Dear Sir/ madam,

We condemn these studies or research which will let children below 3 get exposed to Mental screening.

This will be very traumatic for children and will lead to them being given medication which may not work for them and expose them to side effects.

These kids deserve the right to grow and then be checked if there is any medication required.

At the early age of 0-3 years babies and toddlers can have different growth measures and reactions and should not be used to measure their mental strength .

I represent Multicultural Association of Community Empowerment Inc and would like to advise that we do not agree to the above mental screening and want to protect our kids from this Program.

Regards
