3.2 Measures of early childhood education

There are two primary measures for this indicator¹⁰.

- *Indigenous children aged 4 and 5 years enrolled in a preschool program* is defined as the number of Aboriginal and Torres Strait Islander children aged 4 and 5 years as at 1 July of the collection year, who are enrolled in a preschool program in the year before full time schooling, as a proportion of the estimated number of Aboriginal and Torres Strait Islander children aged 4 years.
- *Indigenous children aged 4 and 5 years attending a preschool program* is defined as the number of Aboriginal and Torres Strait Islander children aged 4 and 5 years as at 1 July of the collection year, who are attending a preschool program in the year before full time schooling, as a proportion of the estimated number of Aboriginal and Torres Strait Islander children aged 4 years.

The data collection for these measures is the ABS National Early Childhood Education and Care Collection (NECECC), with the most recent available data for 2015 (national: Indigenous

(continued next page)

⁹ The Steering Committee notes its appreciation to Associate Professor Karen Martin, Griffith University, who reviewed a draft of this section of the report.

¹⁰ Historically measures have aligned with those for the associated NIRA target. A new method for calculation of measures for the new NIRA early childhood education target was still under development at the time of preparing this report. Data in this section have been calculated using the historical measures and should not be used for assessing performance against the new NIRA target.

Box 4.3.2 (continued)

only; geolocation). For both measures, supplementary data are provided on non-Indigenous children to enable comparisons (all jurisdictions: Indigenous status). Data for non-Indigenous children exclude counts of children for whom Indigenous status is unknown or not stated.

The denominator used for reporting is the 4 year old population. For Aboriginal and Torres Strait Islander children, this is based on single year population projections. There is no annual estimate/projection for non-Indigenous children, so this population is derived by subtracting the Aboriginal and Torres Strait Islander population projections from the estimated resident population for all 4 year olds¹¹.

In 2008, the Council of Australian Governments (COAG) recognised the importance of early childhood education for Aboriginal and Torres Strait Islander children by including it as one of its six Closing the Gap targets. The target was to ensure that, within five years, all Aboriginal and Torres Strait Islander four year olds in remote communities had access to early childhood education by 2013 (operationalised in the NIRA as 95 per cent (COAG 2012, page 13)). In December 2015, COAG renewed the early childhood education target to 95 per cent of all four year old Aboriginal and Torres Strait Islander children enrolled in early childhood education by 2025 (COAG 2015).

In 2008, COAG endorsed National Partnership Agreements (NPAs) for Indigenous Early Childhood Development and Early Childhood Education, with the latter including a national priority to increase early childhood education participation rates, particularly for Aboriginal and Torres Strait Islander and disadvantaged children. Following the expiration of the NPA on Early Childhood Education in mid-2013, the NPA on Universal Access to Early Childhood Education was extended three times, most recently for 2017. These NPAs retained a focus on lifting participation rates for Aboriginal and Torres Strait Islander and vulnerable and disadvantaged children and, from 2015, included a requirement that early childhood education programmes be delivered in all settings, including long day care.

Further to these NPAs, in 2009 COAG endorsed the National Quality Framework for early childhood education and care, and outside school hours care, which was established in 2012, and replaced existing separate licensing and quality assurance processes for early childhood education and care (COAG 2009).

These policy developments have been informed by research on the benefits of early childhood education, particularly for disadvantaged groups. Although early childhood education is important, research shows that childhood development is also influenced by a wide variety of other factors, such as antenatal, family and social environments of children (Harrison et al. 2009; McCain, Mustard and Shanker 2007; Moore 2006; Mustard 2007;

¹¹ To address an anomaly arising from the undercount of infants in the 2011 Census, population estimates for 2015 are based on the average of population projections for 2014 and 2016. Population projections have been used in the calculations for both the Aboriginal and Torres Strait Islander population and non-Indigenous population (the latter derived from population projections for the total population minus projections for the Aboriginal and Torres Strait Islander population).

Schweinhart 2007), with more information on some of these factors included in chapter 6 of this report.

High quality early childhood education and care services can provide development opportunities for children, as well as support the needs of families (McCain, Mustard and Shanker 2007; PC 2014). Early childhood education programs can provide a head start at school and are associated with increased levels of school completion and enhanced literacy, numeracy, social skills, cognitive and problem-solving skills (De Bortoli and Thomson 2010 ; Harrison 2008; O’Connell et al. 2016 Mustard 2007; Schweinhart 2007). A study using data from the Longitudinal Study of Australian Children (LSAC) found that after controlling for socio-demographic characteristics, there was a significant positive association between attendance at preschool and Year 3 National Assessment Program — Literacy and Numeracy (NAPLAN) results (Warren and Haisken-DeNew 2013).

Investment in early childhood education, particularly for disadvantaged children, is more effective than intervention at later ages (Heckman 2006; PC 2014). The provision of services to Aboriginal and Torres Strait Islander children during their early years may also provide an opportunity for early intervention to address developmental problems (Hewitt and Walter 2011).

The quality of early childhood education programs, including program content and staff quality, can influence attendance and outcomes for children (Department of Education 2014). The provision of culturally appropriate programs is an important influence on Aboriginal and Torres Strait Islander children’s attendance at preschool (Fordham and Schwab 2007; High 2008; Hutchins, Saggars and Frances 2009; Mann, Knight and Thomson 2011; Sims et al. 2008). For families of Aboriginal and Torres Strait Islander children, the presence of an Aboriginal and Torres Strait Islander preschool worker is likely to have a positive influence on preschool attendance (Biddle 2007; Fordham and Schwab 2007; Mann, Knight and Thomson 2011).

Participation in preschool is also influenced by factors outside the early childhood education environment (Biddle 2011; Bowes and Kitson 2011; Hewitt and Walter 2011). Biddle (2011) found that going to cultural events and identifying with a cultural/language group were strongly associated with higher rates of preschool participation for Aboriginal and Torres Strait Islander children (section 5.7 has further information on children’s participation in cultural activities), whilst children who have lived in two or more homes since birth and those who had a carer who felt discriminated against were less likely to participate in preschool (section 5.1 has further information on people identifying as being discriminated against). A NSW study from 2008–2010 found that, for Aboriginal and Torres Strait Islander families in remote areas (compared to other areas), the travel and distance involved in accessing services had large financial and family support implications for parents (Bowes and Kitson 2011) (section 5.3 has further information on engagement with services).

Data issues

Data on the number of Aboriginal and Torres Strait Islander children enrolled in, and attending, preschool are available from the NECECC. The NECECC is an administrative data collection with data sourced from Australian, State and Territory government education departments. Five years of data are available from the NECECC (annually from 2011 to 2015). However, due to iterative improvements in data collection over time, 2013 represents the first year for which data are available for all states and territories on children in the year before full time schooling. In this report, data for the number of enrolments and attendance are reported for 2013, 2014 and 2015.

Population data for 4 year olds are used to derive enrolment and attendance rates. There was an undercount of infants (aged less than 1 year) in the 2011 Census, and this has affected the calculation of population projections for 4 year olds in 2015. To address this anomaly, population estimates for 2015 are based on the average of population projections for 2014 and 2016.

These data should be interpreted with care, as there are different preschool arrangements across states and territories (including different starting ages for preschool and primary school) (table 4A.3.1).

Preschool enrolment and attendance

Nationally in 2015, 87.0 per cent of Aboriginal and Torres Strait Islander 4 and 5 year olds were enrolled in preschool in the year before full time schooling (table 4A.3.2):

- 83.8 per cent in major cities
- 87.7 per cent in inner/outer regional areas
- 90.9 per cent in remote/very remote areas (table 4A.3.8).

The enrolment rate for non-Indigenous children was 96.8 per cent. Data by State and Territory are available in table 4A.3.2.

In 2015, 79.8 per cent of Aboriginal and Torres Strait Islander 4 and 5 year olds were attending preschool (table 4A.3.5):

- 79.8 per cent in major cities
- 82.3 per cent in inner/outer regional areas (combined)
- 73.4 per cent in remote/very remote areas (combined) (table 4A.3.11).

The attendance rate for non-Indigenous children was 93.0 per cent. Data by State and Territory are available in table 4A.3.5.

Nationally in 2015, most Aboriginal and Torres Strait Islander children enrolled in a preschool program in the year before full time schooling were enrolled in a standalone or

school-operated preschool (64.7 per cent), with a further 30.7 per cent enrolled in a preschool within a long day care centre (the remaining 4.7 per cent were enrolled in a preschool program which combined both types of settings). The proportion enrolled in a standalone or school-operated preschool increased as remoteness increased, from 51.8 per cent in major cities to 92.8 per cent in remote/very remote areas (table 4A.3.14).

Things that work

The case study in box 4.3.3 describes a program that is improving Aboriginal and Torres Strait Islander peoples' engagement in early childhood education.

Box 4.3.3 'Things that work' – Early childhood education

Families as First Teachers (FaFT) (NT) is an early learning and parenting support program. The program roll-out to 21 remote communities in the Northern Territory (NT) commenced in 2009, and the NT Government announced, in 2015, that FaFT would be expanded to an additional 11 remote communities over three years.

The FaFT program is provided from school sites and supports families from the birth of their children, providing families with the opportunity to learn about child development, health, hygiene and parenting skills while engaging in early learning service. In 2013-14, FaFT had delivered early childhood education programs to more than 2000 children and 2000 adults.

The program has been subject to an external/independent process that studied the establishment of the program through site visits and included interviews with schools, program staff, local community staff and families. Although not a comprehensive formal evaluation, surveys in 2011 and 2012 found that 95 per cent of parents were satisfied with the program and felt more skilled and able to support their child's learning and development. There was also an increase in preschool enrolments in 50 per cent of the FaFT sites surveyed. A survey in 2012 of the principals in the schools where the services were located found that the principals highly valued the program's ability to identify, enrol and prepare children for preschool entry.

The program outputs to date have been the participation of children and families in the program itself, and increased participation in preschool. FaFT is being more formally evaluated over three years, focusing on whether the program produces improved and sustained learning outcomes for children.

Future directions in data

The ABS NECECC is the only comprehensive national source of data on early childhood education participation. This collection receives funding from the Australian Government

under the NPA on Universal Access to Early Childhood Education. In May 2015, the Australian Government committed funding to extend National Partnership agreements for a further two years, until December 2017 (Australian Government 2015).

The ABS and the National Indigenous Reform Agreement Performance Information Management Group are considering ways to improve the measurement of preschool participation rates. Two main issues are being addressed:

- better matching the ages of children counted as enrolled in the year before schooling with the ages at which children are eligible to be enrolled in each state and territory
- improving the identification of Aboriginal and Torres Strait Islander children in the data collection (which varies across states and territories).

4.4 Reading, writing and numeracy¹²

Box 4.4.1 Key messages

- Improving literacy and numeracy levels can improve education and employment outcomes for Aboriginal and Torres Strait Islander people. Measuring literacy and numeracy achievement against national minimum standards (NMSs) is an indicator of progress against COAG's agreed closing the gap target. The key messages focus on Year 3 (the first year of NAPLAN testing). Data for Years 5, 7 and 9 are in the full report and attachment tables.
- In 2015, the proportions of Year 3 Aboriginal and Torres Strait Islander students achieving at or above the NMS were 78.7 per cent for reading, 81.2 per cent for writing and 78.2 per cent for numeracy, lower than those of non-Indigenous students (95.6 per cent for reading, 96.4 per cent for writing and 95.5 per cent for numeracy). Results for Aboriginal and Torres Strait Islander Year 3 students declined as remoteness increased (under 49 per cent in very remote areas for reading, writing and numeracy) (tables 4A.4.1–3, 4A.4.4–6).
- Comparing 2008 to 2015, the proportion of Aboriginal and Torres Strait Islander students achieving at or above the NMS increased for Years 3, 5 and 7 for reading, and for Years 5 and 9 for numeracy. However, volatility in the data means conclusions drawn from comparisons should not be interpreted as consistent improvement over time (table 4A.4.1). Trend data for writing are not comparable for 2008 and 2015.

Box 4.4.2 Measures of reading, writing and numeracy

There are two main measures for this indicator (aligned with the NIRA indicator).

- *NAPLAN student achievement* is defined as the proportion of students at or above the national minimum standard for NAPLAN reading, writing and numeracy, in Years 3, 5, 7 and 9.
- *NAPLAN student participation* is defined as the rate of student participation in the NAPLAN reading, writing and numeracy tests in Years 3, 5, 7, and 9.

The most recent available data for both measures are from the 2015 National Assessment Program — Literacy and Numeracy (NAPLAN) (all jurisdictions: Indigenous status; geolocation). Data are comparable over time for reading and numeracy. However, data for writing from 2011 onwards are not comparable to prior years due to a change in the type of test used.

A supplementary measure on average student achievement (based on NAPLAN mean scale scores) is also reported (all jurisdictions: Indigenous status; remoteness).

Halving the gap for Aboriginal and Torres Strait Islander students in reading, writing and numeracy achievements within a decade (by the end of 2018) is one of the six closing the gap targets announced by COAG (COAG 2009). Improving literacy and numeracy levels and increasing Year 12 completion rates (see section 4.6) could significantly improve education and employment outcomes for Aboriginal and Torres Strait Islander Australians (ACER 2004; Nguyen 2010).

¹² The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

Studies have shown that many Aboriginal and Torres Strait Islander children start school at a disadvantage. On average, they have lower levels of access to, and participation in, early childhood education (see section 4.3), have less access to home educational resources, and their parents tend to have lower levels of education (Biddle and Cameron 2012; De Bortoli and Thomson 2010). A child's expectations of their educational achievement are strongly correlated with their parents' expectations, with parent's expectations strongly correlated with their level of education (PC 2016). Unless quality preschool and early primary school assistance are provided, disadvantaged students are rarely able to keep pace with their peers (Anderson 2012; Biddle 2010; De Bortoli and Thomson 2010).

Regular school attendance is important for developing core skills, such as literacy and numeracy (Purdie and Buckley 2010). On average, Aboriginal and Torres Strait Islander students have higher rates of: late arrival at school; absence for consecutive months of schooling; and multiple changes of school (De Bortoli and Thomson 2010; Hughes and Hughes 2010; Taylor 2010; Zubrick et al. 2006). Section 4.5 has more information on student attendance. For the general student population, the quality of teaching is the most important in-school factor in predicting student achievement in literacy (Hattie 2002). Section 7.1 has more information on teacher quality.

Academic performance can also be affected by emotional distress. Aboriginal students at low risk of clinically significant emotional or behavioural difficulties have higher academic performance compared to those at high risk (Zubrick et al. 2006). Perceived racial discrimination can be a cause of such stress, and its incidence has been found to significantly and negatively predict both spelling and maths achievement (Bodkin-Andrews et al. 2010). Section 8.7 has more information on mental health and social and emotional wellbeing issues for Aboriginal and Torres Strait Islander children.

NAPLAN student achievement

In 2008, national common tests (the NAPLAN) were introduced to assess student achievement against 'National Minimum Standards'. NAPLAN data are not directly comparable with previous learning outcomes data (data for 1999 to 2007 can be found in the 2009 edition of this report).

Measuring literacy and numeracy achievement against national minimum standards (NMSs) provides an indicator of progress against COAG's closing the gap target. However, the NMS is set at a very low level — indicating that a student has demonstrated only the basic elements of literacy and numeracy for the relevant level. In addition, there is volatility in NMS results, as only a small number of test items fall below the NMS. An alternative measure is the mean scale score (MSS), which is more reliable as it is based on all test items. For this reason, MSS is included in this report as a supplementary measure.

Care needs to be taken in interpreting the NAPLAN data, because differences in achievement may sometimes be the result of sampling or measurement error. Confidence intervals are available for all results and are included in the attachment tables. For

comparisons over time involving 2015 results, the tables include an additional ‘nature of the difference’ measure, which combines statistical significance tests with an ‘effect size measure’. This can help identify whether a difference is substantive (as well as statistically significant).

Although this indicator relates to reading, writing and numeracy, only reading and numeracy results are discussed in detail in this report, as data for writing from 2011 onwards are not comparable to prior years, due to change in the type of test used (full results for writing are included in the attachment tables). All NAPLAN data discussed below and reported in tables 4A.4.4–139 are reported by State and Territory and by remoteness (geolocation).

Reading

National Minimum Standards

Table 4.4.1 Proportion of students achieving at or above the national minimum standard for reading, 2008 to 2015^a

△ = achievement is above and is statistically significantly different from the base year (or previous year) at the national level. ■ = achievement is close to or not statistically significantly different from the base year (or previous year).

	Year								Nature of difference	
	2008	2009	2010	2011	2012	2013	2014	2015	2008 and 2015	2014 and 2015
	%	%	%	%	%	%	%	%		
Aboriginal and Torres Strait Islander										
Year 3	68.3	75.1	75.1	76.3	74.2	81.5	74.7	78.7	△	■
Year 5	63.4	66.7	66.2	66.4	64.7	83.3	70.3	73.6	△	■
Year 7	71.9	73.2	76.6	77.1	75.4	73.2	77.1	80.8	△	■
Year 9	70.7	67.0	64.2	71.9	67.2	73.9	71.2	71.7	■	■
Non-Indigenous										
Year 3	93.5	94.8	95.0	94.9	94.7	96.2	94.7	95.6	△	■
Year 5	92.6	93.1	92.7	92.9	93.1	96.9	94.2	94.5	■	■
Year 7	95.4	95.0	95.9	95.7	95.1	95.4	95.9	96.3	■	■
Year 9	94.2	93.5	92.2	93.5	92.7	94.5	93.3	93.6	■	■

^a Exempt students were not assessed and were deemed not to have met the national minimum standard.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.1–97.

Nationally in 2015, the proportions of Aboriginal and Torres Strait Islander students achieving at or above the NMS for reading in Years 3, 5 and 7 were statistically (but not substantially) higher than the proportions in 2008, and not statistically significantly different to 2014 — for Year 9, the proportion was not significantly different to 2014 or 2008 (table 4.4.1). The gap between outcomes for Aboriginal and Torres Strait Islander and non-Indigenous students narrowed for all Year levels from 2008 to 2015, particularly

Year 3 (from 25.2 to 16.9 percentage points) and Year 5 (from 29.2 to 20.9 percentage points).

Figure 4.4.1 Proportion of students achieving at or above the national minimum standard for reading, by remoteness, 2015^{a, b}

^a Exempt students were not assessed and were deemed not to have met the national minimum standard.

^b Error bars represent 95 per cent confidence intervals for within year comparisons. These error bars should not be used for across year comparisons.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.4 and 4A.4.13.

The gap in achievement against the reading NMS widened as remoteness increased. For Year 3 reading, for example, the gap ranged from 9.6 percentage points in metropolitan areas to 46.8 percentage points in very remote areas (figure 4.4.1).

Mean scale scores

Time series data for mean scale scores provides a measure of gain (difference between the average scores) for a cohort of students over time — for this report, students who were in Year 3 in 2009, Year 5 in 2011, Year 7 in 2013 and Year 9 in 2015.

Nationally, the gain for Aboriginal and Torres Strait Islander students (190.9 points — from 327.4 in Year 3 to 518.3 in Year 9) was higher than for non-Indigenous students (168.8 points — from 415.0 in Year 3 to 583.8 in Year 9), albeit from a lower base. For both, the gain was larger between Years 3 and 5 than between Years 5 and 7 and Years 7 and 9, with the exception of Aboriginal and Torres Strait Islander students in very remote areas where the gain between Years 5 and 7 (73.2 points gain) was relatively unchanged from the gain between Years 3 and 5 (72.7 points gain) (tables 4A.4.132, 134, 136, 138).

Numeracy

Table 4.4.2 Proportion of students who achieved at or above the national minimum standard for numeracy, 2008 to 2015^a

△ = achievement is above and is statistically significantly different from the base year (or previous year). ■ = achievement is close to or not statistically significantly different from the base year (or previous year).

	Year								Nature of difference	
	2008	2009	2010	2011	2012	2013	2014	2015	2008 and 2015	2014 and 2015
	%	%	%	%	%	%	%	%		
Aboriginal and Torres Strait Islander										
Year 3	78.6	74.0	76.6	83.6	72.7	81.6	78.2	78.2	■	■
Year 5	69.2	74.2	71.4	75.2	69.2	73.0	71.1	78.6	△	△
Year 7	78.6	75.8	77.0	76.5	74.4	78.1	79.5	82.8	■	■
Year 9	72.5	75.0	70.4	72.0	74.2	65.7	76.2	82.8	△	△

Year 9	94.8	96.0	94.3	94.1	94.7	92.0	95.2	96.4	△	■

^a Exempt students were not assessed and were deemed not to have met the national minimum standard.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.3–99.

Nationally in 2015, the proportions of Aboriginal and Torres Strait Islander students achieving at or above the NMS for numeracy for Years 5 and 9 were statistically (and substantially) higher than the proportions in 2008 – for Years 3 and 7 the proportions were not significantly or substantially different to 2014 or 2008 (table 4.4.2). Across all four year levels, results were 13.6 to 17.5 percentage points lower than for non-Indigenous students (table 4.4.2).

The gap in achievement against the numeracy NMS widened as remoteness increased. For Year 3, for example, the gap ranged from 10.4 percentage points in metropolitan areas to 46.2 percentage points in very remote areas (table 4A.4.6), similar to that for Year 3 reading.

Mean scale scores

Time series data for mean scale scores provides a measure of gain (difference between the average scores) for a cohort of students over time — for this report, students who were in Year 3 in 2009, Year 5 in 2011, Year 7 in 2013 and Year 9 in 2015.

Nationally, the gain for Aboriginal and Torres Strait Islander students in numeracy was 211.4 points (from 320.5 in Year 3 to 531.9 in Year 9) — higher than the gain of 197.5 points for non-Indigenous students (from 397.7 in Year 3 to 595.2 in Year 9), albeit from a lower base (tables 4A.4.133, 4A.4.139).

NAPLAN student participation

NAPLAN participation rates record the proportion of students who participated in NAPLAN testing. Higher participation rates are desirable, as they increase the level of confidence that the results reflect the performance of the population of interest (because the level of performance of students who do not participate is unknown). Students who are exempt from testing because of their lack of proficiency in English (important for some Aboriginal and Torres Strait Islander students) or because of significant intellectual and/or functional disability are included in the participation rate.

Nationally in 2015, the participation rate for Aboriginal and Torres Strait Islander students for reading, writing and numeracy combined was 89 per cent for Years 3 and 5, 85 per cent for Year 7, and 75 per cent for Year 9. The rate for non-Indigenous students was 95 per cent for reading, writing and numeracy combined for Years 3, 5 and 7, and 92 per cent for Year 9 (tables 4A.4.100–103). These rates are similar to those in previous years (tables 4A.4.104–131).

Things that work

The Productivity Commission recently analysed 2014 NAPLAN data for Aboriginal Torres Strait Islander students in Years 3 and 5 to investigate what works best to improve their education outcomes (PC 2016). Box 4.4.3 provides a summary of the key points (more detailed information including analyses are in chapter 13).

Box 4.4.3 Improving primary school education outcomes for Aboriginal and Torres Strait Islander students – What works best

- The recent education literature suggests that the key to improving student achievement, for both Aboriginal and Torres Strait Islander and non-Indigenous students, is high quality instruction — including assessment of each child’s learning needs, identification of strategies to meet them and evaluation of the effectiveness of those strategies. Particularly important to high quality instruction are:
 - the effective use of data in assessing where students are at and evaluating the impact of teaching interventions
 - high expectations (including a student’s expectations of him or herself)
 - positive student wellbeing — which facilitates engagement

(continued next page)

Box 4.4.3 (continued)

- strong student—teacher relationships
- supportive school and system leadership, including with respect to professional development of the teaching workforce.
- But teachers may face particular challenges and opportunities in teaching Aboriginal and Torres Strait Islander children that, when taken into account, help them to more effectively individualise instruction. For example:
 - many Aboriginal and Torres Strait Islander students speak a language other than English or a dialect — Aboriginal English
 - given the history of poor educational achievement, system, school and teacher expectations of Aboriginal and Torres Strait Islander learners might be low
 - the different cultural and language backgrounds of Aboriginal and Torres Strait Islander students might affect their relationships with teachers and sense of self as learners (wellbeing), contributing to poor attendance and engagement
 - Aboriginal and Torres Strait Islander students have a higher risk of health issues like hearing problems that affect learning.
- Cultural recognition, acknowledgment and support have been identified as fundamental to Aboriginal and Torres Strait Islander students' school participation and achievement.

Source: PC 2016, *Indigenous Primary School Achievement*, Productivity Commission, Canberra.

Examples of some initiatives to improve educational outcomes for Aboriginal and Torres Strait Islander students are summarised in box 4.4.4.

Box 4.4.4 'Things that work' — literacy and numeracy engagement

The **Cape York Aboriginal Australian Academy Initiative** (Queensland) is a pilot program operating in primary schools at Coen, Hope Vale and Aurukun. The program began in January 2010 in Coen and Aurukun and January 2011 in Hope Vale. The CYAAA educational model organises the curriculum into three separate learning domains.

- The **Class** domain: where literacy, numeracy and English language are taught using a Direct Instruction method and delivered with an English-only immersion environment
- The **Club** domain: which provides children with artistic, musical and sporting activities
- The **Culture** domain: which provides a comprehensive Aboriginal and Torres Strait Islander culture and language program.

An independent evaluation of the CYAAA Initiative conducted in late 2012/early 2013 found that it was not possible to conclude from the available data whether the Initiative had an impact on student learning as there was too much missing information to draw a conclusion.

(continued next page)

Box 4.4.4 (continued)

However, interviews conducted identified general agreement among school staff and some parents that students were improving in their literacy as a result of the Initiative (ACER 2013).

The evaluation noted that the CYAAA Initiative has been in operation for only a short period of time, and the extent of the outcomes (particularly around student learning) was difficult to assess (ACER 2013). The Steering Committee noted this initiative in its 2014 report, and reiterates that a follow up evaluation would be useful to provide a more robust assessment of outcomes from this program.

In June 2016, the Queensland Department of Education and Training undertook a review of school education in Aurukun and made 27 recommendations to improve schooling outcomes (DET 2016), which it is now working with the Aurukun community to implement. The review acknowledged challenges associated with the implementation of the CYAAA initiative in Aurukun, and recommended broadening the teaching and learning approaches to include a range of high-yield strategies and contextualised curriculum to meet the diverse needs of students in Aurukun, delivering all core requirements of the Australian Curriculum during the compulsory hours of schooling.

QuickSmart is a suite of programs to address literacy and numeracy needs of students in Years 5–8, with pairs of students participating in 30 minute lessons three times a week for 30 weeks. The program has operated since 2001 in clusters of schools in a variety of remoteness locations and with diverse student populations.

An independent evaluation of the **numeracy** program was undertaken in 2012 in 14 schools, and found '[m]ost teachers and tutors reported improved numeracy outcomes for all Aboriginal students, as a result of their participation in QuickSmart. Other academic and social outcomes were also observed, including improved attendance, increased participation in class activities, as well as increased self-esteem, confidence and improved behaviour.' It also reported that improvement in numeracy outcomes for Aboriginal students was at least comparable to, and in some cases greater than, outcomes for non-Indigenous students.

ABRACADABRA (ABRA), an interactive computer tool developed in Canada, was designed to help teach basic literacy skills to young children. An independent multi-stage evaluation was undertaken in the NT from 2008 to 2010 to assess the efficacy of the ABRA tool on reading, letter knowledge and phonological awareness (awareness of English language sounds), including a randomised control trial (RCT) with 164 intervention and 148 control (regular instruction) children (Aboriginal and Torres Strait Islander children comprised 28 per cent of the total sample).

Students in the ABRA groups left their classes for 30–45 minutes four days a week over 16 weeks to receive instruction through ABRA. The RCT showed that regular instruction using ABRA was more effective than regular instruction alone in improving students' phonological awareness and phoneme- grapheme correspondence skills. Aboriginal students gained significantly more per hour of instruction than non-Indigenous students in phonological awareness and early literacy skills.

(continued next page)

Box 4.4.4 (continued)

While the study did not establish that instruction using ABRA had an effect on students' reading scores, it proposed that improved phonological awareness may take time to directly impact reading ability, and that a follow-up study would be needed to show whether this is the case

Future directions in data

NAPLAN data are reported for individual bands of performance by Indigenous status, enabling assessment of movement of higher and lower performers. However, confidence intervals are not currently available for these data. The availability of confidence intervals would enable assessment of the gap within individual performance bands over time.

4.5 Year 1 to 10 attendance¹³

Box 4.5.1 Key messages

- In May 2014, COAG agreed to a target to close the gap in school attendance between Aboriginal and Torres Strait Islander children and non-Indigenous children within 5 years (by the end of 2018) (COAG 2014). Nationally comparable school attendance data have recently become available, and are included in this report for the first time.
- In 2015, the overall attendance rate for Aboriginal and Torres Strait Islander students was 83.7 per cent, compared with 93.1 per cent for non-Indigenous students (table 4A.5.1). These rates were similar to 2014.
- Nationally, the attendance rate for Aboriginal and Torres Strait Islander students declined with increasing remoteness (in 2015, from 86.5 per cent in metropolitan areas to 67.4 per cent in very remote areas), while there was little variation in attendance rates for non-Indigenous students by remoteness area (table 4A.5.2).
- Looking at individual Year levels, the average attendance rates declined from Year 5 to Year 10 for Aboriginal and Torres Strait Islander and non-Indigenous students (11.2 and 3.6 percentage points respectively) (table 4A.5.3).
- Across all schools, 47.4 per cent of schools achieved 90 per cent or greater attendance on average by Aboriginal and Torres Strait Islander students, compared with 87.5 per cent of schools achieving this level of attendance by non-Indigenous students (table 4A.5.12).

Box 4.5.2 Measure of Year 1 to 10 attendance

There is one main measure for this indicator (aligned with the associated NIRA indicator).

- Overall attendance rates for students in Years 1 to 10, by Indigenous status [student attendance rate].

Two supplementary measures are reported (aligned with the associated NIRA indicator).

- Proportion of students who attend school 90 per cent or more of the time, by Indigenous status [student attendance level].
- Number and proportion of schools achieving 90 per cent or greater average school attendance, by Indigenous status.

Student attendance is defined as the number of actual full time equivalent student days attended over the collection period as a percentage of the total number of possible student days, for children enrolled full time in Years 1 to 10. Attendance data are collected annually for the reporting period of Semester 1 (Terms 1 and 2). Data are sourced from the Australian Curriculum, Assessment and Reporting Authority (ACARA) National Schools Attendance Collection, with the most recent available data for 2015 (State and Territory; school sector).

(continued next page)

¹³ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

Box 4.5.2 (continued)

Data are of acceptable accuracy within individual school sectors within a State or Territory, but are currently not comparable across school sectors or all states and territories, due to differences in collection and reporting processes.

The Steering Committee also notes the following data issues:

- From 2014 onwards there has been a break in series for attendance rate data, and data in previous reports are not comparable to attendance rate data in this report.
- Student attendance data for NSW are not collected on a comparable basis with other states and territories, therefore comparisons with other jurisdictions should be made with caution.

Attendance data for the 90 per cent or more level (supplementary measure) for the non-government sector were not provided according to the national standards, and are therefore not directly comparable to data reported for the government sector.

COAG has identified student attendance as one of the progress measures for the Closing the Gap target of halving the gap in Year 12 or equivalent attainment by 2020. As part of the 2014 Closing the Gap report release (Australian Government 2014), the Prime Minister proposed a new target to close the gap in school attendance within five years (by the end of 2018). This is to be accomplished by all schools achieving a minimum 90 per cent attendance rate, regardless of their proportion of Aboriginal and Torres Strait Islander students. COAG agreed the new target in May 2014 (COAG 2014).

National and international research identify that regular school attendance is important to achieving core skills, such as literacy and numeracy (Balfanz and Byrnes 2012; Purdie and Buckley 2010; UNICEF Innocenti Research Centre 2004). The Western Australian Aboriginal Child Health Survey 2000–2002 showed a direct relationship between the number of days absent from school and academic performance (Zubrick et al. 2006). More recent analysis by the Productivity Commission also established that both Aboriginal and Torres Strait Islander students and non-Indigenous students tend to perform better in school reading assessments where school attendance rates are higher, irrespective of the geographic location of the school (PC 2016).

A 2006 study found that school attendance was influenced by three main factors — parental insistence that children go to school, teacher quality and bullying and teasing (DEWR 2006; see also Taylor 2004) (teacher quality is discussed in section 7.1). Aboriginal and Torres Strait Islander students are also less likely to have parental support, such as help with homework, compared with non-indigenous children (UNICEF Innocenti Research Centre 2004).

Cultural recognition has also been found to be important in supporting school attendance by Aboriginal and Torres Strait Islander students (McRae et al. 2000; Gray and Partington 2012; Rahman 2012). Section 5.1 has information on the importance of valuing Indigenous cultures and section 5.6 has information on Indigenous cultural studies.

Research highlights that attendance at school is necessary but it alone is not sufficient to achieve improved educational outcomes (Hancock et al. 2013; Mellor and Corrigan 2004), and other factors such as how engaged a student is at school are also important (student engagement with schooling is discussed in more detail in section 7.2). A recent study has also shown that amongst Aboriginal and Torres Strait Islander students, boys have a lower level of school attendance than girls, and this difference between boys and girls is larger for Aboriginal and Torres Strait Islander students than for non-Indigenous students (Meehl and Biddle 2016).

Student attendance

In Australia in 2015, school attendance was compulsory for children from the age of 6 years (5 years in WA¹⁴ and Tasmania), although children may start school at an age younger than the compulsory age. Most children commence full time schooling in the grade preceding Year 1 (pre Year 1).

As part of the Compact with Young Australians, COAG implemented a National Youth Participation Requirement on 1 January 2010 (COAG 2009), which required young people to:

- participate in schooling (or an approved equivalent) until they complete Year 10
- following Year 10, participate full time (at least 25 hours per week) in education, training or employment, or a combination of these activities, until 17 years of age.

Data on student attendance rates across all school sectors for 2014 and 2015 are available in tables 4A.5.1–7:

- in 2015, the overall attendance rate for Aboriginal and Torres Strait Islander students nationally was 83.7 per cent, compared with 93.1 per cent for non-Indigenous students. These rates are similar to 2014 (table 4A.5.1)
- nationally, the overall attendance rate for Aboriginal and Torres Strait Islander students declined with increasing remoteness (from 86.5 per cent in metropolitan areas to 67.4 per cent in very remote areas) — for non-Indigenous students, there was little variation in attendance rates across remoteness areas (from 93.3 per cent in metropolitan areas to 91.5 per cent in very remote areas) (figure 4.5.1)
- looking at individual Year levels, the average attendance rates across all school sectors for both Aboriginal and Torres Strait Islander students and non-Indigenous students generally declined from Year 5 to Year 10 — nationally, a reduction of 11.2 percentage points for Aboriginal and Torres Strait Islander students and 3.6 percentage points for non-Indigenous students in 2015 (table 4A.5.3)
- the decline in attendance rates from Year 5 to Year 10 was larger in government schools (12.6 percentage point difference for Aboriginal and Torres Strait Islander

¹⁴ The compulsory starting age for WA changed from 6 to 5 years of age starting from 2013.

students, and 4.7 percentage point difference for non-Indigenous students) than non-government schools¹⁵ (5.6 percentage point difference for Aboriginal and Torres Strait Islander students, and 2.1 percentage point difference for non-Indigenous students) (tables 4A.5.4 and 4A.5.7).

Figure 4.5.1 Student attendance rate in Years 1–10, by Indigenous status, by remoteness, 2015

Source: ACARA (unpublished) National Student Attendance Collection; table 4A.5.2.

Data for the supplementary measure *proportion of students who attend school 90 per cent or more of the time* are presented in tables 4A.5.8–11, and data for the supplementary measure *number and proportion of schools achieving 90 per cent or greater average school attendance* are presented in tables 4A.5.12–13.

Nationally in 2015, 46.7 per cent of Aboriginal and Torres Strait Islander students in government schools attended school 90 per cent or more of the time compared with 77.2 per cent of non-Indigenous students (table 4A.5.8). This rate decreased as remoteness increased, with a greater decrease for Aboriginal and Torres Strait Islander students (from 52.8 per cent in metropolitan areas to 22.7 per cent in very remote areas) than for non-Indigenous students (from 78.2 per cent in metropolitan areas to 70.2 per cent in very remote areas) (table 4A.5.10).

Across all schools, 47.4 per cent achieved 90 per cent or greater attendance for Aboriginal and Torres Strait Islander students, compared with 87.5 per cent of schools achieving this

¹⁵ A higher proportion of Aboriginal and Torres Strait Islander students attend government schools than non-Indigenous students.

level of attendance for non-Indigenous students (table 4A.5.12). Patterns by remoteness were similar to those for the student attendance measures (table 4A.5.13).

Things that work

A literature review for the Closing the Gap Clearinghouse found very few high quality evaluations of programs that were aimed at increasing attendance (Purdie and Buckley 2010). However, the review found that a common feature of successful school attendance programs was collaboration between public agencies and the community in program design and decision-making (often by engaging parents or community based organisations).

The Closing the Gap Prime Minister's Report 2016 noted the emerging evidence of success of the Remote School Attendance Strategy (RSAS), with improving attendance rates in some remote communities. RSAS employs local people to work with parents and carers, the community and schools to support children to go to school. In 2014 and 2015, RSAS operated in 73 schools across 69 communities. Out of the 73 RSAS schools, 49 schools saw their attendance rate rise, 21 schools experienced a fall and three schools had no change in their attendance rate from Semester 1, 2013 to Semester 1, 2015. RSAS has been extended for a further three years from 2016 to 2018 (Australian Government 2016). The Steering Committee considers that an evaluation of the RSAS would be useful to provide a more robust assessment of outcomes from this program.

Future directions in data

Data comparability issues across jurisdictions and school sectors previously limited the usefulness of school attendance data. ACARA, in consultation with jurisdictions, has developed National Standards for Student Attendance Data Reporting (National Standards) which were endorsed by the Standing Council on School Education and Early Childhood (SCSEEC) in December 2012. Nationally comparable student attendance data are reported for the first time in this report, with the exception of NSW (for government sector student attendance). It is anticipated that full comparability of attendance data across jurisdictions will be achieved for the next edition of this report, with full reporting against the standards in NSW from 2016.

4.6 Year 12 attainment¹⁶

Box 4.6.1 Key messages

- Halving the gap in year 12 or equivalent attainment rates for Aboriginal and Torres Strait Islander Australians aged 20–24 years by 2020 is a COAG target.
- Nationally in 2014-15, 61.5 per cent of Aboriginal and Torres Strait Islander 20–24 year olds had completed year 12 or equivalent or above, an increase from 45.4 per cent in 2008. The proportion for non-Indigenous Australians was 87.9 per cent, similar to the proportion in 2008 (88.1 per cent) (table 4A.6.1).
- For Aboriginal and Torres Strait Islander Australians attainment was higher in less remote areas (in 2014-15, 66.0 per cent in non-remote areas compared to 42.3 per cent in remote areas) (table 4A.6.4).
- Research suggests that an Aboriginal and Torres Strait Islander student who receives an ATAR score is as likely as a non-Indigenous student to go to university (Biddle and Cameron 2012). Among Aboriginal and Torres Strait Islander young people who could have attended year 12 in 2015, 8.5 per cent achieved an ATAR of 50.00 or above, an increase from 5.7 per cent in 2007 (figure 4.6.2).

Box 4.6.2 Measures of year 12 attainment

There are two main measures for this indicator (aligned with the NIRA indicator):

- *Proportion of the 20–24 year old population who have attained at least a year 12 or equivalent or AQF certificate II or above* is defined as the proportion of people aged 20–24 years who have attained at least a year 12 or equivalent or AQF certificate II or above. The main data source is the Census, with the most recent data available for 2011 (all jurisdictions; remoteness). Supplementary data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available from the 2014-15 NATSISS (all jurisdictions; remoteness; highest level of school completed; age; selected characteristics). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS)/General Social Survey (GSS), with the most recent available data from the 2014 GSS.¹⁷ Survey and Census data are not directly comparable.
- *Year 12 certification.* No measure has been developed for NIRA reporting.

One supplementary measure is reported — Students who have attained an Australian Tertiary Admission Rank (ATAR) of 50.0 or above (all jurisdictions).

¹⁶ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

¹⁷ NIRA reporting uses the ABS Survey of Education and Work (SEW) non-Indigenous population data. However, this report requires a longer time series for all disaggregations (such as remoteness), which is not available from the SEW. Data for 2014-15 from the SEW estimate 86.4 per cent for non-Indigenous Australians (SCRGSP forthcoming) – compared to 87.9 per cent from the GSS (table 4A.6.1).

‘Halving the gap for Indigenous students in year 12 attainment or equivalent attainment rates by 2020’ is one of six closing the gap targets announced by COAG (COAG 2012). Successful completion of year 12 is important if young people are to have access to the full range of further education, training, employment and life chances consistent with their abilities (AIHW 2013; Biddle and Cameron 2012; OECD 2015)).

There is compelling evidence about the importance of completing year 12 (Dandolo Partners 2012; Dusseldorp Skills Forum 2006; Long 2006), and the pivotal role of education in reducing long-term disadvantage (Buckskin 2000; ACER 2003, 2004; Biddle 2010; OECD 2013). Education is linked to economic and social wellbeing, and positive health behaviours, and is considered one of the crucial contributors to the formation of human capital (COAG National Reform Initiative Working Group 2006; Council for the Australian Federation 2007; Karmel et al. 2014; Osbourne, Baum and Brown 2013; OECD 2013).

What happens after year 12 is also important — but there is limited Australian evidence of what works in transitioning school leavers into further education and training, and looking for work (Hunter 2010). Research by Biddle and Cameron (2012) found that, once an Aboriginal and Torres Strait Islander student receives an ATAR score, they are as likely as non-Indigenous students to go to university, though the *Review of Higher Education Access and Outcomes for Aboriginal and Torres Strait Islander People: Final Report* (Behrendt et al. 2012) noted that high-performing Aboriginal and Torres Strait Islander school students often do not go on to higher education. See section 7.3 for more information on transitioning school leavers to work.

Proportion of 20–24 year olds who have completed year 12 or equivalent or AQF certificate level II or above

Nationally in 2014-15, 61.5 per cent of Aboriginal and Torres Strait Islander 20–24 year olds reported completing year 12 or equivalent or AQF certificate level II or above, an increase from 45.4 per cent in 2008. The proportion for non-Indigenous 20–24 year olds was 87.9 per cent (table 4A.6.1).

The Census provides the primary source for reporting this measure, and data are reported for geographical disaggregations below the national level. The most recent Census data are for 2011, and tables 4A.6.3–4 provide data for the 2011 Census and previous 2006 Census.

The following supplementary data for this measure are from more recent sample surveys, and have been included to report the latest indicative trends for this measure. Whilst the trends are broadly similar between the Census and survey data, the two sources are not directly comparable.

Figure 4.6.1 Proportion of 20–24 year olds who had completed year 12 or certificate II or above, by remoteness, 2014-15^{a, b}

^a Data were not collected for non-Indigenous Australians in very remote areas. ^b Error bars represent 95 per cent confidence intervals around the estimates.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2014-15; ABS (unpublished) General Social Survey, 2014; tables 4A.6.1–2.

In 2014-15, the proportion of Aboriginal and Torres Strait Islander Australians aged 20–24 years with year 12 or equivalent or certificate II or above was higher in less remote areas, ranging from 66.0 per cent in non-remote areas (major cities and regional areas) to 42.3 per cent in all remote areas. Differences by remoteness are more difficult to interpret for non-Indigenous Australians due to the greater variability (as indicated by the wider confidence intervals) (figure 4.6.1), but Census data indicate that the proportions for non-Indigenous Australians do not show the same degree of variation as remoteness increases (table 4A.6.4).

Supplementary data show the proportion of Aboriginal and Torres Strait Islander Australians who have left school and have completed year 12 is higher for younger age groups (in 2014-15, 40.7 per cent for 15–24 year olds compared to 7.9 per cent for those aged 55 years and over). The largest percentage point increase over the last 10 years has been for Aboriginal and Torres Strait Islander Australians aged 35–44 years, from 16.7 per cent in 2004-05 to 31.4 per cent in 2014-15 (table 4A.6.5).

More data on the proportion of 20–24 year olds who have completed year 12 or equivalent or AQF certificate level II or above can be found in tables 4A.6.1–7.

Students who attained an Australian Tertiary Admission Rank (ATAR)

The Australian Tertiary Admission Rank (ATAR) is calculated for the use of tertiary institutions to compare the overall achievement of students who have completed different combinations of year 12 certificate studies. University admission organisations use year 12 certificate results issued by State and Territory assessment bodies to calculate a rank to show a student's achievement in relation to other students. Not all students who have qualified for a year 12 certificate are eligible for an ATAR.

ATAR scores range from 0.05 (lowest) to 99.95 (highest). At a minimum, an ATAR of 50.00 or above would usually be required for entry into university. (However, most universities, TAFE colleges and other institutions take a holistic approach when assessing applications from Aboriginal and Torres Strait Islander students, looking beyond academic results (QTAC 2016; SATAC 2016; UAC 2016; University of Tasmania 2016; VTAC 2016).

The ATAR rate is the number of students who achieved an ATAR of 50.00 or above, expressed as a proportion of the estimated potential year 12 population. The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five (tables 4A.6.8–10).

Figure 4.6.2 **Year 12 ATAR rates (50.00 or above), by Indigenous status, 2007 to 2015^a**

^a See table 4A.6.11 for more information on jurisdictional differences and the calculation of the ATAR rate.

Sources: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, Jun 2011*, Cat. no. 3238.0.55.001; ABS 2014, *Australian Demographic Statistics, Sep 2013*, Cat. no. 3101.0; Jurisdiction tertiary admissions centres/boards of studies (unpublished); tables 4A.6.8–11.

Nationally in 2015, 8.5 per cent of the Aboriginal and Torres Strait Islander potential year 12 population achieved an ATAR of 50.00 or above, an increase from 5.7 per cent in 2007. For non-Indigenous young people, 43.8 per cent of the potential population achieved an ATAR of 50.00 or above in 2015, an increase from 39.3 per cent in 2007 (figure 4.6.2). Data on ATAR scores and rates by jurisdiction are available in table 4A.6.11.

Things that work

Many factors influence Aboriginal and Torres Strait Islander young peoples' decisions to stay on and complete secondary school, including the students themselves, family, teachers and the role of culture (Rahman 2009). An example of an initiative that has been successful in increasing Aboriginal and Torres Strait Islander secondary school participation and attainment is in box 4.6.3.

Box 4.6.3 'Things that work' — Year 12 attainment

The **AIME (Australian Indigenous Mentoring Experience) Program** was established in 2005. The goals of the program are to improve retention rates of Aboriginal and Torres Strait Islander high school students to year 12 and, post school, to connect Aboriginal and Torres Strait Islander students to university and employment.

The program is based on the recruitment of university students as mentors, who provide advice and personal support to Aboriginal and Torres Strait Islander school mentees from years 7 to 12. There are two elements to the program:

- the Core Program, which targets local Aboriginal and Torres Strait Islander high school students who attend school, and are able to visit an AIME partner university campus on a weekly basis
- the AIME Outreach Program (AOP), which extends the Core program to Aboriginal and Torres Strait Islander high school students from further afield through a more intensive full day format.

In 2015, AIME connected approximately 5700 high school students with 1900 volunteer university students across 18 Australian universities, in all mainland states and the ACT.

An independent evaluation was undertaken in 2012 to evaluate the AOP, in comparison to the Core Program. The evaluation included a mixed-method design incorporating: observation of program delivery; interviews with program facilitators, mentors and mentees; review of AIME documentation and a quantitative survey of mentees.

The evaluation found that the AIME and AOP are achieving positive results:

- AIME is effective in strengthening and solidifying both the Core and Outreach mentees' school and post-school aspirations, sense of engagement, and sense of identity, and outcomes from both programs are better than the national average
- the achievements and impacts of the AOP are comparable to those of the Core Program, as measured by school progression rates, school completion rates and the AIME evaluation survey results

(continued next page)

Box 4.6.3 (continued)

- in its first year of operation, the AOP reached its objective of encouraging better school grade progression rates for Aboriginal and Torres Strait Islander students, compared with the national average.

Harwood, V., O'Shea, S., Clapham, K., Wright, J., Kervin, L., Humphry, N. and Bodkin-Andrews, G. 2013, *Final Report: Evaluation of the AIME Outreach Program*. <http://reports.aimementoring.com/2012/pdf/aime-2012-independent-evaluation.pdf> (accessed 23 June 2014); AIME website, <https://aimementoring.com/about/aime/> (accessed 3 May 2016).

Future directions in data

There are currently no nationally comparable data on senior secondary certification. Development of measures of year 12 certification had been occurring through the Australian Curriculum, Assessment and Reporting Authority in consultation with key education and training agencies and data providers (SCRGSP 2014, p.51), but this work has since ceased.

4.7 Employment¹⁸

Box 4.7.1 Key messages

- Halving the gap in employment outcomes between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians within a decade [by 2018] is a COAG target.
- In 2014-15, just under half (48.4 per cent) of Aboriginal and Torres Strait Islander 15–64 year olds were employed. The ratio increased from 37.6 per cent in 1994 to 53.8 per cent in 2008, but then declined to 47.5 per cent in 2012-13 (similar to 2014-15), partly driven by changes to the CDEP program (see box 4.7.3 for details) (table 4A.7.5). For non-Indigenous Australians the rate increased from 74.2 per cent in 2004-05 (first year of available data) to 76.6 per cent in 2011-12, but then declined to 74.8 per cent in 2014-15 (table 4A.7.5).
- Trends in employment rates differed between Aboriginal and Torres Strait Islander males and females. The rate for males increased from 1994 to 2008 (47.0 to 62.7 per cent), before declining to 52.8 per cent in 2012-13 (similar to the rate in 2014-15 of 53.9 per cent). The rate for females increased from 1994 to 2002 (28.9 to 41.0 per cent), and has been relatively stable since (43.3 per cent in 2014-15) (table 4A.7.5).
- The labour force participation rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 61.1 per cent in 2014-15. This rate followed a similar pattern to the employment to population ratio, increasing from 60.0 per cent in 2004-05 to 64.5 per cent in 2008, before declining to 60.1 per cent in 2012-13 (similar to 2014-15) (table 4A.7.14).
- In 2014-15, the unemployment rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 20.8 per cent — similar to 2012-13 — and around three times the rate for non-Indigenous Australians (6.2 per cent in 2014-15) (table 4A.7.8).

Box 4.7.2 Measures for employment

There is one main measure for this indicator (aligned with the NIRA indicator).

- *Employment to population ratio* is defined as the proportion of people aged 15 to 64 years who are employed.

Two supplementary measures are reported (aligned with the NIRA indicator).

- *Labour force participation rate* is defined as the proportion of people aged 15 to 64 years who are in the labour force (employed, or unemployed and actively looking for work).
- *Unemployment rate* is defined as the proportion of people aged 15 to 64 years in the labour force who are actively looking for employment¹⁹.

(continued next page)

¹⁸ The Steering Committee notes its appreciation to Ms Heron Loban, Griffith University, who reviewed a draft of this section of the report.

¹⁹ See glossary for full definition.

Box 4.7.2 (continued)

The main data source for the Aboriginal and Torres Strait Islander population for all three measures above is ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data from the 2014-15 NATSISS (all jurisdictions: full time/part time employment; remoteness; and national: age; sex). Data for the non-Indigenous Australian population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS)/General Social Survey (GSS), with the most recent available data from the 2014 GSS.²⁰

Supplementary data are also available from the Census of Population and Housing, with the most recent available data for 2011 (all jurisdictions: Indigenous status; remoteness) and from survey data for long term unemployment (national: sex by remoteness).

The Council of Australian Governments (COAG) has committed to ‘halve the gap in employment outcomes between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians within a decade’ (COAG 2009, 2012). Employment outcomes are directly related to people’s living standards and many aspects of their wellbeing. Being employed leads to improved income for families and communities, which in turn has a positive influence on health and the education of children. Employment also enhances self-esteem, increases opportunities for self-development, influences interaction at the family and community levels and reduces social alienation.

The focus of this section is the extent to which people are participating in the labour force (both employed and unemployed). Employment by part time/full time status and skill level is discussed in more detail in section 9.1. The current policy focus on Indigenous businesses as a means to increasing the employment of Aboriginal and Torres Strait Islander Australians is discussed in section 9.2.

The labour force is the most widely used measure of the economically active population (or the formal supply of labour). It measures the number of people contributing to, or willing to contribute to, the supply of labour and — as defined by the ABS — comprises two mutually exclusive groups within the population:

- the employed (people who have worked for at least one hour in the reference week, including those in the past who have received wages for participating in Community Development Employment Projects (CDEP) – see box 4.7.3 for more information)
- the unemployed (people who are without work, but had actively looked for work in the four weeks up to the end of the reference week and were available to start work in the reference week).

²⁰ NIRA reporting uses the ABS Survey of Education and Work (SEW) non-Indigenous population data. However, this report requires a longer time series for all disaggregations (such as remoteness), which is not available from the SEW. Data for 2014-15 from the SEW estimate 72.6 per cent employment to population rate for non-Indigenous Australians (SCRGSP forthcoming) – compared to 74.8 per cent from the GSS (table 4A.7.5).

The remainder of the population are not in the labour force. There are many reasons why people are outside the labour force. An analysis of the 2008 NATSISS and HILDA data by (Kalb et al. 2012) found that Aboriginal and Torres Strait Islander Australian's lower attachment to the labour force could to a large extent be explained by their lower levels of education, worse health and larger families.

Labour force, employment and unemployment data should be interpreted bearing in mind the following points.

- People who would like to work may become discouraged and cease actively looking for work (and therefore are not counted in the labour force according to the ABS definition). Discouraged jobseekers might believe that there are no suitable jobs in their area, the costs of searching are too great, or that they do not have the appropriate skills or qualifications (Hunter and Gray 2001; Savvas, Boulton and Jepsen 2011). It is likely that the true extent of unemployment — particularly long term unemployment²¹ — is underestimated due to discouraged jobseekers.
- Even if a person is employed, they may not necessarily work the number of hours they would prefer. This is known as underemployment — an issue which has become increasingly prominent in recent decades, as part time employment levels have risen (Hunter 2010). A higher proportion of Aboriginal and Torres Strait Islander Australians work part time than non-Indigenous Australians (see section 9, figure 9.1.1).²²
- While many Aboriginal and Torres Strait Islander Australians in more remote areas are considered 'outside' of the labour force (because they are not employed or seeking paid employment), many are still actively engaged in productive activities, such as the production of art or participation in customs which may generate income but are not always recorded as employment (Altman, Buchanan and Biddle 2006). Analysis of the 2008 NATSISS found that harvesting and cultural production were significant productive activities, particularly in remote areas (Altman, Biddle and Buchanan 2010), and attachment to these customary practices is likely to be important for wellbeing (Hunter and Gray 2016).
- Aboriginal and Torres Strait Islander labour force data are influenced by changes over time in the Australian Government's CDEP program (see box 4.7.3), along with other demand side factors including changes to the composition of labour demand and recent cyclical softness in the labour market (PC 2015).

²¹ Long term unemployment refers to a period of unemployment of 52 consecutive weeks or more.

²² Unemployment and underemployment together provide a measure of underutilisation. Extended labour underutilisation would also capture discouraged job seekers, but data are not available for the Aboriginal and Torres Strait Islander population.

Box 4.7.3 **Community Development Employment Projects (CDEP)**

CDEP had elements of both unemployment and employment, especially in remote and very remote areas. Some CDEP activities were similar to those undertaken by participants in Work for the Dole, while other activities were essential roles in municipal services, health care, community services, education and other sectors that would be considered employment in mainstream communities and organisations.

The scope of CDEP has changed over time. The original aim of the program — introduced in 1977 — was to create local employment opportunities in remote Aboriginal and Torres Strait Islander communities where the labour market might not otherwise offer employment. The program was later extended to all areas (including non-remote). However, in 2009 CDEP was restructured to focus on remote areas, although some non-remote providers continued to operate. From 1 July 2013, remote CDEP was rolled into the Australian Government's Remote Jobs and Communities Program (RJCP). The Community Development Program (CDP) replaced the RJCP on 1 July 2015.

Up until 1 July 2009, CDEP participants received 'wages' and, for statistical purposes, the ABS counted CDEP participation as employment. From 1 July 2009, new CDEP participants were referred for assessment of eligibility for income support by the Department of Human Services. Existing participants had the choice of moving to income support payments or continuing to receive CDEP wages.

- In the 2012-13 AATSIHS, information about CDEP participation was only collected in remote areas (in earlier ABS surveys, CDEP participation was collected in both remote and very remote areas).
- Subsequent ABS collections continued to classify remaining CDEP 'wage' participants as employed (because they were receiving a wage), whilst those under the RCJP/CDP receiving income support are classified as unemployed.

It is important to consider CDEP when analysing historical labour force data because over time:

- the number of CDEP participants receiving 'wages' decreased significantly (from 68.0 per cent of the employed population in very remote areas (about 18 100) in 2004-05 to 27.7 per cent (about 6300) in 2012-13, and zero in 2014-15 after CDEP was replaced) (table 4A.7.4)
- CDEP participant payments comprised a mix of both wages and income support payments such as Newstart Allowance
- some people classified as 'employed' in one period may have been classified as 'unemployed' in another period due to changes in CDEP arrangements, rather than changes in their personal circumstances.
- the latest data for CDEP 'wage' recipients included in this report are for 2012-13.

Employment to population ratio

In 2014-15, the employment to population ratio for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 48.4 per cent. The ratio increased from 37.6 per cent in 1994 to 53.8 per cent in 2008, before declining to 47.5 per cent in 2012-13 (similar to 2014-15) (figure 4.7.1).

Figure 4.7.1 Employment to population ratio for Aboriginal and Torres Strait Islander Australians, by age group, 1994 to 2014-15^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Survey 1994; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey (core component) 2012-13; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2014-15; table 4A.7.5.

A large part of the decrease from 2008 to 2012-13 is explained by a decrease in the ratio for males, and in particular, males aged 15-17 years (a corresponding decrease in the labour force participation rate for males aged 15-17 years indicates that they are not actively looking for work and could be engaged in education or training).²³

The employment to population ratio for Aboriginal and Torres Strait Islander females aged 15-64 years increased from 28.9 per cent in 1994 to 41.0 per cent in 2002, and has been relatively constant since (43.3 per cent in 2014-15). The rate for Aboriginal and Torres Strait Islander males increased from 47.0 per cent in 1994 to 62.7 per cent in 2008, before declining to 52.8 per cent in 2012-13 — and relatively stable since, with a rate in 2014-15 of 53.9 per cent (table 4A.7.5).

The employment to population ratio for non-Indigenous Australians aged 15-64 years declined from 76.6 per cent in 2011-12 to 74.8 per cent in 2014-15 (table 4A.7.5).

²³ In the 2011 Census, 61 per cent of Aboriginal and Torres Strait Islander Australians aged 15-17 years were attending secondary school, up from 53 per cent in 2006 (ABS 2012).

In 2014-15, for Aboriginal and Torres Strait Islander Australians aged 15–64 years, the employment to population ratio was higher in major cities (57.5 per cent) and inner regional areas (48.2 per cent) than very remote areas (35.1 per cent), following a significant decrease in very remote areas from 54.3 per cent in 2008 to 35.1 per cent in 2014-15 (table 4A.7.2). This may be influenced by the change in the number of participants receiving CDEP ‘wages’ in very remote areas over time (table 4A.7.4). For non-Indigenous Australians in 2014-15, the national employment to population ratio did not vary significantly across remoteness areas²⁴ (between 73.0 per cent and 78.1 per cent) (table 4A.7.2). Data are also reported by State and Territory, by remoteness in table 4A.7.2.

Labour force participation rate

In 2014-15, the proportion of Aboriginal and Torres Strait Islander Australians aged 15-64 years employed or looking for work (labour force participation rate) was 61.1 per cent. This was similar across all reporting periods from 2004-05, with the exception of an increase in 2008 (64.5 per cent). The rate for non-Indigenous Australians rose over the same period (from 77.6 per cent in 2004-05 to 79.8 per cent in 2014-15) (table 4A.7.12).

Figure 4.7.2 Proportion of Aboriginal and Torres Strait Islander Australians aged 15–64 years in the labour force, by remoteness area, 2004-05, 2008, 2012-13 and 2014-15^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey (core component) 2012-13; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2014-15; table 4A.7.13.

²⁴ Data on non-Indigenous Australians excludes very remote areas.

The 10 year trend for Aboriginal and Torres Strait Islander Australians was influenced by an increase in major cities from 2004-05 to 2008 (61.3 per cent to 70.6 per cent), followed by a decrease in very remote areas from 2008 to 2012-13 (62.2 per cent to 52.7 per cent) (figure 4.7.2).

Data are also reported for males and females in table 4A.7.14, and by State and Territory in table 4A.7.12.

Unemployment

In 2014-15, the unemployment rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 20.8 per cent — relatively unchanged from 2012-13 (20.9 per cent), but higher than 2008 (16.6 per cent) and 2004-05 (15.5 per cent) (table 4A.7.8). The rate for Aboriginal and Torres Strait Islander Australians in 2014-15 was around three times the rate for non-Indigenous Australians (6.2 per cent) (table 4A.7.8).

Over the 10 years from 2004-05 to 2014-15, the largest percentage point increases in the unemployment rate for Aboriginal and Torres Strait Islander Australians were in very remote areas (11.1 per cent to 28.1 per cent) and in remote areas (13.6 per cent to 27.1 per cent) (table 4A.7.9). In major cities, the unemployment rate for Aboriginal and Torres Strait Islander Australians of 14.5 per cent was similar to 2004-05 (13.3 per cent), following a peak in 2012-13 (21.8 per cent) (table 4A.7.9).

Things that work

Gray, Hunter and Lahoar (2012), in a review of available evidence, suggest that the following approaches are likely to be most effective in increasing employment for Aboriginal and Torres Strait Islander Australians:

- increased human capital of Aboriginal and Torres Strait Islander Australians via formal education and training
- pre-employment assessment and customised training for individuals, to ensure Aboriginal and Torres Strait Islander job seekers are employment-ready
- intensive assistance for job seekers who experience multiple barriers to finding employment (for example, drug and alcohol issues, mental and physical health issues, family violence and a lack of literacy and numeracy), policies and programs involving
- non-standard recruitment strategies to increase the likelihood of Aboriginal and Torres Strait Islander Australians having the opportunity to win jobs
- reducing discrimination against Aboriginal and Torres Strait Islander Australians, including through the provision of cross-cultural training

-
- support mechanisms to improve the retention of Aboriginal and Torres Strait Islander employees, including ongoing mentoring and support, flexible work arrangements and tackling workplace racism through initiatives such as cross-cultural training
 - wage subsidy and other labour market programs
 - a strong macro-economy, which creates a range of new jobs
 - government programs that deliver goods, environmental or personal services having explicit Aboriginal and Torres Strait Islander employment goals.

Box 4.7.4 describes some initiatives that have been successful in improving employment outcomes for Aboriginal and Torres Strait Islander Australians.

Box 4.7.4 'Things that work' — Employment

The **Working on Country** (WoC) programme (national) aims to support Aboriginal and Torres Strait Islander aspirations to care for country. The program, funded by the Australian Government, provides employment and training opportunities for Aboriginal and Torres Strait Islander people living in regional and remote Australia to undertake natural resource management work. Most of the working on ranger groups provide land management services on **Indigenous Protected Areas (IPA)**, a programme funded by the Department of the Environment. Ranger Activities include site management, and nationally accredited training and career pathways in land and sea management. In May 2016, the funding for both the IPA and the WoC programmes supports 777 FTE ranger positions in 109 ranger groups. Together, they employ over 2600 Indigenous people in either full-time, part-time or casual jobs (Australian Government 2016).

An independent evaluation was undertaken in 2011 involving 18 case studies, a review of program and policy data and documentation and consultations with key departmental personnel. The evaluation found that the program had a range of economic, social, cultural and environmental benefits. Rangers saw the jobs as 'real jobs' that provided better income and conditions, more interesting work and ongoing employment, compared to the CDEP alternative (Urbis 2012 cited in AIHW, 2014).

In 2016, an independent Social Return on Investment Analysis of five IPAs and associated ranger programmes found that the programmes demonstrate success in engaging Indigenous Australians on country in meaningful employment to achieve large scale conservation outcomes. Rangers attributed high value to strengthening their connection to country and opportunities for inter-generational learning provided through their work. For government, the value created from the employment outcomes include low cost land management as well as skills development and increased engagement in the work force, reduced income support payments and increased income tax, less violence and safer communities (SVA 2016).

Sources: Urbis (2012), Assessment of the social outcomes of the Working on Country program: Report – May 2012; AIHW 2014, Improving labour market outcomes through education and training, Issues paper no. 9 produced for the Closing the Gap Clearinghouse; Social Ventures Australia (SVA) (2016), Consolidated report on Indigenous Protected Areas following Social Return on Investment analyses; Australian Government (2016), *Indigenous Rangers - Working on Country programme* webpage, <https://www.dpmc.gov.au/indigenous-affairs/environment/indigenous-rangers-working-country>

Future directions in data

Annual data are collected for the general population on barriers to labour force participation, including identification of discouraged job seekers. However, these data are not available by Indigenous status. Information on Aboriginal and Torres Strait Islander discouraged workers is important to understand the potential scope of the labour force and employment.

4.8 Post-secondary education — participation and attainment²⁵

Box 4.8.1 Key messages

- Nationally in 2014-15, 46.8 per cent of Aboriginal and Torres Strait Islander Australians aged 20–64 years either had a Certificate level III or above or were studying, a 20.8 percentage point increase from 26.0 per cent in 2002 (figure 4.8.1).
- In 2014-15, 70.0 per cent of non-Indigenous 20–64 year olds either had a Certificate level III or above or were studying at any level. Between 2002 and 2014-15, the gap in rates between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians remained steady around 23-25 percentage points (figure 4.8.1).
- The gap in the VET load pass rate between Aboriginal and Torres Strait Islander students and non-Indigenous students decreased from 14.3 percentage points in 2004 to 5.9 percentage points in 2015 (figure 4.8.4).
- The gap in the higher education success rate between Aboriginal and Torres Strait Islander students and non-Indigenous students decreased from 22.2 percentage points in 2001 to 13.6 percentage points in 2015 (figure 4.8.5).

Box 4.8.2 Measures of post-secondary education — participation and attainment

There is one main measure for this indicator (aligned with the NIRA indicator).

- *People with or working towards a post-secondary qualification* is defined as the number of 20–64 year olds who have attained post school qualifications in AQF Certificate level III or above, or are currently studying at any level, as a proportion of all 20–64 year olds.

The main data source for this measure is the Census, with the most recent data available for 2011 (all jurisdictions: remoteness; age; sex). Supplementary data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2014-15 (all jurisdictions: remoteness; age; sex). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS)/General Social Survey (GSS), with the most recent data from the 2014 GSS.²⁶ Survey and Census data are not directly comparable.

(continued next page)

²⁵ The Steering Committee notes its appreciation to Ms Lynette Riley, University of Sydney, who reviewed a draft of this section of the report.

²⁶ NIRA reporting uses non-Indigenous population data from the ABS Survey of Education and Work (SEW). However, this report requires a longer time series for disaggregations (such as remoteness), which is not available from the SEW. Data for the 2014 SEW estimate 64.3 per cent for non-Indigenous Australians (SCRGSP forthcoming) – compared to 70.0 per cent from the GSS (table 4A.8.7).

Box 4.8.2 (continued)

This section also includes related data on participation at higher education institutions by course level (broad field of education); VET national load pass rate (all jurisdictions); and higher education success rate (all jurisdictions by sex).

COAG has recognised post-secondary education participation and attainment as a progress measure for its Closing the Gap target of ‘halving the gap in employment outcomes between Indigenous and non-Indigenous Australians by 2018’ (COAG 2012), and should also be viewed in conjunction with the Closing the Gap target of ‘halving the gap in Year 12 or equivalent attainment of 20–24 year olds by 2020’ which incorporates qualifications at AQF Certificate level III or above and year 12 or equivalent (section 4.6).

Post-secondary education includes both vocational education and training (VET) at institutions such as technical and further education (TAFE) colleges, and higher education at universities.

People with a skilled vocational qualification or higher qualifications are more likely to be employed than those without such qualifications (see section 7.3). Other potential benefits that flow from higher education include a positive influence on health outcomes (including children’s health), and educational performance (AIHW 2014; Biddle and Yap 2010; Zubrick et al. 2006; Wolfe and Haveman 2001). Educational achievement is linked to economic and social wellbeing, and positive health behaviours, and contributes strongly to the formation of human capital (Karmel et al. 2014; Osbourne, Baum and Brown 2013; OECD 2013; Council for the Australian Federation 2007).

The participation rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years has been consistently higher than for non-Indigenous Australians over the last 10 years (SCRGSP 2016). Nationally in 2014, the participation rate in government funded VET for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 17.2 per cent compared to 8.2 per cent for non-Indigenous Australians (SCRGSP 2016).

Aboriginal and Torres Strait Islander Australians who commence higher education (university) are less likely to complete their course than their non-Indigenous counterparts. A recent study found that reasons given by less advantaged current students (including Aboriginal and Torres Strait Islander students) for seriously considering leaving university early, tended to revolve around finance, family obligations and core issues relating to ‘getting by’ (Edwards and McMillan 2015).

In non-metropolitan areas, the closer proximity of VET opportunities than higher education institutions also has a bearing on the decision to undertake VET by Aboriginal and Torres Strait Islander Australians (Nguyen 2010).

People with or working towards a post-secondary qualification

Education and training are important means of promoting attachment to the labour force (Hunter and Daly 2008). Certificate level III is considered the minimum qualification necessary to provide pathways to further education and training, and improve employment outcomes. Certificate level III or above includes certificate levels III and IV, diplomas, advanced diplomas, bachelor degrees, graduate diplomas or certificates, and postgraduate degrees.

Figure 4.8.1 Proportion of 20–64 year olds with a post school qualification of Certificate level III or above or studying, 2002, 2008, 2011–13 and 2014–15^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2002; ABS (unpublished) General Social Survey (GSS) 2002; ABS (unpublished) NATSISS 2008; ABS (unpublished) National Health Survey 2007–08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012–13 (2012–13 Core Component); ABS (unpublished) Australian Health Survey 2011–13 (2011–12 NHS component); ABS (unpublished) NATSISS 2014–15; ABS (unpublished) GSS 2014; table 4A.8.7.

Nationally in 2014–15:

- 46.8 per cent of Aboriginal and Torres Strait Islander 20–64 year olds either had a Certificate level III or above or were studying at any level, a 20.8 percentage point increase from 26.0 per cent in 2002. The rate increased for both females (from 24.8 to 47.3 per cent) and males (from 27.4 per cent to 46.2 per cent)
- 70.0 per cent of non-Indigenous 20–64 year olds either had a Certificate level III or above or were studying at any level, a 18.5 percentage point increase from

51.5 per cent in 2002. The rate increased for both females (from 45.0 per cent to 69.3 per cent) and males (from 58.0 per cent to 70.8 per cent) (figure 4.8.1).

Between 2002 and 2014-15, the gap between Aboriginal and Torres Strait Islander and non-Indigenous 20–64 year olds remained steady at around 23–25 percentage points (figure 4.8.1).

Figure 4.8.2 Proportion of 20–64 year olds with a post-school qualification at Certificate level III or above or studying, by remoteness, 2014–15^{a, b}

^a Data were not collected for non-Indigenous Australians in very remote areas. ^b Error bars represent 95 per cent confidence intervals around the estimates.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2014-15; ABS (unpublished) General Social Survey (GSS) 2014; table 4A.8.12.

In 2014-15, the proportion of Aboriginal and Torres Strait Islander 20–64 year olds who had a qualification at Certificate level III or above or were studying at any level decreased with remoteness, from 58.7 per cent in major cities to 23.2 per cent in very remote areas (figure 4.8.2). For non-Indigenous Australians, the proportion was similar in all areas outside of major cities, leading to a widening of the gap as remoteness increased (figure 4.8.2).

More survey data on post-school qualifications by age, for those aged 18 years or over, can be found in tables 4A.8.16–17.

Although not directly comparable with survey results, data from the Census show similar trends to the survey data. Census data for 20–64 year olds with a Certificate level III or above or who were studying at any level, disaggregated by State and Territory, remoteness area and sex, for 2001, 2006 and 2011 are included in tables 4A.8.1–6.

In all years between 2004 and 2015, Aboriginal and Torres Strait Islander students who were participating at higher education institutions were more likely than non-Indigenous

students to be enrolled in enabling and non-award courses, and less likely to be enrolled in postgraduate courses (figure 4.8.3).

Figure 4.8.3 Post-secondary participation at higher education institutions, by course level, 2004 to 2015^a

^a 'Other' includes international students and those with not stated or unknown Indigenous status.

Source: Department of Education (unpublished) Higher education statistics collection; tables 4A.8.18–29.

More data on the types of courses Aboriginal and Torres Strait Islander students were undertaking can be found in tables 4A.8.18–29.

VET load pass rate and higher education success rate

One measure of post-secondary attainment is the extent to which people complete or pass the course they are undertaking. In the VET system this is known as the load pass rate. In the higher education system it is known as the success rate.

VET load pass rate

The VET load pass rate indicates the extent to which students pass assessment in an assessable module or unit of competency. Load pass rates are calculated as the ratio of hours attributed to students who passed assessment to all students who were assessed and either passed, failed or withdrew. The calculation is based on the nominal hours supervised for each assessable module or unit of competency. Care needs to be taken in making

comparisons, because average module durations and standards of competencies achieved by students can vary across courses, institutions and jurisdictions.

Figure 4.8.4 VET national load pass rate, 2004 to 2015^a

^a Includes all VET delivered by TAFE and other government providers and publicly funded VET programs delivered by private providers. Excludes VET delivered in schools, where the delivery was undertaken by schools.

Source: NCVER (unpublished) National VET Provider Collection, 2004–2015; table 4A.8.45

In 2015, the national load pass rate for Aboriginal and Torres Strait Islander students was 76.7 per cent, a 12.2 percentage point increase since 2004. Over the same period, the national load pass rate for non-Indigenous students increased at a slower rate (from 78.8 per cent to 82.6 per cent), and the gap between Aboriginal and Torres Strait Islander students and non-Indigenous students narrowed from 14.3 percentage points to 5.9 percentage points (figure 4.8.4). These data are also reported by State and Territory in table 4A.8.45. The load pass rates for Aboriginal and Torres Strait Islander and non-Indigenous students by remoteness area for 2011 to 2015 are reported in table 4A.8.46. The *Report on Government Services* (SCRGSP 2016) contains further data on VET system outcomes.

Higher education success rate

The success rate is the proportion of units passed within a year compared with the total units enrolled. Although this measure is based on a different calculation to the VET load pass rate, a similar positive trend in outcomes for Aboriginal and Torres Strait Islander students can be observed.

Figure 4.8.5 Higher education success rate, 2001–2015^{a, b}

^a Success is defined as the student progress rate, which is the proportion of units passed within a year compared with the total units enrolled. ^b The non-Indigenous category for 2001 includes 'Indigenous status unknown'.

Source: Department of Education (unpublished) Higher education statistics collection; tables 4A.8.30–44.

From 2001 to 2015, the higher education success rate for Aboriginal and Torres Strait Islander students increased from 65 per cent to 73.6 per cent, and the gap compared to the rate for non-Indigenous students narrowed (from 22.2 percentage points in 2001 to 13.6 percentage points in 2015) (figure 4.8.5). For both Aboriginal and Torres Strait Islander students and non-Indigenous students, females had higher success rates than male students across all years (tables 4A.8.30–44). These data are also available by State and Territory in tables 4A.8.30–44.

4.9 Disability and chronic disease²⁷

Box 4.9.1 Key messages

- In 2012, the overall rate of disability among Aboriginal and Torres Strait Islander Australians was 23.4 per cent, little changed from 21.1 per cent in 2009 (after adjusting for differences in population age structures, in both 2009 and 2012 the rate of disability for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians) (table 4A.9.1).
- In 2014-15, 45.1 per cent of Aboriginal and Torres Strait Islander Australians reported having a disability or long-term health condition, with 7.7 per cent reporting a profound or severe core activity restriction (the most severe end of the disability spectrum) (table 4A.9.5). The most common type of disability reported was physical disability (63.6 per cent), followed by disability related to sight, hearing or speech (47.2 per cent) (table 4A.9.12).
- In 2014-15, hospitalisation rates for all chronic diseases (except cancer) were higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (ranging from 1.8 times for circulatory disease to 11.2 times the rate for kidney failure) (table 4A.9.26). For Aboriginal and Torres Strait Islander Australians, with the exception of cancer, the rates increased as remoteness increased, with the rate for kidney failure in remote areas 69 times the rate for non-Indigenous Australians (table 4A.9.35).

Box 4.9.2 Measures of disability and chronic disease

There are two main measures for this indicator.

- *Disability prevalence* is defined as the proportion of people with disability. The main data source for this measure is the ABS Survey of Disability Ageing and Carers (SDAC), with the most recent data available for 2012 (national; age; sex; remoteness). Supplementary data are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available from the 2014-15 NATSISS (all jurisdictions; age; sex; remoteness). Comparable non-Indigenous data are sourced from the ABS General Social Survey (GSS) for 2014. SDAC and AATSIHS/NATSISS data are not directly comparable (SDAC excludes very remote areas, and Aboriginal and Torres Strait Islander surveys have a less refined scope of disability).
- *Hospitalisation rates* is defined as the rate of hospital separations for people hospitalised for chronic diseases. The most recent available data are for 2014-15 from the AIHW National Hospital Morbidity Database (all jurisdictions; sex; remoteness).

Three supplementary measures are reported:

- Proportion of people with vision loss (national)
- Participation in society by people with disability (national; all jurisdictions for labour force profile)
- Carers of people with disability (all jurisdictions; sex; remoteness).

²⁷ The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

Aboriginal and Torres Strait Islander Australians experience significantly higher rates of disability and chronic disease than non-Indigenous Australians. This is driven in part by socioeconomic disadvantage, trauma and predisposition to a range of risk factors including: low birthweight (Scott 2014) (section 6.4); smoking (section 8.4); high body mass; physical inactivity; poor nutrition (section 8.5); higher rates of infectious diseases (section 10.2); accidents (section 8.2); mental health problems (section 8.7); substance abuse (sections 11.1 and 11.2); and violence (section 4.12) (AIHW 2015; PC 2011). Disability can also entrench socioeconomic disadvantage — for example, Aboriginal and Torres Strait Islander children with hearing loss (section 6.7) have poorer education outcomes (sections 4.4–6 and 4.8), which in turn limits their employment and income prospects (sections 4.7 and 4.10). There is evidence that women with disability are more likely than those without disability to experience domestic violence (Healy et al. 2008), perpetuating the cycle of disadvantage.

Disability is complex, reflecting an interaction between features of a person's body and features of the society in which he or she lives (WHO 2009). People with disability may have long-term physical, mental, intellectual or sensory impairments that can hinder their participation in society on an equal basis with others (UN 2006). The extent to which people with disability or chronic disease are able to be fully involved in society varies; an impairment may not be as severely limiting if there is a sufficiently supportive and enabling environment from both informal carers and formal support services (Aboriginal Disability Network of NSW 2007; Priestly 2001). However, some Aboriginal and Torres Strait Islander Australians face significant barriers to accessing disability support services, due to social marginalisation, concern about approaching government agencies, cultural attitudes towards disability and services that are not mindful of cultural differences. In addition, a higher proportion of Aboriginal and Torres Strait Islander Australians live in very small communities which may not have accessible services (Biddle, Yap and Gray 2013; PC 2011).

Chronic diseases place a significant health and disability burden on Aboriginal and Torres Strait Islander Australians (Vos et al. 2007). Aboriginal and Torres Strait Islander Australians have a continued occurrence of certain diseases that are now virtually unreported in the non-Indigenous population, such as trachoma and acute rheumatic fever (AIHW 2015). In 2008–2012, the majority (70 per cent) of Aboriginal and Torres Strait Islander deaths were due to chronic diseases (for example, circulatory disease, cancer, diabetes, respiratory disease, kidney disease). Aboriginal and Torres Strait Islander Australians died from diabetes, at almost six times the rate of non-Indigenous Australians and at 1.5 times the rate from circulatory diseases (AHMAC 2015). Further information on mortality is available in section 4.1.

Disability prevalence

The Survey of Disability, Ageing and Carers (SDAC) is designed to measure the prevalence of disability and the need for support by people with disability (defined as 'any

limitation, restriction or impairment which restricts everyday activities and has lasted or is likely to last for at least six months'). The most recent SDAC data available for Aboriginal and Torres Strait Islander Australians are from 2012.

There may be specific cultural dimensions to the concept of disability, which are not reflected in the SDAC questions, for example, 'in traditional language there was no comparable word for disability, which suggests that disability may have been accepted as part of the human experience' (First Peoples Disability Network Australia 2016; First Peoples Disability Network sub. 542, p. 8 cited in PC 2011).

In 2012, the reported rate of disability for Aboriginal and Torres Strait Islander Australians was 23.4 per cent, similar to the 2009 rate (21.1 per cent) (table 4A.9.1). After adjusting for differences in population age structures, in both 2009 and 2012 the disability rate for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians (table 4A.9.1). Across all age groups, reported disability prevalence was higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (table 4A.9.2).

More recent data are available from the 2014-15 NATSISS, but on a broader scope including people with a long-term health condition that may not have a specific limitation or restriction. In 2014-15, 45.1 per cent of Aboriginal and Torres Strait Islander Australians reported having a disability or long-term health condition (table 4A.9.5). The most common type of disability reported was physical disability (63.6 per cent), followed by disability related to sight, hearing or speech (47.2 per cent) (table 4A.9.12). Comparable data between Aboriginal and Torres Strait Islander and non-Indigenous Australians are available in table 4A.9.13.

Profound or severe core activity limitation

A person with a 'profound core activity limitation' is unable to do at least one of three main everyday activities (self-care, mobility and communication) at any time or needs constant help. A person with a 'severe core activity limitation' needs help some of the time with at least one of these activities. The combined measure 'profound or severe core activity limitation' therefore identifies people at the more severe end of the disability spectrum (ABS 2013).

In 2012, 7.8 per cent of Aboriginal and Torres Strait Islander Australians had a profound or severe core activity limitation. After adjusting for differences in population age structures, this was 1.7 times the proportion of non-Indigenous Australians (table 4A.9.1).

Whilst not directly comparable to the SDAC, NATSISS data show similar trends in the rate of profound or severe core activity limitation. In 2014-15, 7.7 per cent of Aboriginal and Torres Strait Islander Australians reported a profound or severe core activity restriction (table 4A.9.5). From 2002 onwards, after adjusting for differences in population age structures, the rate of profound or severe core activity limitation for Aboriginal and Torres

Strait Islander Australians has remained around 2 times the rate for non-Indigenous Australians (tables 4A.9.7–11).

Vision loss

A loss of vision can affect development, communication, ability to work, health and quality of life. Compared with the non-Indigenous population, the Aboriginal and Torres Strait Islander population has a much higher rate of vision problems, and almost all vision loss in the Aboriginal and Torres Strait Islander population (94 per cent) is considered unnecessary, as it is preventable or treatable. Over one-third (35 per cent) of Aboriginal and Torres Strait Islander people aged 40 years and over reported they had never had an eye examination (Taylor et al. 2012; Taylor, Jatkar and Anjou 2015).

The most recent comprehensive data on eye health for Aboriginal and Torres Strait Islander Australians are available from the 2008 *National Indigenous Eye Health Survey* (data from the 2014–16 *National Eye Health Survey* were not available in time for inclusion in this report).

Nationally in 2008, 1.5 per cent of Aboriginal and Torres Strait Islander children aged 5–15 years had low vision and 0.2 per cent were blind (table 4A.9.14). Of the 9.4 per cent of Aboriginal and Torres Strait Islander adults aged 40 years and over with vision impairment, the most common causes were refractive error²⁸ (54 per cent) and cataract²⁹ (27 per cent). The leading cause of blindness (found in 1.9 per cent of Aboriginal and Torres Strait adults) was cataract (32 per cent) (Arnold et al. 2009; tables 4A.9.14–15). Further information on trachoma is available in section 10.2.

In 2014–15, a higher proportion of Aboriginal and Torres Strait Islander children (9.7 per cent) reported an eye condition compared with 7.2 per cent in 2008 (based on data from the ABS National Aboriginal and Torres Strait Islander Social Surveys, table 4A.9.16).

Participation in society by people with disability

Education, employment and income

A number of potential barriers can prevent a person with disability from gaining and maintaining employment. For some, their condition is severe enough to preclude any

²⁸ Refractive error occurs when the shape of the eye prevents light from focussing directly on the retina, with the most common symptom blurred vision. Refractive errors can be corrected with visual aids like eyeglasses (National Eye Institute 2010).

²⁹ A cataract is a clouding of the clear lens of the eye, and in early stages may not cause vision problems. When symptoms appear, vision can be improved through visual aids or in advanced cases cataract surgery may restore vision (Vision Australia 2012).

formal engagement with the labour market. However, many others may be willing and able to work but are not able to find a sufficiently supportive employer (Biddle, Yap and Gray 2013). Aboriginal and Torres Strait Islander Australians with disability tend to have poorer education, employment and income outcomes than Aboriginal and Torres Strait Islander Australians without disability. In 2014-15:

- 44.2 per cent of Aboriginal and Torres Strait Islander Australians aged 20–24 years who had a profound or severe core activity limitation had attained at least a year 12 or equivalent or Certificate level II or above, lower than the proportion without disability (62.5 per cent) (table 4A.9.17)
- 43.9 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over who had a profound or severe core activity limitation had left school at year 9 or below, twice the proportion of those without disability (19.5 per cent) (table 4A.9.18)
- Aboriginal and Torres Strait Islander Australians in the working age population (15–64 years) who had a profound or severe core activity restriction had a lower labour force participation rate (31.1 per cent) and employment rate (19.4 per cent) than those without disability (67.9 per cent and 54.9 per cent) (table 4A.9.19)
- a higher proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over with disability reported an equivalised household income³⁰ in the lowest quintile (42.5 per cent), compared to those without disability (33.1 per cent) (table 4A.9.20).

Receipt of disability support pension

Centrelink data show that:

- in 2015, disability support pensions continue to be the second most common type of income support received by Aboriginal and Torres Strait Islander Australians aged 15–64 years (10.5 per cent), at more than twice the rate of non-Indigenous Australians (4.7 per cent) (table 9A.4.10)
- between 2003 and 2015, the proportion of Aboriginal and Torres Strait Islander Australians receiving the disability support pension almost doubled (increasing from 5.5 per cent in 2003 to 10.7 per cent in 2014, with a similar proportion of 10.5 per cent in 2015), while there was no change for non-Indigenous Australians (around 5.0 per cent over the same time period) (table 9A.4.10).

For more information on disability income support, see section 9.4 ‘Income support’.

³⁰ Equivalised household income is a measure which enables comparison between households of different size and composition. For more information on equivalised household income see section 4.10 Household and individual income.

Disability service use

Disability services are currently in transition as the National Disability Insurance Scheme (NDIS) is rolled out. This roll out is occurring over time and at different points in time in different states and territories. The NDIS will largely replace the current provision of services provided under the National Disability Agreement. The Report on Government Services 2016 chapter 14, Services for people with disability, contains more information on this transition and data on Aboriginal and Torres Strait Islander Australians' disability support service use (SCRGSP 2016).

Carers of people with disability

Many Aboriginal and Torres Strait Islander Australians have a strong cultural belief that it is the responsibility of family to provide care and support (PC 2011). Providing care to a person with disability can affect a carer's participation in the labour force, with less time for paid employment, reduced household income, reduced superannuation and lower standards of living (ABS 2012; Hill, Thomson and Cass 2011). Care giving is associated with a higher probability of experiencing poverty in Australia compared to most other OECD countries, with carers of working age, and females carers, at the highest risk of poverty (Colombo 2011). Female carers have lower rates of employment and labour force participation than their male carer counterparts (Cummins et al. 2007; Edwards et al. 2008).

Nationally in 2014-15, around one-quarter (25.5 per cent) of Aboriginal and Torres Strait Islander Australians aged 15 years and over provided care for a person with disability (29.8 per cent of females compared with 20.8 per cent of males) (table 4A.9.21). Additional 2011 Census data (discussed in the 2014 OID report) are available in table 4A.9.22, along with 2011 Census data on unemployment rates for carers (tables 4A.9.23-24), both by Indigenous status of the carer.

Hospitalisation rates

Hospitalisation records provide some information about instances of chronic disease that result in hospitalisation but do not provide a measure of the prevalence of a disease or condition in the population. Hospitalisation rates are for 'separations' for admitted patients only, and there can be multiple separations for the same individual.

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for 'other' which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisations data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres

Strait Islander and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander and other Australians.

Nationally in 2014-15, chronic disease-related hospitalisation rates for Aboriginal and Torres Strait Islander Australians:

- were over 10 times higher for end stage renal diseases³¹ (28 781.3 per 100 000 population) than other hospitalisations by chronic diseases, accounting for around 4 in 5 separations (table 4A.9.25)
- were similar for males and females for most chronic diseases, except female hospitalisation rates for rheumatic heart disease which were 2.6 times the rates for males (tables 4A.9.28 and 31)
- increased as remoteness increased (except for cancer and mental and behavioural disorders), with rates in remote areas more than twice the rates in major cities (table 4A.9.34).

Nationally in 2014-15, after adjusting for differences in population age structures, hospitalisation rates for all chronic diseases (except cancer) were higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (ranging from 1.8 times the rate for circulatory disease to 11.2 times the rate for end-stage renal diseases) (table 4A.9.26). In remote areas, the hospitalisation rate for Aboriginal and Torres Strait Islander Australians for end-stage renal diseases was 69 times the rate for non-Indigenous Australians (table 4A.9.35).

Between 2004-05 and 2014-15, after adjusting for differences in population age structures, for NSW, Victoria, Queensland, WA, SA and the NT combined, the gap in hospitalisation rates between Aboriginal and Torres Strait Islander and other Australians has widened for a number of diseases, particularly for end-stage kidney disease (from 8.8 to 11.5 times the rate for other Australians) (table 4A.9.27).

More information on potentially preventable hospitalisations (admissions that may have been prevented through the provision of appropriate preventive health interventions and early disease management) is available in section 8.2. Injury and preventable childhood diseases are discussed in section 6.6 and rates of disease associated with poor environmental health in section 10.2.

³¹ Chronic irreversible renal failure — the most severe form of chronic kidney disease where kidney function deteriorates so much that dialysis or kidney transplantation is required to survive (AHMAC 2015). Each renal dialysis treatment is counted as a separate hospital episode, so that each person receiving the usual average of three dialysis treatments per week contributes approximately 150 hospital episodes per year.

Things that work

An example of a promising program to improve eye health for Aboriginal and Torres Strait Islander Australians is summarised in box 4.9.3.

Box 4.9.3 Things that work — eye health

Although it has not been formally evaluated, the Steering Committee has identified the Anyinginyi Health Aboriginal Corporation's Eye Program as a promising program worth further examination.

The **Anyinginyi Health Aboriginal Corporation's Eye Program** (NT) commenced in 2006 in the NT (following commencement in NSW in 1999) and coordinates optometrist and eye specialist visits and runs clinics (mobile and permanent) for the people of the Tennant Creek and Barkly region in the NT.

Evidence in increasing the delivery of culturally appropriate eye care services in the region was presented in a case study at the National Rural Health Conference in 2009, which notes that prior to the program (and addressed through the program), access was limited due to perceived cost, transport, lack of eye health awareness, and lack of eye care practitioners with an understanding of Aboriginal and Torres Strait Islander culture. The program's successes over 2007–2008 achieved through increased collaboration and provision of culturally appropriate services included:

- 1385 patients seen with 734 being prescribed spectacles and 146 referred to specialist care
- increase in the services offered from seven days a year to 78 days a year
- increase in the number of custom made spectacles for clients from 52 to 82 per cent.

In 2014-15, 714 pairs of glasses were prescribed for people following examinations, and 36 operations were conducted (AHAC 2015).

Osbourne et al. (2013) note that the success of the program led to other Aboriginal controlled medical services implementing the program across the NT through its partnership with the Brien Holden Vision Institute (formerly the International Centre for Eyecare Education).

A Review of Actions Addressing the Social and Economic Determinants of Indigenous Health*, Paper no. 7 produced for the Closing the Gap Clearinghouse, 2013; AHAC (Anyinginyi Health Aboriginal Corporation) 2015, Anyinginyi Health Aboriginal Corporation 14/15 Annual Report.

Future directions in data

The disability policy and service delivery environment continues to evolve, with the full roll out of the NDIS. Monitoring outcomes for participants, particularly Aboriginal and Torres Strait Islander Australians, will be important and may affect future outcomes for measures included in this report.

4.10 Household and individual income³²

Box 4.10.1 Key messages

- Income levels provide an indicator of the material advantage aspect of wellbeing.
- From 2002 to 2014-15, the median (mid-point) real equivalised gross weekly household (EGWH) income increased for Aboriginal and Torres Strait Islander households from \$402 per week to \$542 per week (figure 4.10.1).
- In 2014-15, the median real EGWH income for Aboriginal and Torres Strait Islander households (\$542) was just under two-thirds the median EGWH income for non-Indigenous households (\$852), and for the first time since 2002 represents a narrowing in the gap nationally in real terms (from \$349 in 2002 to \$316 in 2014-15) (table 4A.10.1).
- The median EGWH income for Aboriginal and Torres Strait Islander households decreased with remoteness (from \$633 in major cities to \$398 in very remote areas), while median EGWH income for non-Indigenous households was highest in major cities (\$945). Across all remoteness areas, median EGWH income was higher for non-Indigenous households than for Aboriginal and Torres Strait Islander households (table 4A.10.1).
- The median real gross weekly personal income increased for Aboriginal and Torres Strait Islander Australians in all age groups (18 years and over) between 2002 and 2008. From 2008 to 2014-15, there were statistically significant increases for those aged 25–34 years, and 55 years and older (table 4A.10.7).

Box 4.10.2 Measures of household and individual income

There are two main measures for this indicator.

- *Median equivalised gross weekly household income* is defined as the mid-point (median) before tax weekly income that has been adjusted for the size and composition of the household.
- *Median gross weekly personal income* is defined as the mid-point before tax weekly personal income.

There are two supplementary measures for this indicator.

- *Mean equivalised gross weekly household income* is defined as the average (mean) before tax weekly income that has been adjusted for the size and composition of the household.
- *Mean gross weekly personal income* is defined as the average before tax weekly personal income.

All measures are limited to people aged 18 years and over. Data for these measures are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data from the 2014-15 NATSISS.

(continued next page)

³² The Steering Committee notes its appreciation to Ms Heron Loban, Griffith University, who reviewed a draft of this section of the report.

Box 4.10.2 (continued)

Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with most recent available data from the 2014-15 NHS (all jurisdictions; remoteness, quintiles: national; age, sex).

Supplementary data are available from the Census (tables 4A.10.4–6), with the most recent available data for 2011 (all jurisdictions, remoteness). Survey and Census data are not directly comparable.

Household and individual income provides an indicator of the material advantage aspect of wellbeing. It is affected by outcomes in other indicators in this report, particularly those relating to education (see chapter 7) and economic participation and development (see chapter 9). Differences in income levels between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians can be attributed in part to a higher proportion of Aboriginal and Torres Strait Islander Australians on income support (see section 9.4) and higher rates of part time work and/or employment in lower skilled occupations (see section 9.1).

This indicator examines both household and individual income. While income is usually received by individuals, people living in families or groups generally contribute to the purchase of goods and services shared by other household members, particularly children. Therefore, household income measures the economic resources available to the household as a whole, including dependent adults and children. *Equivalised* household income is adjusted for household composition and size to aid comparisons across population groups.

Income is an important determinant of socioeconomic status. Section 13.1 includes information about the association between income levels and educational outcomes, labour force participation and employment.

In particular, it is widely acknowledged that health status is affected by the availability of material resources and the income to buy them. In Australia, men and women with lower socioeconomic status, including many Aboriginal and Torres Strait Islander Australians, bear a higher burden of disease (AIHW 2010). Higher incomes can enable the purchase of health-related goods and services, such as better food, housing, recreation and health care, and may provide psychological benefits such as a greater sense of security and control. It is also suggested that less favourable social and economic circumstances can cause anxiety, low self-esteem and social isolation, which in turn can influence physical health (AIHW 2010).

However, higher incomes alone will not improve associated outcomes unless individuals and families are financially literate. Poor financial management skills limit people's capacity to improve their own and their family's circumstances. Although information on general levels of financial literacy are limited (see section 9.2 for more information), available data indicate that the proportion of Aboriginal and Torres Strait Islander people aged 15 years or over who ran out of money for basic living expenses decreased from 43.7 per cent in 2002 to 27.5 per cent in 2014-15 (ABS 2016).

Equivalised gross weekly household income

The measure used in this report is equivalised gross weekly household (EGWH) income. The term ‘equivalised’ means that household income estimates are adjusted to take into account household size and composition, and the economies of scale that arise from the sharing of resources. Research has found substantial differences in the family size and composition of Aboriginal and Torres Strait Islander households and non-Indigenous households. Aboriginal and Torres Strait Islander households are more likely to have a higher number of dependents, multiple generations living together (including extended family) and a large number of transient visitors, all of which are likely to put a strain on resources (ABS 2012; Hunter, Kennedy and Biddle 2004; Hunter, Kennedy and Smith 2003). Such households are not unusual in Aboriginal and Torres Strait Islander communities, and may be the preferred way of living for some families (AHMAC 2015; Memmott, Greenop and Birdsall-Jones 2014).

Although equivalised household income refers to household income, it is not a measure of total income for each household. Rather, it is a measure of the income that a lone person household would need to have the same standard of living as the household in question.

While EGWH income is adjusted for household size and composition, it may not adequately reflect the household circumstances of Aboriginal and Torres Strait Islander Australians. Income can often be shared beyond the immediate household within extended Aboriginal and Torres Strait Islander Australian families (Biddle 2011). In addition, in regional and remote areas of Australia, some Aboriginal and Torres Strait Islander Australians are able to supplement their cash income through traditional hunting, fishing and gathering (Altman 2001; Jackson et al. 2011; section 4.7). No adjustment is made for differences in the cost of living between different remoteness areas — in remote areas, the cost of fresh food can be relatively high, while rent is, on average, relatively low. Section 10.1 (Overcrowding in housing) provides more information on the housing and living arrangements of Aboriginal and Torres Strait Islander Australians.

Median income

Median (mid-point) household income is the preferred measure, as the mean (average) can be skewed by extremely high or low income values. This is important when comparing two populations with different income distributions. Information on mean incomes is provided in table 4A.10.1.

Income data are adjusted for the effects of inflation, allowing for comparisons to be made across different years. Historical median income data in this section have been converted into 2014-15 dollars using the ABS consumer price index (referred to as ‘real’ income).

In 2014-15, the median EGWH income for Aboriginal and Torres Strait Islander adults was \$542, just under two-thirds the median EGWH income of \$852 for non-Indigenous adults (table 4A.10.1).

Figure 4.10.1 Median real equivalised gross weekly household income, people aged 18 years and over, 2002 to 2014-15 (2014-15 dollars)^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2002; ABS (unpublished) General Social Survey (GSS) 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) 2004-05; ABS (unpublished) National Health Survey (NHS) 2004-05; ABS (unpublished) NATSISS 2008; ABS (unpublished) NHS 2007-08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) 2012-13 (Core component); ABS (unpublished) Australian Health Survey (AHS) 2011-13 (core component for 2011-12); ABS (unpublished) NATSISS 2014-15; ABS (unpublished) National Health Survey (NHS) 2014-15; table 4A.10.1.

Figure 4.10.1 shows that the median real EGWH income for Aboriginal and Torres Strait Islander adults increased from \$402 in 2002 to \$542 in 2014-15. For non-Indigenous adults, the median real EGWH income increased from \$751 in 2002 to around \$900 in 2008 and 2011-12, with no statistically significant change between 2011-12 and 2014-15 (\$852 in 2014-15). The increase for Aboriginal and Torres Strait Islander adults in 2014-15 has resulted in a narrowing of the gap nationally between EGWH income for Aboriginal and Torres Strait Islander and non-Indigenous adults in real terms for the first time since 2002 (from \$349 in 2002 to \$310 in 2014-15) (table 4A.10.1).

In 2014-15, the median EGWH income for Aboriginal and Torres Strait Islander adults decreased as remoteness increased (from \$633 in major cities to \$398 in very remote areas). The median EGWH income for non-Indigenous adults was highest in major cities (\$945). Across all remoteness areas, median EGWH income was higher for non-Indigenous adults than for Aboriginal and Torres Strait Islander adults (table 4A.10.1).

Data are also reported by State and Territory in table 4A.10.1.

Income distribution

The proportion of households with incomes in particular ranges is a measure of relative advantage or disadvantage. This report uses income quintiles to define the boundaries of income ranges — all households in the population are ranked in ascending order (from lowest to highest income) and then divided into five equal groups (five quintiles) each comprising 20 per cent of the population. The proportions of Aboriginal and Torres Strait Islander and non-Indigenous households in each quintile are then calculated. If income distribution was similar across Aboriginal and Torres Strait Islander and non-Indigenous populations, there would be about 20 per cent of Aboriginal and Torres Strait Islander Australians in each quintile.

Figure 4.10.2 Distribution of equivalised gross weekly household incomes, people aged 18 years and over, 2014-15^{a, b}

^a The income quintiles shown here are groupings that result from ranking all households in the population in ascending order (from lowest to highest) according to their incomes and then dividing them into five equal groups, each comprising 20 per cent of the population. ^b Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2014-15; ABS (unpublished) National Health Survey (NHS) 2014-15; table 4A.10.2.

In 2014-15, non-Indigenous Australians aged 18 years and over were spread relatively evenly across the EGWH income quintiles — 16.6 per cent were in the lowest income quintile (\$435 or less per week) and 22.0 per cent were in the highest income quintile (\$1551 or more per week). However, Aboriginal and Torres Strait Islander households were concentrated in the lower quintiles — 36.5 per cent in the lowest income quintile, and only 6.2 per cent in the highest quintile (figure 4.10.3). Data are also reported by State and Territory (table 4A.10.2) and by remoteness (table 4A.10.3).

The income quintile boundaries for 2004-05, 2008 and 2014-15 are based on income distributions for the total Australian population (all households) at the time, while quintile boundaries for 2011-13 were derived for Aboriginal and Torres Strait Islander and non-Indigenous households separately. Care should be taken with comparison of income distributions for 2011-13 and other years (tables 4A.10.2-3).

Personal individual income

The main sources of personal income are employment (see sections 4.7 and 9.1), assets (see sections 9.2 and 9.3) and welfare payments (see section 9.4).

Figure 4.10.3 Median gross weekly personal income, people aged 18 years and over, by age group, 2014-15 (2014-15 dollars)^a

^a Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2014-15; ABS (unpublished) National Health Survey (NHS) 2014-15; table 4A.10.7.

In 2014-15, the median real gross weekly personal income for Aboriginal and Torres Strait Islander adults was \$485, compared with \$800 for non-Indigenous adults (table 4A.10.7). There was a significant gap in median personal incomes between Aboriginal and Torres Strait Islander and non-Indigenous adults across all age groups, with the gap narrowest for those aged over 65 years and older (\$48) and largest for those aged 45-54 years (\$554) (figure 4.10.3).

Median real gross weekly personal income increased for Aboriginal and Torres Strait Islander Australians for all age groups between 2002 and 2014-15. Between 2008 and 2014-15, there were statistically significant increases for those aged 25-34 years, and aged 55 years and older (table 4A.10.7).

Things that work

Box 4.10.3 Things that work – household and individual income

The **MoneyMob Talkabout (MMT)** program was established in 2012 in the Amata, Mimili and Pukatja communities of SA and assists people in remote Aboriginal communities to manage their money. (Teams also visit other remote communities in SA, WA and the NT providing services on an outreach basis.) Teams spend time listening and learning about how money is viewed and used in Aboriginal communities while sharing knowledge and information, through a series of fun, engaging and culturally appropriate learning experiences.

In 2014, 758 adult clients (89.7 per cent identified as Aboriginal) used the MMT for a range of money matters, including banking, budgeting, managing debts and fines, retirement incomes and superannuation, tax and insurance (Garner and Pryor 2015).

A rigorous evaluation of the MMT completed in 2013 found that, while many community members still had complex barriers to improving their financial literacy, MMT clients were more likely than non-MMT clients to have developed basic financial management skills (for example, know their bank balance, saved some money, be able to access some money from their bank in an emergency) (Pryor & Garner 2013). Subsequent Community Money Surveys administered in October-November 2014 indicated that people's knowledge, skills, attitudes and behaviours in relation to money were changing in terms of financial capability: money management; choosing products; making provision for the future; and being informed (Garner and Pryor 2015).

The **MPower** program was launched in 2011, and operates in four Cape York communities in Queensland (Aurukun, Coen, Hope Vale and Mossman Gorge). The previous Family Income Management program (a skill and capability development service) has evolved into a fully integrated money management program. It is a free and voluntary program that assists individuals and families to meet their basic material needs, develop financial literacy and build assets through saving and money management.

In December 2015, 1835 people were registered to receive services from the program. During the last quarter of 2015, 662 community members across the four communities accessed MPower a total of 6504 times (Cape York Partnerships 2016).

The CYWR Evaluation Report cited improved money management as an important outcome of the trial. It found that MPower is the most commonly used support service introduced by the trial and that it had assisted residents with household budgeting, saving for large expenses and accessing Internet banking (DSS 2012).

Future directions in data

Supplementary data on household and personal income are available from the Census (tables 4A.10.4–6). However, data are collected in pre-determined income ranges, which affects the level of precision of the median and mean income estimates.

4.11 Substantiated child abuse and neglect³³

Box 4.11.1 Key messages

- Child protection issues continue to be very significant for Aboriginal and Torres Strait Islander families and communities.
- Time series child protection data are difficult to interpret — increases in notifications and orders could reflect changes in laws, policies or child protection practices (for example, changes relating to mandatory reporting, an increased propensity to report or increased access and availability of services, or an underlying change in prevalence, or a mix of factors). There is also likely to be some under reporting.
- The substantiation rate for Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0–17 years have both increased from 2009-10 to 2014-15, from 29.5 to 39.8 per 1000 Aboriginal and Torres Strait Islander children and from 4.7 to 5.9 per 1000 non-Indigenous children, leading to a widening of the gap from 24.8 to 33.9 substantiations per 1000 children. The substantiation rate of Aboriginal and Torres Strait Islander children continues to be over six times the rate for non-Indigenous children (figure 4.11.1).
- Nationally in 2014-15, the most common reason for substantiation for Aboriginal and Torres Strait Islander children aged 0–17 years was neglect (38.3 per cent) followed by emotional abuse (37.7 per cent) (figure 4.11.2).
- The rate of Aboriginal and Torres Strait Islander children aged 0–17 years on care and protection orders increased from 20.7 to 57.5 per 1000 children from 2004-05 to 2014-15. The rate for non-Indigenous children increased from 4.1 to 6.3 per 1000 children over the same period, leading to a widening of the gap from 16.6 to 51.2 care and protection orders per 1000 children (figure 4.11.3).

Box 4.11.2 Measures of substantiated child abuse

There are two main measures for this indicator.

- *Substantiations* is defined as the rate of Aboriginal and Torres Strait Islander children who were the subject of substantiated child protection notifications.
- *Children on care and protection orders* is defined as the rate of Aboriginal and Torres Strait Islander children on care and protection orders.

The most recent available data are for 2014-15 from State and Territory Governments and AIHW (derived from the National Child Protection Data Collection) (all jurisdictions).

Two supplementary measures are also reported:

- placement in accordance with the Aboriginal Child Placement Principle (all jurisdictions)
- diagnoses of sexually transmitted infections in children (national).

³³ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

Child protection issues continue to be very significant for Aboriginal and Torres Strait Islander families and communities. Understanding and addressing the underlying causes of the issues that lead to children being at risk of entering the child protection system is essential if sustainable change is to occur to the socio-economic position of Aboriginal and Torres Strait Islander Australians (SNAICC 2014).

Child protection issues are associated with many other aspects of Aboriginal and Torres Strait Islander disadvantage, including domestic violence (section 4.12), parental substance abuse (sections 6.2, 11.1 and 11.2) and parental mental health problems (section 8.7) (Berlyn and Bromfield 2010; COAG 2009; Kiraly 2015). Families facing these sorts of problems are often affected by other influences including unemployment (section 4.7); lack of education (sections 4.6 and 4.8); young parenthood (section 6.3); overcrowding in housing (section 10.1) and limited access to primary health care (section 8.1) (Bamblett, Bath and Roseby 2010). Historical trauma and the consequences of past removal policies have also contributed to ongoing child protection issues (AHMAC 2015; Higgins 2010).

Longer term effects of child abuse and neglect

Adverse experiences in childhood can have a lifelong legacy. Children who grow up in unsafe homes and communities, and experience trauma, violence and neglect, may demonstrate difficulties in regulating emotions, behaviour, responses to stress, and interactions with others (McGuinness et al. 2013). Research has found children who experience the trauma of relatively high levels of child abuse and neglect have an increased risk of becoming perpetrators of violence as adults (Cripps 2007; Wundersitz 2010). Abuse in childhood has been associated with chronic adult health conditions such as heart disease, diabetes, arthritis, bronchitis/emphysema and cancer (section 4.9) (McGuinness et al. 2013). Child sexual abuse can also have long term effects on physical and mental health, and social, sexual and interpersonal functioning (Cashmore and Shackel 2013). Exposure to trauma and neglect is associated with suicidal behaviour (Atkinson 2013; Robinson, Silburn and Leckning 2011) and contact with the criminal justice system (Weatherburn, Snowball and Hunter 2008; Weatherburn 2014).

Substantiations

Child protection data show how many children come into contact with child protection services. These are the only data routinely collected in Australia on the number of children experiencing child abuse and neglect. Different definitions of what constitutes child abuse and neglect in each State and Territory mean that it is difficult to obtain consistent and comparable national data (Lamont 2011). As many cases of child abuse and neglect are not disclosed to authorities, the data do not reliably indicate how many Aboriginal and Torres Strait Islander children are abused or neglected (AIFS 2015; Berlyn and Bromfield 2010).

Time series data should be interpreted with caution, as rates may be affected by changes in community awareness of child abuse and neglect, changes in propensity to report, changes

in laws, policies or child protection practices (for example changes relating to mandatory reporting over time), changes in service levels and (for Aboriginal and Torres Strait Islander children) improvements in Indigenous identification.

Children can come into contact with State and Territory child protection services in various ways, including reports of concerns made by the child, community members, mandated professionals, organisations, and family or relatives. Before a matter is considered ‘substantiated’ by authorities, it must be notified and investigated.

From the 2009-10 Child Protection Australia report onwards, data on notifications, investigations and substantiations are reported for children aged 0–17 years to maintain a consistent age group for comparability of analysis across the report (AIHW unpublished). Data prior to 2009-10 are reported as the number of children aged 0–16 years to account for some jurisdictional differences in the way 17 year olds were reported (tables 4A.11.2 and 4A.11.4).

Figure 4.11.1 Rate of children aged 0–17 years who were the subject of a substantiation^a

^a See table 4A.11.1 for information on the calculation of rates.

Sources: SCRGSP (2016) *Report on Government Services 2016*, table 15A.8 cites State and Territory Governments (unpublished) for 2012-13 to 2014-15 data and AIHW (unpublished) Child Protection Collection for data prior to 2012-13; ABS (2014) *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; ABS (unpublished) Australian Demographic Statistics, December (various years), Cat. no. 3101.0, Canberra; table 4A.11.1.

The substantiation rate for Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0–17 years have both increased from 2009-10 to 2014-15, from 29.5 to 39.8 per 1000 Aboriginal and Torres Strait Islander children and from 4.7 to 5.9 per 1000 non-Indigenous children, leading to a widening of the gap from 24.8 to

33.9 substantiations per 1000 children. The substantiation rate of Aboriginal and Torres Strait Islander children continues to be over six times the rate for non-Indigenous children (figure 4.11.1).

Figure 4.11.2 Children aged 0–17 years who were the subject of a substantiation by type of abuse or neglect, 2014-15^a

^a If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.

Source: AIHW (2016) *Child Protection Australia 2014-15*, table 4A.11.3.

In 2014-15, Aboriginal and Torres Strait Islander children were substantiated mainly because of neglect (38.3 per cent) followed by emotional abuse (37.7 per cent), with non-Indigenous children more likely to be substantiated because of emotional abuse (45.5 per cent), followed by neglect (21.0 per cent) and physical abuse (19.1 per cent) (figure 4.11.2). Neglect is difficult to define but is strongly associated with disadvantage and poverty (SNAICC 2014; State of Victoria 2016).

Nationally in 2014-15, rates of substantiations for all types of abuse or neglect were higher for Aboriginal and Torres Strait Islander children than for non-Indigenous children. Rates of substantiations for Aboriginal and Torres Strait Islander children ranged from 3.4 per 1000 children for sexual abuse to 15.2 per 1000 children for neglect. Rates for non-Indigenous children ranged from 0.9 per 1000 children for sexual abuse to 2.7 per 1000 children for emotional abuse (table 4A.11.3).

Substantiations across jurisdictions (table 4A.11.3) vary as thresholds differ (for example, some jurisdictions substantiate the harm or risk of harm to the child, whilst others substantiate actions by parents or incidents that cause harm (AIHW 2016)). Family and community violence is discussed in section 4.12.

Children on care and protection orders

If an investigation results in a substantiation, intervention by child protection services might be needed to protect the child. This intervention can take a number of forms, including one or more of: referral to other services; supervision and support; an application to court; and a placement in out-of-home care.

Although child protection substantiations are often resolved without the need for a court order (which is usually a last resort) recourse to a court may take place at any point in the child protection investigation process. The types of care and protection orders available vary across jurisdictions and may include interim and temporary orders, finalised supervisory orders, and finalised guardianship or custody orders (AIHW 2016).

Figure 4.11.3 Rate of children aged 0–17 years on care and protection orders^a

^a See table 4A.11.5 for information on the calculation of rates.

Sources: SCRGSP (2016) *Report on Government Services 2016*, table 15A.8 cites State and Territory Governments (unpublished) for 2012-13 to 2014-15 data and AIHW (unpublished) *Child Protection Collection* for data prior to 2012-13; ABS (2014) *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; ABS (unpublished) *Australian Demographic Statistics, December* (various years), Cat. no. 3101.0, Canberra; table 4A.11.5.

The rate of Aboriginal and Torres Strait Islander children aged 0–17 years on care and protection orders increased from 20.7 to 57.5 per 1000 children from 2004-05 to 2014-15. The rate for non-Indigenous children increased from 4.1 to 6.3 per 1000 children over the same period, leading to a widening of the gap, from 16.6 to 51.2 care and protection orders per 1000 children (figure 4.11.3). Care and protection order data reported by State and Territory are available in table 4A.11.5.

Aboriginal and Torres Strait Islander Child Placement Principle

The Aboriginal and Torres Strait Islander Child Placement Principle³⁴ was developed 30 years ago in response to the trauma experienced by individuals, families and communities from policies that involved the removal of Aboriginal and Torres Strait Islander children families, communities and culture. The fundamental goal of the principle is to enhance and preserve Aboriginal and Torres Strait Islander children's connection to family and community, and sense of identity and culture (Arney et al. 2015). Under The National Framework for Protecting Australia's Children: Third Action Plan, States and Territories commit to continuing to fully implement the principle and to adopt a broader understanding of the principle (DSS 2015). The three broad aims of the principle are to:

- recognise and protect the rights of Aboriginal and Torres Strait Islander children, family members and communities in child welfare matters
- increase the level of self-determination for Aboriginal and Torres Strait Islander Australians in child welfare matters
- reduce the disproportionate representation of Aboriginal and Torres Strait Islander Australians the child protection system (Arney et al. 2015; Tilbury 2013).

Children are placed in out-of-home care as a last resort when it is not in their best interests to remain with their family (COAG 2009). Placement of an Aboriginal and Torres Strait Islander child in out-of-home care is prioritised in the following way:

- with Aboriginal and Torres Strait Islander relatives or extended family members, or other relatives or extended family
- with Aboriginal and Torres Strait Islander members of the child's community
- with other Aboriginal and Torres Strait Islander Australians.

The rate of Aboriginal and Torres Strait Islander children in out-of-home care has increased from 5.4 times the rate of non-Indigenous children in 2004-05 to 9.5 times the rate in 2014-15 (table 4A.11.6).

³⁴ Reference to 'Aboriginal Child Placement Principle' has been amended to 'Aboriginal and Torres Strait Islander Child Placement Principle' in accordance with the National Framework for Protecting Australia's Children, third three-year action plan, 2015–2018 (DSS 2015).

Figure 4.11.4 Placement of Aboriginal and Torres Strait Islander children in out-of-home care, at 30 June^a

^a The denominator for calculating the percentage of children placed in accordance with the principle excludes Aboriginal and Torres Strait Islander children living independently and those whose living arrangements were unknown.

Sources: SCRGSP (2016) *Report on Government Services 2016*, table 15A.19 cites State and Territory Governments (unpublished) for 2012-13 to 2014-15 data and AIHW (unpublished), derived from Child Protection Collection for data prior to 2012-13; table 4A.11.7.

Nationally at 30 June 2015, 67.1 per cent of Aboriginal and Torres Strait Islander children in out-of-home care were placed in accordance with the Aboriginal Child Placement Principle, a gradual decline from a high of 76.7 per cent at 30 June 2005 (figure 4.11.4). The majority of the decline over this period occurred for placement with other Aboriginal and Torres Strait Islander carer or residential care (from 23.1 to 16.3 per cent) — the proportion of placement with relatives/kin³⁵ has remained fairly stable (50.8 per cent at 30 June 2015) (table 4A.11.7).

Data on Aboriginal and Torres Strait Islander children in out-of-home care by relationship of caregiver by State and Territory are available in table 4A.11.7.

Identified barriers between the intent and application of the principle include the shortage of Aboriginal and Torres Strait Islander foster and kinship carers; and inconsistent involvement of and support for, Aboriginal and Torres Strait Islander Australians and organisations in child protection decision-making (Arney et al. 2015).

³⁵ Placement with relatives/kin includes both placement with Aboriginal and Torres Strait Islander and non-Indigenous relatives/kin.

Diagnoses of sexually transmitted infections in children

Whilst the actual prevalence of child sexual assault by Indigenous status is not known, data from incidents that come to the attention of, and are recorded by, police are available. In 2015, Aboriginal and Torres Strait Islander child victims (aged less than 15 years) of sexual assault accounted for 48.4 per cent (NSW), 54.5 per cent (Queensland), 36.4 per cent (SA) and 38.0 per cent (NT) of sexual assault victims in each jurisdiction (section 4.12, table 4A.12.9).

Among older Aboriginal and Torres Strait Islander children it is likely that a significant proportion of sexually transmitted infections (STIs) are the result of early sexual debut and/or sex with peer aged partners. The majority of diagnoses of STIs in the young Aboriginal and Torres Strait Islander population occurred in areas of known high endemicity of STIs, and where screening for STIs is routinely carried out (The Kirby Institute 2015).

Table 4.11.1 Bacterial sexually transmissible infections reported in persons aged less than 16 years, 2010–2014^a

	<i>Aboriginal and Torres Strait Islander</i>			<i>Non-Indigenous</i>		
	<i>Reported cases aged <16 years (no.)</i>	<i>Rate per 100 000</i>	<i>Per cent aged 13–15 years</i>	<i>Reported cases aged <16 years (no.)</i>	<i>Rate per 100 000</i>	<i>Per cent aged 13–15 years</i>
Chlamydia	3 428	266	95	6 670	29	97
Gonorrhoea	1 983	154	94	362	2	92
Infectious syphilis	68	5	93	2	–	100

^a The occurrence of chlamydia, gonorrhoea and infectious syphilis among people aged less than 16 years is described, based on cases notified to the National Notifiable Diseases Surveillance System and is summarised only for those jurisdictions in which Indigenous status was reported for at least 50 per cent of notifications in each year over the past five years. – Nil or rounded to zero.

Sources: The Kirby Institute 2015, *Bloodborne Viral and Sexually Transmissible Infections in Aboriginal and Torres Strait Islander People: Surveillance and Evaluation Report 2015*, UNSW; table 4A.11.8.

For 2010–2014, Aboriginal and Torres Strait Islander children aged under 16 years had higher rates of reported cases of chlamydia, gonorrhoea and syphilis than non-Indigenous children aged under 16 years, with most notifications among those aged 13 to 15 years (table 4.11.1).

Things that work

Addressing Aboriginal and Torres Strait Islander Australians' disadvantage across a broad range of outcomes is critical to addressing the factors that place Aboriginal and Torres Strait Islander children at risk of child abuse and neglect (COAG 2009). Strategies to address the problem of child abuse in Indigenous communities need to consider the known

risk factors for child maltreatment, acknowledge the historical context, be culturally appropriate and emphasise support for family (Higgins 2010). The best way to reduce the number of children and young people who experience abuse and neglect is to strengthen the abilities of families and communities to care for their children and young people (DSS 2015). Box 4.11.3 provides information on two such programs.

Box 4.11.3 ‘Things that work’ — child protection

The **Referral for Active Intervention** (RAI) initiative (Queensland) was mentioned in the 2014 edition of this report as a promising program. A final (mixed method) evaluation by the Queensland government published in 2014 found a reduction in the frequency of contact with the child protection system for RAI families in 2008-09. However, comparison data were not available for families that did not participate in the program during this time (ie, there was no control group). Further assessment comparing outcomes for RAI families to outcomes for a similar group of families who did not participate in RAI would be desirable.

The **Bumps to Babes and Beyond** (BBB) Project (Victoria) offered since February 2012 is a two-year parenting program offered through the Mallee District Aboriginal Services and is adapted from Queen Elizabeth Centre’s Tummies-To-Toddlers pilot program. It was developed to meet the specific needs of the Aboriginal and Torres Strait Islander community of Mildura.

The BBB program engaged 12 mothers over the life of the research period (April 2013 to April 2014). Nine mothers participated in the research evaluation. At the end of the evaluation, all children remained in their family’s care.

Findings included a high rate of breastfeeding amongst BBB mothers (87 per cent of BBB mothers leaving hospital were breast feeding their babies, compared to 45 per cent of all Aboriginal mothers over the same period) and a decrease in mothers’ depression between intake and 3 months post birth. All antenatal appointments were attended by mothers and all children’s immunisations were up to date.

The evaluation recommends follow up research once families exit the program to allow a better understanding of the long-term outcomes.

Future directions in data

As part of the National framework for protecting Australia’s children: third three-year action plan 2015–18, an Aboriginal and Torres Strait Islander working group will be established to ensure the action plan remains focused on achieving outcomes for Aboriginal and Torres Strait Islander children and families (DSS 2015).

4.12 Family and community violence³⁶

Box 4.12.1 Key messages

- Family violence has a significant impact on the health and welfare of individuals, families and communities.
- In 2014-15, around one in five (21.8 per cent) Aboriginal and Torres Strait Islander adults reported experiencing physical or threatened violence, similar to 2002 and 2008. After adjusting for differences in population age structures, this was 2.5 times the rate for non-Indigenous Australians (tables 4A.12.1–2).
- In 2015, Aboriginal and Torres Strait Islander women experienced physical assault at 4.9 (NSW), 9.1 (SA) and 11.4 (NT) times the rates for non-Indigenous women according to police records (table 4A.12.6). The proportions of Aboriginal and Torres Strait Islander women recorded as experiencing:
 - violence by a current partner were 1.1 (NSW), 1.5 (SA) and 2.3 (NT) times the rates for non-Indigenous women (table 4A.12.7)
 - sexual assault by a family member were 1.2 (SA), 1.2 (Queensland), 1.4 (NSW) and 2.6 (NT) times the rates for non-Indigenous women (table 4A.12.11).
- In 2014-15, hospitalisation rates for Aboriginal and Torres Strait Islander family violence-related assaults were 530 females per 100 000 female population and 191 males per 100 000 male population. After adjusting for differences in population age structures, this was 32 times the rate for non-Indigenous females and 23 times the rate for non-Indigenous males (table 4A.12.13).

Box 4.12.2 Measures of family and community violence

There is no main measure for this indicator. Data are reported for four supplementary measures.

- *Incidence and prevalence of violence* is defined by two components.
 - *Prevalence of violence* expressed as the proportion of the population who have experienced violence. Data are sourced from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2014-15 (all jurisdictions; remoteness; sex and age). Data for the non-Indigenous population are sourced from the ABS General Social Survey (GSS), with the most recent data for 2014.
 - *Victimisation rates* expressed as the number of victims recorded by police³⁷ per 100 000 population for selected offences (sexual assault, assault and robbery). Data are sourced from the ABS Recorded Crime Victims collection, with the most recent available data for 2015 (NSW, Queensland, SA and the NT; sex and age).

(continued next page)

³⁶ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

³⁷ An individual may be counted more than once. See (ABS 2016b) for further information.

Box 4.12.2 (continued)

- *Hospitalisation rates* are defined by two components — non-fatal hospitalisation rates for assault and non-fatal hospitalisation rates for family violence-related assaults.
 - Non-fatal hospitalisation rates for assault are expressed as the rate of hospital separations where an external cause indicating assault was recorded.
 - Non-fatal hospitalisation rates for family violence-related assaults are expressed as the rate of separations where an external cause indicating assault was recorded and the relationship of the perpetrator to the victim was recorded as spouse/domestic partner, parent, or other family member.
 - Data are sourced from the AIHW National Hospital Morbidity Database, with the most recent available data for 2014-15 (all jurisdictions; remoteness; sex and age). The calculation of this measure has changed from previous editions of this report, to better reflect separations directly related to hospitalisation due to assaults and data in this report are not directly comparable to previous reports.
- *Homicide rates* are defined as the rate of deaths recorded as homicide. Data are sourced from the ABS Causes of Death collection (for deaths recorded as homicide on death registration forms), with the most recent available data for 2010–2014 (NSW; Queensland, WA, SA and the NT; sex and age) and from the AIC National Homicide Monitoring Program, with the most recent available data for 2013-14 (for deaths recorded as homicide by police) (all jurisdictions; remoteness and sex).
- *People who seek services due to family violence* is defined as the proportion of people seeking assistance from Specialist Homelessness Services for reasons of domestic/family violence. Data are sourced from the AIHW Specialist Homelessness Services collection, with the most recent available data for 2014-15 (all jurisdictions; remoteness; sex).

Family violence remains a serious and widespread issue in Australia (Olsen and Lovett 2016a), and can have a significant impact on the health and welfare of individuals including physical and mental illness, sexually transmitted diseases, substance use, homelessness and poverty (Hovane and Cox 2011). The term ‘family violence’, in an Aboriginal and Torres Strait Islander context, is used to describe the range of violence that takes place including the physical, emotional, sexual, social, spiritual, cultural, psychological and economic abuses that may be perpetrated within a family. The term also recognises the broader impacts of violence; on extended families, kinship networks and community relationships (Cripps and Davis 2012; NSW Department of Health 2011; Wild and Anderson 2007). It also includes lateral violence, which describes how historical and ongoing trauma and social and cultural oppression move through kinship networks, communities and generations (Blagg, Bluett-Boyd and Williams 2015; COAG 2016).

Aboriginal and Torres Strait Islander Australians experience violence at rates well above those of non-Indigenous Australians (Bryant 2009). A greater proportion of violent incidents in Aboriginal and Torres Strait Islander communities are family violence-related (Bryant and Willis 2008). Two separate studies (in Queensland and Victoria) showed an overrepresentation of the Aboriginal and Torres Strait Islander population (around 4 to 5 per cent) breaching family/domestic violence protection orders (Stewart 2000;

VLA 2015). Children who experience or witness violence have a greater risk of becoming perpetrators of such behaviour (Richards 2011; Wundersitz 2010). Substantiated child abuse and neglect is discussed in section 4.11.

The full extent of violence against Aboriginal and Torres Strait Islander Australians is difficult to establish due to underreporting by victims (Cripps 2008; Willis 2011), lack of appropriate screening by service providers, incomplete identification of gender and Indigenous status in many datasets, and the lack of nationally comparable data on family violence available from police, courts, health or welfare sources (ALRC 2011; Bryant and Willis 2008; Cripps 2008; Olsen and Lovett 2016b; Wundersitz 2010). In addition, existing sources of data do not capture the full extent of family and community violence, as they only include data on reported violence (URBIS 2011). Some reports show that violence and abuse is so prevalent in some communities, that the people who live there regard it as inevitable (Willis 2011) and a ‘language of minimisation’ — describing instances of violence as ‘everyday’ or innocuous — is used in communities to avoid confrontation or aggravating the situation (Cripps and Adams 2014; Cripps 2008; Lloyd 2014).

Despite the disproportionate burden of violence against Aboriginal and Torres Strait Islander Australians, violence is not normal or customary in Aboriginal and Torres Strait Islander communities (Olsen and Lovett 2016b). There is no single factor, but rather a multitude of interrelated factors that contribute to the occurrence of family and community violence in Aboriginal and Torres Strait Islander populations, including:

- the trauma attributable to colonisation and dispossession
- the breakdown of traditional culture and kinship practices
- the removal of Aboriginal and Torres Strait Islander children from their families
- experiences of violence, including childhood experience of violence and abuse
- low education and income levels and high unemployment levels, welfare dependency
- poor and overcrowded housing conditions
- poor physical and mental health
- high levels of alcohol misuse and illicit drug use (Bryant 2009; Clapham, Stevenson and Lo 2006; Cripps and Davis 2012; Cripps 2007; Cripps et al. 2009; Olsen and Lovett 2016b; Wundersitz 2010).

Alcohol stands out as a significant contributor to violence in Aboriginal and Torres Strait Islander communities (Bryant and Willis 2008; Bryant 2009; HREOC 2006; Livingston 2011; Meuleners et al. 2010; Weatherburn, Snowball and Hunter 2008; Wundersitz 2010). In 2014-15, over two-thirds of Aboriginal and Torres Strait Islander Australians who had experienced physical violence in the last 12 months reported that alcohol or other substances contributed to the most recent incident (higher in remote areas) (ABS 2016a). The role of alcohol and drug and substance misuse in Aboriginal and Torres Strait Islander homicides is discussed in sections 11.1 and 11.2.

Incidence and prevalence of violence

Self-report

The NATSISS collects data on people's self-reported experiences of physical or threatened violence. In 2014-15, around one in five (21.8 per cent) Aboriginal and Torres Strait Islander adults reported experiencing physical or threatened violence in the previous 12 months. This has not changed significantly since 2008 (22.9 per cent) and 2002 (23.3 per cent) (table 4A.12.1).

After adjusting for differences in population age structures:

- Aboriginal and Torres Strait Islander adults reported experiencing physical or threatened violence in the previous 12 months prior to interview at 2.5 times that reported by non-Indigenous adults. The gap in the prevalence of physical or threatened violence increased between 2008 and 2014-15 (from 8.7 to 12.0 percentage points) — due to a decrease in non-Indigenous rates (table 4A.12.2).
- Aboriginal and Torres Strait Islander women reported experiencing physical or threatened violence in the previous 12 months at 3.1 times the rate of non-Indigenous women (table 4A.12.2).
- Across remoteness areas, Aboriginal and Torres Strait Islander adults reported experiencing physical or threatened violence in the previous 12 months at between 1.6 times the rate of non-Indigenous adults in outer regional areas and 2.8 times in major cities (table 4A.12.3).
- In all states and territories (except the NT, where the proportions were not statistically significantly different), a higher proportion of Aboriginal and Torres Strait Islander Australians than non-Indigenous Australians had experienced physical or threatened violence in the previous 12 months (table 4A.12.4).

One in eight Aboriginal and Torres Strait Islander Australians (13 per cent) experienced physical violence in the previous 12 months (around three in five on more than one occasion) and of those, around half reported that their most recent experience of physical violence was by a family member (ABS 2016a).

Recorded by police

The ABS recorded crime collection relates to victimisation incidents for a selected range of offences recorded by police. There are limits to using police records to measure family and community violence. Police data do not represent all victims of crime, just those who come to the attention of, and whose details are recorded by, police. A high proportion of violent victimisation is not disclosed to police (Wild and Anderson 2007; Willis 2011). Rates of non-disclosure are higher in Aboriginal and Torres Strait Islander communities than

non-Indigenous communities, with studies indicating that around 90 per cent of violence against Aboriginal and Torres Strait Islander women is not disclosed (Willis 2011).

Comparable data by Indigenous status are available for NSW, Queensland (excluding physical assaults), SA and the NT, with the most recent data for 2015.

- Rates of *physical assault* for Aboriginal and Torres Strait Islander Australians were:
 - 3.4 (NSW), 5.7 (NT) and 6.2 (SA) times the rates for non-Indigenous Australians (table 4A.12.5)
 - for males, 2.2 (NSW and NT) and 3.4 (SA) times the rates for non-Indigenous males (table 4A.12.6)
 - for females, 4.9 (NSW), 9.1 (SA) and 11.4 (NT) times the rates for non-Indigenous females (table 4A.12.6).
- Rates of *sexual assault* for Aboriginal and Torres Strait Islander Australians were 2.4 (NT), 2.9 (NSW), 3.3 (Queensland) and 3.5 (SA) times the rates for non-Indigenous Australians (table 4A.12.5). Over three-quarters of Aboriginal and Torres Strait Islander victims of sexual assault were female. The majority of Aboriginal and Torres Strait Islander victims of sexual assault (between 55 and 77 per cent) were less than 19 years of age (table 4A.12.9).
- The proportions of Aboriginal and Torres Strait Islander women reporting:
 - violence by a current partner were 1.1 (NSW), 1.5 (SA) and 2.3 (NT) times the rates for non-Indigenous women (table 4A.12.7)
 - sexual assault by a family member were 1.2 (SA), 1.2 (Queensland), 1.4 (NSW), and 2.6 (NT) times the rates for non-Indigenous women (table 4A.12.11).

Additional information on individual jurisdictions, are available in tables 4A.12.5–12.

Hospitalisation rates

Hospital records provide some information on instances of family violence that result in hospitalisation, and in some cases death. However, these sources are likely to underestimate the true extent of family and community violence, because not all victims seek medical attention and not all hospitalisations resulting from family violence will be recorded as such.

For this report, hospitalisations data are presented for the non-Indigenous population from 2012-13 onwards (for prior years the data are presented for ‘other’ which includes non-Indigenous Australians and those for whom Indigenous status is unknown or not stated). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions for 2012-13 to 2014-15 for Aboriginal and Torres

Strait Islander and non-Indigenous Australians, as well as data for the six jurisdictions for 2004-05 to 2014-15 for Aboriginal and Torres Strait Islander and other Australians.

Nationally in 2014-15, Aboriginal and Torres Strait Islander hospitalisations for non-fatal family violence-related assaults were 530.4 females per 100 000 female population and 191.3 males per 100 000 male population. After adjusting for differences in population age structures, this was 32 times the rate for non-Indigenous females and 23 times the rate for non-Indigenous males) (table 4A.12.13).

Between 2004-05 and 2014-15, after adjusting for differences in population age structures, for NSW, Victoria, Queensland, WA, SA and the NT combined, the rate of hospitalisations for family violence-related assault for Aboriginal and Torres Strait Islander Australians increased from 319.3 per 100 000 to 409.5 per 100 000 and from 12.2 per 100 000 to 13.9 per 100 000 other Australians (table 4A.12.14).

Hospitalisations for assaults increased with remoteness — from 156.5 per 100 000 population in major cities to 1044.4 per 100 000 population in remote areas for *non-fatal family violence-related* assaults and 390.8 per 100 000 population in major cities to 2013.6 per 100 000 population in remote areas for *total* assaults (tables 4A.12.15 and 4A.12.23).

Data on non-fatal hospitalisations for assaults by jurisdiction, sex and relationship of victim to offender, and by remoteness are in tables 4A.12.16–24.

Homicide rates

Homicide data from the AIC National Homicide Monitoring Program are based on police records, whereas ABS homicide deaths data are based on death registrations. Despite the differences in collections, the AIC and ABS mortality data allow for some detailed examination of the circumstances and characteristics of homicide occurring in the Aboriginal and Torres Strait Islander and non-Indigenous populations.

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

For the period 2010–2014, the death rate from homicide was 6.4 per 100 000 Aboriginal and Torres Strait Islander population (after adjusting for differences in population age structures, this was 6.4 times the rate for non-Indigenous Australians). The death rate was highest for Aboriginal and Torres Strait Islander Australians aged 25–34 years and 35–44 years (13.6 and 12.4 per 100 000 population respectively) (table 4A.12.25). Between 1998 and 2014 (after adjusting for differences in population age structures, for NSW, Queensland, WA, SA and the NT combined), the death rate from homicide for Aboriginal and Torres Strait Islander Australians fluctuated between 5 and 9 times the rate

for non-Indigenous Australians (table 4A.12.28). Rates varied across NSW, Queensland, WA, SA and the NT (table 4A.12.27).

Since 2002-03, the majority (between 60 and 85 per cent) of incidents involving an Aboriginal and Torres Strait Islander offender also involved an Aboriginal and Torres Strait Islander victim (table 4A.12.31). Of homicide incidents where the Indigenous status of victims and offenders were known, around 13.7 per cent of incidents involved Aboriginal and Torres Strait Islander people as both offender and victim. Around 4.6 per cent involved a non-Indigenous offender and an Aboriginal and Torres Strait Islander victim (table 4A.12.31).

In 2013-14:

- The Aboriginal and Torres Strait Islander homicide rate increased as remoteness increased (from 1.6 per 100 000 population in major cities to 8.9 per 100 000 population in remote areas) (table 4A.12.30).
- A domestic altercation was the motive for 35.0 per cent of Aboriginal and Torres Strait Islander male homicide incidents and 46.7 per cent of Aboriginal and Torres Strait Islander female homicide incidents (table 4A.12.32).
- The victim and offender were intimate partners in 54.2 per cent of Aboriginal and Torres Strait Islander homicide incidents, compared with 26.2 per cent of non-Indigenous homicide incidents (table 4A.12.33).
- There were no Aboriginal and Torres Strait Islander homicide incidents where the victim and the offender were strangers. The victim and offender were strangers in 22.0 per cent of non-Indigenous homicide incidents (table 4A.12.33).

People who seek services due to family violence

Domestic and family violence-related homelessness is a widespread and growing problem in Australia (Tully et al. 2008). Over one-third of adults and children seeking help from specialist homelessness services in Australia did so for domestic and family violence reasons (AIHW 2016).

The Specialist Homelessness Services (SHS) collection provides information on people who seek assistance from agencies funded under the National Affordable Housing Agreement (NAHA) or the National Partnership Agreement on Homelessness (NPAH).

Aboriginal and Torres Strait Islander people are overrepresented amongst those who received assistance from SHS — around one in four (24 per cent) of all SHS clients (AIHW 2016).

In 2014-15, domestic/family violence was the second most common main reason both Aboriginal and Torres Strait Islander and non-Indigenous people sought SHS (both around 23 per cent) (table 4A.12.34). The proportion of total clients escaping for domestic/ family

violence reasons increased with remoteness for both Aboriginal and Torres Strait Islander and non-Indigenous SHS clients (around 31.8 per cent in major cities compared to 45.7 per cent and 47.7 per cent respectively in very remote areas) (table 4A.12.35). Data on rates of SHS clients escaping domestic/ family violence varied by State and Territory (table 4A.12.35).

In 2014-15, Aboriginal and Torres Strait Islander children aged 0–17 years accompanying SHS clients escaping family violence attended an SHS agency at a rate of 278 per 10 000 population, around 8 times the rate for non-Indigenous children (33 per 10 000 population) (table 4A.12.36).

Things that work

There are currently a range of responses to family violence in Aboriginal and Torres Strait Islander communities provided by Australian, State and Territory governments as well as local initiatives in services and community groups (Olsen and Lovett 2016b). However, there have been few published rigorous, multi-stage evaluation of programs designed to reduce family violence in Aboriginal and Torres Strait Islander communities (CTGCH forthcoming). Some initiatives contributing to a reduction in family and community violence are described in box 4.12.3.

Box 4.12.3 ‘Things that work’ — family and community violence

The **Alice Springs Domestic and Family Violence Outreach Service** (NT) commenced in 2009 and provides targeted outreach support to women living in Alice Springs and the surrounding town camps, who are experiencing domestic and family violence. The program also runs support and education groups to women in town camps.

In 2012-13, almost 400 women were assisted, with around 80 per cent identified as Aboriginal (ASWS 2013). An independent mixed method evaluation of the project that year found that:

- All of the 19 women (with 43 children in their care) interviewed reported their safety had improved with the support of the program
- Of those women who had previously used the crisis accommodation service (84 per cent of respondents), 42 per cent had not used the service again (Gander 2013).

In 2014-15, around 490 women were assisted; the majority were aged from 18–35 years (ASWS 2015).

The project was awarded a National Certificate of Merit at the 2013 Australian Crime and Violence Prevention Awards (AIC 2013).

The **Yuendumu Mediation and Justice Committee** (YM&JC) (NT), operating since November 2011, draws upon traditional Warlpiri dispute resolution and relationship-sustaining practices to strengthen family relationships and develop strategies that promote community safety and address family violence.

(continued next page)

Box 4.12.3 (continued)

The YM&JC is made up of Aboriginal and Torres Strait Islander elders and respected people who provide support tailored to the community to reach durable agreements about group conflicts — this includes independent facilitators and training on negotiation skills, decision-making and dispute management.

An independent mixed method evaluation of the YM&JC estimated its Net Present Value in 2014 as \$14.1 million with a benefit-cost ratio of 4.3 (Daly and Barrett 2015). The project has reduced and prevented violence by ensuring conflicts are settled peacefully and quickly. To be effective, mediation solutions need to be local, specific and ongoing (Williams 2016).

Future directions in data

The National Plan to Reduce Violence Against Women and their Children 2010–2022 (COAG 2010) includes the development of a National Data Collection and Reporting Framework for family and domestic violence and sexual assault (FaHCSIA 2013). All jurisdictions have committed to the national framework, to be operational by 2022.

The ABS have published experimental data for victims of family and domestic violence by Indigenous status for assault and for sexual assault (sourced from police records). However, there are variances in the recording of relationship of offender to victim data across the states and territories which may effect on comparability of data.

4.13 Imprisonment and juvenile detention³⁸

Box 4.13.1 Key messages

- In 2014-15, 91.2 per cent of Aboriginal and Torres Strait Islander Australians (aged 15 years and over) reported never having been incarcerated and around two-thirds (65.1 per cent) reported never having been formally charged by police (ABS 2016).
- However, at 30 June 2015, Aboriginal and Torres Strait Islander Australians made up over a quarter of the adult prison population (27.4 per cent), with around 2 per cent of Aboriginal and Torres Strait Islander adults (4 per cent for males) in prison (2252.6 per 100 000 adults) (tables 4A.13.2–4).
- The imprisonment rate for Aboriginal and Torres Strait Islander males was 9 times the rate for females (4088.9 compared to 460.7 per 100 000 adult population). However, the female imprisonment rate grew faster (increasing 118.7 per cent since 2000 compared with a 50.6 per cent increase for males) (figure 4.13.1).
- After adjusting for differences in population age structures, the rate of imprisonment for Aboriginal and Torres Strait Islander adults was 13 times the rate for non-Indigenous adults, at 30 June 2015. Between 2000 and 2015, the Aboriginal and Torres Strait Islander adult imprisonment rate increased by 77.4 per cent, while the non-Indigenous rate remained fairly constant until 2013 before increasing by 15.2 per cent in the two most recent years (figure 4.13.2).
- The daily average detention rate for both Aboriginal and Torres Strait Islander and non-Indigenous young people fell between 2007-08 and 2014-15 — from 415.8 to 348.6 per 100 000 Aboriginal and Torres Strait Islander young people and from 17.1 to 14.5 per 100 000 non-Indigenous young people. Aboriginal and Torres Strait Islander young people were in detention at 24 times the rate for non-Indigenous young people (figure 4.13.3).

Box 4.13.2 Measures of imprisonment and juvenile detention

There are two main measures for this indicator:

- Adult imprisonment is defined as the rate of people aged 18 years and over (17 years and over in Queensland³⁹) in prison. Data are sourced from the ABS Prisoners in Australia collection, with the most recent available data for 30 June 2015 (all jurisdictions; sex; age).
- Juvenile detention is defined as the rate of people aged 10 to 17 years in youth detention. Data are sourced from the AIHW Juvenile Justice National Minimum Data Set. The most recent available data are for 2014-15 (all jurisdictions; sex).

A supplementary measure on young people subject to community-based supervision orders is also reported (all jurisdictions; sex).

³⁸ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

³⁹ People aged 17 years and over in Victoria prior to 2006 and in Tasmania prior to 2000. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.

A large number of Aboriginal and Torres Strait Islander Australians never commit criminal offences (Wundersitz 2010). In 2014-15, 91.2 per cent of Aboriginal and Torres Strait Islander Australians (aged 15 years and over) reported never having been incarcerated and two-thirds (65.1 per cent) reported never having been formally charged by police (ABS 2016). However, Aboriginal and Torres Strait Islander Australians experience contact with the criminal justice system — as both offenders and victims — at much higher rates than non-Indigenous Australians (Senate Community Affairs References Committee 2010). Section 4.12 (Family and community violence) includes some information on victimisation.

Data on imprisonment and youth detention take account of only one aspect of contact with the criminal justice system. By their nature, offences that result in imprisonment or youth detention tend to be more serious. The data do not address arrests that do not proceed to court (for example, as a result of diversion [section 11.3], including diversion to the child protection system [section 4.11]); convictions that lead to outcomes that are not administered by custodial facilities (for example, community service orders and fines); and short term police custody (for example, for public drunkenness).

Substance abuse (sections 11.1 and 11.2), child neglect and abuse (section 4.11), school completion (section 4.6) and employment (section 4.7) are four major drivers of involvement in crime (Weatherburn 2014; Weatherburn, Snowball and Hunter 2008). The main risk factors linked to violent offending by Aboriginal and Torres Strait Islander Australians include high risk alcohol consumption (11.1), illicit drug use (11.2), being male, being young, childhood experience of violence and abuse (4.11), exposure to pornography, poor schooling (4.4 – 4.6), low income (4.10), unemployment (9.1), poor housing (9.3 and 10.1), mental illness (8.7) and lack of access to services (5.3 and 8.1) (particularly in remote areas of Australia) (Cripps 2007; Wundersitz 2010).

A NSW cohort study of Aboriginal and Torres Strait Islander males with complex needs identified four significant factors that impacted on the frequency of police contact and custody; young age at first contact, experiencing out-of-home care as a child, alcohol misuse and limited locational mobility (Trofimovs and Dowse 2014). The Aboriginal and Torres Strait Islander Mental Health Disorders and Cognitive Disability in the Criminal Justice System Project found that compared to their non-Indigenous counterparts, Aboriginal and Torres Strait Islander female prisoners with known mental health or cognitive disability were more likely to have experienced out-of-home care as children, first police contact at a younger age, custody as juveniles, more police contacts and convictions, homelessness or being a victim of crime (Baldry et al. 2015). Mental health is covered in section 8.7 and disability in section 4.9.

A high proportion of Aboriginal and Torres Strait Islander offenders have experienced trauma and abuse as a child (Wundersitz 2010). A 2003 study of 50 Aboriginal and Torres Strait Islander women in NSW prisons found that 70 per cent had been victims of child sexual abuse, with most also reporting other types of abuse as children (Lawrie 2003a, 2003b; Wundersitz 2010). A study of 116 incarcerated Aboriginal and Torres Strait

Islander women in Queensland estimated that almost half (46 per cent) suffered from post-traumatic stress disorder (from sudden death of a loved one, being the victim of serious domestic violence or sexual assault, or observing serious physical violence in the home as a child) (Heffernan et al. 2015). Substantiated child abuse and neglect is covered in section 4.11.

Changes to judicial processes and criminal justice legislation and policies have been linked to increases in Aboriginal and Torres Strait Islander imprisonment rates — for example, longer sentences, mandatory minimum sentences, increasing parole revocations and technical violations and more restrictive bail conditions (Senate Legal and Constitutional Affairs References Committee 2013; Wood 2014).

Imprisonment has a heavy social and economic impact (Senate Legal and Constitutional Affairs References Committee 2013). Prison can become more of an expectation than a deterrent; for some it may even become a rite of passage and can lead to the ‘normalisation’ of incarceration among community members (Brown 2010).

Adult imprisonment

Data are available for a count of prisoners who are held in adult prisons as at midnight on 30 June of each year. The annual flow through Australia’s prisons is well in excess of the daily number, but information on those moving through prison systems is not yet available (Kinner and Avery 2015). The nature of this collection means that the majority of prisoners counted are serving long term sentences for serious offences, whereas the flow of offenders in and out of prisons consists primarily of persons serving short sentences for lesser offences (ABS 2013).

At 30 June 2015, Aboriginal and Torres Strait Islander Australians made up over a quarter of the adult prison population (27.4 per cent), with around 2 per cent of Aboriginal and Torres Strait Islander adults in prison (2252.6 per 100 000 adult population). The number of Aboriginal and Torres Strait Islander male prisoners equated to 4 per cent of the Aboriginal and Torres Strait Islander adult male population (table 4A.13.2–4).

The imprisonment rate for Aboriginal and Torres Strait Islander males was 9 times the rate for females (4088.9 compared to 460.7 per 100 000 adults). However, the female imprisonment rate grew faster (increasing 118.7 per cent since 2000 compared with a 50.6 per cent increase for males) (figure 4.13.1).

Figure 4.13.1 **Aboriginal and Torres Strait Islander adult imprisonment rate, at 30 June^a**

^a Rates for all years are calculated using population data based on the 2011 Census.

Sources: ABS (various), *Prisoners in Australia*, Cat. no. 4517.0; ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; table 4A.13.4.

Figure 4.13.2 **Adult imprisonment rate, at 30 June^{a, b}**

^a Rates for all years are calculated using population data based on the 2011 Census. ^b Data are age standardised.

Source: ABS (2015) *Prisoners in Australia, 2015*, Cat. no. 4517.0; table 4A.13.5.

After adjusting for differences in population age structures, the rate of imprisonment for Aboriginal and Torres Strait Islander adults at 30 June 2015 was 13 times the rate for non-Indigenous adults (figure 4.13.2). Between 2000 and 2015, the Aboriginal and Torres Strait Islander adult imprisonment rate increased by 77.4 per cent, while the non-Indigenous rate remained fairly constant until 2013 before increasing by 15.2 per cent in the two most recent two years (figure 4.13.2). Rates varied across states and territories, but recorded increased rates for Aboriginal and Torres Strait Islander adults between 2000 and 2015 (table 4A.13.5).

Data by legal status are reported from 2007 and show that the proportion of unsentenced prisoners is increasing for both Aboriginal and Torres Strait Islander prisoners (from a low of 21.3 per cent in 2009 before steadily increasing to 27.3 per cent at 30 June 2015) and non-Indigenous prisoners (rates have varied but peaked at 27.7 per cent at 30 June 2015) (table 4A.13.6).

Around three-quarters of prisoners on 30 June 2015 were sentenced prisoners (72.7 per cent of Aboriginal and Torres Strait Islander prisoners and 72.3 per cent of non-Indigenous prisoners) (table 4A.13.6). Of Aboriginal and Torres Strait Islander sentenced prisoners, the largest proportion had been sentenced with ‘acts intended to cause injury’ (29.5 per cent), whereas the largest proportion of non-Indigenous sentenced prisoners had been sentenced for illicit drug offences 16.3 per cent). The expected time to serve (median years) was shorter or similar for Aboriginal and Torres Strait Islander prisoners compared to non-Indigenous prisoners in all offence categories (table 4A.13.7).

Around 45 per cent of Aboriginal and Torres Strait Islander prisoners were under the age of 30 years, and around half of these prisoners were under the age of 24 years (table 4A.13.8). The median age of Aboriginal and Torres Strait Islander prisoners in Australian prisons at 30 June 2015 was 31.3 years, 4.1 years lower than the median age for non-Indigenous prisoners (35.4 years) (table 4A.13.9).

Juvenile detention

One of the key principles underpinning Australia’s youth justice system is that young people should be placed in detention only as a last resort. It is also consistent with the United Nations Convention on the Rights of the Child (AIHW 2013, 2014; Richards 2011).

In 2014-15, a daily average of 436 Aboriginal and Torres Strait Islander 10–17 year olds were in detention (388 males and 48 females), compared with 313 non-Indigenous 10–17 year olds (285 males and 28 females) (tables 4A.13.10–11).

Figure 4.13.3 **Daily average rate of detention of young people aged 10–17 years^a**

^a Rates for all years are calculated using population data based on the 2011 Census and are per 100 000 persons aged 10–17 years.

Sources: AIHW (2016) *Youth Justice in Australia 2014-15*, Canberra: AIHW; NT government (unpublished); SCRGSP (2016), *Report on Government Services 2016*, ABS (2014) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; ABS (unpublished) *Australian Demographic Statistics*, December, Cat. no. 3101.0, Canberra; table 4A.13.10.

The daily average detention rate for both Aboriginal and Torres Strait Islander and non-Indigenous young people fell between 2007-08 and 2014-15 — from 415.8 to 348.6 per 100 000 Aboriginal and Torres Strait Islander young people aged 10–17 years and from 17.1 to 14.5 per 100 000 non-Indigenous young people aged 10–17 years. Aboriginal and Torres Strait Islander young people were in detention at 24 times the rate for non-Indigenous young people (figure 4.13.3). This ratio was 24 times for males and 29 times for females (table 4A.13.11). Aboriginal and Torres Strait Islander young people were over represented in youth detention in each State and Territory (tables 4A.13.10–11).

Aboriginal and Torres Strait Islander young people spent more time in detention during the year on average (74 days) than non-Indigenous young people (64 days) (AIHW 2016).

Community-based youth justice supervision

Community-based youth justice supervision is an alternative to detention, where a sentenced order or unsentenced order (such as conditional bail) are served in the community. Most young people under youth justice supervision are supervised in the community. In 2014-15, a daily average of 1824 Aboriginal and Torres Strait Islander young people aged 10–17 years were supervised in the community (table 4A.13.12).

The daily average numbers and rates of community-based supervision for both Aboriginal and Torres Strait Islander and non-Indigenous young people in 2014-15 were the lowest since 2007-08. The rate for Aboriginal and Torres Strait Islander young people was 14.2 times the rate for non-Indigenous young people (1458.5 compared to 102.7 per 100 000 population) (table 4A.13.12). The rate for Aboriginal and Torres Strait Islander males (2217.9 per 100 000 population) was 3.3 times the rate for females (670.3 per 100 000 population) (table 4A.13.13). Community-based supervision data by State and Territory are available in tables 4A.13.12-13.

Future directions in data

The Australian Bureau of Statistics is working with corrective services agencies to explore ways to improve prisoner flow data to build a more accurate picture of incarceration. There also needs to be more rigorous evidence of effectiveness and evaluation of efforts to reduce imprisonment. National reporting of prison separations will help inform through-care services for those released from prison (Kinner and Avery 2015). In April 2016, COAG agreed to develop ways to address barriers to employment on release and to support Aboriginal and Torres Strait Islander people as they transition from incarceration to employment (COAG 2016).

Table 4A.13.11	Daily average number and rate (per 100 000) of young people aged 10-17 years in detention, by sex, by Indigenous status, by State and Territory, 2014-15
Table 4A.13.12	Daily average number and rate (per 100 000) of young people aged 10-17 years subject to community-based supervision, by Indigenous status, by State and Territory, 2007-08 to 2014-15
Table 4A.13.13	Daily average number and rate (per 100 000) of young people aged 10-17 years subject to community-based supervision, by sex, by Indigenous status, by State and Territory, 2014-15

Table 4A.1.1 Estimated life expectancies at birth, NSW, Queensland, WA, NT and Australia, 2010–2012 (years) (a)

	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>NT</i>	<i>Australia for comparison (b), (c)</i>	<i>Headline Australia (c), (d)</i>
Aboriginal and Torres Strait Islander						
Life expectancy at birth						
Males	70.5	68.7	65.0	63.4	67.4	69.1
Females	74.6	74.4	70.2	68.7	72.3	73.7
Upper and lower 95 per cent confidence intervals						
Males	69.0-72.0	67.3-70.1	63.4-66.6	61.3-65.5	66.1-68.7	67.8-70.4
Females	73.3-75.9	73.2-75.6	68.8-71.6	66.8-70.6	71.2-73.4	72.5-74.9
Non-Indigenous						
Life expectancy at birth						
Males	79.8	79.4	80.1	77.8	79.8	79.7
Females	83.1	83.0	83.7	83.1	83.2	83.1
Gap between Aboriginal and Torres Strait Islander and Non-Indigenous life expectancies at birth (e)						
Males	9.3	10.8	15.1	14.4	12.4	10.6
Females	8.5	8.6	13.5	14.4	10.9	9.5

(a) Aboriginal and Torres Strait Islander estimates of life expectancy are not produced for Victoria, SA, Tasmania or the ACT due to the small number of Indigenous deaths reported in these jurisdictions.

(b) These estimates are not the headline estimates for Australia, because they are calculated without an age-adjustment, but are provided to enable effective comparison with the State and Territory, and remoteness area estimates.

(c) Australian total includes all states and territories.

(d) Headline estimates for Australia are calculated using an improved methodology (taking into account age-specific identification rates) that could not be applied at the State and Territory or remoteness area levels. Therefore this data should not be compared with data for any state or territory, or remoteness area.

(e) Gaps are based on unrounded estimates.

TABLE 4A.1.4

Table 4A.1.4 **Age specific death rates, Indigenous status, selected states and territories, by sex by age group, NSW, Qld, WA, SA and NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

	Males			Females			Persons		
	Aboriginal and Torres Strait Islander	Non-Indigenous	Rate ratio (h)	Aboriginal and Torres Strait Islander	Non-Indigenous	Rate ratio (h)	Aboriginal and Torres Strait Islander	Non-Indigenous	Rate ratio (h)
<i>Age (years)</i>									
0 years (i), (j)	689.9	375.7	1.8	550.6	320.3	1.7	622.0	348.8	1.8
1–4	37.0	17.8	2.1	35.0	14.8	2.4	36.0	16.3	2.2
5–14	20.1	9.6	2.1	18.6	8.3	2.2	19.4	9.0	2.2
15–24	122.4	49.1	2.5	64.0	22.4	2.9	94.1	36.1	2.6
25–34	229.3	73.3	3.1	131.7	32.1	4.1	180.1	52.9	3.4
35–44	497.4	124.8	4.0	306.7	68.5	4.5	398.3	96.6	4.1
45–54	944.4	268.9	3.5	569.9	163.4	3.5	749.2	215.9	3.5
55–64	1 628.2	631.0	2.6	1 224.6	371.8	3.3	1 419.2	500.9	2.8
65–74	3 200.4	1 563.1	2.0	2 464.4	946.2	2.6	2 803.6	1 252.6	2.2
75 and over	7 918.1	7 197.5	1.1	7 274.0	6 277.1	1.2	7 531.6	6 666.6	1.1

(a) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Indigenous identification in mortality data. Data for these jurisdictions over-represent Indigenous populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions.

(b) Although most deaths of Aboriginal and Torres Strait Islander Australians are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate the Aboriginal and Torres Strait Islander all-causes mortality rate. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous mortality rates because of these data quality issues.

(c) Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period.

(d) Population data between Census years are based on assumptions about past and future levels of fertility, mortality and migration, and have a degree of uncertainty.

TABLE 4A.1.4

Table 4A.1.4 **Age specific death rates, Indigenous status, selected states and territories, by sex by age group, NSW, Qld, WA, SA and NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

<i>Males</i>			<i>Females</i>			<i>Persons</i>		
<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous</i>	<i>Rate ratio (h)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous</i>	<i>Rate ratio (h)</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous</i>	<i>Rate ratio (h)</i>

(e) Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(f) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(g) Age-specific death rates per 100,000 using the midpoint populations for the relevant years.

(h) Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.

(i) For infant deaths (less than one year), the rates represent the number of deaths per 100,000 live births.

(j) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

Source: ABS (unpublished) *Deaths, Australia 2014*, Cat. no. 3302.0, Canberra.

(a) Rates have been directly age-standardised using the 2001 Australian standard population.

(b) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(c) Aboriginal and Torres Strait Islander and non-Indigenous population estimates are available for Census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Aboriginal and Torres Strait Islander population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

(d) Mortality rate for Aboriginal and Torres Strait Islander people divided by the mortality rate for non-Indigenous people.

(e) Mortality rate for Aboriginal and Torres Strait Islander people minus the mortality rate for non-Indigenous people.

All causes	no.	223.5	361.2	683.1	224.2	908.8	404.6

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the direct method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (f) Data based on reference year.

TABLE 4A.1.6

Table 4A.1.6 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (j)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (j), (k)</i>
--	-------------	------------	----------------	-----------	-----------	-----------	-----------------------

(g) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(h) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.

(i) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Indigenous Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

(j) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(k) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(l) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(m) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

(n) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

np Not published.

Rate ratio (i)	no.	1.4	1.6	2.3	1.4	2.5	1.7
Rate difference (j)	no.	223.7	361.2	683.6	223.9	908.9	404.6

(a) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the direct method, age standardised by 5 year age groups to 75 years and over.

(b) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(c) Data are based on jurisdiction of usual residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Data are based on year of registration. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Causes of Death collection have the same meaning.

Table 4A.1.7 **Age standardised all-cause mortality rate, variability bands, rate ratios and rate differences, by Indigenous status, NSW, Qld, WA, SA, NT, five year aggregate, 2010–2014 (a), (b), (c), (d), (e), (f)**

	<i>NSW</i>	<i>Qld (g)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (g)</i>
<p>(e) Aboriginal and Torres Strait Islander and non-Indigenous population estimates are available for Census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Aboriginal and Torres Strait Islander population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous Aboriginal and Torres Strait Islander estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.</p> <p>(f) Some totals and figures may not compute due to the effects of using different denominators and of rounding.</p> <p>(g) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.</p> <p>(h) Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals.</p> <p>(i) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.</p> <p>(j) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.</p>

Digestive diseases (K00-K93)	5.4	5.6	5.3	7.5	5.4	5.6
Kidney diseases (N00-N29)	1.8	1.5	2.2	2.4	3.4	2.2
Certain conditions originating in the perinatal period (P00-P96)	1.9	2.7	1.5	1.9	2.3	2.1
Certain infectious and parasitic diseases (A00-B99)	2.5	2.5	2.1	3.4	2.3	2.5
Diseases of the nervous system (G00-G99)	2.5	2.2	3.1	4.1	2.1	2.5
Other causes (j)	6.6	8.5	7.3	7.5	7.8	7.5
All causes	100.0	100.0	100.0	100.0	100.0	100.0

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).

(b) Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared over time or across jurisdictions.

(c) Data are reported individually by jurisdiction of usual residence for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Data are presented in five-year groupings due to the volatility of small numbers each year.

Table 4A.1.9 **Proportion of Aboriginal and Torres Strait Islander deaths, by selected causes of death, NSW, Queensland, WA, SA, NT, 2010–2014 (crude percentage) (a), (b), (c), (d), (e), (f), (g)**

	<i>NSW</i>	<i>Qld (h)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (h), (i)</i>
--	------------	----------------	-----------	-----------	-----------	-----------------------

(e) Data based on reference year.

(f) Some totals and figures may not compute due to the effects of rounding.

(g) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(h) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(i) Total includes data for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

Other causes (j)	no.	20.7	45.3	183.2	82.9	265.3	81.9
Total (all causes)	no.	221.6	305.0	688.3	302.3	1 066.2	410.3

(a) Causes of death data for 2014 are preliminary and subject to a revisions process. For further information see Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).

(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(c) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(f) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.

(g) Data based on reference year.

(h) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.

(i) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(k) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

Table 4A.1.10 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2014 (a), (b), (c), (d), (e), (f), (g), (h)

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (i)</i>
--	-------------	------------	------------	-----------	-----------	-----------	------------------

(l) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

np Not published.

Total (all causes)	no.	257.6	437.5	589.0	240.1	857.7	427.2

- (a) Causes of death data for 2013 are revised and subject to a further revisions process. For further information see Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Denominators used in the calculation of rates for the Indigenous population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.
- (g) Data based on reference year.
- (h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (i) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.
- (k) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

Table 4A.1.11 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2013 (a), (b), (c), (d), (e), (f), (g), (h)

Total (all causes)	no.	282.5	293.3	693.3	110.9	765.0	382.8

(a) Causes of death data for 2011 are revised and subject to a revisions process. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.

(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(c) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(f) Data based on reference year.

(g) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

(h) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(i) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(k) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

(l) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

Table 4A.1.13 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2011 (a), (b), (c), (d), (e), (f), (g), (h)

- (a) Causes of death data for 2009 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (g) Data based on reference year.

Table 4A.1.15 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2009 (a), (b), (c), (d), (e), (f), (g), (h)

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA (i)</i>	<i>SA</i>	<i>NT</i>	<i>Total (j)</i>
(h)	Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.						
(i)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.						
(j)	Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.						
(k)	'Other causes' consist of all conditions excluding the selected causes displayed in the table.						
(l)	Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.						
(m)	Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.						

np Not published.

- (a) Causes of death data for 2008 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Data based on reference year.
- (g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

Table 4A.1.16 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2008 (a), (b), (c), (d), (e), (f), (g), (h)

- (a) Causes of death data for 2006 have undergone revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28–32.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.
- (g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

Table 4A.1.18 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2006 (a), (b), (c), (d), (e), (f), (g), (h)

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (i)</i>
--	-------------	------------	------------	-----------	-----------	-----------	------------------

(h) Data based on reference year.

(i) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(k) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

(l) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

np Not published.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).

(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. See the 'Standard Population for Use in Australian-Standardisation Table' data cube in Australian Demographic Statistics, Dec 2012 (cat. no. 3101.0) for the ABS standard population. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(d) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(e) Denominators used in the calculation of rates for the Indigenous population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.

(f) Data based on reference year.

(g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(h) Data provided includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(i) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(j) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

Table 4A.1.19 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 1998 to 2014 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Unit</i>	2014	2013	2012	2011	2010	2009	2008	2007	2006	2005	2004	2003	2002	2001	2000	1999	1998
--	-------------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------

(k) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).

(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. See the 'Standard Population for Use in Australian-Standardisation Table' data cube in Australian Demographic Statistics, Dec 2012 (cat. no. 3101.0) for the ABS standard population. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(c) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(d) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(e) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.

(f) Data based on reference year.

Table 4A.1.20 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, by sex, 2006 to 2014 (a), (b), (c), (d), (e), (f), (g), (h)**

		2014		2013		2012		2011		2010 (i)		2009 (j)		2008 (j)		2007 (j)		2006	
Unit		Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female

(g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(h) Data provided includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(j) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.

(k) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.

(l) Rate ratio is the age standardised Aboriginal and Torres Strait Islander rate divided by the non-Indigenous rate.

(m) Rate difference is the age standardised Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

Table 4A.2.1 **All causes perinatal, infant and child mortality, by Indigenous status, single year, 1998 to 2014 (a), (b), (c), (d), (e), (f), (g)**

	<i>Aboriginal and Torres Strait Islander</i>					<i>Non-Indigenous</i>			
	<i>Unit</i>	<i>Perinatal (h)</i>	<i>Infants 0-1 (i)</i>	<i>Children 0-4 (j)</i>	<i>Children 1-4 (j)</i>	<i>Perinatal (h)</i>	<i>Infants 0-1 (i)</i>	<i>Children 0-4 (j)</i>	<i>Children 1-4 (j)</i>
Rate ratio (m)	no.	2.0	3.0	1.9	1.0
Rate difference (n)	no.	7.9	9.0	101.8	0.5

- (a) Causes of death data for 2014 are preliminary and subject to a revisions process. For further information see Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Data are based on jurisdiction of residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (c) Aboriginal and Torres Strait Islander and non-Indigenous estimates are available for Census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Aboriginal and Torres Strait Islander population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Aboriginal and Torres Strait Islander population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.
- (d) Data based on reference year for perinatal deaths. Data based on year of registration for infant and child deaths. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Perinatal Deaths collection have the same meaning.
- (e) Although most deaths of Aboriginal and people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality and perinatal mortality rates.
- (f) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.
- (g) The average of three years population data centred around the reporting year has been used as the denominator for child mortality rates.
- (h) Perinatal deaths include neonatal deaths (i.e. death of a live born baby within 28 completed days of birth) and stillbirths of at least 20 completed weeks of gestation or with a birth weight of at least 400 grams.
- (i) Infant deaths include all deaths within the first year of life.
- (j) Includes deaths of all children aged 0-4 years and 1-4 years. Records with not stated age at death have been pro-rated acrosses these two groups.

Table 4A.2.1 **All causes perinatal, infant and child mortality, by Indigenous status, single year, 1998 to 2014 (a), (b), (c), (d), (e), (f), (g)**

	Aboriginal and Torres Strait Islander					Non-Indigenous			
	Unit	Perinatal (h)	Infants 0-1 (i)	Children 0–4 (j)	Children 1–4 (j)	Perinatal (h)	Infants 0-1 (i)	Children 0–4 (j)	Children 1–4 (j)
(k)	For perinatal deaths, the rates represent the number of deaths per 1000 of all births (including live births and stillbirths of at least 20 completed weeks of gestation or with a birth weight of at least 400 grams). For infant deaths (less than one year), the rates represent the number of deaths per 1000 live births. For child deaths (0-4 years), the rates represent the number of deaths per 100 000 Estimated Resident Population (0-4) years for the mid point year.								
(l)	Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals. See data quality statement for details.								
(m)	Rate ratio is the Aboriginal and Torres Strait Islander mortality rate divided by the non-Indigenous mortality rate.								
(n)	Rate difference is the Aboriginal and Torres Strait Islander mortality rate less the non-Indigenous mortality rate.								
	.. Not applicable.

Number of deaths							
Aboriginal and Torres Strait Islander	no.	165	306	142	19	162	794
Non-Indigenous	no.	3 614	2 806	1 046	581	93	8 140
Rate (m)							
Aboriginal and Torres Strait Islander	per 1000 relevant births	5.9	11.6	11.2	4.0	20.7	9.9
Non-Indigenous	per 1000 relevant births	7.7	9.7	7.3	6.2	7.7	8.1
Rate ratio (n)	no.	0.8	1.2	1.5	0.6	2.7	1.2
Rate difference (o)	no.	-1.8	1.9	3.9	-2.2	13.0	1.9

(a) Data are reported for NSW, Queensland, WA, SA and the NT only. These five states and territories are considered to have adequate levels of Aboriginal and Torres Strait Islander identification in mortality data. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.

(b) Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period.

(c) Data cells with small values have been randomly assigned to protect the confidentiality of individuals. As a result, some totals will not equal the sum of their components. It is important to note that cells with a zero value have not been affected by confidentialisation.

Table 4A.2.2 All causes perinatal mortality, by Indigenous status, 2009–2013 (a), (b), (c), (d), (e), (f)

	<i>Unit</i>	<i>NSW</i> (g)	<i>Qld</i> (h)	<i>WA</i> (i)	<i>SA</i>	<i>NT</i>	<i>Total</i>
(d)	Although most deaths of Aboriginal and Torres Strait Islander children are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these statistics are likely to underestimate Aboriginal and Torres Strait Islander perinatal mortality and, depending on the under-identification in births, may either underestimate or overestimate the rates. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous perinatal mortality rates because of these data quality issues.						
(e)	All causes of death data from 2006 onward are subject to a revisions process – once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2009–2011 (final), 2012 (revised) and 2013 (preliminary). See Explanatory Notes 52–57 and Causes of Death Revisions 2011 and 2012 (Technical Note) in Causes of Death, Australia, 2013 (cat. no. 3303.0).						
(f)	Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.						
(g)	Data have been revised to include previously unprocessed NSW birth registrations for the period 2005 to 2010.						
(h)	Care should be taken when interpreting mortality rates for Queensland due to changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.						
(i)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. These data were released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). The adjusted data have been included in this table.						
(j)	Fetal deaths of at least 20 weeks gestation or with a birthweight of at least 400 grams.						
(k)	Neonatal death is death of a live-born baby within 28 days of birth.						
(l)	Perinatal deaths are all foetal deaths (at least 20 weeks gestation or at least 400 grams birthweight) plus all neonatal deaths.						
(m)	For fetal deaths and perinatal deaths, the rates represent the number of deaths per 1000 of all births (including live births and stillbirths of at least 20 completed weeks of gestation or with a birth weight of at least 400 grams). For neonatal deaths, the rates represent the number of deaths per 1000 of all lives births.						
(n)	Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.						
(o)	Rate difference is the mortality rate for Aboriginal and Torres Strait Islander Australians minus the mortality rate for non-Indigenous Australians.						

np Not published.

Source: ABS (unpublished) Perinatal Deaths, Australia, 2013.

Table 4A.2.3 All causes infant (<1 year) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g)

	<i>Unit</i>	<i>NSW (h)</i>	<i>Qld (i)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (h),(i),(j)</i>
Number of deaths							
Aboriginal and Torres Strait Islander	no.	121	174	81	31	98	505
Non-Indigenous	no.	1 625	1 243	357	271	44	3 540
Rate (k)							
Aboriginal and Torres Strait Islander	per 1000 live births	4.4	6.2	6.1	7.0	12.4	6.2
Non-Indigenous	per 1000 live births	3.5	4.3	2.4	2.8	3.5	3.5
Rate ratio (l)	no.	1.3	1.4	2.6	2.5	3.5	1.8
Rate difference (m)	no.	0.9	1.9	3.7	4.2	8.9	2.7

(a) Includes all deaths within the first year of life.

(b) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.

(c) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Data are presented in five-year groupings due to volatility of the small numbers involved.

(e) Data are based on year of registration. See data quality statements for a more detailed explanation.

(f) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

(g) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. For more information data quality statements are available on the AIHW website along with the METeOR data specifications.

(h) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014. For more information data quality statements are available on the AIHW website along with the METeOR data specifications.

(i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and deaths registrations. Queensland deaths data for 2010 have been adjusted to minimise the the impact of late registration of deaths on mortality indicators. See data quality statements for more information.

(j) Total includes data for NSW, Queensland, WA, SA and the NT only.

(k) Infant deaths per 1000 live births. The volatility in infant mortality rates is partially due to the relatively small number of infant deaths registered.

(l) Rate ratio is the Aboriginal and Torres Strait Islander mortality rate divided by the non-Indigenous mortality rate.

(m) Rate difference is the Aboriginal and Torres Strait Islander mortality rate less the non-Indigenous mortality rate.

Table 4A.2.4 All causes child (1–4 years) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)

	<i>Unit</i>	<i>NSW</i>	<i>Qld (k)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (k), (l)</i>
Number of deaths							
Aboriginal and Torres Strait Islander	no.	26	28	22	6	23	105
Non-Indigenous	no.	270	199	102	67	10	648
Rate (m)							
Aboriginal and Torres Strait Islander	per 100 000 persons	25.1	27.9	52.6	33.4	78	35.8
Non-Indigenous	per 100 000 persons	14.9	17.4	16.8	17.8	22.2	16.3
Rate ratio (n)	no.	1.7	1.6	3.1	1.9	3.5	2.2
Rate difference (o)	no.	10.2	10.5	35.8	15.6	55.8	19.5

(a) Includes deaths of all children aged 1–4 years.

(b) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Aboriginal and all causes mortality rate.

(c) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Aboriginal and Torres Strait Islander and non-Indigenous population estimates are available for Census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Aboriginal and Torres Strait Islander population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Aboriginal and Torres Strait Islander population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012 onwards, used in the calculation of non-Indigenous comparison rates, are first release preliminary estimates.

(e) A derived Estimated Resident Population (ERP) based on the 2011 Census is used in the calculation of total population rates. Non-Indigenous ERP was derived by subtracting Aboriginal and Torres Strait Islander projections based on the 2011 Census (3238.0) from the total population ERP. Population estimates from Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (cat. no. 3238.0) (based on the 2011 Census) are used to calculate Aboriginal and Torres Strait Islander rates.

(f) Data are presented in five-year groupings due to volatility of the small numbers involved.

(g) Data are based on year of registration. For more information data quality statements are available on the AIHW website along with the METeOR data specifications.

(h) Age at death unknown has been prorated across age group.

(i) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

(j) From 2014, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. For more information data quality statements are available on the AIHW website along with the METeOR data specifications.

Table 4A.2.4 All causes child (1–4 years) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)

	<i>Aboriginal and Torres Strait Islander</i>			<i>Non-Indigenous</i>			<i>Rate ratio (j)</i>	<i>Rate difference (k)</i>
	<i>Number</i>	<i>Rate per 1000 relevant births (h)</i>	<i>Crude percentage % (i)</i>	<i>Number</i>	<i>Rate per 1000 relevant births (h)</i>	<i>Crude percentage % (i)</i>		
Complications of placenta, cord and membranes (P02)	104	1.3	13.6	1 125	1.1	14.2	1.2	0.2
Other complications of labour and delivery and noxious influences transmitted via placenta or breast milk (P03-P04)	47	0.6	6.1	415	0.4	5.2	1.4	0.2
Total deaths (m)	766	9.5	100.0	7 914	7.8	100.0	1.2	1.7

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis. They do not represent a quasi-Australia figure.
- (c) Perinatal deaths are all fetal deaths (at least 20 weeks gestation or at least 400 grams birth weight) plus all neonatal deaths. See *Perinatal Deaths, Australia* (ABS Cat. no. 3304.0) Glossary for further information.
- (d) Data are presented in 5-year groupings due to volatility of the small numbers involved.
- (e) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.
- (f) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.
- (g) The process for coding perinatal deaths has changed from the 2013 reference year which impacts on the timeseries. Please refer to the Perinatal data quality statement and Changes to Perinatal Death Coding (Technical Note) in Causes of Death, Australia, 2013 (cat. no. 3303.0).
- (h) Crude rates for perinatal deaths represent the number of deaths per 1000 total relevant births which comprises live births and fetal deaths (with at least 20 weeks gestation or at least 400 grams birth weight).

TABLE 4A.2.6

Table 4A.2.6 **Mortality rates for selected causes of death, perinatal deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

<i>Aboriginal and Torres Strait Islander</i>		<i>Non-Indigenous</i>		<i>Rate ratio (j)</i>	<i>Rate difference (k)</i>
<i>Number</i>	<i>Rate per 1000 relevant births (h)</i>	<i>Number</i>	<i>Rate per 1000 relevant births (h)</i>		
	<i>Crude percentage % (i)</i>		<i>Crude percentage % (i)</i>		

(i) Crude percentage is number of deaths by cause divided by all deaths registered during the five year period. Crude percentages cannot be compared across jurisdictions or across years.

(j) Rate ratio calculated by dividing Aboriginal and Torres Strait Islander rates by non-Indigenous rates.

(k) Rate difference is the Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

(l) Other conditions' consist of all conditions excluding the selected causes displayed in the table.

(m) Includes 'no condition in mother'.

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52–54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0)

TABLE 4A.2.7

Table 4A.2.7 **Mortality rates for selected causes of death, infant deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g)**

	Aboriginal and Torres Strait Islander			Non-Indigenous				
	Number	Rate per 1000 live births (h)	Crude percentage % (i)	Number	Rate per 1000 live births (h)	Crude percentage (i) %	Rate ratio (j)	Rate difference (k)
(b)	Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are considered to have adequate levels of Aboriginal and Torres Strait Islander identification in mortality data. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.							
(c)	Although most deaths of Indigenous infants are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate Indigenous infant deaths and, depending on the under-identification in births, may either underestimate or overestimate the rates. Different causes of death may have levels of completeness of identification of Indigenous deaths that differ from the all-cause under-identification (coverage) estimates.							
(d)	Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is births for the mid-point year for the time period.							
(e)	Because of changes in the level of accuracy of Indigenous identification in the births and deaths data over time, caution should be used in interpreting changes in Indigenous infant mortality rates. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous infant mortality rates because of these data quality issues.							
(f)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.							
(g)	Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(h)	For infant deaths (less than one year), crude rates represent the number of deaths per 1000 live births.							
(i)	Crude percentage is number of deaths by cause divided by all deaths registered during the five year period. Crude percentages cannot be compared across jurisdictions or across years.							
(j)	Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians							
(k)	Rate difference is the mortality rate for Aboriginal and Torres Strait Islander Australians minus the mortality rate for non-Indigenous Australians.							

TABLE 4A.2.7

TABLE 4A.2.8

Table 4A.2.8 **Mortality rates for selected causes of death, children (1–4 years) deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	Aboriginal and Torres Strait Islander			Non-Indigenous				
	Number	Rate per 100 000	Crude percentage % (j)	Number	Rate per 100 000	Crude percentage % (j)	Rate ratio (k)	Rate difference (l)
(b)	Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are currently considered to have adequate levels of Indigenous identification in mortality data for these periods. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.							
(c)	Although most deaths of Indigenous children are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate Indigenous child mortality and, depending on the under-identification in births, may either underestimate or overestimate the rates. Different causes of death may have levels of completeness of identification of Indigenous deaths that differ from the all-cause under-identification.							
(d)	Because of changes in the level of accuracy of Indigenous identification in the births and deaths data over time, caution should be used in interpreting changes in Indigenous infant mortality rates. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous child mortality rates because of these data quality issues.							
(e)	Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the average of the population for the time period.							
(f)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.							
(g)	Includes all deaths of children aged 1-4 years.							
(h)	These data exclude 17 registered deaths where the Indigenous status was not stated over the period 2010-2014.							

TABLE 4A.2.8

Table 4A.2.8 **Mortality rates for selected causes of death, children (1–4 years) deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	Aboriginal and Torres Strait Islander			Non-Indigenous				
	Number	Rate per 100 000	Crude percentage % (j)	Number	Rate per 100 000	Crude percentage % (j)	Rate ratio (k)	Rate difference (l)
(i)	Aboriginal and Torres Strait Islander and non-Indigenous population estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Aboriginal and Torres Strait Islander population from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011-census-based Aboriginal and Torres Strait Islander population projections from the 2011-census based total persons estimated resident population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.							
(j)	Crude percentage is number of deaths by cause divided by all deaths registered during the five year period. Crude percentages cannot be compared across jurisdictions or across years.							
(k)	Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.							
(l)	Rate difference is the mortality rate for Aboriginal and Torres Strait Islander Australians minus the mortality rate for non-Indigenous Australians.							
(m)	Other conditions include: neoplasms; diseases of blood and blood-forming organs; endocrine, nutritional and metabolic diseases; mental and behavioural disorders; diseases of the eye and adnexa; diseases of the ear and mastoid process; diseases of the digestive system; diseases of the musculoskeletal system and connective tissues; diseases of the genitourinary system; and diseases of the skin and subcutaneous tissue.

Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99)	104	29.1	17.0	400	8.0	9.6	3.6	21.1
External causes of morbidity and mortality (V01–Y98)	78	21.2	12.8	305	6.1	7.3	3.5	15.1
Diseases of the nervous system (G00–G99)	17	4.6	2.8	149	3.0	3.6	1.5	1.6
Other causes (m)	21	5.7	3.4	287	5.8	6.9	1.0	- 0.1
All causes	610	166.0	100.0	4 188	84.1	100.0	2.0	81.9

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0)

TABLE 4A.2.9

Table 4A.2.9 **Mortality rates for selected causes of death, children (0–4 years) deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h)**

	Aboriginal and Torres Strait Islander			Non-Indigenous			Rate ratio (k)	Rate difference (l)
	Number	Rate per 100 000 (i)	Crude percentage % (j)	Number	Rate per 100 000 (i)	Crude percentage % (j)		
(b)	Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are currently considered to have adequate levels of Indigenous identification in mortality data for these periods. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.							
(c)	Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the average of 2010-2014 population.							
(c)	Although most deaths of Aboriginal and Torres Strait Islander children are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these statistics are likely to underestimate Indigenous child deaths and, depending on the under-identification in births, may either underestimate or overestimate the rates. Different causes of death may have levels of completeness of identification of Aboriginal and Torres Strait Islander deaths that differ from the all-cause under-identification (coverage) estimates.							
(d)	Because of changes in the level of accuracy of Aboriginal and Torres Strait Islander identification in the births and deaths data over time, caution should be used in interpreting changes in Aboriginal and Torres Strait Islander child mortality rates. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous child mortality rates because of these data quality issues.							
(e)	Includes all deaths of children aged 0-4 years.							
(f)	These data exclude 124 registered deaths where the Aboriginal and Torres Strait Islander status was not stated over the period 2010-2014							
(g)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.							
(h)	Aboriginal and Torres Strait Islander and non-Indigenous population estimates are available for census years only. In the intervening years, Aboriginal and Torres Strait Islander population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Aboriginal and Torres Strait Islander population from the ERP for the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.							
(j)	Rates are crude rates per 100 000 population.							

TABLE 4A.2.9

Table 4A.2.9 **Mortality rates for selected causes of death, children (0–4 years) deaths, 2010–2014 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Aboriginal and Torres Strait Islander</i>			<i>Non-Indigenous</i>			<i>Rate ratio (k)</i>	<i>Rate difference (l)</i>
	<i>Number</i>	<i>Rate per 100 000 (i)</i>	<i>Crude percentage % (j)</i>	<i>Number</i>	<i>Rate per 100 000 (i)</i>	<i>Crude percentage % (j)</i>		

(j) Crude percentage is number of deaths by cause divided by all deaths registered during the five year period. Crude percentages cannot be compared across jurisdictions or across years.

(k) Rate ratio is the mortality rate for Aboriginal and Torres Strait Islander Australians divided by the mortality rate for non-Indigenous Australians.

(l) Rate difference is the mortality rate for Aboriginal and Torres Strait Islander Australians minus the mortality rate for non-Indigenous Australians.

(m) Other conditions include: neoplasms; diseases of blood and blood-forming organs; endocrine, nutritional and metabolic diseases; mental and behavioural disorders; diseases of the eye and adnexa; diseases of the ear and mastoid process; diseases of the digestive system; diseases of the musculoskeletal system and connective tissues; diseases of the genitourinary system; and diseases of the skin and subcutaneous tissue.

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (c) Includes all deaths of infants aged less than 1 year of age.
- (d) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).
- (e) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.
- (f) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.
- (g) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.
- (h) Crude rates calculated per 1000 live births.
- (i) Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.
- (j) Rate ratio calculated by dividing Aboriginal and Torres Strait Islander rates by non-Indigenous rates.

TABLE 4A.2.10

Certain conditions originating in the perinatal period (P00–P96)	63	87.7	46.7	354	39.7	39.1	2.2	48.0

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).
- (b) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (c) Includes all deaths of children aged 0–4 years.
- (d) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).
- (e) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.
- (f) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.
- (g) Deaths where the Aboriginal and Torres Strait Islander status of the deceased was not stated are excluded from analysis.
- (h) Crude rate is the number of deaths registered during the reference year per 100 000 estimated resident population for children aged 0–4 for the average of the 3 years surrounding the reference year. Crude rates cannot be compared across jurisdictions or across years.

TABLE 4A.2.11

Table 4A.2.11 **Leading cause of death, children (0–4 years), 2007 to 2014 (a), (b), (c), (d), (e), (f), (g)**

	Aboriginal and Torres Strait Islander			Non-Indigenous				
	Number	Rate per 100 000 (h), (i)	Crude percentage % (j)	Number	Rate per 100 000(h), (i)	Crude percentage % (j)	Rate ratio (k)	Rate difference (l)
(i)	Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Aboriginal and Torres Strait Islander population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Aboriginal and Torres Strait Islander status were not stated.							
(j)	Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.							
(k)	Rate ratio calculated by dividing the Aboriginal and Torres Strait Islander rates by non-Indigenous rates.							
(l)	Rate difference is the Aboriginal and Torres Strait Islander rate less the non-Indigenous rate.

Tas	Department of Education	Kindergarten	4 by 1 January	Department of Education	Preparatory	5 by 1 January
ACT (g)	Education and Training Directorate	Preschool	4 by 30 April	Education and Training Directorate	Kindergarten	5 by 30 April
NT (h)	Department of Education	Preschool	4 by 30 June	Department of Education	Transition	5 by 30 June

- (a) The ECEC chapter reports data for child care and preschool services only. Data on primary school are reported in the School education chapter (chapter 4), but relate to 2014 or 2015. Information on the first year of primary school are included here to show the point at which children can transition from preschool to the first year of primary school in each jurisdiction.
- (b) The departmental responsibility of agencies varies between child care and preschool. Agency responsibility refers to licensing services for child care, and licensing, funding and/or providing services for preschool programs. State and Territory education departments are responsible for primary school.
- (c) NSW subsidises early access to community preschool for 3 year old Aboriginal children and 3 year old children from low income families. In NSW, all licensed children's services for under 6 year olds (who have not commenced Kindergarten) are required to offer programs that meet children's educational and developmental needs.
- (d) In Victoria, Aboriginal and Torres Strait Islander children and children known to child protection are eligible for free kindergarten through Early Start Kindergarten funding if they are aged 3 by 30 April of the year in which they are enrolled.

Table 4A.3.1 Early Childhood Education and Care in Australia, as at 30 June 2015 (a)

-
- (e) All licensed children's services in Queensland are required to provide an appropriate program that is designed to stimulate and develop each child's creative, emotional, intellectual, lingual, physical, recreational and social potential.
 - (f) SA provides early access to Department funded preschool for children who are Aboriginal or under the Guardianship of the Minister after their 3rd birthday. The compulsory school starting age in SA is 6 years at the oldest.
 - (g) In the ACT, private preschools are monitored and assessed by the ACT Community Services Directorate.
 - (h) NT provides early access to preschool for Aboriginal and Torres Strait Islander children living in remote areas if they turn 3 by 30 June of the year they are enrolled. Children turning 4 after 30 June are eligible to enrol in a preschool program after their birthday, if places are available and with the understanding that the child will access more than 12 months of preschool.

Source: State and Territory governments unpublished.

NMS = National Minimum Standard.

- (a) The achievement percentages reported in this table include 95 per cent confidence intervals (for example, 80.0 per cent ± 2.7 per cent). The confidence intervals in this table are for the specific year applicable and do not provide an indication of statistically significant difference between years. See section 2.6 of the statistical context chapter for more information on confidence intervals.
- (b) Exempt students were not assessed and are deemed not to have met the national minimum standard. The proportion of absent and withdrawn students varies across jurisdictions. Readers are urged to be cautious when comparing results.
- (c) A student is considered to be 'Aboriginal and Torres Strait Islander' if he or she identifies as being of Aboriginal and/or Torres Strait Islander origin. Students for whom Indigenous status was not stated are not included in these calculations.
- (d) Nature of difference refers to the combined impact of statistical significance and effect size:
 For Comparison of percentage of students at or above national minimum standard (NMS): ▲ Percentage of students at or above NMS is substantially higher than and is statistically significantly different from the base year (or previous year) for this State/Territory △ Percentage of students at or above NMS is higher than and is statistically significantly different from the base year (or previous year) for this State/Territory. ■ Percentage of students at or above NMS is close to or not statistically different from the base year (or previous year) for this State/Territory ▽ Percentage of students at or above NMS is lower than and is statistically significantly different from the base year (or previous year) for this State/Territory. ▼ Percentage of students at or above NMS is substantially lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

For Comparison of means: ▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory. △ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory. ■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory. ▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory. ▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

Table 4A.4.132 **Mean scale score for year 3 reading, by Indigenous status, by geolocation, by year (number) (a), (b)**

		Year							
	Unit	2008	2009	2010	2011	2012	2013	2014	2015
Total	no.	405.0 ± 1.1	415.0 ± 1.1	418.6 ± 1.0	420.4 ± 1.1	424.2 ± 1.0	423.4 ± 1.0	423.2 ± 1.0	430.7 ± 1.1

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.133 **Mean scale score for year 3 numeracy, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.134 **Mean scale score for year 5 reading, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.135 **Mean scale score for year 5 numeracy, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.136 **Mean scale score for year 7 reading, by Indigenous status, by geolocation, by year (number) (a), (b)**

	Year							
Unit	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.137 **Mean scale score for year 7 numeracy, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.138 **Mean scale score for year 9 reading, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) The method used to identify Aboriginal and Torres Strait Islander students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

Table 4A.4.139 **Mean scale score for year 9 numeracy, by Indigenous status, by geolocation, by year (number) (a), (b)**

Unit	Year							
	2008	2009	2010	2011	2012	2013	2014	2015

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

(a) Non-Indigenous includes those whose Indigenous status is unknown/not stated.

(b) Refer to the *ACARA National Standards for School Attendance Data Reporting 2015* for additional detail on the key components of the national standards on which school attendance data in Australia are requested. This document is available electronically via the ACARA website.

(c) For primary and secondary totals the following cut off grades have been used as a proxy for all jurisdictions: years 1–6 for all primary and year 7–10 for all secondary. Structural changes across states and territories over time should be considered when making time series comparisons within a jurisdiction. Primary or secondary ungraded are not included in the primary and secondary totals as there is not a consistent definition of primary and secondary schooling nationally and the data can not be apportioned accordingly.

(d) Students in ungraded classes who cannot readily be allocated to a year of education are included as either ungraded primary or ungraded secondary, according to the typical age level in each state or territory. Students in secondary support units, physically located in a primary school and vice versa, are counted as ungraded in either primary or secondary school.

(e) NSW data are not collected on a comparable basis with other states and territories. Therefore comparisons with other jurisdictions should be made with caution.

Table 4A.5.8 Proportion of students, in government school sector, who attend school 90 per cent or more of possible days for students in years 1–10 (per cent), 2015 (a), (b), (c)

	<i>Unit</i>	<i>NSW (d)</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Australia (d)</i>
Aboriginal and Torres Strait Islander	%	na	58.9	51.6	38.3	43.1	64.0	50.2	27.2	46.7
Non-Indigenous	%	na	79.7	75.3	77.2	74.6	75.2	76.3	72.0	77.2
Proportion difference (e)		na	-20.8	-23.7	-38.9	-31.5	-11.2	-26.1	-44.8	-30.5
Total	%	na	79.3	73.0	73.9	72.7	74.1	75.3	50.9	75.0

(a) Non-Indigenous includes those whose Indigenous status is unknown/not stated.

(b) Government school data in this table are based on a full-time equivalent student measure, dependent on the sum of 'possible school days' for students. Non-government schools student level data (table 4A.5.9) are based on a different measure of headcounts of students attending more than 90 per cent of the time, and are not directly comparable with data in this table.

(c) Refer to the ACARA National Standards for School Attendance Data Reporting 2015 for additional detail on the key components of the national standards on which school attendance data in Australia are requested. This document is available electronically via the ACARA website.

(d) NSW data are not available for this measure. Australian totals do not include NSW.

(e) Proportion difference is the proportion of Aboriginal and Torres Strait Islander students who attend school 90 per cent or more of possible days minus the equivalent non-Indigenous data item.

na Not available.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) These survey data for Aboriginal and Torres Strait Islander people should not be compared to data from the Census of Population and Housing.

(c) People aged 20–24 years who have completed year 12 or Certificate II or above (includes 'Certificate I/II not further defined (nfd) and III/IV nfd' but excludes persons with a 'Certificate I and Certificate nfd' and people whose level of non-school qualification could not be determined).

(d) Due to the small sample size for the Northern Territory in 2007-08, data for non-indigenous people should be treated with high degree of caution.

– Nil or rounded to zero.

(a) The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. The Aboriginal and Torres Strait Islander population are derived from ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (series b, 2011 base).

(a) The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. The Indigenous population are derived from ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (series b, 2011 base). Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

Table 4A.6.11 Year 12 students achieving ATARs, by ATAR range, 2006–2015 (a), (b), (c)

<i>ATAR range</i>	<i>Unit</i>	<i>Aboriginal and Torres Strait Islander</i>	<i>Non-Indigenous</i>	<i>Unknown</i>	<i>All students</i>
-------------------	-------------	--	-----------------------	----------------	---------------------

- (a) This is a count of all year 12 students in each year grouped into those achieving ATARs in various ranges. The count includes year 12 students who did not apply for admission to a tertiary institution or college.
- (b) The ATAR is calculated solely for the use of tertiary institutions to compare the overall achievement of students who have completed different combinations of year 12 certificate studies. ATAR was previously known as ENTER (Equivalent National Tertiary Entrance Rank) in Victoria and TER (Tertiary Entrance Rank) in Western Australia, South Australia, Tasmania and the NT. The change to ATAR, the nationally agreed name used by all Australian states and territories (except Queensland), is a change in name only. There is no change to the calculation. Universities admission organisations use year 12 certificate results issued by State/Territory assessment bodies to calculate the ATAR. The ATAR is not a score - it is a rank (which shows a student's achievement in relation to other students). Queensland uses a ranking system (OP) which is not equivalent to the ATAR. A conversion table for the Queensland OP to the ATAR is available on the QTAC website (www.qtac.edu.au).
- (c) Most universities, TAFE colleges and other institutions take a holistic approach when assessing applications from Indigenous students. Institutions typically have parallel assessment processes. This means that Indigenous applicants are often not assessed solely on the basis of their academic results.
- (d) Indigenous status not available for 2006 NSW school-leavers. International students included for NSW school-leavers for all years.
- (e) The ATAR rate shown in this report is the number of students who achieved an ATAR of 50.00 or above expressed as a percentage of the estimated potential year 12 population. The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. Calculations of rates for the Indigenous population are based on ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (low series, 2006 base). Non-Indigenous estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.
- (f) The ineligible data for all students is based on an age-weighted calculation using the ABS estimates of each age cohort and the relative age distribution of people achieving the ATAR in the year. Tasmania was unable to provide this data disaggregated by Indigenous status for 2011 to 2013.
- (g) Ineligible means completed the requirements for an ACT Year 12 certificate only. That is did not meet ACT requirements for an ATAR.
- (h) Does not include WA.
- (i) In 2001, the Western Australian Government increased the pre-school and school entry age by six months to align with other states and territories. This change reduced the kindergarten cohort in 2001 by approximately 40%, and that cohort completed Year 12 in 2014. This is reflected in the smaller number of Year 12 students in 2014.

RSE = Relative standard error.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Data for Indigenous people are from the 2004-05 National Aboriginal and Torres Strait Islander Health Survey, 2008 National Aboriginal and Torres Strait Islander Social Survey; 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey and 2014-15 National Aboriginal and Torres Strait Islander Social Survey.
- (c) People employed full-time, as a proportion of all employed people.
- (d) People employed part-time, as a proportion of all employed people.
- (e) Data for non-Indigenous people are from the 2004-05 National Health Survey, 2007-08 National Health Survey; 2011-13 Australian Health Survey (2011-12 period) and 2014 General Social Survey.
- (f) Rate ratio is the Indigenous proportion divided by the non-Indigenous proportion.
- (g) Rate difference is the Indigenous proportion less the non-Indigenous proportion.

RSE = Relative standard error.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) 2004-05 Total includes CDEP status not known.

(c) In the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey, the question on CDEP participation was only asked of respondents in remote and very remote areas.

.. Not applicable. – Nil or rounded to zero.

RSE = Relative standard error.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Data for Aboriginal and Torres Strait Islander people are from the 2004-05 National Aboriginal and Torres Strait Islander Health Survey, 2008 National Aboriginal and Torres Strait Islander Social Survey; 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey and the 2014-15 National Aboriginal and Torres Strait Islander Social Survey.
- (c) Data for non-Indigenous people are from the 2004-05 National Health Survey, 2007-08 National Health Survey; 2011-13 Australian Health Survey (2011-12 period) and the 2014 General Social Survey.
- (d) Rate ratio is the Aboriginal and Torres Strait Islander proportion divided by the non-Indigenous proportion.

TABLE 4A.7.12

RSE = Relative standard error.

Table 4A.7.13 **Proportion of the working age population (15–64 year olds) who are in the labour force, by remoteness, by Indigenous status, 2004-05, 2008, 2011-13 and 2014-15 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
(a)	Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.									
(b)	Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.									
(c)	Data for Aboriginal and Torres Strait Islander people are from the 2004-05 National Aboriginal and Torres Strait Islander Health Survey, 2008 National Aboriginal and Torres Strait Islander Social Survey; 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey and the 2014-15 National Aboriginal and Torres Strait Islander Social Survey.									
(d)	Data for non-Indigenous people are from the 2004-05 National Health Survey, 2007-08 National Health Survey; 2011-13 Australian Health Survey (2011-12 period) and the 2014 General Social Survey.

RSE = Relative standard error. CI = Confidence interval.

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Includes people who have indicated that they have attained a non-school qualification at Certificate III level or above.
- (d) Includes people who have indicated that they are studying, but excludes those who already have a non-school qualification at Certificate III level or above.
- (e) Total 20–64 year old population, excluding people who were not studying and had a level of non-school qualification that was not stated.
- Nil or rounded to zero.

RSE = Relative standard error. CI = Confidence interval.

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(c) Comprises people who have indicated that they have attained a non-school qualification at Certificate III level or above.

(d) Includes people who have indicated that they are studying, but excludes those who already have a non-school qualification at Certificate III level or above.

(e) Total excludes people who were not studying and had a level of non-school qualification where the level was not determined.

na Not available. – Nil or rounded to zero. np Not published.

RSE = Relative standard error. CI = Confidence interval.

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(c) Includes people who have indicated that they have attained a non-school qualification at Certificate III level or above.

(d) Includes people who have indicated that they are studying, but excludes those who already have a non-school qualification at Certificate III level or above.

(e) Total excludes people who were not studying and had a level of non-school qualification where the level was not determined.

na Not available. - Nil or rounded to zero.

(a) Success is defined as the student progress rate (SPR), which is the proportion of units passed within a year compared with the total units enrolled.

(b) Numbers have been rounded to zero decimal places.

(c) Data is for domestic students only.

(d) Includes students with unknown Indigenous status.

– Nil or rounded to zero.

(a)	Includes all VET delivered by TAFE and other government providers and publicly funded VET programs delivered by private and community education providers. Excludes VET delivered in schools, where the delivery was undertaken by schools.			
(b)	Student remoteness (ARIA+) was developed by the National Centre for Social Applications of Geographic Information Systems based on ARIA. ARIA+ is now the standard ABS endorsed measure of remoteness. It is an index of remoteness derived from measures of road distances between populated localities and service centres. These road distances are then used to generate a remoteness score for any location in Australia. ARIA+ forms the basis for the ABS 'Remoteness Structure' component of the Australian Statistical Geography Standard (ASGS). The ASGS replaces the Australian Standard Geographical Classification (ASGC). ARIA+ was updated in 2011 using 2011 Census data of Population and Housing. The indices for previous years are based on the 2006 Census. For more details refer to: http://www.adelaide.edu.au/apmrc/research/projects/category/aria.html

Total (number '000)	205.1	77.1	282.2

Prop. = Proportion. **RSE** = Relative Standard Error. **CI** = Confidence Interval.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Profound/severe core activity restriction data for non-remote areas only are comparable across the whole time series (2002, 2008, 2012-13 and 2014-15).

(c) 2014-15 data are comparable with 2012-13 data. 2014-15 data are comparable with 2008 data for disability status, disability type and type of restrictions for non-remote areas. 2014-15 data are comparable with 2002 data for profound/severe core activity restriction data for non-remote areas only.

(d) Includes 'has no specific limitation or restriction'.

TABLE 4A.9.5

Table 4A.9.5 **Proportion of Aboriginal and Torres Strait Islander people (aged 15 years and over) with disability, by remote/non-remote, by disability status, 2002, 2008, 2012-13 and 2014-15 (a), (b)**

Unit	Non-remote			Remote			Total		
	Prop.	RSE	95% CI	Prop.	RSE	95% CI	Prop.	RSE	95% CI
	%	%	±	%	%	±	%	%	±

(e) 2012-13 data are comparable with 2014-15 data. 2012-13 data are comparable with 2008 and 2002 data for profound/severe core activity restriction data for non-remote areas only.

(f) In the 2002 and 2008 NATSISS a larger set of criteria were used to identify people with disability in non-remote areas, than were used in remote areas. Data presented in this table are limited to the common set of criteria used in remote and non-remote areas. Data are therefore not comparable with 2002 or 2008 NATSISS data for people in non-remote areas only, nor with disability data from the 2002 GSS or 2007-08 NHS.

(g) In 2008, additional criteria were used to identify people with disability in remote areas. These were: any condition, such as back problems or bad headaches, that stop or reduce a person's ability to do physical activity or work; scars, loss of limbs or other conditions affecting appearance; fears or any emotional problems such as depression that make it hard to do things; and a long term condition such as arthritis, asthma, heart disease, diabetes/sugar problems, and kidney problems. These may account for some of the increase in the disability rate between 2002 and 2008.

(h) Due to differences in collection methodology, separate data for 'profound' and 'severe' core activity restrictions are not available from the 2008 NATSISS. Data have been grouped to provide a comparison between 'total with profound/severe core activity' in 2002 and 2008.

Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE	Prop.	RSE

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution.

(b) The 2014-15 NATSISS (for remote areas) and 2012-13 AATSIHS (NATSIHS component) total population is not strictly comparable with 2008 NATSISS as the 2008 NATSISS had a different question ordering which may have overestimated disability prevalence. The ordering of questions in the disability module of the National Health Survey also changed between 2007-08 and 2011-12. 2002 and 2008 NATSISS are not comparable due to the addition of two extra disability categories in 2008. 2004-05 NATSIHS and 2004-05 NHS data for this indicator is not available.

np Not published. – Nil or round to zero.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Excludes people still attending school.

(c) Self-reported data consisting of persons who report having a disability or restrictive long-term health condition where a limitation, restriction, impairment, disease or disorder has lasted, or is expected to last for six months or more, and restricts everyday activities. Levels of activity limitation (profound, severe, moderate, mild, unspecified, and school/employment restriction only) are based on whether, and how often, a person needs help, has difficulty, or uses aids or equipment with any core activities (self-care, mobility or communication). A person's overall level of core activity limitation is determined by their highest level of limitation in any of these activities. Only current difficulties with education and/or employment were collected. Respondents aged 65 years and over were not asked about employment restrictions and so some may be categorised as not having a specific limitation or restriction that would otherwise have been assigned 'schooling/employment restriction only' had they been asked the question.

(d) Includes people who never attended school.

Est. = Estimate. **Prop.** = Proportion. **RSE** = Relative Standard Error. **CI** = Confidence Interval.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Excludes people still attending school.

(c) Self-reported data consisting of persons who report having a disability or restrictive long-term health condition where a limitation, restriction, impairment, disease or disorder has lasted, or is expected to last for six months or more, and restricts everyday activities. Levels of activity limitation (profound, severe, moderate, mild, unspecified, and school/employment restriction only) are based on whether, and how often, a person needs help, has difficulty, or uses aids or equipment with any core activities (self-care, mobility or communication). A person's overall level of core activity limitation is determined by their highest level of limitation in any of these activities. Only current difficulties with education and/or employment were collected. Respondents aged 65 years and over were not asked about employment restrictions and so some may be categorised as not having a specific limitation or restriction that would otherwise have been assigned 'schooling/employment restriction only' had they been asked the question.

(d) Total with disability includes 'has no specific limitation or restrictions'.

(e) Includes 'has no disability but has non-restrictive long-term health condition'.

(f) Includes people who never attended school.

– Nil or round to zero.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) Self-reported data consisting of persons who report having a disability or restrictive long-term health condition where a limitation, restriction, impairment, disease or disorder has lasted, or is expected to last for six months or more, and restricts everyday activities. Levels of activity limitation (profound, severe, moderate, mild, unspecified, and school/employment restriction only) are based on whether, and how often, a person needs help, has difficulty, or uses aids or equipment with any core activities (self-care, mobility or communication). A person's overall level of core activity limitation is determined by their highest level of limitation in any of these activities. Only current difficulties with education and/or employment were collected. Respondents aged 65 years and over were not asked about employment restrictions and so some may be categorised as not having a specific limitation or restriction that would otherwise have been assigned 'schooling/employment restriction only' had they been asked the question.

(c) The employment rate is the labour force expressed as a percentage of the total civilian population aged 15–64 years.

Table 4A.9.19 Labour force profile Aboriginal and Torres Strait Islander people (aged 15–64 years) by disability status, by State and Territory, 2014-15 (a), (b)

(a) The 'Unpaid Assistance to a Person with a Disability' variable records people who, in the two weeks prior to Census night, spent time providing unpaid care, help or assistance to family members or others because of a disability, a long term illness or problems related to old age.

(b) Based on place of usual residence.

(c) Includes 'Other Territories'.

(d) Includes 'Aboriginal', Torres Strait Islander' and 'Both Aboriginal and Torres Strait Islander'.

(e) The number of employed carers expressed as a percentage of all carers aged 15–64 years.

(f) The number of unemployed carers expressed as a percentage of all carers aged 15–64 years in the total labour force.

(g) The number of carers in the labour force expressed as a percentage of all carers aged 15–64 years.

Chronic obstructive pulmonary diseases (J41–J44)	3 198	59 183	605	462.6	266.2

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Data are reported for public and private hospitals in all jurisdictions. From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality.

(c) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only those for whom Indigenous status was not stated.

Source: AIHW (unpublished) National Hospital Morbidity Database.

Chronic obstructive pulmonary diseases (J41–J44)	1 032.8	232.5	4.4	800.3

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Data are reported for public and private hospitals in all jurisdictions. From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality.

(c) Directly age-standardised (AS) using the Australian 2001 standard population.

(d) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only those for whom Indigenous status was not stated.

(e) Rate ratio is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

(f) Rate difference is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate minus the non-Indigenous hospitalisation rate.

Source: AIHW (unpublished) National Hospital Morbidity Database.

	2014-15	2013-14	2012-13	2011-12	2010-11	2009-10	2008-09	2007-08	2006-07	2005-06	2004-05
(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis and sub-chapter level diseases in the ICD-10-AM classification were used to select the diseases.											
(b) From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality (see previous table).											
(c) Data are reported for public and private hospitals in NSW, Victoria, Qld, WA and SA and public hospitals in the Northern Territory, for residents of these jurisdictions.											
(d) 'Other' includes hospitalisations of non-Indigenous people and those for whom Indigenous status was not stated.											
(e) Directly age-standardised using the Australian 2001 standard population.											
(f) Rate ratio is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the 'other Australians' hospitalisation rate (which includes Indigenous status not reported).											
(g) Rate difference is the age standardised Aboriginal and Torres Strait Islander hospitalisation rate minus the 'other Australians' hospitalisation rate.

Chronic obstructive pulmonary diseases (J41–J44)	345.0	554.8	781.3

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis and sub-chapter level diseases in the ICD-10-AM classification were used to select the diseases.

Table 4A.9.34 Hospitalisations by chronic disease, Aboriginal and Torres Strait Islander Australians, by remoteness (numbers and crude rates) 2014–15 (a), (b)

	<i>Major cities</i>	<i>Inner and outer regional</i>	<i>Remote and very remote</i>
--	---------------------	---------------------------------	-------------------------------

(b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(c) Rates per 100 000 population are calculated using ABS Estimated Resident Population at 30 June preceding the reference year by remoteness classification from the 2011 Census.

\$/week	%	±	\$/week	%	±	\$/week	%	±	\$/week	%	±

(a) Adjusted for changes in the Consumer Price Index. Factors applied to change nominal dollar values to 2014-15 dollars for data collected earlier than 2014-15 are as follows: For all 2002 data, the adjustment is 1.373340. For all 2004-05 data, the adjustment is 1.306023. For all 2008 data, the adjustment is 1.154179. For 2011-13, adjustment for data from the 2011-12 Australian Health Survey is 1.071478, and 1.044499 for data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

RSE = Relative standard error. **CI** = Confidence interval.

- (a) Estimates with a RSE of between 25 per cent to 50 per cent should be used with caution. Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Equivalised household income quintile boundaries for the total population as derived from the 2004-05 National Health Survey are: lowest quintile less than \$295 per week; second quintile \$295–\$478 per week; third quintile \$479–\$688 per week; fourth quintile \$689–\$996 per week; highest quintile \$997 or more per week. These have been applied to both the Aboriginal and Torres Strait Islander and non-Indigenous populations.

Table 4A.10.2 Equivalised gross weekly household income quintiles, people aged 18 years or over, by State and Territory, 2004-05, 2008, 2011-13 and 2014-15 (a), (b), (c), (d), (e) (Survey)

<i>Aboriginal and Torres Strait Islander</i>				<i>Non-Indigenous</i>			
<i>Estimate</i>	<i>Proportion</i>	<i>RSE</i>	<i>95 per cent CI</i>	<i>Estimate</i>	<i>Proportion</i>	<i>RSE</i>	<i>95 per cent CI</i>
<i>'000</i>	<i>%</i>	<i>%</i>	<i>±</i>	<i>'000</i>	<i>%</i>	<i>%</i>	<i>±</i>

(c) Equivalised household income quintile boundaries for the total population as derived from the 2008-09 Survey of Income and Housing are: lowest quintile less than \$330 per week; second quintile \$330–\$561 per week; third quintile \$562–\$835 per week; fourth quintile \$836–\$1 240 per week; highest quintile \$1 241 or more per week. These have been applied to both the Aboriginal and Torres Strait Islander and non-Indigenous populations.

(d) Non-Indigenous: Equivalised household income quintile boundaries for the total population as derived from the 2011-13 Australian Health Survey are: lowest quintile less than \$399 per week; second quintile \$399–\$638 per week; third quintile \$639–\$958 per week; fourth quintile \$959–\$1 437 per week; highest quintile \$1 438 or more per week.

Aboriginal and Torres Strait Islander: Equivalised household income quintile boundaries for the total population were derived from the 2011-13 Australian Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2011-12 enumeration period of the National Health Survey and National Nutrition and Physical Activity Survey and the 2012-13 enumeration period of the National Aboriginal and Torres Strait Islander Health Survey. These are: lowest quintile less than \$407 per week; second quintile \$407–\$651 per week; third quintile \$652–\$978 per week; fourth quintile \$979–\$1 467 per week; highest quintile \$1 468 or more per week.

(e) Equivalised household income quintile boundaries for the total population were derived from the 2014-15 National Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2014-15 enumeration period of the National Health Survey and the 2014-15 enumeration period of the National Aboriginal and Torres Strait Islander Social Survey. These are lowest quintile \$0–\$435 per week; second quintile \$436–\$675 per week; third quintile \$676–\$1 018 per week; fourth quintile \$1 019–\$1 550 per week; highest quintile \$1 551 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.

(f) Comprises persons living in households where household income was stated. Note that equivalised gross weekly household income quintiles are calculated as a proportion of households with stated household income.

(g) Total with household income stated shown as a proportion of the total.

(h) Includes people who reported no source of income.

– Nil or rounded to zero (including null cells). **np** Not published.

RSE = Relative standard error. **CI** = Confidence interval.

- (a) Estimates with a RSE of between 25 per cent to 50 per cent should be used with caution. Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Equivalised household income quintile boundaries for the total population as derived from the 2004-05 National Health Survey are: lowest quintile less than \$295 per week; second quintile \$295–\$478 per week; third quintile \$479–\$688 per week; fourth quintile \$689–\$996 per week; highest quintile \$997 or more per week. These have been applied to both the Aboriginal and Torres Strait Islander and non-Indigenous populations.
- (c) Equivalised household income quintile boundaries for the total population as derived from the 2008-09 Survey of Income and Housing are: lowest quintile less than \$330 per week; second quintile \$330–\$561 per week; third quintile \$562–\$835 per week; fourth quintile \$836–\$1 240 per week; highest quintile \$1 241 or more per week. These have been applied to both the Aboriginal and Torres Strait Islander and non-Indigenous populations.
- (d) Non-Indigenous: Equivalised household income quintile boundaries for the total population as derived from the 2011-13 Australian Health Survey are: lowest quintile less than \$399 per week; second quintile \$399–\$638 per week; third quintile \$639–\$958 per week; fourth quintile \$959–\$1 437 per week; highest quintile \$1 438 or more per week.
 Aboriginal and Torres Strait Islander: Equivalised household income quintile boundaries for the total population were derived from the 2011-13 Australian Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2011-12 enumeration period of the National Health Survey and National Nutrition and Physical Activity Survey and the 2012-13 enumeration period of the National Aboriginal and Torres Strait Islander Health Survey. These are: lowest quintile less than \$407 per week; second quintile \$407–\$651 per week; third quintile \$652–\$978 per week; fourth quintile \$979–\$1 467 per week; highest quintile \$1 468 or more per week.

Table 4A.10.3 **Equivalised gross weekly household income quintiles, people aged 18 years or over, by remoteness, 2004-05, 2008, 2011-13 and 2014-15 (a), (b), (c), (d), (e) (Survey)**

	<i>Aboriginal and Torres Strait Islander</i>				<i>Non-Indigenous</i>			
	<i>Estimate</i>	<i>Proportion</i>	<i>RSE</i>	<i>95 per cent CI</i>	<i>Estimate</i>	<i>Proportion</i>	<i>RSE</i>	<i>95 per cent CI</i>
	<i>'000</i>	<i>%</i>	<i>%</i>	<i>±</i>	<i>'000</i>	<i>%</i>	<i>%</i>	<i>±</i>
(e) Equivalised household income quintile boundaries for the total population were derived from the 2014-15 National Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2014-15 enumeration period of the National Health Survey and the 2014-15 enumeration period of the National Aboriginal and Torres Strait Islander Social Survey. These are lowest quintile \$0-\$435 per week; second quintile \$436-\$675 per week; third quintile \$676-\$1 018 per week; fourth quintile \$1 019-\$1 550 per week; highest quintile \$1 551 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.								
(f) Comprises persons living in households where household income was stated. Note that equivalised gross weekly household income quintiles are calculated as a proportion of households with stated household income.								
(g) Total with household income stated shown as a proportion of the total.								
(h) Includes people who reported no source of income.								
– Nil or rounded to zero (including null cells). na Not available.

(a) An income quintile is derived by ranking the population from lowest to highest income, and dividing it into five equal groups. The lowest quintile is made up of the 20 per cent of the population with the lowest incomes.

(b) Data excludes 'all incomes not stated' and 'partial incomes'.

(c) Quintile 1 includes households with Negative or Nil Income.

(d) Comprises households where at least one usual resident at home on Census night was of Aboriginal and/or Torres Strait Islander origin.

(e) Total includes Migratory/Offshore/Shipping areas.

(f) Australia total includes Other Territories.

.. Not applicable. – Nil or rounded to zero.

Source: ABS (unpublished) derived from the 2011 Census of Population and Housing.

RSE = Relative standard error. **CI** = Confidence interval

(a) Adjusted for changes in the Consumer Price Index. Factors applied to change nominal dollar values to 2014-15 dollars for data collected earlier than 2014-15 are as follows: For all 2002 data, the adjustment is 1.373340. For all 2004-05 data, the adjustment is 1.306023. For all 2008 data, the adjustment is 1.154179. For 2011-13, adjustment for data from the 2011-12 Australian Health Survey is 1.071478, and 1.044499 for data from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(a) For 2009-10 onwards, rates of children in substantiations are calculated as the number of children aged 0–17 years (including children whose ages were not stated) divided by the estimated population of children aged 0–17 years at 31 December, multiplied by 1000. For Aboriginal and Torres Strait Islander children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Prior to 2009-10, rates of children in substantiations were calculated as the number of children aged 0–16 years (see table 4A.11.2).

(b) A separate unknown Indigenous status category is reported. Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.

(c) Tasmania: For 2010-11, the proportion of substantiations for children of unknown Indigenous status impacts the reliability of these data. As such, any comparisons of the Indigenous status breakdown to previous years should be made with caution.

– Nil or rounded to zero.

(a) Prior to 2009-10, rates of children in notifications, investigations and substantiations were calculated as the number of children aged 0–16 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0–16 years at 31 December, multiplied by 1000. For Aboriginal and Torres Strait Islander children, the June projections for two years were averaged to obtain a population figure for December of the relevant year.

(b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category.

Table 4A.11.2 Children (aged 0–16 years) in substantiations, by Indigenous status, by State and Territory, 2003-04 to 2009-10 (number and rate per 1000 children) (a), (b), (c)

	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust (e)</i>
(c) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.									
(d) Victoria: During 2006-07, Victoria introduced a major new data system. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with previous years data.									
(e) Aust: For 2003-04, Australia total does not include NSW.

Table 4A.11.3 Children (aged 0–17 years) who were the subject of a substantiation, by type of abuse or neglect, by State and Territory, 2009-10 to 2014-15 (proportion and rate per 1000) (a), (b), (c)

<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
<p>(a) If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.</p> <p>(b) Rates of children in substantiations are calculated as the number of children aged 0-17 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0-17 years at 31 December, multiplied by 1000. For Aboriginal and Torres Strait Islander children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Prior to 2009-10, rates of children in notifications, investigations and substantiations were calculated as the number of children aged 0–16 years (see table 4A.11.4).</p> <p>(c) Total (numbers) for 2012-13 onwards may not equal total (numbers) for 2012-13 onwards reported in other tables in this attachment. The data in this table were sourced from the AIHW, data for other tables were sourced directly from Australian State and Territory Governments.</p> <p>(d) For 2014-15, data produced from the CP NMDS based on nationally agreed specifications may not match Queensland figures published elsewhere. Queensland data for 2014–15 onward are not comparable with data for previous years. In Western Australia and Tasmania, the proportion of substantiations for children with an unknown Indigenous status affects the reliability of these data. In Tasmania and the Australian Capital Territory, the proportion of Aboriginal and Torres Strait Islander children who were the subjects of substantiations should be interpreted with caution due to small numbers. In the Northern Territory, due to recording issues, sexual exploitation is under-reported. This has been addressed and it is expected numbers in this area will be similar to those of other jurisdictions in future years.</p> <p>(e) In 2014-15, Victoria, WA, SA and Tasmania the abuse type for some substantiations was recorded as 'not stated' and could not be mapped to physical, sexual, emotional or neglect. These substantiations are included in the totals; as such, total may not equal the sum of categories.</p> <p>(f) A separate unknown Indigenous status category is reported. Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category.</p> <p>(g) Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.</p> <p>(h) In 2013-14, in SA, Tas and the ACT, the abuse type for some substantiations was recorded as 'not stated' and could not be mapped to physical, sexual, emotional or neglect. These substantiations are included in the totals; as such, total may not equal the sum of categories.</p>									

– Nil or rounded to zero.

(a) If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.

(b) Other children are non-Indigenous plus unknown Indigenous status.

(c) Rates of children in substantiations are calculated as the number of children aged 0-16 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0-16 years at 31 December, multiplied by 1000. For Aboriginal and Torres Strait Islander children, the June projections for two years were averaged to obtain a population figure for December of the relevant year.

(d) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Aboriginal and Torres Strait Islander estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.

Table 4A.11.4 Children (aged 0–16 years) who were the subject of a substantiation, by type of abuse or neglect, by State and Territory, 2001-02 to 2009-10 (proportion and rate per 1000) (a), (b), (c), (d)

Table 4A.11.5 Children (aged 0–17 years) on care and protection orders, by Indigenous status, by State and Territory, at 30 June, 2005 to 2015 (number and rate per 1000 children) (a), (b)

	NSW	Vic (c)	Qld	WA (d)	SA	Tas	ACT	NT	Aust (e)
Children aged 0–17 years on care and protection orders at 30 June 2004									
Number of children									
Aboriginal and Torres Strait Islander	na	574	1 146	583	275	83	53	230	2 944
Non-Indigenous	na	4 677	3 804	1 056	1 180	551	300	115	11 683
Rate per 1000 children aged 0–17 years at 30 June 2004									
Aboriginal and Torres Strait Islander	na	32.1	15.9	17.0	20.0	8.9	21.3	8.6	11.3
Non-Indigenous	na	4.1	4.3	2.3	3.5	5.1	4.0	3.4	2.6

(a) Rates of children on care and protection orders were calculated as the number of children aged 0–17 years (including children whose ages were not stated) who were on a care and protection order at 30 June, divided by the estimated population aged 0–17 at 30 June, multiplied by 1000. Rates may be different to that published in the Report on Government Services as the report used March population data.

(b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported. Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.

(c) Victoria: During 2006-07, Victoria introduced a major new data system. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with previous years data.

(d) WA: Implementation of the Children and Community Services Act 2004 in March 2006 required the legal status of children in care to be reviewed and Protection Orders were sought for a number of children already in care but not under care and protection orders. WA is currently unable to report a child's characteristics based on his or her first substantiation. As a result, a small number of children might be double counted in this table where there has been more than one substantiation and these notifications had differing characteristics such as age or abuse type. Children on care applications are included in the category 'interim and temporary orders'. Specifically, in WA, the application for a care and protection order to be issued for a child is counted as an interim order for national reporting purposes. However, no order is actually issued during this stage. It is thus not valid to compare the number of orders on a percentage basis.

(d) Aust: For 2003-04, Australia total does not include NSW.

Non-Indigenous	na	5.8	5.1	3.3	4.7	5.5	6.9	4.5	3.4

(a) Data prior to 2004 on children in out-of-home care include the following categories of children even if they do not meet the definition of 'out-of-home care': wards, children under a guardianship order, protected persons (including overseas adoptees) and pre-adoption placements.

(b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported.

(c) The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer.

(d) Rates of children during the year were calculated as the number of children aged 0–17 years (including those whose age was not stated) at 31 December, multiplied by 1000. For Aboriginal and Torres Strait Islander children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Rates of children at 30 June, were calculated as the number of children aged 0–17 years (including those whose age was not stated) divided by the estimated population aged 0–17 at 30 June, multiplied by 1000.

(e) NSW: In NSW, payments are made to relative/kin carers as well as foster carers. Relative/kin carers care for many children who are not on an order.

Table 4A.11.6 Children (aged 0–17 years) in out-of-home care, by Indigenous status, by State and Territory, 2004-05 to 2014-15 (number and rate per 1000 children) (a), (b), (c), (d)

	NSW (e)	Vic (f)	Qld	WA	SA	Tas (g)	ACT	NT (h)	Aust (i)
<p>(f) Victoria: The foster care category for Victoria includes children on permanent care orders where carers are in receipt of foster care payment and children in individually tailored home-based arrangements. During 2006-07, Victoria introduced a major new data system, which will be rolled out across the State by mid-2008. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with data from previous years.</p> <p>(g) Tasmania: The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer. Tasmania is not able to adhere to this definition of out-of-home care. However, the number of carers declining a financial payment is likely to be low. The number of children in out-of-home care as at 30 June 2007 is not comparable to that reported for previous years for Tasmania because of exclusion of a cohort of children who did not meet the definition of out-of-home care.</p> <p>(h) NT: Improvement in data quality in 2008-09 resulted in a more accurate count of children in out of home care. The number of children reported to be in out-of-home care in 2007-08 was likely to be undercounted.</p> <p>(i) Aust: For out-of-home care placements during 2003-04, Australia total does not include NSW.</p>
