Step-by-Step Calculation of the Index of Remoteness	16

There is now a growing interest in the statistical definition of remoteness. Remoteness has been taken into account in revisions of the Australian Classification of Local Governments by the Department of Housing and Regional Development (HARD). See Appendix D.

This edition has been jointly developed by the Department of Human Services and Health (HSH) and DPIE to meet the increasing demand for a common national rural and remote classification and to overcome limitations in the methodology of the existing HSH and DPIE classifications. These classifications are compared in Appendix D.

The Australian Bureau of Statistics (ABS) was funded to provide data analysis based on the methodology proposed for the 1991 census by Arundell (1991) and has provided invaluable service and advice. The response to this edition will assist the ABS, in consultation with other organisations, in the development of a standard, national classification of remoteness.

## **2. PURPOSE AND APPLICATION**

The classification is a public tool to enlarge the knowledge and information base about rural and remote areas. It aims to assist decision makers concerned with a range of social justice and economic issues which are common to non-metropolitan areas. These issues include the management of industry adjustment and rural and regional development. The classification is relevant to:

- analysis of social needs
- analysis of cost, labour and marketing factors in business operations
- equitable locational distribution of public resources
- service access issues such as availability, targeting, price, access time and cultural appropriateness
- access to information about government policies and activities
- assessment of the impact of program responses aimed at overcoming the difficulties of service provision in rural and remote areas
- monitoring, assessment and evaluation of government programs.

The classification is a general purpose one and is not designed to meet the needs of any specific program.

The previous remoteness classifications have been used as analytical tools for a variety of purposes by analysts and program managers. The HSH *Rural and Remote Areas Classification* has been used in a wide range of programs and policy areas within the HSH portfolio and by academic and other institutions in related fields. It has been particularly important in the assessment of needs and service availability in disadvantaged areas including on a cross-program basis, as well as in more basic program administration. The DPIE *Rural, Remote and Metropolitan Zones Classification* has been used by Commonwealth, state and other agencies in a variety of policy or program areas including information services, education, employment, training, regional development, community services, transport and communications and the arts.

In association with other criteria, the classifications are being used to assist in making program funding decisions.

This Rural, *Remote and Metropolitan Areas Classification* will be incorporated into the 1991 population census geographic data base to enable agencies to specify tables according to the categories defined in the classification.

### **3. STRUCTURE OF THE CLASSIFICATION**

The classification divides each of Australia's states and territories into three groups -metropolitan areas, rural zones and remote zones, and a total of seven categories within these zones, as shown in Figure 1.

The structure and criteria are very similar to that of the DPIE 1986 census edition of the *Rural, Remote and Metropolitan Zones Classification*. In comparison, the HSH *Rural and Remote Areas Classification* had two, not three, rural categories and had greater differences between the criteria. Different nomenclature was used in both the HSH and the DPIE classifications (see Appendix D).

The SLA is the building block for the categories and zones. Appendix A describes the standard statistical units of area used in this classification.

A full alphabetical listing of SLAs appears in Appendix F. The detailed structure of the classification showing local government areas, SLAs and relevant urban centre populations for each state and territory and category is shown in Appendix G.

Local government areas are listed alphabetically in Appendix H along with their state/ territory, category and code in the Australian Standard Geographical Classification (ASGC, Ed 2.1 - ABS 1991).

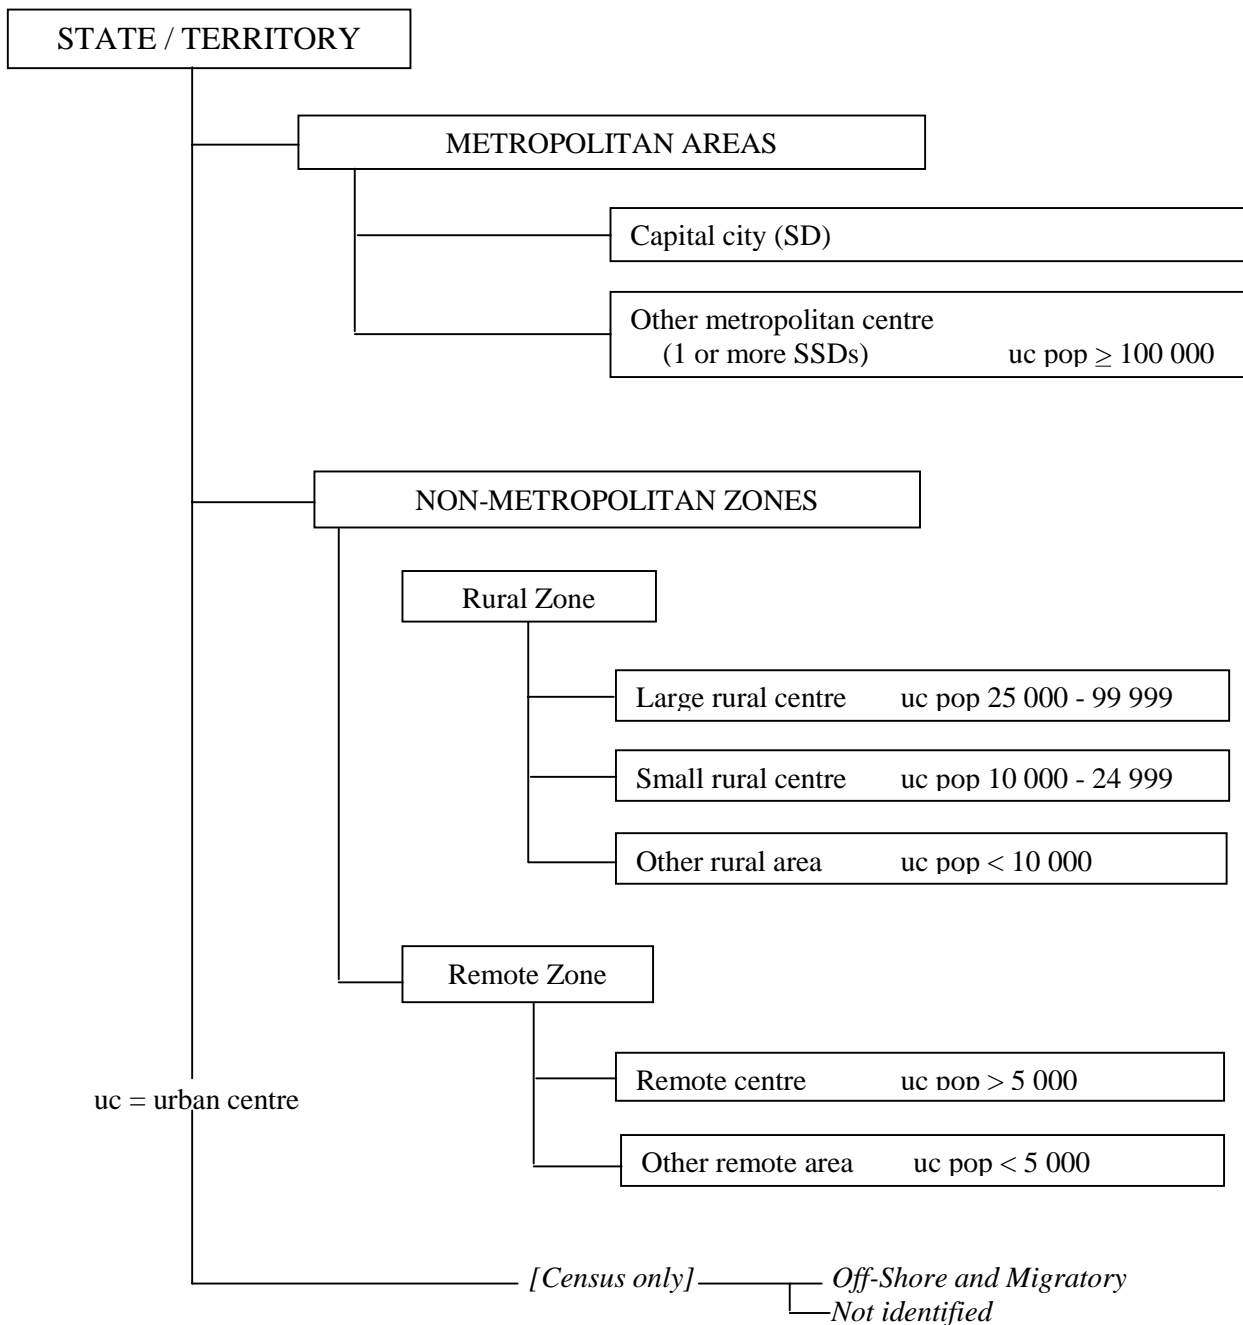

The categories are illustrated in map form in Appendix E.

#### ***METROPOLITAN AREAS***

The definition of metropolitan is as agreed by Commonwealth agencies in their Working Group Report on Rural Data (1992). The metropolitan areas are the state and territory capital city statistical divisions (SDs) plus other statistical subdivisions (SSDs) or groups of SSDs which include urban centres of population 100 000 or more in size. There are two metropolitan categories.

The first category, capital city, consists of state and territory capital city statistical divisions.

**FIGURE 1: STRUCTURE OF THE CLASSIFICATION**

The second category, other metropolitan centre consists of one or more statistical subdivisions which have an urban centre of population 100 000 or more in size. For the 1991 census edition, these areas are associated with the urban centres of Canberra-Queanbeyan, Geelong, Cold Coast-Tweed Heads, Newcastle, Townsville-Thuringowa and Wollongong.

The category other metropolitan centre has been slightly redefined since the DPIE 1986 census edition. In accordance with the Commonwealth Working Group Report on Rural Data, the statistical subdivision, not the SLA, is now the primary geographic unit for other metropolitan centre. In Queensland, New South Wales and Victoria these other metropolitan centres are therefore larger in area and population size than in 1986.

Index of remoteness values have not been calculated for SLAs classified as other metropolitan centres or capital cities. Most of these areas have an index value of zero.

## *NON-METROPOLITAN ZONES*

### **Rural Zones and Categories**

The rural zones consist of those non-metropolitan SLAs whose index of remoteness is less than or equal to 10.5. There are three rural categories - large rural centres, small rural centres and other rural areas. Large rural centres are SLAs where most of the population reside in urban centres of population 25 000 or more.

Small rural centres are SLAs in rural zones containing urban centres of population between 10 000 and 24 999.

Rural and remote centres are defined according to the population size of their associated urban centres, not according to the population size of their SLAs.

Other rural areas are the remaining SLAs within the rural zone.

### **Remote Zones and Categories**

The remote zones consist of those SLAs which have an index of remoteness greater than 10.5. There are two remote categories - remote centres and other remote areas.

Remote centres are SLAs in the remote zone containing urban centres of population of 5 000 or more.

Other remote areas are the remaining SLAs within the remote zone.

### **Off-Shore, Migratory and Not Identified**

These categories identify those people for whom a place of usual residence could not be identified on census night. They are included in the classification to enable all statistical data to be related to the total national population. See Appendices A and C.

### **Special Cases**

Some SLAs need special examination because of particular characteristics. These include islands and SLAs without permanent residents. Exceptions to the standard classifying rules have been made for Hume (S) in NSW, Unincorporated Whyalla in SA and Jabiru in NT. These cases are discussed more fully in Appendix C.

## 4. CONCEPTS

### *REMOTENESS*

'Remote' is commonly associated with mining activities, broadacre farming, Aboriginal communities and very low population densities. 'Remote' also implies distance - distance from neighbours and distance from large towns and cities and the goods, services, facilities and opportunities offered by large towns and cities.

People and businesses in locations which are distant from goods and services tend to be socially and economically disadvantaged in terms of their access to goods and services. The larger a town or city, the greater the range, quality and variety of goods and services tends to be.

Remoteness can also bring advantage. For example, generally remote areas do not have problems associated with urban congestion, such as high land prices and high air pollution levels.

Specific attributes of remoteness will vary in their importance with different policy issues. Remoteness in this classification is about distance - distance to large towns and cities and distance from other people. These attributes are relevant to a broad range of policy issues.

### *INDEX OF REMOTENESS*

Faulkner and French developed a concept of remoteness and a method for calculating an index of remoteness which was related to distances from a point to the nearest urban centres of different size (Faulkner and French, 1983). Being point based, the Faulkner and French index has limited capacity for use with available area-based statistics. The most widely available area-based statistics are at the SLA level. This classification links remoteness to the SLA and overcomes other weaknesses in previous classifications.

The ASGC does not take account of remoteness but as a result of deliberations on rural data by a working group of Commonwealth agencies, the ABS agreed to investigate 'methodologies for, and implications of, a rural and remote classification for wide and general application' (DPIE 1992). Responses to this classification will be important to these later deliberations.

The index of remoteness developed in this classification draws on Central Place Theory (Faulkner and French). The index has been developed with the following assumptions:

- people tend to obtain goods and services from the nearest urban centre that offers these
- goods and services available in a smaller urban centre are also available in a larger urban centre, with the larger urban centre offering a wider range
- remoteness is a function of straight line distance from goods and services, and hence from the nearest urban centres of various minimum sizes
- frequency of access to goods and services is related to remoteness: goods and services available at a nearby town are likely to be purchased or utilised more often than those available at a more distant town or city. Also, goods and services that are most needed are more likely to be available locally.
- for the purpose of calculating remoteness, urban centres can be treated as a small number of discrete classes grouped by size, rather than as a continuum of sizes.

The index of remoteness uses a hierarchy of *urban centre population sizes* similar to that used by Faulkner and French:

<u>Level in urban hierarchy</u>	<u>Population size</u>
● small urban centre	10 000 to 24 999
● large urban centre	25 000 to 99 999
● other metropolitan urban centre	≥100 000 and not a capital city
● capital city urban centre	≥ 100 000

The index of remoteness is constructed for each SLA using *distance factors* related to these urban centres plus a factor called '*personal distance*' (Arundell, 1991). Personal distance relates to population density and indicates the 'remoteness' of residents from each other. It is the average distance between residents.

Personal distance will tend to be small in SLAs which contain numerous small towns or large cities or are closely settled. Conversely, it will tend to be large in SLAs which contain few towns or are sparsely settled.

The index of remoteness is a relative measure which enables the remoteness of two or more SLAs to be compared. The usefulness of individual index numbers in Policy analysis remains to be tested empirically.

The methodology for calculating the index of remoteness is described in Appendix B. Distance between each SLA and the nearest urban centre in each level of the urban hierarchy is used to calculate a partial index. Weights are applied to each of these partial indices reflecting their relative importance. The index of remoteness is calculated as the weighted sum of the urban and personal distance-based partial indices.

The index of remoteness value of 10.5 has been agreed as the value which divides rural SLAs from remote SLAs. The location of this boundary reflects a common view of the location of 'rural' and 'remote' areas as determined during the development of the 1986 Millwood Classification. It aligns closely to the position of the boundary for the previous DPIE and HSH classifications.

All population figures used in the classification are those applying to the usual place of residence on census night except for the population of urban centres which is available only on the basis of place of enumeration.

## ***RURAL***

The variety of usage of the term 'rural' often causes confusion.

The common association of 'rural' is with mixed farming, small villages and towns, and population densities less than those of the metropolitan areas. The term 'rural' is variously used in industry, occupational, locational and settlement contexts. It can be synonymous with agriculture or farming. It can also be synonymous with the 'country'. Or it can be any area which is not a town or city. It often is used to include towns and cities. Sometimes there is a coincidence in the agricultural and geographic usage. Often there is not.

### **Rural areas**

Different definitions of 'rural' apply to statistical data. In this classification, 'rural' is about the degree of 'remoteness' of an area. 'Rural' areas are 'less remote' than 'remote' areas. The classification defines the term 'rural' precisely and its use in this classification should not be confused with the variety of meanings applying in other contexts.

### **The Australian Standard Geographical Classification**

Most widely used are the definitions of the Australian Standard Geographical Classification (ASGC). In the ASGC, 'rural' is used only in a geographic sense. The ASGC defines several geographic categories as 'rural'. In each case 'rural' is synonymous with 'non-urban'.

Areas which are not 'urban centres' are 'rural'. Any area not included in an urban centre of more than 1000 people is 'rural'. This 'section of state' definition is the most common definition of 'rural' used in relation to ABS statistics. However, within the section of state structure, 'rural' is further categorised into 'bounded localities', which are between 200 and 1000 in population size, and 'other rural' areas. 'Rural' areas extend over most of the continent, the matrix in which most of the nation's small and large towns and small cities are located.

The small collection district is defined in the ASGC as either 'rural' or 'urban'. This rural/urban grouping of collection districts is used to derive the rural/urban section of state of urban centres. Most SLAs contain both 'rural' localities and larger 'urban centres'. SLAs are not defined in the ASGC as either 'rural' or 'urban'.

All capital city statistical subdivisions are predominantly 'urban'. Statistical sub-divisions which are outside the capital city SDs but which have urban centres with populations greater than 24 999, are also designated 'urban' if they consist of more than one LGA. Other SSDs are mainly 'non-urban'.

#### Report of the Commonwealth Working Group on Rural Data

The Report of the Commonwealth Working Group on Rural Data provided a definition of 'rural' and 'metropolitan' statistical divisions and subdivisions for rural development purposes. 'Metropolitan' regions were defined as those statistical divisions or sub-divisions surrounding urban centres with populations greater than 99 999.

This definition of 'metropolitan' has been adopted in this *Rural, Remote and Metropolitan Areas Classification*. It should be noted that the Working Group Report used the term 'rural' to describe the remainder of Australia. However, to avoid further ambiguities associated with the term 'rural', this classification has adopted the term 'non-metropolitan' to describe the areas defined as 'rural' by the Working Group.

#### The Rural Indicators Project - Organisation of Economic Co-Operation and Development

A different approach to categorising rural data is being assessed by the Organisation of Economic Co-operation and Development (OECD, 1994) through its Rural Development Program to enable international analysis of rural indicators. For this project, ABS working with DPIE, has applied OECD criteria to identify SLAs as 'rural' or 'urban' and, statistical divisions as 'predominantly rural regions', 'significantly rural regions' or 'predominantly urban regions' (OECD). The importance of this work to domestic policy development is yet to be assessed in Australia.

### **ZONES**

A zone is an area with more or less specific boundaries defined on the basis of particular characteristics. The distinction between zone and region is sometimes blurred, but a region is generally considered as a spatial unit which is defined by a broader set of criteria for geographic, administrative, jurisdictional, economic, social or cultural purposes.

In this classification, zones are aggregates of SLAs. A metropolitan area crosses a state boundary if the defining urban centre crosses the state boundary. Within each state, a zone is usually contained within a single boundary. The rural zone in each State is a more or less continuous area adjacent to a metropolitan area while the remote zone occupies the remaining area.

In each state, rural SLAs generally align in one contiguous area as the rural zone and remote SLAs align similarly as the remote zone.

The zones exhibit differences in relation to, for example, service and infrastructure provision, economic base, land use, natural resources, demography and social structure. Within each zone there is a degree of congruence between these characteristics. Most areas within remote zones can be broadly distinguished from areas within rural or metropolitan zones by the following characteristics:

- a very low population density:
- few towns a high dependence on a few natural resource based industries
- a low rainfall
- degraded or depleted soil, water or vegetation resources
- low levels of transport and communications infrastructure and public utilities
- low levels of commercial, financial and government service provision
- high price structures for most goods and services.

The distributions of resident characteristics relating to, for example, health status and per capita income in rural, remote and metropolitan areas tend to be significantly different.

### ***METROPOLITAN AND NON-METROPOLITAN AREAS***

This classification emphasises the differences between the biggest city areas (metropolitan) and the rest of the country (non-metropolitan). Non-metropolitan areas are the aggregate of rural and remote zones.

The characteristics described above which distinguish remote zones from rural zones and metropolitan areas, also distinguish metropolitan areas from non-metropolitan areas.

HSH - Department of Human Services and Health  
DPIE - Department of Primary Industries and Energy

**APPENDIX G: Detailed Structure by State/Territory and Categories showing, Local Government Areas, Statistical Local Areas and relevant Urban Centre Populations\_for Metropolitan, Rural and Remote Centres**

*Note: For the capital city in a state/territory, LGAs are listed in alphabetical order with any component SLAs listed in italics under the LGA.*

*For other metropolitan centres, urban centres (in bold type) which define the LGA's category, are listed alphabetically with related LGAs and component SLAs being listed under the urban centre. If the urban centre and LGA share the same name, the name is only listed once.*

*Where an LGA has component SLAs in different categories, the LGA is listed in each category in [square] brackets.*

*Urban centres have not been listed for other rural or other remote areas.*

*Unincorporated areas with zero population are listed in italics in [square] brackets.*
