The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

Introduction

Plants in Australia can be intellectual property protected by patents under the Patents Act 1990 (Cth) (Patents Act) and plant breeder’s rights (PBR) according to the International Convention for the Protection of New Varieties of Plants (UPOV Convention) compliant with the Plant Breeder’s Rights Act 1994 (Cth) (PBR Act). In dealing with the patent or PBR, the rights holder can collect royalties – these are an amount associated with the patent or PBR – as consideration to use the right, for the right to use the right, for information and knowledge about the patent or PBR, and the supply of assistance to exploit the patent or PBR.

The royalties on protected plant materials were traditionally determined as part of an agreement between the right holder (or the assignee or licensee) and the purchaser at the time of purchase. The End Point Royalty (EPR) is an alternative to this model applying not at the point of purchase but on the outcomes from exercising the patent or PBR – either on the sale of harvested material, or the sale of products made from the harvested material. The EPR is then calculated either as a periodic payment imposed on the grower directly by the patent or PBR holder (or their licensor or assignee) based on reported harvested materials, or an automatic deduction imposed on growers when they deliver their harvested materials to traders (and then paid by the trader to the patent or PBR holder). In each case, the EPR is calculated according to the amount of harvested materials rather than the materials purchased at the time of first sale.

In the 1990s, EPRs were considered to be desirable because they would "encourage more rapid adoption of a new variety", "increase revenue to support plant breeding programmes", and "encourage further private investment in crop improvement". Most significantly:

EPRs have the benefits of reducing upfront seed costs for growers, overcoming loss of sales through farmer's privilege ... and sharing the risk of crop failure between growers and PBR owners.

The purpose of this article is to review the development of EPRs as an alternative model for royalties to the traditional point of sale royalty models and the institutional architecture that has been implemented through law that enables EPRs as a means of collecting royalties. EPRs have now matured in Australia and it is timely to reflect on the current arrangements and perhaps consider the longer-term consequences of these developments.

The article is structured as follows: The first part places the EPR arrangements within the statutory scheme for patents under the Patents Act and PBRs under the PBR Act. The following parts trace the evolution of the PBR scheme to accommodate EPRs and consider the approaches of the various Primary Industries and Energy Research and Development Act 1989 (Cth), and the Research and Development Corporations (RDCs) to EPRs. The final part sets out a discussion.

The article concludes that, despite a series of legislative developments to enable EPRs under the PBR Act, these were not necessary and that the impetus has come from certain of the RDCs, as a generalisation, educating growers about the benefits of EPRs, assigning unique grower identifiers, streamlining contractual arrangements, and providing science-based information to growers about the growing characteristics of the EPR-protected varieties. Finally, some of the future challenges are considered.

Current Patent Scheme

Under the Patents Act, a standard patent is personal property that can be assigned and licensed to others, that is the "exclusive right" to "exploit the invention and to authorise another person to exploit the invention", where "exploit" includes:

(a) Where the invention is a product – make, hire, sell or otherwise dispose of the product, offer to make, sell, hire or otherwise dispose of it, use
Any plant materials may be patented if the or components of plants. Significantly, for the and parts or components of plants allow the holder to exercise their "exclusive rights" until the patent exhausts. This does not happen as long as the patent holder (or the assignee or licensee) only gives away less that the whole interest in the patent and does not extend to the progeny (a remaking of the invention). 11 Significantly, the patent's "exclusive rights" enable the patent holder (or the assignee or licensee) to impose conditions of the purchase of plant materials at the point of sale, including EPR arrangements.

**Current PBR Scheme**

Under the PBR Act, a PBR in a "plant variety", 14 is "personal property" that can be assigned and licensed to others, 15 that is the "exclusive right":

Subject to this Act, to do, or to license another person to do, the following acts in relation to propagating material of the variety:

(a) produce or reproduce the material;
(b) condition the material for the purpose of propagation;
(c) offer the material for sale;
(d) sell the material;
(e) import the material;
(f) export the material;
(g) stock the material for the purposes described in paragraph (a), (b), (c), (d), (e) or (f). 16

These "exclusive rights" in some circumstances extend to essentially derived varieties, 17 certain dependent plant varieties, 18 harvested material 19 and products obtained from harvested materials. 20 These "exclusive rights" do not apply to acts done privately and for non-commercial purposes, for experimental purposes, or for the purpose of breeding other plant varieties, 21 to the conditioning and using of farm saved seed, 22 acts done by a person authorised by or under a law of the Commonwealth or of a State or Territory with adequate "equitable remuneration", 23 where not all reasonable steps to ensure reasonable public access to that plant variety has been made, 24 and where the PBR has exhausted. 25 The relevant provisions, in respect of "harvested material", and subject to a farmer seed saving provision, 26 are:

**If:**

(a) propagating material of a plant variety covered by PBR is produced or reproduced without the authorisation of the grantee; and

(b) the grantee does not have a reasonable opportunity to exercise the grantee's right in relation to the propagating material; and

(c) material is harvested from the propagating material; section 11 (the PBR's "exclusive rights") operates as if the harvested material were propagating material. 27

and:

**If:**

(a) propagating material of a plant variety covered by PBR is produced or reproduced without authorisation of the grantee; and

(b) the grantee does not have a reasonable opportunity to exercise the grantee's rights in relation to the propagating material; and

(c) material is harvested from plants grown from the propagating material but the grantee does not have, in the circumstances set out in section 14, a reasonable opportunity of exercising the grantee's rights in the harvested material; and

(d) products are made from the harvested material; section 11 (the PBR's "exclusive rights") operates as if those products were propagating material. 28

The PBR Act also provides an exemption for "farm saved seed" (really meaning all "propagating material" and not just seeds) if:

(a) a person engaged in farming activities legitimately obtains propagating material of a plant variety covered by PBR either by purchase or by previous operation of this section, for use in such activities; and

(b) the plant variety is not included within a taxon declared by the Plant Breeder's Rights Regulations 1994 (Cth) 29 to be a taxon to which this subsection does not apply; and

(c) the person subsequently harvests further propagating material from plants grown from that first-mentioned propagating material;
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

the PBR is not infringed by:

(d) the conditioning of so much of that further propagating material as is required for the
person's use for reproductive purposes; or

(e) the reproduction of that further propagating material.39

The "farm saved seed" exemption is fairly narrow as the only "exclusive rights" exempted are the "reproduction" and "conditioning" for "reproduction". The other "exclusive rights" of producing, conditioning for producing, offering for sale, selling, importing, exporting and stock for these purposes remain. Further, the limiting of the conditioning to "for the person's use for reproductive purposes" means that "the reproduction of that further propagating material" is also confined to "for the person's use for reproductive purposes". In effect, the "farm saved seed" really only allows re-using the "propagating material" for personal use. Hence, it may be limited to only the first generation materials as subsequent farm saved seed generations may again be treated as "harvested materials" subject to the PBR's "exclusive rights". Any other dealings beyond personal use require the permission of the PBR holder.

Significantly, for our purposes, the PBR's "exclusive rights" enable the PBR holder (or the assignee or licensee) to impose conditions of the purchase of plant materials at the point of sale, including EPR arrangements.

Evolution of the PBR Scheme to Accommodate EPRs

The original legislative intervention in this area was the Plant Varieties Act 1987 (Cth) that followed a detailed consideration of the competing issues relating to the desirability of a statutory scheme.38 The main concerns driving legislation was access to desirable foreign plant materials and "an incentive for the private sector in Australia to become more active in plant breeding".36 The resulting Plant Variety Rights Act 1987 (Cth) was itself a long-fought compromise.37

Following Australia joining the UPOV Convention in 1983, and then the revision of the UPOV Convention in 1991,38 and various legislative amendments,39 the PBR Act replaced the Plant Varieties Act 1987 (Cth).40 The PBR Act was drafted to conform to the revised 1991 UPOV Convention, and various other changes to introduce other provisions that would further increase the efficiency of the plant variety rights scheme.41 Some of the key changes in the 1991 UPOV Convention that were incorporated in the PBR Act were:42

(a) Extending the scope of the PBR by specifying the "exclusive rights" exercisable by the PBR holder in addition to producing, reproducing, selling and licensing the "propagating material" to include condition the material, offering the material for sale, exporting and importing the material, and stocking the material for any of these purposes.43

(b) Extending protections from just "propagating material" also to include "harvested material" and the "products made from harvested material".44

(c) Extending the PBR beyond the first sale where the "grantee does not have a reasonable opportunity to exercise the grantee's right in relation to" the "propagating material" and "harvested material".45

The PBR Act was later amended by the Plant Breeder's Rights Amendment Act 2002 (Cth) to avoid an interpretation of the PBR that allowed "some 30 per cent of PBR protected grain varieties in Australia pass through the commercial system without the PBR breeder having any opportunity to seek reward for their innovation".46 The PBR Act had provided an exemption that acts done with the "propagating material" for use "as a food, food ingredient or fuel" or "for any other purpose that does not involve the production or reproduction of the propagating material" was not an infringement of the PBR.47

At the same time, another amendment allowed a person authorised by a law (such as a statutory marketing authority) to infringe the PBR using "propagating material" and then pay "equitable remuneration".48 At the time of the amendments, the Australian Government asserted that the "[a]gricultural industry is anticipating the introduction of the amendments positively as they will facilitate commercial arrangements based on plant breeder's rights, including through a system of end point royalties".49 The PBR Act has had other amendments,40 albeit not in material ways for the purposes of this article.47

The basic scheme that enables EPR under the PBR Act was this provision for "exclusive rights" applying to "propagating material"41 and certain "harvested material"42 where there has not been "a reasonable
opportunity" to collect a royalty on "propagating material". 32 Importantly, the Plant Variety Rights Act 1987 (Cth) had only addressed "exclusive rights" for "plants of that variety", "reproductive material of plants of that variety", "plants of that variety for sale", "reproductive material of plants of that variety for sale", "asexual plants of that variety", "asexual reproductive material of plants of that variety" and some of the fruit, flowers, or any other product of asexual plants. 33 By expressly recognising both "propagating material" and "harvested material", 34 the PBR Act confirmed that dealings with harvested products of the PBR protected plants (such as seeds, flowers, fruits, cuttings, and so on) was an object that attracted the PBR's "exclusive rights". 35

Added to this there was express recognition that royalties could be imposed after sale 36 if there had not been "a reasonable opportunity" with the "propagating material". 37

With this authority of the PBR under the PBR Act, the rights holder can limit any dealings with the subject matter of the PBR (including the "harvested material") subject to agreement between the rights holder and the other party. Despite extending the PBR and the potential for EPRs to both "propagating material" and "harvested material", it is the basic "exclusive rights" over "propagating material" that founds agreements imposing EPRs. 39 The EPR is then set out as a term of the agreement on the purchase of plant materials at the point of sale: 39

(a) As a term requiring the purchaser to later declare how much "harvested material" was produced (other than as farm saved seed) and paying the PBR holder (or their agent) directly. This approach relies on the purchaser of the PBR protected materials properly declaring the amount of "harvested material" produced. The disadvantage of this approach is that the EPRs are not collected on materials that are not declared.

(b) As an authorised deduction on the payment made on "harvested material" delivered to a selected collection agency (such as a bulk grain handler). This approach relies on a centralised collection point properly identifying the PBR protected materials. The disadvantage of this approach is that the EPRs are not collected on materials that are not delivered to the centralised collection point.

The Patents Act was not best with the perceived problems under the PBR Act as the patent does not necessarily exhaust on first sale and the progeny seeds are within the scope of the invention because they are a re-making of the invention. This is a distinction between using the patent-protected product and making the patent protected product. This distinction is necessary to avoid some important decisions that are likely to be significant in Australia as a consequence of the Australia-United States Free Trade Agreement. 40

In both the United States Supreme Court decisions of Quanta Computer Inc v LG Electronics Inc and United States v Unisys Corp, the invention was embodied in the product and the licences were an attempt to limit the uses of the product. 41 In contrast, the lower court decisions in Monsanto Company v Bowman, Monsanto Company v Scruggs and Monsanto Company v McFarling involved making the second-generation (or progeny) seeds. 42 Arguably, making is fundamentally different from using in the context of patents and exhaustion, and the authority of Quanta Computer Inc v LG Electronics Inc and United States v Unisys Corp arguably does not apply to making. 43 The United States Supreme Court is presently considering an appeal in the Monsanto Company v Bowman matter and seems likely to confirm the lower Court decision.

While both patents and PBRs enable EPRs to be imposed, the efficiency and effectiveness of imposing EPRs has been addressed through structural adjustments in the plant breeding industries. Without these structural adjustments steered by the RDCs, this would not have been possible. This is considered next.

Plant Breeding Industry Structure

The majority of Australian plant agriculture depends on self-pollinated field crops and annual pasture plants traditionally enabling farmers to maintain their own seed lines through on-farm planting and seed saving. 44 This has been the common practice because the growing and ripening conditions in Australia make on-farm planting a reliable source of saved seed for future growing. 45 This is in contrast with the European experience where ripening conditions make on-farm planting an unreliable source of seed for future growing and so encouraged farmers to buy in seeds that has sustained a significant commercial breeding culture for field, horticulture and ornamental plants. 46
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

In the United States, a reliance on hybrid varieties of corn that imposed a natural (hybrid vigour) block on seed saving sustained a significant commercial breeding culture. The result for Australian agriculture is that the ability of farmers to bulk up their own seeds for the self-pollinated field crops and annual pasture plants meant that only governmental breeding programs were sustainable. As a consequence, Australian agricultural research relies significantly on taxpayer funding and has only slowly moved to a broader array of funding including a greater reliance on private funding. This move has coincided with significant technology developments and the development of new institutions. It is these institutional changes establishing RDCs that have driven the adoption of EPRs by facilitating their implementation and adoption.

Through various evolutionary models, the current governmental arrangements under the Primary Industries and Energy Research and Development Act 1989 (Cth) provide for RDCs. These RDCs essentially provide for a private sector-like corporation governed by industry and government experts that levy primary producers (and some processors), and then co-ordinate, among other things, a research investment strategy relying on the levy; some voluntary contributions and some co-investment from taxpayers. Thus, for example, the Sugar Research and Development Corporation Regulations 1990 (Cth) established the Sugar Research and Development Corporation as a Primary Industries and Energy Research and Development Act 1989 (Cth) RDC, that benefits from the levy imposed on "sugar cane produced in Australia ... and accepted at a sugar mill for processing" of 14 cents per tonne.

In recent times, the main change has been the transformation of some of the RDCs into industry-owned corporations operating under the Corporations Act 2001 (Cth), enabling them to separate out their research activities from their marketing operations. Thus, for example, the former Horticultural Research and Development Corporation was replaced by Horticulture Australia Limited [ACN 095 566 108] as a company declared by the Horticulture Marketing and Research and Development Services Act 2000 (Cth) that benefits from the levy imposed on "horticultural products ... produced in Australia ... that are ... sold by the producer or used by the producer in the production of other goods of amounts per weight according to the horticultural products (almonds, apples, and so on)."

In dealing with plants, the main RDCs address cotton (Cotton Research and Development Corporation (CRDC)), cotton (Graize Research and Development Corporation (GRDC)), grapes (Grape and Wine Research and Development Corporation (GWRDC)), sugar (Sugar Research and Development Corporation (SRDC)), miscellaneous agricultural plants (Rural Industries Research and Development Corporation (RIRDC)), forestry (Forest and Wood Products Australia (FWPA)), and horticulture (Horticulture Australia Limited (HAL)). These organisations are considered next to illustrate the various approaches, limitations and institutional infrastructure necessary to impose EPRs and the leading roles driving the adoption of EPRs by the CRDC and GRDC, and the moves towards EPRs by the RIRDC and HAL.

Forest and Wood Products Australia (FWPA) FWPA receives "forest industries products' levy funding" from the Commonwealth for, in part, "marketing, promotion, research and development activities, or other activities, for the benefit of the Australian forestry industry according to a 'Funding Contract'." FWPA also receives matching funding from the Commonwealth for "research and development activities for the benefit of the Australian forestry industry and the Australian community generally." FWPA is a not-for-profit unlisted public company limited by guarantee under the Corporations Act 2001 (Cth) formed in 2007 as an industry owned replacement for the former Forest and Wood Products Research and Development Corporation. The change was ...

The "Funding Contract" provides that FWPA can only spend the levy and matching funds for "approved activities" that are "consistent with" a "Strategic Plan", the "Annual Operating Plan", the "Guidelines", and "in a manner that is otherwise efficient, effective and ethical". The systematic breeding of plants for forest and wood products is
clearly within the remit of the company’s funding and there is an active program of breeding. The FWPA “Strategic Plan” and “Annual Operating Plan” require, among other things, an articulated “Research and Development Program”, and the firm must maintain an “Intellectual Property Management Plan”. The current “Strategic Plan” and “Annual Operating Plan” identify plant breeding as part of the company’s priorities, including its investment priorities: “[g]enetic improvement and delivery for increased wood yield and quality and for managing risks”. The “Annual Operating Plan” also provides:

Company funding policy is that all intellectual property created with FWPA funding is owned by the research provider, with FWPA maintaining an equity position in future IP commercialisation income. One of the conditions of FWPA funding for R&D projects is that levy payers have a beneficial right of access to final commercialised IP through either reduced or waived royalty structures or other such arrangements that reflect the value of the levy funds provided to FWPA by the industry.

FWPA is also required to prepare an “Annual Report” that addresses, among other matters, “intellectual property creation and protection, including management of intellectual property arising from research and development activities or acquired with funds”. A review of recent annual reports shows that EPRs are not a feature of FWPA’s activities. This is almost certainly because the harvested materials of forest industries products, such as trees, take a very long time to grow and collecting the EPR will be too far into the future. In most instances, this is likely to be after the 20-25 year PBR term expires. As a consequence, EPRs are not a realistic model for the forest industries products.

Grape and Wine Research and Development Corporation (GWRDC)

The GWRDC receives levy funding from the Commonwealth for “the industry in Australia concerned with the production and processing of grape and wine, and the distribution, storage, marketing and sale of grape or wine”. The GWRDC also receives matching funding from the Commonwealth for some of the research and development activities. The functions of the GWRDC include “to investigate and evaluate the requirements for research and development”, “to co-ordinate or fund the carrying out of R&D activities that are consistent with the annual operational plan prepared by the Corporation and in force at the time” and “to facilitate the dissemination, adoption and commercialisation of the results of research and development”. The GWRDC is a Commonwealth authority under the “Strategic Research, Development, and Extension Plan 2012-17 and our Annual Operating Plan 2012-13 both articulate a research, development and extension (RD&E) "that supports a competitive Australian wine sector". None of these documents specifically addresses intellectual property, and perhaps significantly, the Annual Report 2011-2012 provides that "the GWRDC holds no patents or other registered intellectual property". While intellectual property is reported in commissioned research reports, this does not appear to be actively taken up by the GWRDC. Like forest industries products, such as trees addressed above, vines take a long time to grow and collecting the EPR is a long way into the future. In many instances, this is likely to be after the 20-25 year PBR term expires. In the case of rootstock used for grafting desirable vines, there are no harvested materials. As a consequence, EPRs are not a realistic model.

Sugar Research and Development Corporation (SRDC)

The SRDC receives levy funding from the Commonwealth for “the industry in Australia concerned with the production and processing of sugar cane, and the distribution, storage, marketing and sale of raw sugar”. The SRDC also receives matching funding from the Commonwealth for some of the research and development activities. The functions of the SRDC include “to investigate and evaluate the requirements for research and development”, “to co-ordinate or fund the carrying out of R&D activities that are consistent with the annual operational plan prepared by the Corporation and in force at the time” and “to facilitate the dissemination, adoption and commercialisation of the results of research and development”. The SRDC is a Commonwealth authority under the Commonwealth Parliament.
authority under the Commonwealth Authorities and Companies Act 1997 (Cth) with various obligations to the Minister for Agriculture, Fisheries and Forestry and the Commonwealth Parliament.\(^{125}\)

As a part of the SRDC’s operations there is an active breeding program.\(^{126}\) There does not, however, appear to be any interest in EPRs. This may be, in part, because sugar cane is planted from pieces of mature sugarcane (setts) that are planted using special machines which cut the mature cane into setts that are then mechanically placed into the prepared soils. After harvesting, the sugar cane then grows from the stubble left behind (the Ratoon Crop) that can be harvested and regrown three to four times.

**Rural Industries Research and Development Corporation (RIRDC)**

The RIRDC\(^{127}\) receives levy funding from the Commonwealth\(^ {128}\) for a wide range of industries including the plant related "growing and harvesting of plants, grains, seeds, fruit or vegetables", "production of ... plant fibres", "growing, harvesting and processing of trees", and "production of animal feed".\(^ {129}\) The RIRDC also receives matching funding from the Commonwealth for some of the research and development activities.\(^ {130}\) The functions of the RIRDC include "to investigate and evaluate the requirements for research and development", "to co-ordinate or fund the carrying out of R&D activities that are consistent with the annual operational plan prepared by the Corporation and in force at the time" and "to facilitate the dissemination, adoption and commercialisation of the results of research and development".\(^ {131}\) The RIRDC is a Commonwealth authority under the Commonwealth Authorities and Companies Act 1997 (Cth) with various obligations to the Minister for Agriculture, Fisheries and Forestry and the Commonwealth Parliament.\(^ {132}\)

As a part of the RIRDC’s operations there are active breeding programs,\(^ {133}\) albeit EPRs are only starting to be considered.\(^ {134}\) Within the diversity of the RIRDC’s broad interests there is starting to be some interest in EPRs.\(^ {135}\)

**Horticulture Australia Limited (HAL)**

HAL\(^ {136}\) receives “horticultural product” levy funding\(^ {127}\) from the Commonwealth for marketing and research and development\(^ {138}\) according to a "deed of agreement".\(^ {139}\) HAL also received matching funding from the Commonwealth for certain research and development activities.\(^ {140}\) HAL is a not-for-profit unlisted public company limited by guarantee under the Corporations Act 2001 (Cth) formed in 2001 as an industry-owned replacement for the former Horticultural Research & Development Corporation and Australian Horticultural Corporation.\(^ {141}\) The “deed of agreement” of 3 November 2010 provides that HAL may only apply the levy funding and matching Commonwealth finding according to a “Strategic Business Plan”, an "Annual Operational Plan" and “Guidelines”.\(^ {142}\)

The systematic breeding of plants for horticulture products is clearly within the remit of the company’s funding for "horticulture research and development projects" and the "carrying out, and coordination and funding for the carrying out, of horticulture [systematic experimentation or analysis] activities".\(^ {143}\) There is currently an active program of breeding.\(^ {144}\) The “deed of agreement” of 3 November 2010 also requires HAL to have an “Intellectual Property Management Plan”.\(^ {145}\) The Plan has not yet been published by HAL and remains confidential.\(^ {146}\) Perhaps surprisingly, however, the "Strategic Business Plan", the “Annual Operational Plan” and the “Guidelines” do not address intellectual property.\(^ {147}\) Despite this, HAL has taken an important role in promoting EPRs and the broader education of growers about EPRs.\(^ {148}\)

**Cotton Research and Development Corporation (CRDC)**

The CRDC\(^ {149}\) receives levy funding from the Commonwealth\(^ {150}\) for "the Australian industry concerned with the production, distribution, processing and sale of cotton".\(^ {151}\) The CRDC also receives matching funding from the Commonwealth for some of the research and development activities.\(^ {152}\) The functions of the CRDC include "to investigate and evaluate the requirements for research and development", "to co-ordinate or fund the carrying out of R&D activities that are consistent with the annual operational plan prepared by the Corporation and in force at the time" and "to facilitate the dissemination, adoption and commercialisation..."
of the results of research and development”. The CRDC is a Commonwealth authority under the Commonwealth Authorities and Companies Act 1997 (Cth) with various obligations to the Minister for Agriculture, Fisheries and Forestry and the Commonwealth Parliament. As a part of the CRDC's operations there is an actively supported breeding program, albeit only part funded and administered by the CRDC. To address the market failure in the late 1980s for breeding in the cotton industry the CRDC established a research program specifically directed to breeding improved cotton plants. This proved successful and, with the release of new varieties (almost yearly), and associated royalty sharing arrangements (addressed further below), the CRDC then withdrew. The CRDC's breeding endeavours were superseded in 2007 with the Cotton Breeders Australia joint venture between the Commonwealth Scientific and Industrial Research Organisation (CSIRO) and Cotton Seed Distributors Ltd (a grower owned enterprise formed in the 1980s).

In effect, the market failure identified and addressed by the CRDC in the late 1980s had been resolved and the CRDC/CSIRO joint venture was the independent and active breeding program envisioned by the CRDC. The CRDC has since shifted to funding new challenges posed by changing climate and the “multi-enterprise production systems” (growing cotton as well as other crops in different seasons) so that the “emphasis for future R&D investment is to creating greater value for cotton post-farm-gate”. Despite this change in major emphasis, the CRDC still funds breeding programs to improve cotton plant varieties as a part of its strategic investments, and in particular, premium cotton varieties for the high value yarn market.

Of particular interest for our purposes are the EPR arrangements for the CRDC-funded breeding programs for which royalties are payable until 2017, and the varieties made available from the Cotton Breeders Australia joint venture. These breeding programs essentially introduced patent protected genetic elements into cotton varieties bred to suit Australian agricultural landscapes. This involved breeding agreement between the owners of the germplasm, the owners of the proprietary genetic elements and the funders of the research introducing the proprietary genetic elements into the desirable germplasm, including agreement as to the division of royalties. Farmers then purchase the seed for cropping according to an agreement and the payment of fees that include an option for EPRs. Cotton varieties with the proprietary elements “Bollgard II stacked with Roundup Ready Flex” illustrate the role and place of EPRs.

Before taking possession of seeds incorporating the proprietary elements “Bollgard II stacked with Roundup Ready Flex”, the farmer is required to “complete and sign” the “Technology User Agreement”. The farmer is assigned a unique number that is required for each purchase of seeds, and undertakes not to re-sell or supply seeds unless the farmer “has a bona fide and reasonable belief that the purchaser intends to and will use it only as stock feed or for cotton seed oil production”, and not to plant the seeds produced from the harvest. By signing the agreement, the farmer also agrees to allow the owner of the proprietary elements access to the farm and any records for audits, surveys and inspections, and to pay one of the following fees:

(a) “Cotton Choices — Price discount” — A fixed price per hectare ($370) on the amount declared at the time of purchase and paid by a fixed date (28 February 2013).

(b) “Cotton Choices — Late Crop Removal and Extended Term” — A fixed price per hectare ($401) that is “is waived if the crop is removed due to hail, drought or other adverse conditions or events” and with a later fixed date for payment (31 July 2013).

(c) “Cotton Choices — End Point Royalties for Cotton” — A fixed price per bale of harvested and ginned cotton lint ($50/227kg bale) paid monthly.

Where a farmer (or “Grower”) elects the “Cotton Choices — End Point Royalties for Cotton” fee then the following term applies:

Upon harvesting the Grower shall deliver all seed cotton produced on the Farm Unit to a Monsanto designated ginning organization. Monsanto shall inform the Grower of such designated ginning organizations from time to time. The Grower shall be responsible for making the necessary arrangements with the designated ginning organization for ginning the seed cotton. The Grower shall bear the costs of delivering the seed cotton to the designated...
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

ginning organization and the costs of ginning the cotton. 178

The farmer is also required to inform the “designated ginning organisation” of information to identify the farmer 179 that will be used to cross match the identifying information 180 and report on the farmer’s delivered harvest. 181 The farmer is then required to pay the EPR according to the harvest delivered and measured as units of bales of ginned cotton lint ($50/227 kg bale). 182 The agent of the owner of the proprietary elements invoices the farmer for the EPR. 183

Grains Research and Development Corporation (GRDC)
The GRDC 184 receives levy funding from the Commonwealth 185 for “the industry concerned with the production, processing, manufacture, distribution and sale of grains”. 186 The GRDC also receives matching funding from the Commonwealth for some of the research and development activities. 187 The functions of the GRDC include “to investigate and evaluate the requirements for research and development”, “to co-ordinate or fund the carrying out of R&D activities that are consistent with the annual operational plan prepared by the Corporation and in force at the time” and “to facilitate the dissemination, adoption and commercialization of the results of research and development”. 188 The GRDC is a Commonwealth authority under the Commonwealth Authorities and Companies Act 1997 (Cth) with various obligations to the Minister for Agriculture, Fisheries and Forestry and the Commonwealth Parliament. 189

As a part of the GRDC’s operations there is an actively supported breeding program, albeit the GRDC has not had the same involvement in recent times. In the early 2000s, the GRDC moved to encourage market-based breeding programs and established a series of companies dedicated to plant breeding: Australian Grain Technologies Pty Ltd established in 2002; HRZ Wheats Pty Ltd established in 2003; and InterGrain Pty Ltd established in 2007. 190 GRDC has also entered joint ventures (such as Arista Cereal Technologies Pty Ltd) and invested in other plant breeding enterprises (such as Canola Breeders Western Australia Pty Ltd).

As at 2012, GRDC retains significant shareholdings in Australian Grain Technologies Pty Ltd (39 per cent), HRZ Wheats Pty Ltd (18 per cent), Arista Cereal Technologies Pty Ltd (21 per cent), InterGrain Pty Ltd (27 per cent), and Canola Breeders Western Australia Pty Ltd (39 per cent). 191 GRDC also remains involved in pre-breeding activities 192 and a range of other activities associated with breeding that “support effective competition by Australian grain growers in global grain markets, through enhanced profitability and sustainability”. 193 GRDC has also retained some breeding activity for minor crops where EPRs are not considered to be feasible. 194

Of particular interest for our purposes has been the GRDC’s role in advocating EPRs and implementing the institutional changes to enable EPRs through its strategy to “[coordinate a national grains R&D agenda and portfolio] by [working] with partners to tackle industry-wide issues such as ... value chain issues, including end point royalties”. 195 Particularly important has been the GRDC’s role in:

(a) Streamlining the contracts between PBR/patent holders and growers – On the purchase of a variety covered by EPRs the grower enters into a contract with the PBR/patent holder that allows the PBR/patent to be exploited and establishes the obligation to pay the EPR. At this stage, there are different contracts for each of the participating PBR/patent holders that are made available through the website http://varietycentral.com.au. For example, Australian Grain Technologies Pty Ltd provides an Industry Standard PBR License Agreement that grants the licence, allows use, imposes obligations to keep records, make reports and pay EPRs, together with the EPR obligations including authorising the EPR to be collected. 196

(b) The adoption of EPR collection practices across the grains industry – The adoption of a common Grower EPR Harvest Declaration Form that identifies the grower with a unique identity on the National Grower Registry. 197 The declaration form then collects data about the total grain harvested, amounts of grain used on-farm, amounts stored future sales and amounts saved. 198 The grower then uses the forms to calculate the EPR amounts payable with the amounts being either deducted from payments to the grower on delivery of the crop or invoiced to the grower by a royalty manager. 199 The major growers have also now agreed to use a single entity, SeedVise Pty Ltd, to negotiate and collect EPRs. 200
(c) The provision of variety performance information for growers to make informed choices about varieties – A website providing "access to independent results on the performance of recently released grain and field crop varieties from trials conducted across Australia," this site provides the data that allows EPR varieties to be compared with non-EPR varieties to determine whether the additional EPR is worthwhile for the particular grower.

As a consequence of these arrangements, most new wheat varieties available in Australia are subject to "exclusive rights" limit dealings with the plants and their products and the contracts then provide the machinery for the imposition and collection of the EPRs. The significance of the analysis in this article is to demonstrate that to make EPRs work requires both "exclusive rights" and the development of specific collaborative institutional arrangements through the RDCs. The analysis of the various RDCs shows that the leadership of the CRDC and the GRDC in the cotton and grains industry respectively has had a significant effect on the adoption of EPRs. These examples also demonstrate the coordinating role of these RDCs (and HAL) in promoting and educating about EPRs, and then developing the contracting and information resources to implement EPRs.

The CRDC provides a model for dealing with patents (and PBRs) and EPRs, and the GRDC provides a model for dealing with PBRs and EPRs. EPRs are, however, not suitable for all sectors, with the GWRDC and rootstocks and the FWPA and trees being good examples of, respectively, plant varieties that have no harvested materials on which to impose and EPR or taking too long to grow to effectively collect an EPR. Despite the apparent successes for EPRs there remain some hurdles to achieve more successful EPR arrangements for breeders.

Some of these are now addressed.

One of the challenges faced by EPRs in the grains industry was the deregulation of bulk wheat export marketing under the Wheat Export Marketing Act 2008 (Cth) and the Wheat Export Accreditation Scheme 2008 (Cth) and of non-bulk wheat export (in bags and containers) under the Wheat Marketing Amendment Act 2007 (Cth). The effect of this deregulation was to remove the single-desk export and marketing and in its place accredit numerous exporters so that breeders moved from dealing with a single exporter to collect the EPRs to dealing with a multitude of exporters and a multitude of collection points. To a large extent, this has been resolved through developing collaborative institutional arrangements: a unique identity on the National Grower Registry; a common Grower EPR Harvest Declaration Form founding the billing/invoicing arrangements; streamlined contracts made available through the website http://varietycentral.
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

The positive outcome has been to effectively demonstrate the basic requirements for a workable and effective EPR that might be broadly applied across the different plant breeding sectors. At a minimum, this requires a means of identifying growers using the protected plant varieties, a means of tracking the growing activities of growers using the protected plant varieties and acceptable contracts that bind growers within the EPR tracking and collecting scheme. The elegance of the wheat industry example is that the different and competing entities involved from growers to wheat handlers have been able to agree to sufficiently uniform arrangements for the EPR system to work in practice. This is undoubtedly a model for the expansion of EPRs into other agricultural sectors.

There remain, however, weaknesses in the existing EPR scheme whereby some EPRs are not being paid to PBR (and patent) holders. A number of factors may contribute to inaccurate or mis-declaration of grain variety at point of delivery. Factors include industry structure, end point use (animal or human food) and lack of incentive for growers to accurately declare variety identity. Mis-declaration may also be inadvertent due to the complexity of variety audit systems. Other specific factors include:

- Difficulties associated with tracking and establishing ownership of the seed.
- Grain from several varieties may be mixed on farms during harvest and storage activities.
- Grain is often intermingled with other grain soon after delivery at the accumulation point based on the variety declared and some physical and chemical characteristics of the grain.
- Many grain varieties are closely related, have many attributes in common and are particularly difficult to distinguish on appearance.
- Considerable paperwork is often required by growers and/or others making it too difficult or onerous to comply with multiple EPR systems.
- Errors in varietal declaration occur due to the exercise of farm saved seed provisions on a variety for several years.

The current differences in the level of EPR among varieties would appear to encourage flagrant mis-declaration of variety identity.

Some 660,000 deliveries of grain are made by farmers to grain accumulation entities around Australia each year.

Subsequently, enforcement measures against infringers may be very difficult because of the structure and practices of receival systems (and lack of a robust varietal identification).

In addressing these problems the Advisory Council on Intellectual Property (ACIP) considered that variety identification was critical for an effective EPR scheme and that under the PBR Act there was no positive obligation to knowingly declare a PBR protected variety as such. The ACIP considered that, if various consumer and fair trading laws were insufficient to make a knowing declaration that avoided paying an EPR illegal, then “the PBR Act should be amended to make such an act an infringement of PBR”. The Australian Government’s response was that the existing provisions of the Competition and Consumer Act 2010 (Cth) involving misleading and deceptive conduct, false representations about the characteristics of good and false and misleading representations about goods were sufficient. The same comments might equally apply to the Patents Act where protected varieties’ materials are improperly identified.

The ACIP also considered the circumstances in which the PBRs “exclusive rights” could not be efficiently enforced because of the costs of tracing large numbers of growers’ royalty obligations, and the significant amounts of “harvested material” that is sold directly to other than traders and bulk-handlers (such as millers, maltsters, ethanol producers, and other end users), or used as livestock feed on-farm and in feed-lots. The ACIP also identified that, in many instances, those best placed to collect the EPR were not exercising a PBR and so could not be obliged to collect the EPRs for the breeders. The ACIP considered extending the “exclusive rights” to include a “use right” and a “purchase right”, eventually recommending against a “use right” and in favour of a “purchase right”. The proposed “purchase right” would apply to declared taxa only and be an addition “exclusive right” to “do, or license another person to do, the following acts in relation to the propagating material of the variety ... purchase the material”.

com.au; and independent variety performance information made available to growers.
Another measure that the ACIP recommended to enhance the EPR system was clarification that "harvested material" that is also "propagating material" for the purposes of the "exclusive rights". There was some confusion about this matter following the Cultivator Pty Ltd v Grain Pool Pty Ltd decisions. The Australian Government's response to the ACIP's recommendations was to accept that the PBR Act be amended to clarify that "harvested material" that is also "propagating material" for the purposes of the "exclusive right", and reject the "purchase right". The reason for rejecting the "purchase right" was because the problems could be resolved through contracts and that "[EPR] arrangements are evolving and are having greater acceptance across the grains industry" so that, at this stage, the change was not necessary. The amendment to the PBR Act clarifying the meaning of "harvested material" is still pending.

Another concern of growers has always been whether the increased EPRs are actually getting back to the breeders. While there is not a lot of publicly available analysis, there has been some insight from recent analysis of barley varieties in Western Australia. The Western Australian Government through the Department of Agriculture and Food commits funds, together with the GRDC and Grain Pool Pty Ltd, to a Barley Breeding Project and a Barley Improvement Project. Together, the projects are directed to developing new barley varieties with have improved desirable traits and then assisted growers to integrate these improved varieties into their production systems. As a case study, this demonstrates the adoption of EPRs and the return of the amounts paid to further breeding programs.

Essentially, an analysis of the program over the period 2000/01 to 2006/07 showed the declining use of the non-EPR variety "Stirling" (65 per cent of total Western Australian production in 2000/01 to 21 per cent in 2006/07) and its replacement by the non-EPR variety "Gairdner" (released in 2003 and 23 per cent of production), and the EPR varieties "Baudini" (released in 2003 and 23 per cent of production), "Hamelin" (released in 2004 and 10 per cent of production) and "Vlamingh" (released in 2006). The price paid for delivered barley (harvested materials) depended on the variety and quality: "Stirling" attracted no premiums or EPRs; "Gairdner" attracted a variety premium of $5.00 per tonne and a protein premium of $2.50 per tonne and no EPRs; "Baudini" attracted a variety premium of $7.00 per tonne and a protein premium of $5.00 per tonne and EPRs of $3.00 per tonne for malting barley and $1.00 per tonne for feed barley; "Hamelin" attracted a variety premium of $7.00 per tonne and a protein premium of $5.00 per tonne and EPRs of $3.00 per tonne for malting barley and $1.00 per tonne for feed barley; and "Vlamingh" variety premiums had not been determined as at the time of the study it was yet to be planted and EPRs of $3.50 per tonne for malting barley and $1.50 per tonne for feed barley.
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

During the 2000/01 to 2006/07 period of the Barley Breeding Project the five-year average price was $240.00 per tonne for malting barley and $200 per tonne for feed barley. The seven-year average for barley yield was 2.03 tonne per hectare. As a rough and generalised estimate, this means that for the EPR varieties ("Hamelin" and "Baudin") the EPR as a proportion of the harvest price was approximately 1.25 per cent for malting barley and 0.5 per cent for feed barley. Alternatively, the EPR was about $6.18 per hectare for malting barley and $2.03 per hectare for feed barley. The total EPRs collected for the period 2000/01 to 2006/07 was $3.58 million of which the Department of Agriculture and Food received $2.1 million and this was invested back into the ongoing Barley Breeding Program. The other EPR amounts collected also appear to have gone towards breeding programs.

Whether this example reflects the broader practices is not certain. Perhaps some indication of the potential for amounts that might be extracted as profits (after some amounts are set aside for breeding programs) is the recent acquisitive interest in Australian seed companies. This reflects a broader consolidation among transnational corporations and the increasing networking (mostly through cross-licensing agreements) among these entities. As examples, Vilmorin & Cie (a wholly owned plant breeding subsidiary of Limagrain Holdings) has purchased a 25 per cent stake in Australian Grain Technologies Pty Ltd; Monsanto Company has purchased a 20 per cent stake in InterGrain Pty Ltd; and Dow AgroSciences Australia (a subsidiary of Dow Chemical Company) has purchased a 50 per cent stake in HRZ Wheats Pty Ltd. This does not confirm that these breeding entities spawned by the GRDC and its collaborators will not continue to invest their EPRs in breeding programs. It does, however, show that these larger life sciences companies see them as desirable entities and this might, at least in part, be because the locking-in of EPR contracts has the potential to extract higher returns from seed sales than were previously available without EPRs. The steady increase in EPRs suggests this is at least a possibility.

Perhaps the more important immediate analysis in evaluating the benefits or otherwise of EPRs is to return to the original policy objectives of adopting and regulating for PBRs in Australia. The key driver of PBR protections in Australia was the need to access foreign plants and the decision by owners of foreign grants of rights not to release their plants in Australia without protections such as PBR. While "[there are] other mechanisms available for stimulating private plant breeding such as subsidies, bonuses, gratuities, trade marks, and so on, these would not give protection to owners of overseas varieties," the other driving factor was to promote a private sector plant breeding capacity with the incentive of a PBR encouraging and enabling the private sector to invest and make viable plant breeding businesses. The EPR is one of the mechanisms that facilitates the appropriation of the benefits of the PBR and patent holders and is advocated, particularly in the grains and horticulture industries, because EPRs:

- help to reduce up-front costs to growers, encourage uptake of varieties, overcome loss of sales through farmers' privileges and share the risk of crop failures between PBR owners and growers.

There is no doubt that in some sectors EPRs have been extraordinarily successful and eagerly adopted by those sectors. The GRDC and grains and the CRDC and cotton are, as the analyses in this article demonstrate, role models. Other sectors have been less successful to date, and for some sectors, such as FWPA for the forest industry products and GWRDC for grapes, EPRs may not be an appropriate mechanism.

For all sectors promoting and adopting EPRs, however, there remain some potential future problems for plant breeding as a consequence of drawing closer to the immediate interests of the private sector and away from the broader interests of government. This is a loss of the long-term cross cutting research that is required both to found future research and deliver a sustainable industry. The particular problems are likely to be the concentration of private breeding because of economies of scale resulting in less plant variety diversity, and an increase in seed prices because of private sector market power through consolidation. There is also a requirement for the Australian Government to recognise that where EPR collection is difficult the consequence is likely to be an under-investment in germplasm protection and development, and plant breeding. This probably accounts for the ongoing interest of the RDCs, including the CRDC and the GRDC, in plant breeding programs, and in particular pre-breeding.

126 See, for example, Sugar Research and Development Corporation, Annual Operational Plan 2012-2013 (Sugar Research and Development Corporation, 2012), 36-46.
127 Primary Industries and Energy Research and Development Act 1989 (Cth), s.5.
128 Primary Industries and Energy Research and Development Act 1989 (Cth), ss.5 and 9; Rural Industries Research and Development Corporation Regulations 2000 (Cth), reg.3(1), 20(1) and 4(1); Primary Industries (Exotic) Livestock Act 1999 (Cth), s.7 and sch.21 (ch.3 and 5) and 27 (ch.3 and 5); Primary Industries (Exotic) Livestock Regulations 1999 (Cth), reg.5 and sch.23 (12) and 27 (12).
129 Primary Industries and Energy Research and Development Act 1989 (Cth), s.2(1); Rural Industries Research and Development Corporation Regulations 2000 (Cth), reg.6(1).
130 Primary Industries and Energy Research and Development Act 1989 (Cth), s.3(1).
131 Primary Industries and Energy Research and Development Act 1989 (Cth), s.3(1).
132 See, for example, Rural Industries Research and Development Corporation, Annual Report 2011-2012 (Rural Industries Research and Development Corporation, 2012), 3. See also Lawson, above n116, 151-171.
133 These include willow trees and native plants, tea trees, and rice; Rural Industries Research and Development Corporation, Annual Report 2011-12 (Rural Industries Research and Development Corporation, 2012), 89, 92 and 122, respectively. Other programs include gilpinia and western gums: Rural Industries Research and Development Corporation, New and Developing Plant Industries; RIRDC Completed Projects in 2011-12 and Research in Progress As of June 2012 (Rural Industries Research and Development Corporation, 2013), 45 and 63, respectively.
134 Rural Industries Research and Development Corporation (Annual Report 2011-12), Ibid., 88.
136 Horticulture Australia Limited 095 566 108; Horticulture Marketing and Research and Development Services Act 2000 (Cth), s.1(1).
137 Horticulture Marketing and Research and Development Services Act 2000 (Cth), ss.9, 4, 9 and 16(1); Primary Industries (Exotic) Livestock Act 1999 (Cth), s.7 and sch.13 (ch.5 and 6); Primary Industries (Exotic) Livestock Regulations 1999 (Cth), reg.5 and sch.13 (ch.5-14, 17, 18, 19-21, 4, 22, 5, 25, 24, 25, 5, 34, 37-4 and 54).
138 Horticulture Marketing and Research and Development Services Act 2000 (Cth), s.16(1).
139 Horticulture Marketing and Research and Development Services Act 2000 (Cth), s.17(1).
140 Horticulture Marketing and Research and Development Services Act 2000 (Cth), ss.14 and 16(1).
143 Ibid., ch.1 and 7.4.
144 A list of current projects is not cut in the Annual Report identifying a variety of breeding programs: Horticulture Australia Limited, Annual Report 2012 (Horticulture Australia Limited, 2012), pp.53 (append), 41 (append), 46 (append), 52 (append), 59 (append), and so on.
145 Deal of Agreement, above n142, cl.12(1)(c).
146 See Ibid., cl.12.3.
149 Primary Industries and Energy Research and Development Act 1989 (Cth), s.8; Cotton Research and Development Corporation Regulations 1991 (Cth), reg.4.
150 Primary Industries and Energy Research and Development Act 1989 (Cth), ss.5 and 8; Cotton Research and Development Corporation Regulations 1990 (Cth), reg.4 and 5(1); Primary Industries (Exotic) Livestock Regulations 1999 (Cth), reg.5 and sch.23 (12) and 27 (12).
The Evolution of a Workable Scheme for End Point Royalties for Plant Varieties

Levi's Act 1999 (Cth), s.7 and sch. 5 (ch.3 and 5); Primary Industries (Grain) Act 1989 (Cth) s.8; Cotton Research and Development Corporation Regulations 1991 (Cth), reg.5 and 4.

157 Primary Industries and Energy Resources Research and Development Act 1989 (Cth), s.10.

158 Primary Industries and Energy Research and Development Act 1989 (Cth), s.30(1).

159 Cotton Research for Amma/ Operation Plant 2012/2013 (Cth), s.30(1). See also Commonwealth Research and Development Corporation, Annual Report 2010-11 (Cotton Research and Development Corporation, 2011), in. See also Lawson, above n116, 151-171.

160 See, for example, Cotton Research and Development Corporation, Annual Report 2010-11 (Cotton Research and Development Corporation, 2011), 11-12, 14-15.

162 See, for example, Cotton Research and Development Corporation, Annual Assessment Plan 2012/2013 (Cotton Research and Development Corporation, 2012), 12-13.

167 Cotton Research and Development Corporation (Annual Report 2010-11), ibid., 90; Cotton Research and Development Corporation, Annual Report 2009-10 (Cotton Research and Development Corporation, 2010), 126; and so on.

169 See, for example, Cotton Research and Development Corporation (Annual Report 2006-07), above n138, 45 and 65.

170 Essential to the CRCD-funded breeding programs conducted by the CSIRO in conventionally improve the plant varieties and to introduce insect resistance and herbicide tolerant genes see, for example, Cotton Research and Development Corporation, Annual Report 1999-2000 (Cotton Research and Development Corporation, 2000), 30-31 and 35; Cotton Research and Development Corporation, Annual Report 2000-2001 (Cotton Research and Development Corporation, 2001), 20-23; Cotton Research and Development Corporation, Annual Report 2001-2002 (Cotton Research and Development Corporation, 2002), 25-28; and so on.

171 See, for example, Garnet Research and Development Corporation (Annual Report 2005-06), above n154, 9-10.

172 Other parasitic elements are also available including Bayer CropScience’s “LibertyLink”; see Cotton Seed Distributors Pty Ltd, 2012 Variety Guide (Cotton Seed Distributors Pty Ltd, 2012), 7-10.
