# State and Territory based assessment of Australian research

Linda Butler, Kumara Henadeera and Bev Biglia  
Research Evaluation and Policy Project  
Research School of Social Sciences  
The Australian National University

*September 2006*

## **Background**

This bibliometric analysis has been undertaken by the Research Evaluation and Policy Project (REPP) for the Productivity Commission. It provides State and Territory data on scientific research publications and the citations they attract in the international journal literature. The main output of the study will be provided in the form of Excel files. This paper seeks to outline the methodology used, and identify any issues relating to the data that need to be highlighted.

## **Time period covered**

Data is extracted for two years, 1995 and 2002. The choice of years was made to allow sufficient time for any underlying changes to the distribution and performance of scientific output to become apparent; and to allow time for the most recent year (2002) to attract sufficient citations for an analysis of performance based on the data to be reasonably robust.

## **The Research Evaluation and Policy Project database**

The REPP database is created from data files purchased from Thomson Scientific, and currently covers the period 1981-2005. It captures all publications with an Australian address in their three major Indices: Science Citation Index (SCI), Social Sciences Citation Index (SSCI) and Arts & Humanities Citation Index (A&HCI).

---

The database also contains the yearly counts of citations to each of the Australian publications.

## Data specifications

For this project, publications were restricted to those that appeared in journals indexed in the SCI. The data was also limited to the main types of articles reporting original research, or new syntheses of prior research: research articles and review articles. It excludes editorials, letters to the editor, book reviews, opinion pieces, etc.

The analysis is based on whole publication counts – where more than one State or Territory collaborated on a publication, each was given a count of 1 for that publication (‘whole counting’).

Because ‘whole counting’ is employed, the sum of publications from all States and Territories will be more than the Australian total from which the effect of collaboration has been removed.

## Classification to fields of research – journal set analysis

The ideal scenario for field of research classification would be to classify each publication separately. As this is clearly impossible for a study of this size and complexity, the standard practice of classifying the journal which carries the publication has been adopted. Thomson Scientific has its own descriptive classification system involving about 200 subject categories and we have, for a number of previous exercises, translated these as closely as possible into the fields and sub-fields<sup>1</sup> of the Research Fields, Courses, and Disciplines (RFCD) classification scheme. Most Thomson subject categories slot neatly into one of the RFCD sub-fields, though some problems are encountered.

One particular example has significant implications for any analysis of Australian research.

Thomson Scientific journal sets do not distinguish between research that focuses on animals or plants, and that which focuses on humans.

---

<sup>1</sup> ‘Fields’ and ‘sub-fields’ in our terminology equate to Divisions and Disciplines respectively in the RFCD.

---

As a consequence, subject categories such as Physiology, Virology and Parasitology can have elements of two or more RFCD fields in their composition. To avoid allocating too many categories to interdisciplinary codes, REPP classified a journal set to a particular field where more than half the journals clearly related to that field. Where this was not possible, the subject category was allocated to a ‘science – general’ journal set.

It should be noted that ISI allocates some journals to more than one subject category with the effect that some double-counting between fields exists.

The translation of ISI subject categories into the science fields of the RFCD can be supplied on request.

## **Small numbers**

A special note of caution is required concerning the small numbers of publications tabulated in some fields. In the SCI system as a whole, many publications receive no citations at all, and the majority receive less than 5 citations. The number achieving a high citation count is extremely small. The very nature of citation practice means that averages can be disproportionately affected by a single highly cited publication. The smaller the number of publications being analysed, the greater the effect such an item will have on the average.

For the bibliometric measures used in this analysis, citation information based on any units with less than 100 publications have been omitted.

Our experience suggests that extra caution should also be used for citation figures based on units with between 100 and 200 publications.

## **The bibliometric performance indicators**

A general description of the bibliometric measures used is given below.

### **Citation per publication rates (cpp)**

The number of publications produced by each State and Territory in 1995 was tabulated, together with the number of citations these publications receive between 1995 and 2005, the most recent citing year available (i.e. these publications had 11 years in which to attract citations). An average citation rate was then calculated. For 2002 publications, the citation ‘window’ was only 4 years (2002-2005). The

---

calculations were made for the total output from each jurisdiction, and for their output in each field of science.

Analytical use of this measure is restricted to comparisons between States and Territories within a field. Direct comparison between the two time periods cannot be made because of the different citation windows employed. To overcome this shortcoming, comparisons over time can be made using relative citation and journal impact calculations (described below).

In addition, cross-field citation rate comparisons cannot be made, even within the same year, as the citation practices in different fields vary markedly. The world benchmark data for each field demonstrates this clearly. Again, the field-normalised relative citation and journal impacts overcome this problem.

### **Relative impact**

An assessment of relative impact has two field-normalised components. The relative citation impact compares the citation rate of a unit's output with the relevant world average. It is calculated by dividing the average number of citations per publication for the unit in a given field by the average number of citations for all publications in that field (i.e. the world citation rate for that field).

Thus, a relative citation impact of more 1.0 indicates a higher/better position than the world average, while a relative citation impact of less than 1.0 would indicate a relatively low performance.

Likewise, the relative journal impact compares the average impact of the journals in which the unit publishes in a particular field to the average impact of all journals classified to that field. A score of more than 1.0 indicates that the unit is publishing in high impact journals, while a score of less than 1.0 indicates the placement of publications is in relatively low impact journals.

## **Identification of State and Territory publications**

State and Territory publication sets were identified by using two address fields in the REPP database. Initially, the "province" field was used, which in the majority of cases specified either the state and/or the postcode for Australian publications. Where neither was present, they were identified on the basis of the "city" field. In the process, the publications of a number of institutions and organisations that crossed political boundaries were split. For example, CSIRO publications are to be found in every jurisdiction, and ANSTO publications, and those from many

---

Cooperative Research Centres also cross boundaries. Publications from ADFA fall within the ACT, and are not linked to their parent institution in New South Wales.

## **SCI Coverage**

Before any discussion of publications and citations occurs, it is important to be clear what proportion of research output from the units under study is covered by bibliometric measures.

Fields of research vary in the extent to which journal publication can be regarded as the normal mode of research dissemination, and the extent to which its journal output is captured in Thomson (previously referred to as ISI) indexes. Data from a REPP research project illustrates this issue clearly. Table 1 shows the proportion of total output for each of the research schools and faculties of the university that appears in ISI journals (column 3). It also shows the proportion of the journals in which each unit publishes that are indexed by ISI (column 4).

**Table 1: Distribution of Australian University research by type of publication and field, 1999-2001**

<i>Field</i>	<i>Total publications</i>	<i>No. ISI journal publications</i>	<i>% Total output in ISI</i>	<i>% Journal publications in ISI.</i>

Law	1925	86	<b>4</b>	6
<b>Total</b>	<b>78709</b>	<b>33774</b>	<b>43</b>	<b>61</b>

The data in Table 1 clearly shows why bibliometric analysis is problematic in some fields of research. In the applied sciences, and particularly in the social sciences and humanities, much of their research is not published in journal articles, and even when it is, the capture rate in ISI indices may be very small. Bibliometric analysis is most appropriate for the natural and life sciences, and less so for the more applied sciences.

### Sheet Index

#### Publication Output by Field

Publication output for each State and Territory classified by field

#### Citation per Publication

Citation per publication rates, in aggregate and for each field

#### Relative Impact Data

Relative citation impact and relative journal impact of each State and Territory's publications, in aggregate and by field. This worksheet also contains data for publications, citations, journal impact, the world journal impact, and the world citations per publication rate for each field that are used to calculate the relative citation impact and relative journal impact.

#### Relative Impact - Sample Charts

This worksheet contains two sample charts together with relevant data.

#### Collaborations 1995

Collaboration between States and Territories, in aggregate and by field for 1995. "Interstate collaborations" and "International collaborations" indicate the total number of publications that were produced with the interstate and international collaborations respectively.

#### Collaborations 2002

Collaboration between States and Territories, in aggregate and by field for 2002

#### Collaborations -Total Publications

Summary of total publications by year for each State and Territory

**Publication output for each State and Territory by field - 1995**
