(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) Responses for children aged 3 to 14 years were provided by an adult proxy.

(c) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

Table 5A.7.15 Participation in sporting, community or social activities, and attendance at cultural events of Aboriginal and Torres Strait Islander children (aged 3 to 14 years), by remoteness, 2014-15 (a) (b)

| | <i>Unit</i> | <i>Major cities</i> | <i>Inner regional</i> | <i>Outer regional</i> | <i>Total non-remote</i> | <i>Remote</i> | <i>Very remote</i> | <i>Total remote</i> | <i>Aust</i> |
|--|-------------|---------------------|-----------------------|-----------------------|-------------------------|---------------|--------------------|---------------------|-------------|
|--|-------------|---------------------|-----------------------|-----------------------|-------------------------|---------------|--------------------|---------------------|-------------|

- (b) Responses for people aged 3 to 14 years were provided by an adult proxy.
- (c) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.
- (d) Includes participating in 'recreational or cultural group activities', 'attended native title meeting', 'community or special interest group activities', 'church or religious activities' or 'attended funerals/sorry business, ceremonies or Indigenous festivals'.
- (e) Includes participating in social activities such as 'went to a café, restaurant or bar', 'visited a library, museum or art gallery', 'attended movies, theatre or concert', 'visited park, botanic gardens, zoo, theme park', 'watched indigenous TV' or 'listened to Indigenous radio'.
- (f) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (g) Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) Sum of components may exceed total as people may have participated in more than one of the selected activities.

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.
- (b) Includes respondents that didn't know if they were allowed to visit homelands or not.
- (c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.
- (d) Asked of persons who visit their homelands at least once per year.
- (e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.
- (f) Includes people who recognised their homelands but did not know if they were allowed to visit.
- (g) Total includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. For 2014-15, this applies to responses for: 'Length of longest visit to homelands', 'How often allowed to visit Homelands', or 'Whether allowed to visit Homelands'.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use. Includes only those present at the interview.

Table 5A.8.2 **Aboriginal and Torres Strait Islander people (aged 18 years or over), selected cultural characteristics, by state and territory, 2018-19 (a)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----|--|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (b) | Identifies' includes persons who reported cultural identification with a tribal, language or regional group, a clan or a mission. More than one response allowed. Categories include: a tribal group, a language group, a clan, a mission, Aboriginal/Torres Strait Islander/Aboriginal or Torres Strait Islander group. | | | | | | | | | |
| (c) | Includes respondents that didn't know if they were allowed to visit homelands or not. | | | | | | | | | |
| (d) | Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month. | | | | | | | | | |
| (e) | Asked of persons who visit their homelands at least once per year. | | | | | | | | | |
| (f) | Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months. | | | | | | | | | |
| (g) | Includes people who recognised their homelands but did not know if they were-allowed to visit. | | | | | | | | | |
| (h) | Includes includes people who refused to answer or who provided 'don't know' responses. | | | | | | | | | |
| | .. Not applicable. – Nil or rounded to zero. np Not published. | | | | | | | | | |

| Total | ± | .. | .. | .. | .. | .. | .. | .. | .. |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) Includes respondents that didn't know if they were allowed to visit homelands or not.

(c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.

(d) Asked of persons who visit their homelands at least once per year.

(e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.

(f) Includes people who recognised their homelands but did not know if they were-allowed to visit.

TABLE 5A.8.3

| | Unit | Major cities | Inner regional | Outer regional | Total | Remote | Very remote | Total | Australia |
| (a) | Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use. Includes only those present at the interview. | | | | | | | | |
| (b) | Identifies' includes persons who reported cultural identification with a tribal, language or regional group, a clan or a mission. More than one response allowed. Categories include: a tribal group, a language group, a clan, a mission, Aboriginal/Torres Strait Islander/Aboriginal or Torres Strait Islander group. | | | | | | | | |
| (c) | Includes respondents that didn't know if they were allowed to visit homelands or not. | | | | | | | | |
| (d) | Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month. | | | | | | | | |
| (e) | Asked of persons who visit their homelands at least once per year. | | | | | | | | |
| (f) | Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months. | | | | | | | | |
| (g) | Includes people who recognised their homelands but did not know if they were-allowed to visit. | | | | | | | | |
| (h) | Includes includes people who refused to answer or who provided 'don't know' responses. | | | | | | | | |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) Includes respondents that didn't know if they were allowed to visit homelands or not.

(c) Includes people who reported visiting their homelands at least once a week or once a fortnight or once a month.

(d) Asked of persons who visit their homelands at least once per year.

(e) Includes people who reported they visit homelands at least once per year, but did not visit in the last 12 months.

(f) Includes people who recognised their homelands but did not know, if they were-allowed to visit.

(g) Total includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. For 2014-15, this applies to responses for: 'Length of longest visit to homelands', 'How often allowed to visit Homelands', or 'Whether allowed to visit Homelands'.

6 Early child development

Strategic areas for action

A good start can help children to thrive and lead happy and healthy lives into adulthood. Addressing challenges in early childhood, including before children are even born, can reduce the development of problems that would prevent them achieving their full potential.

The indicators in the early child development strategic area focus on the drivers of long term advantage or disadvantage:

- antenatal care (section 6.1) — the health and wellbeing of women during pregnancy, childbirth and the period following birth is important for their future wellbeing and the wellbeing of their children
- health behaviours during pregnancy (section 6.2) — the health behaviours of women during pregnancy, including the consumption of tobacco and other drugs, affect the wellbeing of both mothers and children
- teenage birth rate (section 6.3) — teenage births are associated with poorer health outcomes, along with poorer educational attainment and employment prospects and lower incomes, which can lead to an intergenerational cycle of disadvantage
- birthweight (section 6.4) — low birthweight babies require longer periods of hospitalisation after birth, and are more likely to have poor health or even to die in infancy and childhood. Low birthweight is also correlated with poorer health outcomes later in life
- early childhood hospitalisations (section 6.5) — the hospitalisation rate provides a broad indicator of serious health issues experienced by children
- injury and preventable disease (section 6.6) — most childhood diseases and injuries can be successfully prevented or treated without hospitalisation

-
- ear health (section 6.7) — recurring ear infections, if not treated early, can become chronic and lead to hearing impairment. This can affect children’s capacity to learn and socialise
 - basic skills for life and learning (section 6.8) — children’s early social and cognitive development provides the foundations upon which later relationships and formal learning depend.

Several COAG targets and headline indicators reflect the importance of early child development:

- young child mortality (section 4.2)
- early childhood education (section 4.3)
- substantiated child abuse and neglect (section 4.11).

Other headline indicators are important influences on early childhood outcomes:

- household and individual income (section 4.10)
- family and community violence (section 4.12).

Outcomes in the early child development area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- education and training — school engagement (chapter 7)
- healthy lives — access to primary health care, obesity and nutrition, mental health (chapter 8)
- economic participation — income support (chapter 9)
- home environment — overcrowding, access to functioning water, sewerage and electricity services (chapter 10)
- safe and supportive communities — alcohol/drug misuse and harm (chapter 11).

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, ‘table 6A.1.1’). These tables can be found on the web page (www.pc.gov.au/oid2020).

6.1 Antenatal care¹

Box 6.1.1 Key messages

- Antenatal care provides expectant mothers with information and screening, prevention and treatment services to maximise their health throughout pregnancy, and the health of their babies.
- Over time, the proportion of Aboriginal and Torres Strait Islander expectant mothers attending at least one antenatal visit in the first trimester has increased. Of all Aboriginal and Torres Strait Islander mothers who gave birth in 2018, 66 per cent attended at least one antenatal visit in the first trimester of pregnancy (compared with 50 per cent in 2011).
- This increase has contributed to a narrowing of the gap over time to non-Indigenous women. From 2011 to 2018 the gap nearly halved, and is now 8 percentage points.
- Almost all Aboriginal and Torres Strait Islander women who gave birth at 32 weeks or more of gestation in 2018 attended at least one antenatal visit (99 per cent). Of these women, 88 per cent attended five or more antenatal visits and proportions were above 80 per cent across all remoteness areas.
- Although the gap has narrowed, the proportion who gave birth at 32 weeks or more after attending five or more antenatal visits remains lower for Aboriginal and Torres Strait Islander women than for non-Indigenous women.
- Culturally safe antenatal care services, including holistic care, greater continuity of carers throughout pregnancy and access to birthing on Country sites can facilitate early and ongoing engagement with these services by Aboriginal and Torres Strait Islander expectant mothers.
- Greater engagement of partners and other family members during the antenatal period may also facilitate better outcomes for parents and babies.

Box 6.1.2 Measures of antenatal care

There are two main measures for this indicator (aligned with reporting for the National Indigenous Reform Agreement (NIRA), which was in effect at the time of preparing this report).

- *Antenatal visits in the first trimester* is defined as the proportion of women who gave birth who attended at least one antenatal visit in the first trimester (that is, up to and including 13 completed weeks).
- *Five or more antenatal visits* is defined as the proportion of women who gave birth at 32 weeks or more gestation, who attended five or more antenatal visits.

(continued next page)

¹ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University, who reviewed a draft of this section of the Report.

Box 6.1.2 (continued)

The most recent available data for both main measures are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are that:

- nationally standardised data on *gestation at first antenatal visit* are only available from July 2010, and nationally standardised data on *number of antenatal visits* are only available from July 2012. (Caution should be used making jurisdictional comparisons prior to these dates.)
- data by remoteness area are provided from 2011. Data for prior years are not directly comparable and are not included in this report.

A supplementary measure on health and nutrition during pregnancy is also reported, but new data were not available for this report (see tables 6A.1.20 and 6A.1.22 for 2014-15 data.).

Antenatal care aims to maximise women's health throughout pregnancy along with the health of their babies (AIHW 2020). Antenatal care provides expectant mothers with information and screening and prevention and treatment services and can help manage any issues that may affect birth outcomes. Early and ongoing access to, and engagement with, antenatal care is a key part of improving pregnancy outcomes (AHMAC 2012).

The optimal number and timing of antenatal care visits is unclear (Department of Health 2018; Gausia et al. 2013). National, evidence-based antenatal care guidelines recommend a first visit within the first 10 weeks of gestation, with the subsequent schedule of antenatal visits to be based on the individual woman's needs (for uncomplicated pregnancies — 10 visits for the first pregnancy and 7 visits for subsequent pregnancies) (Department of Health 2018). This report aligns with other national reporting (including the NIRA and the Aboriginal and Torres Strait Islander Health Performance Framework) by reporting on attending for five or more visits.

The type of antenatal care available in Australia often depends on service availability, the woman's preferences and her risk profile (Gibson-Helm et al. 2016). It can comprise primary and/or hospital care and often involves a range of health professionals. In remote locations, pregnancy care is usually provided by primary health care centres, with women transferring to hospitals in regional centres or metropolitan areas for the birth between four and six weeks prior to the due date (Reibel et al. 2015).

Over time, the proportion of Aboriginal and Torres Strait Islander expectant mothers attending at least one antenatal visit in the first trimester has increased ...

Nationally in 2018, 66 per cent of Aboriginal and Torres Strait Islander women who gave birth had attended at least one antenatal visit in the first trimester, an increase from 50 per cent in 2011 (table 6A.1.1). This pattern held across states and territories (figure 6.1.1) and by remoteness — with increases of between 13 and 18 percentage points

across remoteness categories between 2011 and 2018 (table 6.A.1.6).² Historical data prior to 2011 are available for selected jurisdictions and are reported in tables 6A.1.2–5.

Figure 6.1.1 Aboriginal and Torres Strait Islander women who attended at least one antenatal visit in the first trimester of pregnancy, 2011 to 2018^a

^a See table 6A.1.1 for detailed definitions, footnotes and caveats.

Source: AIHW analysis of the National Perinatal Data Collection; table 6A.1.1.

... but the proportion remains lower than for non-Indigenous expectant mothers

The proportion of Aboriginal and Torres Strait Islander women giving birth who attended at least one antenatal visit in the first trimester of pregnancy remained lower than for non-Indigenous women, although the gap has narrowed (figure 6.1.2). In 2018, after adjusting for differences in population age structures, the gap was about 8 percentage points, nearly half of what it was in 2011 (table 6A.1.7). The gap narrowed in major cities between 2011 and 2018; variability in the data means that definitive statements on changes in the gap cannot be made for other remoteness areas (figure 6.1.2).

² The trend was negative in major cities and inner regional areas between 2011 and 2013, but was reversed in 2014.

Figure 6.1.2 Women who gave birth and attended at least one antenatal visit in the first trimester, by Indigenous status and remoteness, 2011 and 2018 (age-standardised)^{a,b}

^a Age-standardised data for non-Indigenous women in very remote areas were not reported in 2018. ^b See tables 6A.1.7 and 6A.1.12 for detailed definitions, footnotes and caveats.

Source: AIHW analysis of the National Perinatal Data Collection; tables 6A.1.7 and 6A.1.12.

Most Aboriginal and Torres Strait Islander mothers who gave birth at 32 weeks or more of gestation attended five or more antenatal visits

Most Aboriginal and Torres Strait Islander women who gave birth at 32 weeks or more of gestation attended five or more antenatal visits during pregnancy. Nationally in 2018, almost all women who gave birth at 32 weeks or more gestation (99 per cent) attended at least one antenatal visit, and 88 per cent attended at least five visits (table 6A.1.13). These proportions are largely unchanged since 2012 (table 6A.1.13).³

Of women who gave birth at 32 weeks or more of gestation, the proportion who attended five or more visits was above 80 per cent across all remoteness areas. In 2018, the proportions (age-standardised) ranged from 84 per cent in remote areas to 91 per cent in inner regional areas (table 6A.1.19).

Between 2011 and 2018, the gap between Aboriginal and Torres Strait Islander and non-Indigenous women who gave birth at 32 weeks or more of gestation and attended five

³ The trends exclude data for Victoria, which were first reported in 2016. Age-standardised rates for women who gave birth at 32 weeks or more of gestation and attended five or more antenatal visits are available by Indigenous status and state and territory from 2011 to 2018 and are reported in table 6A.1.14. Historical data for selected jurisdictions are reported in tables 6A.1.15–18.

or more antenatal visits during pregnancy narrowed, from 12 to 7 percentage points (table 6A.14).

What can be done to further increase early and ongoing engagement with antenatal care?

Early and ongoing engagement with antenatal care is facilitated by the provision of culturally safe and evidence-based care relevant to the local community (Clarke and Boyle 2014; Middleton et al. 2017). Cultural safety is defined by the individual's experiences of health care, and by their ability to raise concerns. Part of the process of developing cultural safety requires improving the cultural competence of health professionals (Bainbridge et al. 2015) — which is essential for effective health communication (Clarke and Boyle 2014) — and monitoring progress at the service level (Aitken and Stulz 2018). Culturally safe maternal and child health services are particularly critical to improving health for Aboriginal and Torres Strait Islander mothers and babies (Kildea et al. 2016).

Across Australia, there are an increasing number of maternity models that recognise the contributions of Aboriginal and Torres Strait Islander people in the design and delivery of services (Clarke and Boyle 2014; Gibson-Helm et al. 2016; Hickey et al. 2019; Kildea et al. 2016) to improve birth outcomes for Aboriginal and Torres Strait Islander women (Kildea et al. 2016). Programs in which Aboriginal and Torres Strait Islander people — members of the workforce and the community — work in partnership with staff in primary health care services and maternity services to design and deliver services, and to incorporate traditional midwifery knowledge and skills in those services, have been found to encourage Aboriginal and Torres Strait Islander women's use of antenatal services and have led to better maternal and birth outcomes (Bertilone and McEvoy 2015; Kildea et al. 2012, 2019a; Middleton et al. 2017).

Research suggests that providing culturally safe antenatal care involves:

- supporting the vital role of the kinship system in Aboriginal and Torres Strait Islander communities to transfer child bearing knowledge (Dietsch et al. 2011) and encourage and support new parents through the antenatal period and the parenting journey (Reibel et al. 2015)
- holistic care (Clarke and Boyle 2014; Kildea and Van Wagner 2013) that addresses emotional wellbeing (Gibson-Helm et al. 2018) and takes into account the social and cultural determinants of health (Bertilone and McEvoy 2015; Reibel, Wyndow and Walker 2016)
- continuity of caregiver (midwife and/or Aboriginal health education officer) (Clarke and Boyle 2014; Gibson-Helm et al. 2018; Homer 2016; Kildea et al. 2012, 2019a)
- providing antenatal care closer to home, and the option of birthing on Country (Kildea et al. 2016, 2019b, 2019a, Hickey et al. 2018). Services that do this well encompass some of the following elements: they are community-based and community-governed, encourage traditional practices, involve a connection with lands and Country, have a

holistic definition of health, and value Aboriginal and Torres Strait Islander people's ways of knowing and learning (Kildea et al. 2016).

Many Aboriginal and Torres Strait Islander men also want to engage with antenatal (and postnatal) programs and services, but there are limited options for them to do so (Canuto et al. 2019, Canuto et al. 2020). Evidence from Australian and international studies looking at other population groups indicates that supporting and engaging partners during the antenatal, birthing and post-natal period may have positive impacts on:

- partners themselves, given increasing evidence of the mental health challenges associated with fatherhood (Baldwin et al. 2018; Giallo et al. 2012)
- the mother's psychological wellbeing and birth outcomes (Jeffery et al. 2015).

Aboriginal and Torres Strait Islander men's engagement with parental and child health services can be supported by culturally safe and gender-sensitive health care and community services that include men, focus on men's psychological empowerment and provide them with support to build confidence with parenting (Reilly and Rees 2018).

Future directions in data

The most recent data on the supplementary measure on Aboriginal and Torres Strait Islander mothers and young children's nutrition and health are not reported because the data are only available every six years from the ABS National Aboriginal and Torres Strait Islander Social Survey; the most recent data are for 2014–15, and are included in attachment tables for this section. More regular data, and comparative data for non-Indigenous mothers and children, would improve reporting.

6.2 Health behaviours during pregnancy⁴

Box 6.2.1 Key messages

- The health and wellbeing of a pregnant woman and her baby is influenced by health behaviours such as nutrition, physical activity, smoking, and alcohol and drug use.
- Tobacco smoking is one of the most significant and most common reversible risk factors for the health of pregnant women and their babies.
- The proportion of Aboriginal and Torres Strait Islander women smoking during pregnancy has declined in the past decade — from 52 per cent in 2009 to 44 per cent in 2018.
- However, the gap in smoking during pregnancy for Aboriginal and Torres Strait Islander women compared with non-Indigenous women increased (from three times the proportion in 2009 to nearly four times in 2018), as smoking in pregnancy for non-Indigenous women also declined and it was from a lower base rate.
- Self-reported consumption of alcohol during pregnancy by the mothers of Aboriginal and Torres Strait Islander children more than halved in the past decade, from 20 per cent in 2008 to nine per cent in 2018-19.
- Self-reported drug use rates during pregnancy for Aboriginal and Torres Strait Islander women remained relatively unchanged over this period — and in 2018-19 it was three per cent.
- Further reductions in these risk factors require a holistic approach to health that includes an understanding of, and strategies to overcome, the impacts of intergenerational trauma and racism on current ill health and social disadvantage, and of their association with health behaviours.
- Many Aboriginal and Torres Strait Islander pregnant women are motivated to quit smoking during pregnancy. Social support, health literacy and culturally responsive health care are key to helping them achieve this objective.
- Also key to reducing smoking rates during pregnancy are strategies to prevent the uptake of smoking by young people in adolescence and early adulthood — around the age when many Aboriginal and Torres Strait Islander women have children.

Box 6.2.2 Measuring health behaviours during pregnancy

There is one main measure for this indicator (aligned with reporting for the NIRA, which was in effect at the time of preparing this report). *Tobacco smoking during pregnancy* is defined as the number of women who smoked during pregnancy as a proportion of the total number of women who have given birth.

(continued next page)

⁴ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University, who reviewed a draft of this section of the Report.

Box 6.2.2 (continued)

The most recent available data are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are that:

- data are available for all states and territories from 2009 onwards. Prior to 2009 data were not available for Victoria
- nationally standardised data items on tobacco smoking are available from July 2010. Caution should be used in making jurisdictional comparisons prior to this date
- remoteness data are presented from 2011 onwards (and are not comparable with previous years).

Data for three supplementary measures are also provided: The measures are of the proportion of mothers, with Aboriginal and Torres Strait Islander children aged 0–3 years, who: used tobacco during pregnancy; consumed alcohol during pregnancy; used illicit drugs during pregnancy.

The data for these measures come from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) (all jurisdictions; remoteness), and from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) (all jurisdictions; remoteness). The most recent available data are from NATSIHS 2018-19).

Data on tobacco use during pregnancy from the NPDC and the NATSISS are not directly comparable.

The health and wellbeing of a woman and her baby during pregnancy are enhanced by certain behaviours. These include eating a healthy diet containing iron and calcium-rich foods, drinking plenty of water, doing low to moderate-intensity physical activity, taking vitamins and minerals such as folic acid and iodine (DoH 2019) and receiving vaccinations for influenza and whooping cough (DoH 2020).

On the other hand, behaviours like tobacco smoking, alcohol and drug use during pregnancy have long-lasting negative impacts on the mother (Greenhalgh 2015; Wilson et al. 2017) and the baby. All three behaviours are linked to at least one adverse perinatal outcome such as low birthweight (section 6.4 *Birthweight*), being small for gestational age, or pre-term birth and perinatal death (section 4.2 *Young child mortality*) (AIHW 2020b; Brown et al. 2016; Kelly, Graham and Sullivan 2010; O’Leary et al. 2020; Oni et al. 2019) and can have ongoing developmental effects (Gould et al. 2017; Reid et al. 2015). Alcohol use creates a risk of fetal alcohol spectrum disorder (FASD) — which can mean birth defects and growth and developmental problem — (Fitzpatrick et al. 2017; Reid 2018).⁵ And the effects of alcohol and illicit drug use can include neonatal abstinence syndrome (Davies et al. 2016).

During pregnancy, there is no safe amount of tobacco smoking or illicit drug use (DoH 2019), but it is not yet known how much alcohol is safe to drink. The risk of damage to the baby is greatest with high, frequent alcohol consumption during the first trimester (12 weeks) (AIHW 2020a), and binge drinking is especially harmful (AIHW 2020c). The

⁵ The prevalence of FASD in Australia is unknown; it is estimated that as many as 2 per cent of all Australian babies may be born with some form of FASD (DoH 2018).

National Health and Medical Research Council (NHMRC) advises that the safest option for pregnant women is to abstain from drinking if they are pregnant, planning a pregnancy or breastfeeding (NHMRC 2009).

Furthermore, the risks of adverse health outcomes are significantly higher when these substances are used simultaneously, rather than in isolation (Oni et al. 2019; Reynolds et al. 2020) and simultaneous use is not uncommon (AIHW 2020c; Brown et al. 2016; Gibberd et al. 2019; Passey et al. 2014).⁶

The pregnancy period presents a unique opportunity to support women to engage in healthier behaviours for themselves and their babies. While these behaviours often carry into pregnancy (AIHW 2020c), pregnant women are motivated to quit (Gould et al. 2013, 2015) and continue to not smoke after the baby is born (see section 8.4 *Tobacco consumption and harm*).

Tobacco smoking is one of the most significant and most common reversible risk factors for the health of pregnant women and their babies (AIHW 2020b; Gould et al. 2017); and the main focus in this section. Obesity is also a significant emerging risk factor for perinatal morbidity and mortality (for example, see Thrift and Callaway 2014) that may become an additional focus for future reporting (see section 8.5 *Obesity and nutrition* for further information on overweight/obesity).

Rates of Aboriginal and Torres Strait Islander women smoking during pregnancy have declined across all areas, except very remote areas ...

The proportion of Aboriginal and Torres Strait Islander women smoking during pregnancy has decreased over time, from 52 per cent in 2009 to 44 per cent in 2018 (table 6A.2.1).⁷ This decrease can be seen across all remoteness areas, except very remote areas, where there was an increase (figure 6.2.1). The less remote the area, the larger the decrease in smoking during pregnancy was over time. This means that the gap across remoteness areas has increased over time (from a range of 46 to 53 per cent in 2011 to 39 to 57 per cent in 2018) (table 6A.2.2).

⁶ The association between smokeless tobacco use, such as chewing tobacco, and adverse health effects differs by type of product (Greenhalgh, Scollo and Winstanley 2020). The effects on birth outcomes of Aboriginal and Torres Strait Islander expectant women's chewing a tobacco plant known as pituri will soon be known (Ratsch et al. 2019).

⁷ National data (excluding Victoria) from 2005 available in table 6A.2.1 also showed a downward trend.

Figure 6.2.1 **Tobacco smoking during pregnancy for Aboriginal and Torres Strait Islander women, by remoteness, 2011 to 2018^a**

^a See table 6A.2.2 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Perinatal Data Collection; table 6A.2.2.

... but the ratio of the rates of smoking during pregnancy for Aboriginal and Torres Strait Islander women to non-Indigenous women increased

Smoking rates during pregnancy for both non-Indigenous and Aboriginal and Torres Strait Islander women decreased over the decade to 2018 (figure 6.2.2). The decline was statistically similar — 3.5 percentage points for Aboriginal and Torres Strait Islander women and 4.6 percentage points for non-Indigenous women — leaving the rate difference largely unchanged (table 6A.2.3). However, as the rate for non-Indigenous women was lower at the start of the period, the proportional decline in the rate was greater for non-Indigenous women. This led to an increase in the ratio of the rates of smoking during pregnancy for Aboriginal and Torres Strait Islander women to non-Indigenous women from 3.0:1 in 2009 to 3.9:1 in 2018 (figure 6.2.2).

Figure 6.2.2 Tobacco smoking during pregnancy by Indigenous status, 2009 to 2018 (age-standardised rate and rate ratio)^a

^a See table 6A.2.3 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Perinatal Data Collection; table 6A.2.3.

Alcohol use during pregnancy is decreasing and drug use remains low

More mothers of Aboriginal and Torres Strait Islander children are reporting abstaining from alcohol during their pregnancies. In 2018-19, around nine per cent of mothers of Aboriginal and Torres Strait Islander children aged 0–3 years reported that they consumed alcohol during pregnancy, a figure which is half of what it was in 2008 (20 per cent) (table 6A.2.5). While declines were observed across remoteness areas, they were only statistically significant in non-remote areas (figure 6.2.3).

The most recent *National Drug Strategy Household Survey* (NDSHS) confirmed a general decline in self-reported alcohol use for pregnant women in Australia (AIHW 2020c). Nationally in 2019, of all the women surveyed who had been pregnant in the previous twelve months, over one-third (35 per cent) reported drinking alcohol during pregnancy — down from 44 per cent in 2016. Of those who did, most (90 per cent) drank infrequently (monthly or less) and the overwhelming majority (96 per cent) consumed one to two standard drinks on a typical day they drank (AIHW 2020c).

Figure 6.2.3 **Alcohol and drug use during pregnancy for mothers of Aboriginal and Torres Strait Islander children, by remoteness, 2008, 2014-15 and 2018-19^{a,b}**

^a Confidence intervals for drug use in remote areas in 2008 and 2018-19 were not available. ^b See tables 6A.2.5–6 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Surveys 2008 and 2014-15 and ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2018-19; tables 6A.2.5–6.

Rates of self-reported drug use among Aboriginal and Torres Strait Islander women during pregnancy have remained relatively unchanged over time. In 2018-19, three per cent of mothers of Aboriginal and Torres Strait Islander children aged 0–3 years reported using illicit drugs or substances during pregnancy, a figure which is statistically similar to the proportion in 2008 (table 6A.2.5 and figure 6.2.3). Data from the NDSHS indicate that, in 2019, zero per cent of Australian women reported continuing to use cannabis or other illicit drugs once they found out they were pregnant — compared with five per cent and two per cent, respectively, who reported consuming drugs before they knew they were pregnant (AIHW 2020c). However, due to high sampling error, the data should be interpreted with caution.

Social support and culturally responsive and holistic health care support are key to help the many Aboriginal and Torres Strait Islander women who want to quit smoking during pregnancy

Reducing smoking rates during pregnancy requires strategies to prevent the uptake of smoking by young people and to support women to quit smoking during pregnancy. For the most part, smoking uptake occurs in adolescence and early adulthood (Heris et al. 2020) — around the age when many Aboriginal and Torres Strait Islander women have children (section 6.3 *Teenage birth rate*) — and often carries into pregnancy (AIHW 2020c). Section 8.4 *Tobacco consumption and harm* contains more information about the

determinants of smoking uptake and approaches to reduce its consumption, including localised solutions.

Research suggests that strategies to support Aboriginal and Torres Strait Islander women of childbearing age to quit smoking need to be multifaceted and holistic taking into account the social and cultural determinants of health and health-related behaviours (Bertilone and McEvoy 2015; Cockburn, Gartner and Ford 2018; Lovett, Thurber and Raglan 2017; Reibel, Wyndow and Walker 2016).

The factors affecting smoking during pregnancy are complex and interrelated. Aboriginal and Torres Strait Islander people are resilient (Beyond Blue Australia 2020). However, the cumulative effects of colonisation and dispossession, the removal of children and racism (Bovill et al. 2019; Gould et al. 2017) have led to intergenerational trauma and marked social disadvantage (Paradies 2016) and a deterioration in mental health and wellbeing (Beyond Blue Australia 2020; Calma, Dudgeon and Bray 2017; Macedo et al. 2020). Smoking rates are known to be associated with socioeconomic status (O’Leary et al. 2020; Thrift, Nancarrow and Bauman 2011) and emotional wellbeing (Kotz et al. 2016; Prandl, Rooney and Bishop 2012), including the stress and anxiety that results from the cumulative effects of multiple stressful life events (Askew et al. 2019; Harris et al. 2019; Wyndow, Walker and Reibel 2018).

Many pregnant Aboriginal and Torres Strait Islander women are motivated to quit smoking (Gould et al. 2013, 2015). They are more likely to be successful when they have some level of social support during their attempts to quit, particularly support from their partner and mother (Harris et al. 2019). Social support is important because Aboriginal and Torres Strait Islander women face many barriers during their attempts to quit (Harris et al. 2019). These barriers include high levels of daily stress and smoking as a social norm (Harris et al. 2019).

Key to supporting pregnant Aboriginal and Torres Strait Islander women to quit smoking is building health literacy. That is, changing the health literacy environment to improve health literacy for women, their families and healthcare providers (ACSQHC 2014). Aboriginal and Torres Strait Islander pregnant women face uncertainty regarding messages on the specific harm caused by smoking to themselves and their babies, which poses a barrier to quitting (Harris et al. 2019). For Aboriginal and Torres Strait Islander pregnant women, the provision of culturally appropriate health information that is designed in partnership with communities and provided in schools could assist to build their health literacy (Ireland and Smith 2020).

Also key is culturally responsive and holistic health care. This means providing appropriate education and training to health care professionals (Clifford et al. 2015; Hearn et al. 2011) — and particularly those professionals who may lack knowledge about smoking cessation strategies and the confidence to discuss smoking cessation with pregnant women (Harris et al. 2019). Supporting pregnant women requires assessing the women’s smoking status on the first antenatal visit (see section 6.1 *Antenatal care*), advising them of the risks associated with smoking in pregnancy, and providing support to stop or reduce smoking — including

on possible approaches for quitting (DoH 2019) (Bovill et al. 2019; Harris et al. 2019; Walker et al. 2019).

But current research on smoking cessation programs for pregnant Aboriginal and Torres Strait Islander women is limited (Gould et al. 2017; Harris et al. 2019; Williams and Allan 2019), as is comparable international research for Indigenous people (Washio and Cassey 2016). For Aboriginal and Torres Strait Islander women, there is some evidence that programs are more likely to be effective if they are community-led (Williams and Allan 2019) and supported by Aboriginal and Torres Strait Islander women, families, and communities (Chamberlain et al. 2017; Gibberd et al. 2019; Gould et al. 2019).

Future directions in data

The AIHW National Perinatal Data Collection (NPDC) contains information about maternal smoking during pregnancy. Data on paternal smoking during pregnancy would be a useful addition to the data collection because of the impacts of second-hand smoking.

Limited information is available about the prevalence of FASD in Australia. This is due to several factors including a low level of awareness by clinicians, the complexity of diagnosis and, until recently, the absence of nationally agreed and consistent diagnostic criteria, definitions and tools (Heyes 2018). Collection of data on alcohol use during pregnancy would provide an important contribution to the knowledge base.

The AIHW is continuing to pursue the collection of nationally consistent data on alcohol use during pregnancy through the National Maternity Data Development Project (NMDDP) (AIHW 2018). A list of high priority data items for national standardisation and reporting has been developed, including data on alcohol consumption in pregnancy. Six data items around the consumption of alcohol during pregnancy were introduced to the Perinatal National Best Endeavours Data Set (NBEDS) for collection from 1 July 2019.

There is also limited information available about nutrition and physical activity during pregnancy. These are important given their link to obesity in pregnancy. Collection of this information, would provide valuable information to support reporting on key risk and protective factors for the health of pregnant women and their babies.

6.3 Teenage birth rate⁸

Box 6.3.1 Key messages

- For some young women, teenage motherhood (giving birth under 20 years of age) can be a positive experience. But giving birth as a teenager can pose health risks for both the mother and the baby, and is also associated with socioeconomic disadvantage at the birth of the child, which can be lifelong for the mother due to the interruption of education and employment opportunities.
- The teenage birth rate is at a historical low nationally for all women. In 2018, it was 48 births per 1000 Aboriginal and Torres Strait Islander women aged 15–19 years. This rate is the lowest in the 15 years of reported data, down from a peak of 74 per 1000 births in 2009.
- The decrease in the birth rate for Aboriginal and Torres Strait Islander teenage women is seen across all teenage years.
- Despite a downward trend, Aboriginal and Torres Strait Islander women are still more likely than non-Indigenous women to have a baby in their teenage years. In 2018, the rate for Aboriginal and Torres Strait Islander teenage women was seven times the rate for non-Indigenous teenage women — and more than half of the approximately 200 births in Australia to all women under 16 years (less than one per cent of all births in Australia) were births to Aboriginal and Torres Strait Islander women.
- Over time, the proportion of babies born to teenage Aboriginal and Torres Strait Islander women is decreasing. Of all births to Aboriginal and Torres Strait Islander women in 2018, 13 per cent were to women aged under 20 years, down from 20 per cent two decades earlier. Similarly, the proportion has decreased for those under 18 years, from 10 per cent to 4 per cent.
- The proportion of births to teenage mothers who also had a teenage father has been stable over the past decade at around 30 per cent for Aboriginal and Torres Strait Islander women, only a few percentage points higher than the proportion for non-Indigenous women. Caution should be used in interpreting data on the age of the father given the large proportion of births for whom the age of the father is unrecorded.
- Sexual and reproductive health education, culturally safe primary healthcare and better education opportunities and socioeconomic conditions in childhood and adolescence play an essential role in reducing and managing teen births.
- For young Aboriginal and Torres Strait Islander women who are pregnant and decide to proceed with the pregnancy, appropriate support is important to maximise the outcomes for mother and child.

⁸ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University, who reviewed a draft of this section of the Report.

Box 6.3.2 Measures of teenage birth rate

The main measure for this indicator is *Teenage birth rate*, defined as the number of live births to women aged less than 20 years per 1000 women aged 15–19 years.

Data are also provided for two supplementary measures:

- Births to teenage mothers, by age of mother
- Births to teenage mothers, by age of father.

The most recent available data for all measures are from the ABS Birth Registrations Collection (all jurisdictions; age; remoteness). Births are reported according to the date of registration (which may occur in a different year to the birth itself).

The ABS Birth Registrations Collection data are not directly comparable to the AIHW's National Perinatal Data Collection (NPDC) due to differences in methods, timing and reporting, and the NPDC has a shorter time series than the ABS data collection.

For some young women, teenage motherhood can be a positive experience (AIHW 2020). It can change unhealthy behaviours and relationships (AHRC 2017) and provide mothers with a newfound sense of purpose, maturity, and responsibility (Larkins et al. 2011; Price-Robertson 2010).

However, teenage motherhood is often associated with poor health outcomes for the mother and baby (see section 4.2 *Young child mortality*). For example, teenage mothers (under 20 years of age) face higher risks of systemic infections than women aged 20 to 24 years (WHO 2020), and babies born to teenage mothers are also more likely to die during the perinatal period (AIHW 2018). The younger the teenage mother, the greater the likelihood of poorer outcomes for the mother and baby (WHO 2020).

Furthermore, teenage motherhood is also associated with socioeconomic disadvantage at the birth of the child, which can become a lifelong issue for the mother and child (Boden, Fergusson and John Horwood 2008; Gibb et al. 2015; Kalb, Le and Leung 2015). For example, teenage mothers are more likely to have more children over their lifetimes (Venn and Crawford 2018) and are less likely to complete year 12, to be employed, and to have more personal income (Kalb, Le and Leung 2015). For babies born to Aboriginal and Torres Strait Islander teenage women, analysis of data from the Longitudinal Study of Indigenous Children (LSIC) found that the children had greater vocabulary and social and emotional difficulties compared with children born to older Aboriginal and Torres Strait Islander women, even after accounting for other characteristics (DSS 2015).⁹

The relationship between teenage motherhood and socioeconomic disadvantage is complex. Teenage mothers often have relatively disadvantaged childhood backgrounds when compared with older mothers, and tend to leave school early (Jeon, Kalb and Vu 2011; Kalb, Le and Leung 2015). While there is no evidence to suggest that disadvantage directly leads

⁹ Analysis of data from the LSIC did not show the same results for babies born to non-Indigenous women with age not being a factor when other characteristics were taken into account (DSS 2015).

women to become adolescent mothers, the reality in disadvantaged communities where unemployment rates are high and rates of school completion are low can shape young women's expectations and aspirations (Gore et al. 2017; Senior and Chenhall 2012), and they may see few alternatives to early motherhood (Larkins and Page 2016).

The birth rate for Aboriginal and Torres Strait Islander teenage women has declined, and across all teenage years

The birth rates for Aboriginal and Torres Strait Islander teenage women is at its lowest level over the 15 years of available data, with decreases across all teenage years (figure 6.3.1). The number of live births per 1000 Aboriginal and Torres Strait Islander women aged 15–19 years increased from 63 in 2004 to 74 in 2009, before declining to 48 in 2018 (table 6A.3.1). This decrease has contributed to the narrowing of the gap with non-Indigenous women over time (table 6A.3.2).

However, not all births may be registered, and so the birth rate may be underestimated. There is evidence (analysis of births up to 2012) indicating non-registration of around 17–18 per cent of births to Aboriginal mothers in Queensland and WA (Endo, van Schalkwijk and Wills 2014; Gibberd, Simpson and Eades 2016).

Figure 6.3.1 **Birth rate for Aboriginal and Torres Strait Islander teenage mothers, by age of mother, 2004–2018^a**

^a See table 6A.3.1 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Births, Australia, various years, Cat. no. 3301.0; ABS (2019) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031*, Cat. no. 3238.0; ABS (various years) Australian Demographic Statistics, June quarter; table 6A.3.1.

Despite a downward trend in birth rates for Aboriginal and Torres Strait Islander teenage women and a narrowing of the gap, Aboriginal and Torres Strait Islander women remain

more likely to have a baby in their teenage years than non-Indigenous women. In 2018, the rate of births to Aboriginal and Torres Strait Islander teenage women was seven times the rate for non-Indigenous teenage women (table 6A.3.2). — and more than half of the 201 babies born in Australia to women aged under 16 years (less than one per cent of all babies born in Australia) were born to Aboriginal and Torres Strait Islander women (table 6A.3.6).

The proportion of babies born to Aboriginal and Torres Strait Islander mothers who are teenagers is declining

Over the years, there has been a decrease in the proportion of babies born to Aboriginal and Torres Strait Islander mothers who are aged under 20 years. The percentage of babies born to women under 20 years of age decreased from around 20 per cent between 1998 and 2010 to 13 per cent in 2018 (table 6A.3.4), and this downward trend held across all teenage years (figure 6.3.2). For those under 18 years of age, the proportion decreased from 10 per cent to 4 per cent (table 6A.3.4). These trends are similar when data are reported by the Indigenous status of the baby (table 6A.3.3).

Figure 6.3.2 Proportion of births to Aboriginal and Torres Strait Islander mothers, by age of teenage mother, 1998–2018^a

^a See table 6A.3.4 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Births, Australia, various years, Cat. no. 3301.0; table 6A.3.4.

While the proportion of babies born to Aboriginal and Torres Strait Islander mothers who are teenagers decreased in all remoteness areas between 2001 and 2018, it continues to be higher in more remote areas (figure 6.3.3). In 2018, it was 11 per cent in major cities,

increasing to 18 per cent in very remote areas (table 6A.3.7). For babies born to non-Indigenous mothers the proportion born to teenage mothers, ranged between 1 and 3 per cent across remoteness areas (table 6A.3.7).

Figure 6.3.3 Proportion of births to Aboriginal and Torres Strait Islander mothers who are teenagers, by remoteness, 2001–2018^a

^a See table 6A.3.7 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Births, Australia, various years, Cat. no. 3301.0; table 6A.3.7.

The proportion of babies born to Aboriginal and Torres Strait Islander teenage mothers who also had a teenage father has been stable at around 30 per cent, close to that for non-Indigenous teenage mothers

International research indicates that children of teenage fathers have an increased risk of adverse birth outcomes such as preterm birth, low birthweight, being born small for gestational age, low Apgar Score¹⁰ and infant mortality (Alio et al. 2012; Chen et al. 2008; Doamekpor, Amutah and Ramos 2013).

The proportion of babies born to Aboriginal and Torres Strait Islander teenage mothers who also had a teenage father has remained relatively stable over the last decade, and is close to that for teenage non-Indigenous mothers. In 2018, 30 per cent of births to Aboriginal and Torres Strait Islander teenage mothers involved a father aged less than 20 years; a similar

¹⁰ The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability.

proportion of the children of non-Indigenous teenage mothers also had a teenage father (27 per cent) (table 6A.3.8).

However, as a large proportion of babies born to teenage mothers have the age of their father recorded as unknown — in 2018, 33 per cent for Aboriginal and Torres Strait Islander teenage mothers, and 17 per cent for non-Indigenous teenage mothers — interpretation of these data is difficult (table 6A.3.8).

What are the factors associated with higher Aboriginal and Torres Strait Islander teenage births, and how can they be addressed to reduce teenage birth rates?

While Aboriginal and Torres Strait Islander young women want control over family planning (James, Toombs and Brodribb 2018), obtaining and using contraception may be difficult for varying reasons including gender inequalities (MacPhail and McKay 2018) and sociocultural factors such as ideas surrounding women's health, social isolation and shame (Ireland and Smith 2020; James, Toombs and Brodribb 2018). Shame may be a larger issue in remote communities where confidentiality can be harder to achieve (Warwick et al. 2019).

Helping young Aboriginal and Torres Strait Islander people better plan for their families by improving sexual and reproductive health literacy could help reduce teenage births (Lewis and Skinner 2014).

- Aboriginal and Torres Strait Islander young men and women and their female family members have expressed a need for improved sexual and reproductive health literacy, particularly in relation to relationships, first sexual experiences and negotiating condom use (Helmer et al. 2015; James, Toombs and Brodribb 2018; Reibel et al. 2015).
- Assisting Aboriginal and Torres Strait Islander young men and women to build their health literacy means providing culturally appropriate reproductive health information that is responsive to the gendered needs of males and females and is designed in partnership with communities and provided in schools (Ireland and Smith 2020).
- This information should be embedded in a holistic primary health care system, providing culturally appropriate support where health professionals enable autonomous family planning that is inclusive of men by offering information and resources both antenatally and postnatally (Griffiths et al. 2019; James, Toombs and Brodribb 2018; Larkins and Page 2016).

Research indicates that attention should also be given to the broader social and cultural determinants associated with Aboriginal and Torres Strait Islander teenage births (Burbank, Senior and McMullen 2015; James, Toombs and Brodribb 2018; Larkins and Page 2016). As socioeconomic disadvantage and early school leaving are linked to high rates of teenage births (Kalb, Le and Leung 2015; Venn and Crawford 2018; WHO 2020), improving socioeconomic conditions in childhood and increasing education opportunities could have positive implications for teenage parenthood.

For young Aboriginal and Torres Strait Islander women who are pregnant and decide to proceed with the pregnancy, appropriate support beyond that provided by kinship networks is important to maximise the outcomes for mother, father and child. These include:

- facilitating Aboriginal and Torres Strait Islander men's and women's engagement with the health system in relation to their health and the health of their babies. Evidence from a small scale qualitative study in WA indicates that destigmatizing young parenthood and providing continuous care in culturally safe environments (with culturally competent health professionals) could help expectant Aboriginal and Torres Strait Islander teenage mothers to engage with the healthcare system (Reibel et al. 2015; Reibel, Wyndow and Walker 2016). Another study found that Aboriginal and Torres Strait Islander men's roles as parents can be supported by culturally safe and gender sensitive health care and community services that include men, focus on men's psychological empowerment and provide support and encouragement to male parents to address shame and lack of confidence around parenting (Reilly and Rees 2018).
- supporting Aboriginal and Torres Strait Islander young parents to continue their education, which may assist in addressing the potentially negative longer-term effects of teenage parenthood on employment and income (Griffiths et al. 2019; Kalb, Le and Leung 2015).

Future directions in data

National data and evidence are lacking on knowledge, access to and use of contraceptive methods and sexual and reproductive health services (including pregnancy termination services) for Aboriginal and Torres Strait Islander young women and their partners. The most recent ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) in 2018-19 did not collect any information about contraception, whereas in previous surveys data was collected for women aged 18–49 years.

Further work is required to encourage all births to be registered, and the age of the father to be recorded for births to teenage mothers. The ABS births data collection has data on the age of the mother and father, but where the mother is a teenager there is a high proportion of births where the age of the father is unknown. Identification of the father is currently not compulsory on birth registrations, and capturing this information would assist in developing age-appropriate programs for teenage parents.

6.4 Birthweight¹¹

Box 6.4.1 Key messages

- Children with a low birthweight have a greater risk of poor health or death at birth, and face a continued risk to their healthy development.
- Most babies born to Aboriginal and Torres Strait Islander women (about nine in ten in 2018) are born at a normal birthweight. About one in ten babies born to Aboriginal and Torres Strait Islander women are of low birthweight. This rate has decreased by one percentage point over the past decade.
- The proportion of babies born to Aboriginal and Torres Strait Islander women who are of low birthweight increases with remoteness, from 10 per cent in major cities and inner regional areas to 13 per cent in very remote areas in 2016–2018.
- While the gap has narrowed, the proportion of babies born to Aboriginal and Torres Strait Islander women who have low birthweight remains more than twice the proportion born to non-Indigenous women who have low birthweight, and the gap still increases with remoteness.
- Australian research indicates that supporting Aboriginal and Torres Strait Islander women with their health during pregnancy is important for addressing low birthweight. In particular, support in ceasing smoking and the provision of culturally safe antenatal services are important factors in improving maternal outcomes.

Box 6.4.2 Measures of birthweight

There is one main measure for this indicator.

- *Incidence of low birthweight among live-born babies* is defined as the number of low birthweight (less than 2500 grams) live-born singleton infants as a proportion of the total number of live-born singleton infants with known birthweight. The choice of low birthweight was to align with the associated measure under the National Indigenous Reform Agreement (NIRA), which was in effect at the time of drafting this report.

The most recent available data for this measure are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are that:

- since 2011, data have been available by the Indigenous status of the baby. Historical data are only available by the Indigenous status of the mother
- data disaggregated by geography are based on the place of usual residence of the mother
- data disaggregated by remoteness are presented for 2011 onwards only, as remoteness data are not directly comparable for earlier years.

The foundations for good health start in the antenatal period and the first years of life. Children who are born at a normal birthweight have a better chance of a healthy start.¹²

¹¹ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University who reviewed a draft of this section of the Report.

¹² Normal birthweight is defined as 2500 grams to 4499 grams (AIHW 2020).

By contrast, babies with a low birthweight have a greater risk of poor health or death at birth and face continued risks to their healthy development (AIHW 2018b; McEwen et al. 2018; OECD 2019; Westrupp et al. 2019). Approximately four in five fetal deaths (stillbirths) are low birthweight babies (with rates similar for Aboriginal and Torres Strait Islander and non-Indigenous mothers) (table 6A.4.24).

Low birthweight is often due to pre-term births (births before 37 completed weeks of gestation) — although the infant may be within the expected weight range for its gestational age (Ford et al. 2018). In 2018, almost 3 in 4 of all low birthweight babies were pre-term, and more than half of pre-term babies were of low birthweight (AIHW 2020).

Pre-term birth and low birthweight complications contribute to the increased burden of disease experienced by Aboriginal and Torres Strait Islander people, and are among the top ten contributors to the burden (AIHW 2016).

Low birthweight is also associated with:

- reduced social, emotional and cognitive development in childhood (DeKieviet et al. 2012; Guthridge et al. 2015)
- higher death rates in adult life, due to an increased likelihood of developing chronic diseases including cardiovascular disease, kidney disease and diabetes mellitus (AIHW 2018a; Arnold, Hoy and Wang 2016; Hoy and Nicol 2019; Luyckx et al. 2013).

Most babies born to Aboriginal and Torres Strait Islander women are born at a normal birthweight, and the proportion born with a low birthweight has decreased over the past decade...

Most babies born to Aboriginal and Torres Strait Islander women are born at a normal birthweight (approximately nine in ten in 2018). And a small proportion (about 1 per cent) are born at a high birthweight (AIHW 2020).

The proportion of babies born to Aboriginal and Torres Strait Islander women who were of low birthweight has decreased over the last decade, from 11.2 per cent in 2007 to 10.2 per cent in 2018 (figure 6.4.1).

Figure 6.4.1 **Proportion of live-born singleton babies born with low birthweight, by Indigenous status of mother, 2007 to 2018^a**

^a See table 6A.4.1 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Perinatal Data Collection; table 6A.4.1.

Nationally, in 2016–2018,¹³ the proportion of babies born to Aboriginal and Torres Strait Islander mothers who were of low birthweight increased with remoteness, from less than 10 per cent in major cities and inner regional areas to 13 per cent in very remote areas (figure 6.4.2).

Similar data and trends are apparent for the low birthweight rate for Aboriginal and Torres Strait Islander babies (that is, based on the Indigenous status of the baby, rather than the mother) (tables 6A.4.14–22).

...however, the proportion of babies born to Aboriginal and Torres Strait Islander women who were of low birthweight remains more than twice that for non-Indigenous women

While there has been a narrowing in the gap with non-Indigenous women, the proportion of babies born to Aboriginal and Torres Strait Islander women who were of low birthweight remains more than twice the proportion born to non-Indigenous women (figure 6.4.1), and the gap increases with remoteness (figure 6.4.2).

¹³ Aggregating three years of data smooths out some of the volatility in the data stemming from small numbers.

Figure 6.4.2 **Proportion of live-born singleton babies born to Aboriginal and Torres Strait Islander mothers with low birthweight, by remoteness area, 2016–2018^{a,b}**

^a Error bars represent the variability band associated with each point estimate. ^b See table 6A.4.13 for detailed definitions, footnotes and caveats.

Research indicates that supporting Aboriginal and Torres Strait Islander women with their health during pregnancy is important for addressing low birthweight

Australian and international research suggests that the risk factors for low birthweight and pre-term birth include maternal smoking, alcohol consumption and poor nutrition during pregnancy, maternal health factors (such as diabetes, high blood pressure, and low maternal body mass index), lower socioeconomic status, maternal age and unfavourable obstetric conditions, and issues with accessing health care in Aboriginal and Torres Strait Islander communities (AIHW 2018a; Barreto et al. 2019; Ford et al. 2018; OECD 2019).

A higher prevalence of these and other risk factors help explain the gap in the proportions of babies born to Aboriginal and Torres Strait Islander and non-Indigenous women with low birthweight. For example, Aboriginal and Torres Strait Islander people are more likely to live in remote areas or areas of socioeconomic disadvantage. Analysis of perinatal data for 2012–2014 found that for low birthweight babies born to Aboriginal and Torres Strait Islander women, 21 per cent of the low birthweight was attributable to area-level socioeconomic status and 5 per cent to remoteness (AIHW 2018b).

Australian research indicates that supporting Aboriginal and Torres Strait Islander women with their health during pregnancy is important for addressing pre-term birth and low birthweight. In particular, support with the following issues is considered important.

- Reducing maternal smoking rates (AIHW 2018b; Ford et al. 2018; Khalidi et al. 2012; McInerney et al. 2019; Wyndow, Walker and Reibel 2018). Analysis of perinatal data for 2012–2014 indicates that 51 per cent of low birthweight births to Aboriginal and Torres Strait Islander women were attributable to smoking, compared with 16 per cent for non-Indigenous women (AHMAC 2015). While rates of smoking during pregnancy for Aboriginal and Torres Strait Islander mothers are decreasing, they remain higher than for non-Indigenous mothers (see section 6.2 *Health behaviours during pregnancy* for further information).

Higher rates of smoking during pregnancy are partly explained by higher rates of smoking across Aboriginal and Torres Strait Islander communities, which have been associated with socioeconomic disadvantage (Gould et al. 2017; Oni et al. 2019). In addition, research has found that stress, difficult relationships and times of chaos within women's lives affect their capacity to prioritise smoking cessation during pregnancy (Walker et al. 2019). Culturally responsive support, whereby Aboriginal and Torres Strait Islander women are provided with the knowledge, self-agency, and advice on effective interventions to cease smoking, is likely to be more effective (Walker et al. 2019).

- Increasing antenatal care use (AIHW 2018b; Khalidi et al. 2012; Taylor et al. 2013). Antenatal visits enable education and the monitoring of risk factors. Nationally in 2014–15, a lower proportion of mothers of Aboriginal and Torres Strait Islander children born with low birthweight attended regular check-ups whilst pregnant (84 per cent), compared with mothers of children with higher birthweights (98 per cent) (table 6A.4.26).

While rates are increasing over time (and the gap with non-Indigenous women is narrowing), the proportion of Aboriginal and Torres Strait Islander women attending antenatal care in the first trimester remains below that for non-Indigenous women. (See section 6.1 *Antenatal care* for further information on antenatal care for Aboriginal and Torres Strait Islander women.)

Culturally safe service provision (which includes involving Aboriginal and Torres Strait Islander elders and the community in developing services, holistic care, the continuity of caregivers, and the incorporation of traditional midwifery knowledge and skills) has been found to encourage Aboriginal and Torres Strait Islander women to access maternity health services — leading to better maternal outcomes (Kildea et al. 2012; Kildea and Van Wagner 2013; Murphy and Best 2012; Reibel and Walker 2010; Simmonds et al. 2010; Wilson 2009).

Future directions in data

Further research on the services that are effective in improving the health of Aboriginal and Torres Strait Islander women during pregnancy will be important for addressing low birthweight.

6.5 Early childhood hospitalisations¹⁴

Box 6.5.1 Key messages

- Children's health in their early years establishes the foundations for lifelong health, and also affects their social, emotional, and cognitive development.
- Early childhood hospitalisation rates are a proxy indicator of the health of young children aged under 5 years old. However, hospitalisation data should be interpreted with caution, as they are not a measure of the actual prevalence of injury and disease.
- The rate of hospitalisation among Aboriginal and Torres Strait Islander young children is increasing. Nationally in 2018-19, there were around 3 hospitalisations for every 10 Aboriginal and Torres Strait Islander children. This rate has increased by almost 40 per cent over the past decade.
- The gap with non-Indigenous young children is widening — nationally in 2018-19, the rate for Aboriginal and Torres Strait Islander children was 1.4 times the rate for non-Indigenous children — an increase from a ratio of 1.1 times in 2010-11. This widening is because hospitalisations for Aboriginal and Torres Strait Islander young children have grown faster than those for non-Indigenous children.
- The rates of hospitalisation for Aboriginal and Torres Strait Islander young children in major cities and regional areas have increased, but remain below those in remote areas (which have decreased slightly).
- Respiratory diseases — including influenza, pneumonia and asthma — accounted for over a quarter of all Aboriginal and Torres Strait Islander child hospitalisations, and were the largest contributor to the growth in hospitalisations.
- Improving housing conditions and increasing access to primary health care are important responses to facilitate reductions in respiratory diseases.

Box 6.5.2 Measures of early childhood hospitalisations

The main measure for this indicator is the *hospitalisation rate*, which is defined as the hospital separation rate per 100 000 Aboriginal and Torres Strait Islander children aged 0–4 years, by principal diagnoses. A separation is a completed episode of care for an admitted patient. Data are sourced from the National Hospital Morbidity Database (all jurisdictions; remoteness), with the most recent data available for 2018-19.

Children's health in their early years establishes the foundations for lifelong health (Emerson, Fox and Smith 2015; Hartz 2017), and also affects their social, emotional, and cognitive development (Bell et al. 2016; Guthridge et al. 2015).

¹⁴ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University, who reviewed a draft of this section of the Report.

Hospitalisation rates are a proxy indicator of the health of young children. However, hospitalisation data should be interpreted with caution, as they do not measure the actual prevalence of injury and disease:

- Hospitalisations only represent the most serious illnesses or injuries. Many children suffering disease and injury do not require hospital treatment — most do not require formal medical treatment, or are treated by doctors, nurses and other primary health care providers outside of hospital.
- Hospitalisation rates may reflect the level of access and use of primary health care. If primary health care is difficult to access, hospital may be accessed as an alternative.
- Hospitalisation rates may reflect the level of access and use of hospital services for secondary and tertiary care services.

This section should be read together with section 6.6 *Injury and preventable diseases*.

The rate of hospitalisation among Aboriginal and Torres Strait Islander young children is increasing, and the gap with non-Indigenous children is widening

Most babies of Aboriginal and Torres Strait Islander mothers (97 per cent) are born healthy (AIHW 2020), and the total burden of disease is relatively low in young Aboriginal and Torres Strait Islander children (AIHW 2016).

However, the rate of hospitalisation among Aboriginal and Torres Strait Islander young children is increasing. Nationally in 2018-19, there were 32 328 hospitalisations per 100 000 Aboriginal and Torres Strait Islander young children — around 3 hospitalisations for every 10 children (figure 6.5.1). This rate has increased by almost 40 per cent over the past decade, up from 23 523 hospitalisations per 100 000 children in 2010-11.

The rate of hospitalisation among Aboriginal and Torres Strait Islander young children is higher than for non-Indigenous young children. In 2018-19, the rate was 1.4 times that of non-Indigenous young children (which was 23 804 per 100 000 children), an increase from 1.1 times the rate of non-Indigenous children in 2010-11 (figure 6.5.1). Hospitalisation rates for non-Indigenous young children have increased over the past decade, but not as much for Aboriginal and Torres Strait Islander children — and, as a result, the gap in hospitalisation rates has widened (figure 6.5.1)

Figure 6.5.1 Rate of hospitalisations for young children (aged 0–4 years), by principal diagnosis, by Indigenous status, 2010-11 to 2018-19^a

^a See table 6A.5.1 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.5.1.

The rates of hospitalisation among Aboriginal and Torres Strait Islander young children in major cities and regional areas have increased, but remain below those in remote areas

An increase in hospitalisation rates for Aboriginal and Torres Strait Islander children occurred in major cities (where it grew by 66 per cent between 2010–12 and 2016–18) and regional areas (where it grew by about 35 per cent) (figure 6.5.2).¹⁵ In contrast, the hospitalisation rate for Aboriginal and Torres Strait Islander children in remote areas declined slightly (by 2.8 per cent) between 2010–12 and 2016–18. Even though the rate declined in remote areas, it remains just under twice the rate in non-remote areas (47 531 per 100 000 children, compared with about 28 548 per 100 000 children). This is in contrast to non-Indigenous young children, for whom hospitalisation rates are similar across remoteness areas (figure 6.5.3).

¹⁵ Aggregating three years of data smooths out some of the volatility in the data by remoteness area.

Figure 6.5.2 Rate of hospitalisations for Aboriginal and Torres Strait Islander young children (aged 0–4 years), by principal diagnosis, by remoteness, 2010–12 and 2016–18^a

^a See table 6A.5.5 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.5.5.

Respiratory diseases accounted for over a quarter of all hospitalisations for Aboriginal and Torres Strait Islander young children, and the largest portion of the gap with non-Indigenous children

Respiratory diseases — such as influenza and pneumonia, asthma, and other respiratory infections and diseases — accounted for over a quarter of all Aboriginal and Torres Strait Islander child hospitalisations (table 6A.5.1). These diseases also accounted for the largest portion of the gap with non-Indigenous children, and were the largest contributor to the growth in Aboriginal and Torres Strait Islander child hospitalisations (table 6A.5.1). Infectious and parasitic diseases — such as viral and bloodstream infections — accounted for a further 9 per cent of child hospitalisations in 2018–19.

The high rates of hospitalisations for respiratory and infectious diseases are consistent with research that indicates that Aboriginal and Torres Strait Islander children are more likely to suffer from these diseases, particularly in remote communities (AHMAC 2017; AIHW 2016; Falster et al. 2016; Hartz 2017; O’Grady et al. 2018). For example, hospitalisation rates for Aboriginal and Torres Strait Islander infants (aged less than 12 months) in the NT (and particularly the Central Australian region) for pneumonia and acute lower respiratory infections are among the highest rates in the world (Binks et al. 2019).

Poverty, poor quality housing, exposure to tobacco smoking and malnutrition all contribute to the higher rates of respiratory and infectious diseases among Aboriginal and Torres Strait Islander children, and in particular for young children in remote and low socioeconomic areas (AHMAC 2017; Falster et al. 2016; O’Grady et al. 2018).

Figure 6.5.3 Rate of hospitalisations for young children (aged 0–4 years), by principal diagnosis, by remoteness, by Indigenous status, 2016–18^a

^a See table 6A.5.5 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.5.5.

Other diagnoses that contribute to Aboriginal and Torres Strait Islander child hospitalisations include conditions originating in the perinatal period — such as birth trauma, fetal growth disorders, and complications of pregnancy (see sections 6.1 *Antenatal care*, 6.2 *Health behaviours during pregnancy* and 6.4 *Birthweight*) — along with injury, poisoning and certain other consequences of external causes (see section 6.6 *Injury and preventable diseases*).

Improved housing conditions and access to primary health care are important responses to higher rates of hospitalisations

Approaches that ensure Aboriginal and Torres Strait Islander families have access to affordable and appropriate housing can reduce infectious disease transmission (Ali, Foster and Hall 2018; O’Grady et al. 2018). Some of the key barriers to be addressed include providing sufficient housing stock where it is needed (Habibis 2013; Lowell et al. 2018), regular repairs and maintenance (Standen et al. 2020), and affordable short term

accommodation options for visitors (House of Representatives Standing Committee on Aboriginal and Torres Strait Islander Affairs 2001; Memmott, Birdsall-Jones and Greenop 2012). For further information on housing conditions see chapter 10 *Home environment*.

Access to primary health care can also help prevent the need for childhood hospitalisations with early intervention to detect and treat common childhood diseases. Barriers to accessing primary health care for families of Aboriginal and Torres Strait Islander children — some of which disproportionately affect those living in remote and disadvantaged areas — include the physical availability of health services, transport, flexible service delivery, affordability, and the cultural acceptability and appropriateness of health services (Falster et al. 2016).

Vaccinations (including maternal vaccinations) are also an important factor in protecting individuals against communicable diseases (AIHW 2018b). Vaccination has led to a decrease in the rates of a number of diseases (such as hepatitis A, meningococcal C, measles, diphtheria and mumps) in Aboriginal and Torres Strait Islander children (NCIRS et al. 2019).

Nationally in 2018, vaccination coverage (as per the National Immunisation Program Schedule¹⁶) was high for Aboriginal and Torres Strait Islander children — 92 per cent and 89 per cent of children aged 1 year and 2 years, respectively (section 8.1 *Access to primary health care*, table 8A.1.19). Despite these relatively high vaccination rates, Aboriginal and Torres Strait Islander children continue to incur higher rates of hospitalisations from vaccine-preventable diseases than non-Indigenous children (AIHW 2018b; Li-Kim-Moy et al. 2016). The higher rates of disease are most likely explained by:

- environmental and social disadvantage, which increases the likelihood of being exposed to respiratory and infectious diseases. It is estimated that hospitalisation rates would be even higher if vaccination rates were lower (AIHW 2018b; NCIRS et al. 2019)
- the fact that not all vaccines are available on the National Immunisation Program Schedule. Some vaccines (such as those for seasonal influenza) are available for Aboriginal and Torres Strait Islander children, but vaccination coverage is not optimal (NCIRS et al. 2019)
- timeliness of vaccination — a higher proportion of Aboriginal and Torres Strait Islander children receive their vaccinations late (in reference to the Schedule) (NCIRS et al. 2019).

Section 8.1 *Access to primary health care* contains information on access to primary health care, including data on childhood immunisations.

¹⁶ The current definition of fully immunised for measuring coverage rates includes vaccination against: hepatitis B, diphtheria, tetanus, whooping cough, *Haemophilus influenza* type b, polio, measles, mumps, rubella, pneumococcal disease, varicella and meningococcal C (AIHW 2018a).

Future directions in data

Understanding the pathways Aboriginal and Torres Strait Islander children take through the health care system could help identify whether they are gaining access to the appropriate services at the right time. The National Integrated Health Services Information Analysis Asset (NIHSI AA) project, aims to bring together hospitals data from states and territories with data from the Medicare Benefits Schedule, Pharmaceutical Benefits Scheme and the National Death Index. NIHSI AA is currently in its pilot phase and will be managed by the Australian Institute of Health and Welfare.

6.6 Injury and preventable disease¹⁷

Box 6.6.1 Key messages

- Potentially preventable hospitalisations and potentially avoidable deaths for children include those for:
 - health conditions that might have been prevented by the provision of appropriate and timely health services
 - injuries that might have been prevented through community-wide childhood injury prevention strategies or appropriate treatment.
- For Aboriginal and Torres Strait Islander children aged 0–4 years, about half of all hospitalisations and one in five deaths were potentially preventable; that is they could have potentially been prevented by timely and adequate health care in the community.
- The rate of potentially preventable hospitalisations for injury and disease among young Aboriginal and Torres Strait Islander children increased by 25 per cent over the past decade (to around 17 hospitalisations for every 100 young children in 2018-19). But the rate for young non-Indigenous children is largely unchanged, and as a result the gap has widened.
- The increased rates of potentially preventable hospitalisations for young Aboriginal and Torres Strait Islander children can be seen across most diagnosis categories. Diseases of the respiratory system and infectious and parasitic diseases accounted for around two-thirds of potentially preventable hospitalisations in 2018-19, and three-quarters of the growth over the past decade.
- Between 2014 and 2018, there were about 1.5 potentially avoidable deaths per 1000 young Aboriginal and Torres Strait Islander children, which was about twice the rate for young non-Indigenous children.
- The rate of potentially avoidable deaths for young Aboriginal and Torres Strait Islander children did not change substantially between 2009–2013 and 2014–2018. When considered against increasing hospitalisation rates for young Aboriginal and Torres Strait Islander children, the stable rate of potentially avoidable deaths could indicate that better care is being received once in hospital and/or diseases are being detected earlier leading to earlier entry and treatment in hospital.
- Governments can assist in preventing disease and promoting children's health by providing quality housing and community infrastructure and culturally safe primary health care, and through community wide childhood injury prevention strategies which involve Aboriginal and Torres Strait Islander communities in their design.

¹⁷ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University who reviewed a draft of this section of the Report.

Box 6.6.2 Measures of injury and preventable disease

There are two main measures for this indicator:

- *Potentially preventable hospitalisations* is a subset of all early childhood hospitalisations (section 6.5 *Early childhood hospitalisations*) and is defined as the number of potentially preventable hospital separations for injury and disease. Data are presented as a rate per 100 000 children aged 0–4 years. A separation is a completed episode of care for an admitted patient.

Potentially preventable hospitalisations are those admissions that may have been prevented through appropriate preventive health interventions and early disease management, usually delivered in primary care and community-based care settings. See tables 6A.6.1–5 for a summary of the diagnosis categories counted in potentially preventable hospitalisations.

The main data source is the Australian Institute of Health and Welfare (AIHW) National Hospital Morbidity Database, with the most recent available data for 2018–19.

- *Potentially avoidable deaths* is defined as the number of potentially preventable deaths from injury and disease. Data are presented as a rate per 100 000 children aged 0–4 years. See table 6A.6.6 for a summary of the categories of injury and disease counted in potentially avoidable deaths. The main data source is the ABS Causes of Death collection, with the most recent available data for 2014–2018 (NSW, Queensland, WA, SA and the NT).

Children’s health and physical wellbeing in their early years establishes the foundations for lifelong health (Emerson, Fox and Smith 2015; Hartz 2017). Minimising injuries and disease is therefore important in ensuring that children receive the best possible start in life.

A large proportion of the hospitalisations and deaths of Aboriginal and Torres Strait Islander infants and children are potentially preventable — that is, they could be prevented if more effective health and injury prevention strategies and non-hospital care are available and used (AHMAC 2017; Clapham et al. 2019). Potentially avoidable deaths and potentially preventable hospitalisations for young children stem from:

- childhood injuries — like all children, Aboriginal and Torres Strait Islander children are naturally curious and explore their environment using an hands-on approach. While this is important for children’s development (Fox and Geddes 2016), it can also expose them to injuries (such as from falls, poisoning, and burns) (WHO 2008). Many of these injuries can be prevented through community-wide childhood injury prevention strategies (such as car safety regulations, safety standards for household products, safe playgrounds, or swimming between the flags campaigns) (Clapham et al. 2019; Mitchell, Curtis and Foster 2018; Möller et al. 2017)
- conditions that might have been prevented by the provision of population health interventions (such as immunisation) and primary care services (such as early interventions to detect and treat common childhood diseases) (AHMAC 2017). For example, hospitalisations can be prevented for conditions such as measles and tetanus through vaccinations, and for other conditions such as selected respiratory and chest infections through timely treatment in primary health care settings using antibiotics.

Data on potentially preventable hospitalisations and potentially avoidable deaths are proxy indicators of the health of young children. However, these data should be interpreted with caution, as they do not measure the actual prevalence of injury and disease. Deaths and hospitalisations represent the most serious cases, with many children suffering disease and injury that can be treated in the community with the support of primary health care providers outside of hospital. High or increasing hospitalisation rates may also reflect appropriate or improving referral mechanisms and access to hospital care (AHMAC 2017).

Nationally in 2018-19, about half of all hospitalisations for Aboriginal and Torres Strait Islander young children were potentially preventable (tables 6A.5.1 and 6A.6.1). This section should be read together with section 6.5 *Early childhood hospitalisations*.

The rate of potentially preventable hospitalisations for injury and disease among young Aboriginal and Torres Strait Islander children is increasing, and the gap with non-Indigenous children is widening

The rate of potentially preventable hospitalisations for injury and disease among young Aboriginal and Torres Strait Islander children is increasing (table 6A.6.1). Nationally in 2018-19, there were 17 148 of these child hospitalisations per 100 000 Aboriginal and Torres Strait Islander young children (figure 6.6.1). This rate has increased by 25 per cent over the past decade; it stood at 13 664 hospitalisations per 100 000 children in 2010-11 (figure 6.6.1).

The rate of potentially preventable hospitalisations for injury and disease among young Aboriginal and Torres Strait Islander children is higher than that of non-Indigenous children, and the gap is widening. (figure 6.6.1). While the rate for Aboriginal and Torres Strait Islander children grew, the rate for non-Indigenous children (10 477 hospitalisations per 100 000 children) is largely unchanged from a decade ago (figure 6.6.1), leading to a widening of the gap. Nationally in 2018-19, the rate for Aboriginal and Torres Strait Islander children was 1.6 times the rate for non-Indigenous children, compared with 1.3 times the rate in 2010-11.

^a See table 6A.6.1 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.6.1.

The rate of potentially preventable hospitalisations for injury and disease among young Aboriginal and Torres Strait Islander children in non-remote areas increased, but remains below that in remote areas

Like total hospitalisation rates for Aboriginal and Torres Strait Islander young children (section 6.5 *Early childhood hospitalisations*), potentially preventable hospitalisation rates for Aboriginal and Torres Strait Islander young children increased both in major cities (where they grew by more than 60 per cent between 2010–2012 and 2016–2018) and regional areas (where they grew by about 25 per cent) (table 6A.6.5).¹⁸ In contrast, the potentially preventable hospitalisations rate for Aboriginal and Torres Strait Islander children in remote areas declined slightly (by 2.4 per cent) between 2010–2012 and 2016–2018. Even though the rate has declined in remote areas, it remains more than twice the rate of non-remote areas (table 6A.6.5). Rates for non-Indigenous young children in 2016–2018 were also higher in remote areas, but to a lesser extent (being less than 25 per cent above non-remote areas) (table 6A.6.5).

Higher rates of potentially preventable hospitalisations for young Aboriginal and Torres Strait Islander children in remote compared with non-remote areas is likely due to:

¹⁸ Aggregating three years of data smooths out some of the volatility in the data by remoteness area.

-
- greater exposure to the risk factors associated with potentially preventable injury and disease (discussed below)
 - barriers to accessing primary health care health in remote areas — including the physical availability of health services, transport, flexible service delivery, affordability, and the cultural acceptability and appropriateness of health services (Falster et al. 2016). See also sections 6.5 *Early childhood hospitalisations* and 8.1 *Access to primary health care*.

Aboriginal and Torres Strait Islander children are being hospitalised at higher rates than a decade ago, across most potentially preventable diagnosis categories

Nationally in 2018-19, Aboriginal and Torres Strait Islander children were hospitalised at higher rates than they were a decade ago, across most potentially preventable diagnosis categories (table 6A.6.1 and figure 6.6.1).

Respiratory system and infectious and parasitic diseases have contributed most of the increase in potentially preventable hospitalisations among Aboriginal and Torres Strait Islander young children. Together, these diagnoses accounted for about two-thirds of all potentially preventable hospitalisations in 2018-19, and three-quarters of the growth in potentially preventable hospitalisations between 2010-11 and 2018-19 (table 6A.6.1). Most of the growth in rates for these diseases has been in non-remote areas (table 6A.6.5).

Other diagnoses (where infections are a significant contributor) that help explain the higher rates of potentially preventable hospitalisations among Aboriginal and Torres Strait Islander children include diseases of the ear and mastoid process (see section 6.7 *Ear health*) and diseases of the skin and subcutaneous tissue (with each category accounting for 8 per cent of these hospitalisations in 2018-19). However, while hospitalisation rates for diseases associated with the ear have increased over the past decade (by half), they have decreased slightly for diseases associated with the skin (table 6A.6.1).

Aboriginal and Torres Strait Islander children are more susceptible to respiratory and infectious conditions (including skin and ear infections), as research shows that they are more likely to be exposed to the risk factors for these diseases, particularly if they live in remote areas or areas of socioeconomic disadvantage (Falster et al. 2016; Hendrickx et al. 2018). Risk factors include poverty, inadequate housing, overcrowding, insufficient community infrastructure, and exposure to environmental tobacco smoke (Coleman et al. 2018; Davidson, Knight and Bowen 2020; Falster et al. 2016).

It can be difficult to maintain good hygiene practices when living in poor quality or overcrowded housing (including housing with poor health hardware¹⁹), which can lead to higher rates of respiratory and infectious diseases (Ali, Foster and Hall 2018). Overcrowded

¹⁹ Health hardware includes safe electrical systems, toilets, showers, taps, kitchen cupboards and benches, stoves, ovens and fridges collectively (DoH 2013).

housing can mean that infectious diseases, once present in a community, can circulate more rapidly (May, Bowen and Carapetis 2016). While insufficient community infrastructure and services can result in higher exposure to environmental health diseases. For example, exposure to dust from unsealed roads or insufficient waste disposal facilities (particularly affecting remote areas) leads to higher levels environmental health diseases (such as trachoma and lung infections) (Clifford et al. 2015; Department of Health 2014; McDonald, Bailie and Michel 2013; Melody et al. 2016; The Kirby Institute, UNSW 2015). See section 10.2 *Rates of disease associated with poor environmental health*.

Injury, poisoning and certain other consequences of external causes accounted for 14 per cent of potentially preventable hospitalisations for Aboriginal and Torres Strait Islander young children in 2018-19 (table 6A.6.1). The increase in rates over the past decade has been in non-remote areas (table 6A.6.5). Analysis of the causes of injury for Aboriginal and Torres Strait Islander children which led to hospitalisation has identified that falls (particularly falls from playground equipment) and other unintended causes were the most common (Möller et al. 2017; Pointer 2016).

Research shows that people living in low socioeconomic and remote areas (where Aboriginal and Torres Strait Islander people are overrepresented) are at increased risk of childhood injuries (Clapham et al. 2019; Möller et al. 2017). For example, lack of resources has been described as a main barrier to adequate maintenance of playgrounds (where many Aboriginal and Torres Strait Islander child injuries occur) in disadvantaged and remote areas (Möller et al. 2017).

The rate of potentially preventable deaths has changed little over time for young Aboriginal and Torres Strait Islander children, but has decreased for non-Indigenous children

For 2014–2018, about one in five deaths (18 per cent) among Aboriginal and Torres Strait Islander children aged 0–4 years was attributable to preventable and treatable injuries and diseases (table 6A.6.6).

During this five-year-period, there were 109 potentially preventable deaths of young Aboriginal and Torres Strait Islander children across NSW, Queensland, WA, SA and the NT combined, a decrease from 132 deaths in the previous five-year period (table 6A.6.6). However, the rates did not change significantly between these periods: they stood at 146 deaths per 100 000 children in 2014–2018, compared with 150 deaths per 100 000 children in 2009–2013 (figure 6.6.2).²⁰

²⁰ Aggregating five years of data smooths out some of the volatility in the young child mortality data. Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

The rate of deaths from preventable and treatable injuries and diseases was over twice as high for young Aboriginal and Torres Strait Islander children as for non-Indigenous children in 2014–18. While the Aboriginal and Torres Strait Islander rate has not changed, the rate for non-Indigenous children has decreased, from 90 deaths per 100 000 children in 2009–2013 to 72 deaths per 100 000 children in 2014–2018 (figure 6.6.2).

When stable or decreasing death rates are considered against increasing hospitalisation rates (bearing in mind the considerably larger number of hospitalisations compared to deaths), this could indicate better care once in hospital and/or earlier detection of diseases leading to earlier entry to hospital. For example, increased efforts to identify and treat preventable disease — such as through Aboriginal and Torres Strait Islander child health checks and targeted screening and health services — may have led to increased hospitalisation rates, but decreased the likelihood of long-term disease and death (AHMAC 2017; AIHW 2018).

Figure 6.6.2 Deaths from external causes and preventable diseases, children aged 0–4 years, by Indigenous status, NSW, Queensland, WA, SA and the NT, 2009–2013 and 2014–2018^a

^a See table 6A.6.6 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.6.6.

Quality housing and community infrastructure and culturally safe health care and injury prevention programs may assist to reduce potentially preventable hospitalisations for Aboriginal and Torres Strait Islander children

Approaches to ensure that Aboriginal and Torres Strait Islander families have access to affordable and appropriate housing (including housing that receives adequate and timely repair and maintenance) can reduce infectious disease transmission and subsequently reduce the demands on health services (Ali, Foster and Hall 2018; O’Grady et al. 2018). Similarly, attention needs to be paid to whether community services and infrastructure (such as

sanitation, waste disposal and dust control) is sufficient for community needs (Department of Health 2014). Further information on housing conditions and Aboriginal and Torres Strait Islander health is provided in chapter 10 *Home environment*.

Early detection and treatment through primary health care (including dental and immunisation services) has significant benefits for those at risk of disease and can reduce the rate of potentially preventable hospitalisations and deaths (AHMAC 2017).

However, there are barriers to the families/carers of Aboriginal and Torres Strait Islander children accessing prevention and early intervention services. These barriers include the physical availability of health services, transport, flexible service delivery, affordability, language and the cultural acceptability and appropriateness of health services (Conway, Tsourtos and Lawn 2017; Falster et al. 2016).

Evidence suggests that access to primary health care can be improved where primary health care services can find ways of these barriers (Davy et al. 2016), and where these health services are provided in a culturally safe environment (Davy et al. 2016; Dwyer et al. 2015; Jennings, Bond and Hill 2018).

Further information on Aboriginal and Torres Strait Islander people's access to primary health care is provided in section 8.1 *Access to primary health care*.

Similarly, community-wide childhood injury prevention strategies can be effective in reducing childhood injuries. Research suggests that community interventions appear to be most successful where agencies work with the Aboriginal and Torres Strait Islander communities, and where the communities set the agenda for priority projects and have ownership over them (Clapham et al. 2019).

Future directions in data

National data on the health status of Aboriginal and Torres Strait Islander people aged 0–14 years has historically been collected in the National Aboriginal and Torres Strait Islander Health Survey, but was not collected in 2018–19. Data on the timely use of primary health care services was also not available for this age group from this survey. These are critical information gaps at the population level for Aboriginal and Torres Strait Islander children.

Understanding the pathways Aboriginal and Torres Strait Islander children take through the health care system could help identify whether they are gaining access to the appropriate services at the right time. The National Integrated Health Services Information Analysis Asset project, aims to bring together hospital data from states and territories with data from the Medicare Benefits Schedule, Pharmaceutical Benefits Scheme and the National Death Index. The project is currently in its pilot phase and will be managed by the Australian Institute of Health and Welfare.

6.7 Ear health²¹

Box 6.7.1 Key messages

- Good hearing is important for a child's social, emotional, and cognitive development. Poor hearing (or extended periods of poor hearing) can impede a child's development of language and communication skills, as well as their cognitive development and subsequent school performance.
- The proportion of Aboriginal and Torres Strait Islander children with a long-term hearing problem has decreased by one third in the past two decades, and has nearly halved in remote areas.
- However, in 2017–19, this rate remained twice that of non-Indigenous children, with the gap for otitis media (a treatable ear infection) even higher.
- The rate of hospitalisation among Aboriginal and Torres Strait Islander children for diseases of the ear is increasing, particularly for younger children (less than four years old); this may reflect improved diagnosis and use of ear health services and/or improved access to hospitals.
- The higher rates of ear diseases among Aboriginal and Torres Strait Islander children correspond to higher rates of hearing loss, compared to non-Indigenous children. These higher rates are related to poor living conditions and environmental risk factors, such as exposure to tobacco smoke, together with barriers to accessing primary health care and issues with communication and coordination between service providers.

Box 6.7.2 Measures of ear health

There are two main measures for this indicator:

- *Prevalence of hearing conditions in children* is defined as the proportion of children aged 0–14 years with a reported hearing condition. Data are available from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available from the 2018-19 NATSIHS. Data for the non-Indigenous population are sourced from the ABS National Health Survey (NHS), with the most recent data available from the 2017-18 NHS. Data are self-reported — adults responded on behalf of children aged less than 15 years.
- *Hospitalisation rates for ear and hearing problems in children* is defined as the proportion of hospital separations for children aged 0–14 years for which the principal diagnosis was diseases of the ear and mastoid. A separation is a completed episode of care for an admitted patient. Data are sourced from the National Hospital Morbidity Database, with the most recent data available for 2018-19 (all jurisdictions; by age; remoteness).

Good hearing in childhood is important for social, emotional, and cognitive development, and helps young people to socialise, play and communicate.

²¹ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University who reviewed a draft of this section of the Report.

Conversely, poor hearing (or extended periods of poor hearing) can impede a child's development of language and communication skills, as well as their cognitive development and subsequent school performance (AMA 2017; Arefadib and Moore 2017; Bell et al. 2016; Burns and Thomson 2013; Simpson et al. 2020). Analysis of data from the Australian Early Development Census (AEDC) found that children with reported hearing loss were more than twice as likely as their hearing peers to be developmentally vulnerable when entering school (Simpson et al. 2020). In a study of Aboriginal children in the NT, Su et al. (2020, p. 6) found using data linkage that hearing impairment 'increases the risk for poorer outcome in early childhood development and school readiness ... and that risk may increase with the severity of [hearing impairment]'.

Poor hearing throughout childhood is also associated with emotional and behavioural difficulties, social isolation, and lower levels of self-esteem (AMA 2017; Burns and Thomson 2013). As well as influencing school engagement and performance (AIHW 2018; Burns and Thomson 2013), these issues can compromise family functioning (AMA 2017) and could affect a child's participation in and enjoyment of a range of activities including sporting, cultural, family, and community events.

Poor hearing in childhood can also have life-long consequences. Research has shown that hearing loss during a child's first year can lead to lifelong auditory processing disorders (AMA 2017). Hearing loss in childhood is associated with limited employment options and income in adulthood. In addition, hearing loss is associated with increased contact with the criminal justice system, which may result from increased antisocial behaviour, but also from difficulties communicating with authorities (AIHW 2018; Vanderpoll and Howard 2012). A 2011 study, on the hearing health of prisoners in the NT found that about 94 per cent of Aboriginal and Torres Strait Islander prisoners had significant hearing loss (Vanderpoll and Howard 2012).

The proportion of Aboriginal and Torres Strait Islander children with a long-term hearing problem has decreased by one-third in the past two decades, and has nearly halved in remote areas...

Nationally in 2018-19, seven per cent of Aboriginal and Torres Strait Islander children aged 0-14 years had a self-reported long-term hearing condition, which includes deafness or partial deafness, otitis media, tinnitus, or Ménière's disease (table 6A.7.1).²²

This rate decreased over the past two decades by over one-third, or four percentage points (figure 6.7.1). The decrease was greatest for Aboriginal and Torres Strait Islander children in remote areas, with the rate almost halving between 2001 (18 per cent) and 2018-19

²² Data on self-reported hearing loss should be considered with caution: they are likely to underestimate hearing loss as respondents can be unaware of the extent of their own or their child's hearing loss (particularly in mild cases) (AIHW 2016). For the first time in Australia, the 2018-19 NATSIHS collected measurements of hearing using a voluntary self-administered hearing test. Among Aboriginal and Torres Strait Islander children aged 7-14 years, 29 per cent had a hearing impairment (ABS 2019).

(10 per cent) (figure 6.7.1). But the rate for those in remote areas who had a self-reported long-term hearing condition remained 1.5 times the rate for those in non-remote areas (table 6A.7.3).

...but it remains higher than for non-Indigenous children, with the gap for treatable ear infections particularly high

In 2017–19, Aboriginal and Torres Strait Islander children were twice as likely as non-Indigenous children to have long-term hearing conditions; similar to the ratio reported in 2001 (figure 6.7.1).

Figure 6.7.1 Children aged 0–14 years with a long-term hearing problem, by Indigenous status, by remoteness; 2001, 2004–05, 2008, 2011–13, 2014–15, and 2017–19^{a,b}

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See tables 6A.7.3-4 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) National Aboriginal Torres Strait Islander Health Survey (various years); ABS (unpublished) National Aboriginal Torres Strait Islander Social Survey (various years) ABS (unpublished) National Health Survey (various years); ABS (unpublished) General Social Survey (various years); tables 6A.7.3-4.

Among Aboriginal and Torres Strait Islander children with hearing problems, about one-third had otitis media. The proportion of Aboriginal and Torres Strait Islander children with otitis media was about three times the rate observed in non-Indigenous children (table 6A.7.4). Otitis media is a treatable middle ear infection that can affect hearing in the short-term; however, if left untreated, chronic otitis media can lead to permanent hearing loss (AMA 2017). Compared to non-Indigenous children, Aboriginal and Torres Strait

Islander children experience their first episode of otitis media at a younger age, followed by more frequent episodes that come in more severe and persistent forms (AIHW 2018; AMA 2017; Coleman et al. 2018; Jervis-Bardy et al. 2017).

The most recent data on self-reported treatment are for 2014-15, when 16 per cent of Aboriginal and Torres Strait Islander children with hearing problems or problems with their ears reported that they had not had treatment for these problems (26 per cent in remote areas). Of those children with hearing problems who had not received treatment, the majority in non-remote areas reported that they had not sought treatment; while, the majority in remote areas reported that no treatment was available or that treatment was not affordable (table 6A.7.5). Data are not available for non-Indigenous children.

The rate of hospitalisation for diseases of the ear is increasing for Aboriginal and Torres Strait Islander children which may reflect improved diagnosis and use of services

Nationally in 2018-19, there was 1261 Aboriginal and Torres Strait Islander children aged 0–3 years hospitalised for diseases of the ear per 100 000 children of the same age. This rate increased by more than 40 per cent over the past five years and, by 2018-19, was similar to the rate for young non-Indigenous children (figure 6.7.2).

Figure 6.7.2 Hospitalisations per 100 000 children where the principal diagnosis was diseases of the ear and mastoid process, by Indigenous status, by age group, 2010-11 to 2018-19^a

^a See table 6A.7.6 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 6A.7.6.

By contrast, the rate of hospitalisation for diseases of the ear among Aboriginal and Torres Strait Islander children aged 4–14 years did not increase as steeply. Nationally in 2018–19, there was 720 Aboriginal and Torres Strait Islander children aged 4–14 years hospitalised for diseases of the ear per 100 000 children of the same age (figure 6.7.2).

Hospitalisation rates for Aboriginal and Torres Strait Islander children for diseases of the ear increase with remoteness. In 2016–2018, among Aboriginal and Torres Strait Islander children, there was 734 hospitalisations per 100 000 children for diseases of the ear in major cities.²³ This rate was slightly higher for children in regional areas (to 761 hospitalisations per 100 000 children), but was more than double in remote areas (1495 hospitalisations per 100 000 children) (table 6A.7.8). Non-Indigenous child hospitalisations for diseases of the ear also increased with remoteness in 2016–2018, but to a lesser extent than for Aboriginal and Torres Strait Islander children (table 6A.7.8).

The most common hospital diagnoses are diseases of the middle ear and mastoid process (table 6A.7.6). Among Aboriginal and Torres Strait Islander children hospitalised for diseases of the middle ear and mastoid process, three quarters had *myringotomy* (an incision in the eardrum to relieve pressure caused by excessive fluid build-up) or *tympanoplasty* (a reconstructive surgical treatment for a perforated eardrum) procedures (AIHW 2018). While non-Indigenous children had similar myringotomy and tympanoplasty procedure rates, they had their procedures at relatively younger ages (AIHW 2018).

Hospitalisations for diseases of the middle ear and mastoid process appear to reflect increasing use of hospital services, rather than the increasing prevalence of these conditions in the community. This, in turn, may reflect improved early diagnosis and use of other ear health services (AIHW 2018) (as evidenced by the increasing hospitalisation rates for younger Aboriginal and Torres Strait Islander children noted above). Efforts over the past two decades to decrease the underlying prevalence of ear disease in Aboriginal and Torres Strait Islander children — such as through Aboriginal and Torres Strait Islander child health checks and targeted screening and health services — may have led to increased hospitalisation rates (AIHW 2018).

Higher rates of ear diseases and hearing loss are associated with greater exposure to risk factors and barriers to access and coordination of health care

Risk factors for ear disease, together with barriers to accessing primary health care and issues of poor communication and coordination between service providers, explain these higher rates of hearing loss for Aboriginal and Torres Strait Islander children.

- Research indicates that risk factors for ear diseases include environmental risk factors (such as poor community and housing infrastructure, and overcrowded housing), along with exposure to tobacco smoke (AIHW 2018; Coleman et al. 2018; DeLacy, Dune and

²³ Aggregating three years of data smooths out some of the volatility in the data by remoteness area.

Macdonald 2020). These factors are more likely to be experienced by people living in lower socioeconomic and remote areas, in which Aboriginal and Torres Strait Islander people are overrepresented.

- Aboriginal and Torres Strait Islander people often face barriers to primary health care, particularly in remote areas, which can delay the diagnosis, treatment and management of ear diseases among Aboriginal and Torres Strait Islander children (Gunasekera et al. 2009; table 6A.7.5). These delays in treatment can lead to prolonged periods of hearing loss and long-term hearing impairment (AIHW 2017).
- There is also an ongoing need for governments and service providers to continue to work with Aboriginal and Torres Strait Islander communities and families so that they understand the importance of seeking treatment for ear diseases, particularly where they may have come to accept ear infections/diseases as a part of growing up (AMA 2017; Siggins Miller 2017).
- Lack of prioritisation of Aboriginal and Torres Strait Islander ear health — and the lack of effective coordination and communication between primary, secondary and (where required) tertiary health services — have also been identified as barriers (Siggins Miller 2017).

Addressing environmental risk factors (see chapter 10 *Home environment*) and barriers to primary health care (see section 8.1 *Access to primary health care*) could further reduce the prevalence of ear diseases and associated hospitalisations.

Future directions in data

More comprehensive and reliable data are required to enable assessment of the type and severity of ear infections in Aboriginal and Torres Strait Islander children and of any resulting hearing loss.

- Only sparse data are available on the burden of poor ear health in Aboriginal and Torres Strait Islander children, with current survey data limited by the difficulty of obtaining reliable estimates for small populations.
- Limited data are available on the prevalence and severity of hearing loss in the community. Current measures use self-reported data — which are likely to be underestimates, as respondents may be unaware of the extent of their children's hearing loss. While the 2018-19 NATSIHS included a hearing test to address this limitation, the collection was limited to respondents aged seven years or over and did not provide information about the causes of the hearing loss (ABS 2019).²⁴ Comparable data for non-Indigenous children are also unavailable.

²⁴ Aboriginal and Torres Strait Islander respondents who completed the test were given their results on a Measurements Card, with advice as to whether they should see a General Practitioner or health service provider. Data were not collected on whether the respondents sought medical advice (ABS 2019).

- Only limited data are available on whether Aboriginal and Torres Strait Islander children are seeking and receiving treatment for ear or hearing problems. These data were collected in the 2014-15 NATSISS (table 6A.7.4). However, they were not collected in the 2018-19 NATSIHS, and comparable data for non-Indigenous children are not available.

6.8 Basic skills for life and learning²⁵

Box 6.8.1 Key messages

- Early on in life, children develop the key social, emotional and cognitive skills that are important for their successful transition to school and for their later academic achievement, mental health and wellbeing.
- The majority of Aboriginal and Torres Strait Islander children are meeting developmental milestones as specified in the Australian Early Development Census (AEDC). Nationally in 2018, in each of the five AEDC domains, between 60–65 per cent of Aboriginal and Torres Strait Islander children were assessed as being developmentally ‘on track’, all up from 2009.
- However, there remains a substantial gap with non-Indigenous children, with Aboriginal and Torres Strait Islander children being assessed in the AEDC as developmentally vulnerable at twice the rate of non-Indigenous children in four of the five AEDC domains. And this gap widens as remoteness increases.
- Much of the difference in early childhood development outcomes between Aboriginal and Torres Strait Islander children and non-Indigenous children is likely to be associated with greater experience of disadvantage, such as lack of access to quality and secure housing, and/or the experience of more major life stressors.
- In addition, while the AEDC has been validated for use for Aboriginal and Torres Strait Islander children, some have questioned whether it is culturally appropriate for assessing their development and if the instrument itself leads to lower scores for Aboriginal and Torres Strait Islander children.
- Children not proficient in standard Australian English are more likely to be assessed as developmentally vulnerable. Of the Aboriginal and Torres Strait Islander children assessed in the 2018 AEDC, around one-third of children in remote areas and three-quarters of children in very remote areas spoke English as a second or additional language.
- A safe and stimulating home learning environment, early childhood education and regular health checks can all positively influence a child’s development.

Box 6.8.2 Measures of basic skills for life and learning

There are two main measures for this indicator. Data are available for all jurisdictions.

- *Children on track on Australian Early Development Census (AEDC) domains* is defined as the proportion of children entering their first year of full time school who are on track (based on national cut-off scores established on the basis of the top 75 per cent of scores in the 2009 AEDC), in each of the five AEDC domains: physical health and wellbeing; social competence; emotional maturity; language and cognitive skills (school-based); and communication skills and general knowledge. The most recent available data are for 2018.

(continued next page)

²⁵ The Steering Committee notes its appreciation to Associate Professor Catherine Chamberlain, La Trobe University, who reviewed a draft of this section of the Report.

Box 6.8.2 (continued)

- *Informal learning activities* is defined as the proportion of children aged 3–8 years who undertook informal learning activities with their main carer in the last week. The most recent available data are for 2014–15 from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) for Aboriginal and Torres Strait Islander children, and for 2014 from the ABS Childhood Education and Care Survey for non-Indigenous children.

Data are also provided for two supplementary measures:

- *Language background* is defined as the proportion of Aboriginal and Torres Strait Islander children entering their first year of school for whom English is considered a second or additional language. The most recent available data are for 2018 from the AEDC.
- *Health checks* is defined as the number of health assessments received per 100 children aged 0–4 years in the population. The most recent available data are for Aboriginal and Torres Strait Islander children in 2018–19 from Medicare Item Reports. Comparable data for non-Indigenous children are not available.

Children in their early years develop key social, emotional and cognitive skills — such as the skills to solve problems, to think, to communicate, to control their emotions, and to form relationships (Pascoe and Brennan 2017). These skills are important for their successful transition to school and are related to their academic achievement, mental health and wellbeing in adulthood (Williamson et al. 2019).

Aboriginal and Torres Strait Islander children can develop many strengths in their early years. Some of these strengths — such as independence from an early age, well-developed visual-spatial and motor skills, and the capacity to self-judge and to take risks — are specifically associated with Aboriginal and Torres Strait Islander cultural child-rearing practices (Armstrong et al. 2012; Lohoar, Butera and Kennedy 2014; Taylor 2011).

The majority of Aboriginal and Torres Strait Islander children are meeting developmental milestones, with the proportions increasing over the past decade in each of the five AEDC domains...

Nationally in 2018, in each of the five AEDC domains, the majority of Aboriginal and Torres Strait Islander children were considered developmentally on track — with the proportions ranging between 60 per cent (for the social competence domain) and 65 per cent (for the emotional maturity domain) (figure 6.8.1).

Since 2009, there has been an increase in the proportion of Aboriginal and Torres Strait Islander children developmentally on track in each of the domains, with the largest increase (15 percentage points) in the language and cognitive skills (school-based) domain (figure 6.8.1).

Figure 6.8.1 **Proportion of children assessed as developmentally on track, by AEDC domain, 2009 to 2018^a**

^a See tables 6A.8.1–4 for detailed definitions, footnotes and caveats.

Source: Department of Education, Skills and Employment (DESE) 2019, *Australian Early Development Census*; tables 6A.8.1–4.

...however, there remains a substantial gap with non-Indigenous children, with Aboriginal and Torres Strait Islander children twice as likely to have been assessed as developmentally vulnerable...

In each AEDC domain, the gap between Aboriginal and Torres Strait Islander children and non-Indigenous children has decreased over the past decade. However, there remains a substantial gap with non-Indigenous children. For each domain in 2018, the differences between Aboriginal and Torres Strait Islander and non-Indigenous children who were assessed as developmentally on track were between 13 and 23 percentage points (table 6A.8.1).

Children who are not assessed as developmentally on track are assessed as being ‘at risk’ or, worse, ‘vulnerable’. Nationally in 2018, Aboriginal and Torres Strait Islander children were assessed as developmentally vulnerable at about twice the rate of non-Indigenous children across four of the five AEDC domains, and over three times the rate in the language and cognitive skills (school-based) domain (table 6A.8.1).

...and the gap widens as remoteness increases

The proportion of Aboriginal and Torres Strait Islander children classified as developmentally on track decreases with remoteness. Nationally in 2018, in all AEDC developmental domains, as remoteness increased the proportion of Aboriginal and Torres Strait Islander children classified as on track decreased. The proportions for non-Indigenous children were fairly similar across remoteness areas (figure 6.8.2). The domain showing the greatest difference across remoteness areas for Aboriginal and Torres Strait Islander children was language and cognitive skills (school-based) (figure 6.8.2).

Figure 6.8.2 **Proportion of children developmentally on track, by domain, by remoteness, 2018^a**

^a See table 6A.8.5 for detailed definitions, footnotes and caveats.

Source: DESE 2019, *Australian Early Development Census*; table 6A.8.5.

In part, this geographic gradient may be explained by Aboriginal and Torres Strait Islander children in more remote areas having limited access to services (particularly culturally and linguistically appropriate services) known to mediate the impact of adversity in early childhood (Arefadib and Moore 2017).

The various factors that can negatively impact developmental outcomes are more likely to be experienced by Aboriginal and Torres Strait Islander children

Much of the difference in developmental outcomes between Aboriginal and Torres Strait Islander children and non-Indigenous children is likely to be associated with differential experiences of socioeconomic disadvantage, access to key facilities or services (Williamson

et al. 2019) and multiple major life stresses. For example, poorer developmental outcomes have been linked to: poor parent/carer health; low levels of parental education, occupation and employment; poor quality and overcrowded housing; social isolation; exposure to family violence and child protection intervention; and the intergenerational effects of trauma associated with colonisation (AEDC 2014; Arefadib and Moore 2017; Guthridge et al. 2016).

- In a cross-sectional data linkage study of children across NSW, Williamson et al. (2019) found that a large proportion of the inequality in social and emotional development between Aboriginal and Torres Strait Islander children and non-Indigenous children was explained by differences in socioeconomic disadvantage.
- Similarly, analysis of data from the Longitudinal Study of Indigenous Children (LSIC) showed that housing insecurity, money worries and being harassed for money (over an extended period) were found to be associated with children's social and emotional difficulties (FaHCSIA 2013).
- This LSIC analysis also showed that major life stressors were associated with social and emotional difficulties — including having a close family member who has problems with the police/jail (over an extended period); being cared for by someone other than their regular carer for at least a week; and being scared by other people's behaviour.
- In addition, Aboriginal and Torres Strait Islander children's rates of exposure to a number of perinatal risk factors (such as young maternal age, smoking in pregnancy, no or low antenatal care, and premature birth) are strongly associated with poor attainment of developmental milestones (Williamson et al. 2019). See sections 6.1 *Antenatal care*, 6.2 *Health behaviours during pregnancy*, 6.3 *Teenage birth rate*, and 6.4 *Birthweight* for further details.

Another factor that may affect the AEDC outcomes in relation to a child's development is speaking 'standard Australian English' as a second or additional language. While many children who speak English as a second or additional language are developmentally on track (and may indeed have a developmental advantage), Australian research shows that children who begin school with limited English *proficiency* are more likely to be assessed as developmentally at risk (DET 2019; FaHCSIA 2012; Guthridge et al. 2016; O'Connor et al. 2018).

Nationally in 2018, about 14 per cent of Aboriginal and Torres Strait Islander children spoke English as a second language. This rate increased with remoteness — one-third of children in remote areas and three-quarters of Aboriginal and Torres Strait Islander children in very remote areas spoke English as a second language (table 6A.8.9). Nationally, a similar proportion of non-Indigenous children spoke English as a second language (18 per cent); however, a higher proportion were proficient in English²⁶, and they were more likely to be located in major cities (table 6A.8.9) (where more support services are likely to be available).

²⁶ Based on analysis of English proficiency data in the 2018 AEDC Complete Microdata file.

The AEDC has been validated for use for Aboriginal and Torres Strait Islander populations (Silburn et al. 2009). However, some researchers question whether standard collection instruments (such as the AEDC) are culturally and linguistically appropriate for assessing development among Aboriginal and Torres Strait Islander children. They contend these instruments may possess an innate bias, and so do not fully measure the strengths of Aboriginal and Torres Strait Islander children (Sydenham 2019; Taylor 2011).

The home learning environment, early childhood education, and health checks can significantly influence a child's development

A child's home learning environment can significantly influence their development. Engagement between parents and children builds cognitive and language skills, positive dispositions to learning, and thinking and reasoning skills (Pascoe and Brennan 2017). Growing up in a stimulating home benefits children's Year 3 NAPLAN scores by the equivalent of more than four months of schooling for reading, and eight weeks of schooling for numeracy (Yu and Daraganova 2014). Analysis from the LSIC showed that the majority of Aboriginal and Torres Strait Islander families read books to their children, and that this positively affected their English language acquisition (FaHCSIA 2012).

Almost all young Aboriginal and Torres Strait Islander children do some informal learning in their home. In 2014–15, almost all Australian children aged 3–8 years had done some form of informal learning activity with their main carer in the previous week, with the proportion for Aboriginal and Torres Strait Islander children (99 per cent) similar to the Australian total (table 6A.8.12). For both Aboriginal and Torres Strait Islander and other Australian children, the most common informal learning activities their main carers did with them were 'Told stories, read or listened to the child read' (89 per cent and 96 per cent, respectively) and 'Watched TV, video or DVD' (90 per cent and 85 per cent, respectively) (table 6A.8.14).

Attendance at quality early childhood education programs (including that programs are culturally safe) also provides an important foundation for all children by developing their cognitive and non-cognitive skills (OECD 2017; Pascoe and Brennan 2017). Recent data indicates that preschool participation rates are increasing substantially among Aboriginal and Torres Strait Islander children. (See section 4.3 *Early childhood education*.)

Aboriginal and Torres Strait Islander children can receive annual health checks through the Medicare Benefits Schedule (MBS). These health assessments aim to encourage early detection, diagnosis and intervention for common and treatable conditions that cause morbidity and early mortality (AIHW 2019). Morbidity can impair a child's development; for example, Aboriginal and Torres Strait Islander children who have had problems with their ears or hearing have been found to suffer language development issues (FaHCSIA 2012; Simpson et al. 2020). (See section 6.7 *Ear health*.)

MBS-funded health checks have been available to Aboriginal and Torres Strait Islander children since 2006 (AIHW 2019). Since that time, the rate of Aboriginal and Torres Strait Islander children aged 0–4 years receiving an Aboriginal and Torres Strait Islander health

assessment has been increasing.²⁷ Nationally in 2018-19, there were 29 health assessments per 100 children aged 0–4 years — an almost tenfold increase in the rate since 2006-07 (when it was 3 assessments per 100 children) (figure 6.8.3).

To improve health outcomes, health checks require a follow-up for any issues identified (Bailie et al. 2014; Dutton, Stevens and Newman 2016). Currently, data are only available on Indigenous-specific follow-ups to Aboriginal and Torres Strait Islander health assessments; data are not available on whether a follow-up was required, or on whether a person received an alternative follow-up service. Nationally in 2016-17 (the latest period for which data are available), about 40 per cent of children aged 0–4 years who received an Aboriginal and Torres Strait Islander health assessment received an Indigenous-specific follow-up within 12 months of their health check, an increase of 32 percentage points (from 8 per cent) since 2010-11 (AIHW 2019).

Figure 6.8.3 Aboriginal and Torres Strait Islander Health Assessments per 100 children aged 0–4 years, 2006-07 to 2018-19^a

^a See table 6A.8.11 for detailed definitions, footnotes and caveats.

Source: Services Australia (2020), derived from Medicare Item Reports (<http://medicarestatistics.humanservices.gov.au/statistics/>); ABS (2019) *Estimates and Projections of Aboriginal and Torres Strait Islander Australians, 2006 to 2031*, Cat. no. 3238.0; table 6A.8.11.

Future directions in data

Additional measures on culturally appropriate developmental milestones and data on the developmental strengths of Aboriginal and Torres Strait Islander children — particularly

²⁷ Data for the number of assessments received under the MBS Aboriginal and Torres Strait Islander Health Assessment understate the total number of health assessments received by Aboriginal and Torres Strait Islander children. Aboriginal and Torres Strait Islander children can receive other health assessments, so the MBS data provided here should not be viewed as representative of all health assessments.

those who speak English as a second or additional language — would be beneficial. In addition, further research is required on whether these strengths are appropriately recognised and built upon by educators in the Australian education and care system.

There is a need for comprehensive data on the availability and use of developmental health checks for Aboriginal and Torres Strait Islander and non-Indigenous children. Data presented in this Report only cover selected MBS-funded services, and so they understate the total number of health assessments received. For example, babies and young children may also receive regular developmental health checks from maternal and child health nurses employed by State, Territory or local governments.

Table 6A.1.1 Attendance of at least one antenatal visit in the first trimester for Aboriginal and Torres Strait Islander women who gave birth, by state and territory, 2011 to 2018 (crude rate) (a), (b)

| | <i>Unit</i> | <i>NSW</i> | <i>Vic (c)</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT (d)</i> | <i>NT</i> | <i>Total</i> | <i>3-state total (e)</i> |
|-----|---|------------|----------------|------------|-----------|-----------|------------|----------------|-----------|--------------|--------------------------|
| (a) | Women who gave birth and identified as Aboriginal and Torres Strait Islander, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in Vic and WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy. | | | | | | | | | | |
| (b) | Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated. | | | | | | | | | | |
| (c) | Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional. | | | | | | | | | | |
| (d) | For the ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported. | | | | | | | | | | |
| (e) | Total includes NSW, SA, and the NT only to allow comparison with historical data. | | | | | | | | | | |

TABLE 6A.1.2

Table 6A.1.2 **Attendance of at least one antenatal visit in the first trimester for Aboriginal and Torres Strait Islander women who gave birth, by state and territory, 2010 (crude rate) (a), (b)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic (c)</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>ACT</i> | <i>NT</i> | <i>Total (d), (e)</i> |
|--|-------------|-------------|----------------|-------------|-------------|-------------|-------------|-------------|-----------------------|
| Number who attended at least one antenatal visit in the first trimester | no. | 2 250 | 376 | 1 267 | 307 | 342 | 36 | 686 | 5 264 |
| Number of women who gave birth (f) | no. | 3 139 | 779 | 3 321 | 1 032 | 603 | 63 | 1 313 | 10 250 |
| Proportion who attended at least one antenatal visit in the first trimester | % | 71.7 | 48.3 | 38.2 | 29.7 | 56.7 | 57.1 | 52.2 | 51.4 |

- (a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published. Data are by place of usual residence of the mother. Women who gave birth in NSW, Victoria, Qld, WA, SA, the ACT or the NT but reside in another jurisdiction are not reported due to small numbers.
- (c) Due to data system reforms the Victorian Perinatal Data Collection for 2010 are provisional pending further quality assurance work.
- (d) Total includes data for Vic, WA, and the ACT for the first time and is not comparable with totals from previous years.
- (e) Total includes NSW, Vic, Qld, WA, SA, ACT and the NT only. These data are not generalisable to Australia.
- (f) Excludes women whose gestation at first antenatal visit was not stated.

TABLE 6A.1.7

Table 6A.1.7 **Attendance of at least one antenatal visit in the first trimester for women who gave birth, by Indigenous status, 2011 to 2018 (age-standardised) (a), (b), (c), (d)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT (e)</i> | <i>NT</i> | <i>Total</i> | <i>3-state total (f)</i> |
|---------------------------------------|-------------|------------|------------|------------|-----------|-----------|------------|----------------|-----------|--------------|--------------------------|
| Variability bands for rate | | | | | | | | | | | |
| Aboriginal and Torres Strait Islander | ± | 3.9 | 5.0 | 3.1 | 4.4 | 9.1 | np | np | 6.0 | 1.8 | 3.1 |
| Non-Indigenous | ± | 0.7 | 0.7 | 0.8 | 1.1 | 1.6 | 2.9 | 2.7 | 4.5 | 0.4 | 0.6 |
| Rate ratio (g) | no. | 0.8 | 0.7 | 0.7 | 0.6 | 0.7 | np | np | 0.7 | 0.8 | 0.8 |
| Rate difference (h) | no. | - 10.8 | - 16.0 | - 16.9 | - 23.9 | - 19.9 | np | np | - 27.6 | - 14.1 | - 14.3 |

- (a) Women who gave birth, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in Vic and WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes women whose Indigenous status was not stated and women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) aged 15–44 as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np).
- (d) Results based on very small numbers (fewer than 5 events) are not published (np). Consequential suppression (n.p.) has been applied in affected rows and columns to prevent back-calculation of small numbers.
- (e) For the ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.
- (f) Total includes NSW, SA and the NT only to allow comparison with historical data.
- (g) Rate ratio is the directly age-standardised Aboriginal and Torres Strait Islander proportion divided by the directly age-standardised non-Indigenous proportion.
- (h) Rate difference is the directly age-standardised Aboriginal and Torres Strait Islander proportion less the directly age-standardised non-Indigenous proportion.
- np** Not published.

TABLE 6A.1.8

Table 6A.1.8 **Attendance of at least one antenatal visit in the first trimester for women who gave birth, NSW, Vic, Qld, WA, SA, ACT, NT, by Indigenous status, 2010 (age-standardised) (a), (b), (c)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>ACT (d)</i> | <i>NT</i> | <i>Total (e)</i> | <i>3-state total (f)</i> |
|--|-------------|------------|------------|------------|-----------|-----------|----------------|-----------|------------------|--------------------------|
| At least one antenatal visit reported in first trimester (rate) | | | | | | | | | | |
| Aboriginal and Torres Strait Islander | % | 70.6 | 50.9 | 37.3 | 28.2 | 56.3 | np | 50.5 | 50.4 | 63.7 |
| Non-Indigenous | % | 78.7 | 60.3 | 61.3 | 54.6 | 78.9 | 45.5 | 79.8 | 67.5 | 78.7 |
| Variability bands for rate | | | | | | | | | | |
| Aboriginal and Torres Strait Islander | ± | 4.0 | 6.1 | 2.7 | 4.5 | 8.9 | np | 5.5 | 1.8 | 3.1 |
| Non-Indigenous | ± | 0.7 | 0.8 | 0.8 | 1.2 | 1.6 | 2.9 | 4.4 | 0.4 | 0.7 |
| Rate ratio (g) | no. | 0.9 | 0.8 | 0.6 | 0.5 | 0.7 | np | 0.6 | 0.7 | 0.8 |
| Rate difference (h) | no. | -8.1 | -9.4 | -24.0 | -26.3 | -22.6 | np | -29.3 | -17.1 | -15.0 |

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes mother's whose Indigenous status was not stated and mothers with not stated gestation at first antenatal visit. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published. Data are by place of usual residence of the mother. Women who gave birth in NSW, Victoria, Qld, WA, SA, the ACT or the NT but reside in another jurisdiction are not reported due to small numbers.

(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with Data Principle 2, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.

(d) For ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.

(e) Total includes data for Vic, WA, and the ACT for the first time and is not comparable with totals from previous years.

(f) Total includes NSW, SA, and NT only.

(g) Rate ratio is the directly age-standardised Aboriginal and Torres Strait Islander proportion divided by the directly age-standardised non-Indigenous proportion.

(h) Rate difference is the directly age-standardised Aboriginal and Torres Strait Islander proportion less the directly age-standardised non-Indigenous proportion.

Table 6A.1.8 **Attendance of at least one antenatal visit in the first trimester for women who gave birth, NSW, Vic, Qld, WA, SA, ACT, NT, by Indigenous status, 2010 (age-standardised) (a), (b), (c)**

TABLE 6A.1.9

Table 6A.1.9 **Attendance of at least one antenatal visit in the first trimester for women who gave birth, NSW, Qld, SA, NT, by Indigenous status, 2009 (age-standardised) (a), (b), (c), (d)**

| | <i>Unit</i> | <i>NSW</i> | <i>Qld (e)</i> | <i>SA</i> | <i>NT</i> | <i>Total (f)</i> | <i>3- state total (g)</i> |
|--|-------------|------------|----------------|-----------|-----------|------------------|---------------------------|
| At least one antenatal visit reported in first trimester (rate) | | | | | | | |
| Aboriginal and Torres Strait Islander | % | 67.8 | 36.2 | 52.6 | 44.6 | 53.5 | 59.4 |
| Non-Indigenous | % | 77.1 | 58.1 | 76.8 | 76.3 | 72.8 | 76.9 |
| Variability bands for rate | | | | | | | |
| Aboriginal and Torres Strait Islander | ± | 4.0 | 4.0 | 8.6 | 4.9 | 2.4 | 3.0 |
| Non-Indigenous | ± | 0.7 | 1.1 | 1.6 | 4.3 | 0.6 | 0.7 |
| Rate ratio (h) | no. | 0.9 | 0.6 | 0.7 | 0.6 | 0.7 | 0.8 |
| Rate difference (i) | no. | -9.3 | -21.9 | -24.2 | -31.7 | -19.2 | -17.5 |

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes mother's whose Indigenous status was not stated and mothers missing data for gestation at first antenatal visit. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit is not part of the Perinatal NMDS in 2009. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish.

(c) Data are by place of usual residence of the mother. Women who gave birth in NSW, Qld, SA or the NT but reside in another jurisdiction are not reported due to small numbers.

(d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population.

(e) For Queensland, antenatal visit in the first trimester data were collected from 1 July 2009.

(f) Total includes data for Queensland for the first time and is not comparable with totals from previous years.

(g) Total includes NSW, SA and the NT only.

(h) Rate ratio is Aboriginal and Torres Strait Islander proportion divided by the non-Indigenous proportion (both directly age-standardised).

(i) Rate difference is the Aboriginal and Torres Strait Islander proportion less the non-Indigenous proportion (both directly age-standardised).

(a) Women who gave birth, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in Vic and WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes women whose Indigenous status was not stated and women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy. A small number of women were missing the remoteness classification and hence were excluded.

(b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.

Table 6A.1.12 **Attendance of at least one antenatal visit in the first trimester for women who gave birth, by Indigenous status, by remoteness, 2011 to 2018 (age-standardised) (a), (b), (c)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT (d)</i> | <i>NT</i> | <i>Total</i> | <i>3-state total (e)</i> |
|--|-------------|------------|------------|------------|-----------|-----------|------------|----------------|-----------|--------------|--------------------------|
|--|-------------|------------|------------|------------|-----------|-----------|------------|----------------|-----------|--------------|--------------------------|

(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) aged 15–44 as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np).

(d) For the ACT, first antenatal visit is often the first hospital antenatal clinic visit. In many cases earlier antenatal care provided by the woman's GP is not reported.

(e) Total includes NSW, SA and the NT only to allow comparison with historical data.

– Nil or rounded to zero. **np** Not published. .. Not applicable.

- (a) Women who gave birth and identified as Aboriginal and Torres Strait Islander at 32 weeks or more gestation to a live birth or stillbirth. Excludes women whose number of antenatal visits was not stated. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Number of antenatal visits is included in the Perinatal NMDS from July 2012. Vic started collecting data on the numbers of antenatal visits from July 2015 and started reporting data from January 2016. WA supplied data on the number of antenatal visits for births from July 2012.
- (d) Results based on very small numbers (fewer than 5 events) are not published (np). Consequential suppression has been applied in affected rows and columns to prevent back-calculation of small numbers.
- (e) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data.
- (f) Total (at least one) includes specified number of visits and does not include women with an unknown number of antenatal visits.

np Not published. **na** Not available.

- (a) Women who gave birth at 32 weeks or more gestation to a live birth or stillbirth. Excludes women whose Indigenous status was not stated and women whose number of antenatal visits was not stated. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Number of antenatal visits is included in the Perinatal NMDS from July 2012. Vic started collecting data on the numbers of antenatal visits from July 2015 and started reporting data from January 2016.
- (c) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) aged 15–44 as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np).
- (e) Results based on very small numbers (fewer than 5 events) are not published (np). Consequential suppression (n.p.) has been applied in affected rows and columns to prevent back-calculation of small numbers.
- (f) Total includes all jurisdictions that provided data in a given year. This total should not be used for comparisons over time.
- (g) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data.
- (h) Total includes Qld, SA and the NT only to allow comparison with historical data.
- (i) Rate ratio is the Aboriginal and Torres Strait Islander proportion divided by the non-Indigenous proportion (both directly age-standardised).
- (j) Rate difference is the Aboriginal and Torres Strait Islander proportion less the non-Indigenous proportion (both directly age-standardised).

| Rate ratio (f) | no. | 0.8 | 0.8 | np | 0.9 | 0.8 |
| Rate difference (g) | no. | -15.3 | -17.9 | np | -14.0 | -15.6 |

(a) Women who gave birth at 32 week or more gestation to a live birth or stillbirth. Excludes mothers whose Indigenous status was not stated and mothers whose number of antenatal visits was not stated. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Number of antenatal visits is not part of the Perinatal NMDS in 2010. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for NSW, Victoria, and WA. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published.

(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with Data Principle 2, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals.

(d) Data are by place of usual residence of the mother. Women who gave birth in Qld, SA, ACT or NT but reside in another jurisdiction are not reported due to small numbers.

(e) Total includes Queensland, SA, the ACT and the NT only. These data are not generalisable to Australia.

(f) Rate ratio is the Aboriginal and Torres Strait Islander proportion divided by the non-Indigenous proportion (both directly age-standardised).

(g) Rate difference is the Aboriginal and Torres Strait Islander proportion less the non-Indigenous proportion (both directly age-standardised).

np Not published.

Excludes mothers whose Indigenous status was not stated and mothers whose number of antenatal visits was not stated. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Number of antenatal visits is not part of the Perinatal NMDS in 2007. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for NSW, Victoria, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in Qld, SA or NT but reside in another jurisdiction are not reported due to small numbers.

(c) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population.

(d) Data are by place of usual residence of the mother. Women who gave birth in Qld, SA, or NT but reside in another jurisdiction are not reported due to small numbers.

(e) Total includes Qld, SA and the NT only. These data are not generalisable to Australia.

(f) Rate ratio is the directly age-standardised Aboriginal and Torres Strait Islander proportion divided by the directly age-standardised non-Indigenous proportion.

(g) Rate difference is the directly age-standardised Aboriginal and Torres Strait Islander proportion less the directly age-standardised non-Indigenous proportion.

- (a) Women who gave birth at 32 weeks or more gestation to a live birth or stillbirth. Excludes women whose Indigenous status was not stated and women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy. A small number of women were missing the remoteness classification and hence were excluded.
- (b) Number of antenatal visits is included in the Perinatal NMDS from July 2012. For 2011 and 2012, data collection may not be consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data were not available for Victoria and WA in 2011. Victoria started collecting data on the numbers of antenatal visits from July 2015 and started reporting data from January 2016.
- (c) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) aged 15–44 as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np).
- (e) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data.
- (f) Total includes Qld, SA and the NT only to allow comparison with historical data.
- .. Not applicable. **na** Not available **np** Not published.

| Responding population | % | – | – | – | – | – | – | – | – | – |

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

Table 6A.1.20 **Antenatal care and childbirth, Aboriginal and Torres Strait Islander children (aged 0–3 years), by State and Territory, 2014-15 (a)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----|--|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (b) | Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population. | | | | | | | | | |
| (c) | Child born late (42 weeks or more). Child born on time (37-41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33-36 weeks). | | | | | | | | | |
| (d) | Comprises: had regular check-ups while pregnant, had check-ups while pregnant but not regular and had check-ups while pregnant but not known if regular. | | | | | | | | | |
| (e) | Comprises: Took folate prior to and during pregnancy, took folate prior to pregnancy only and took folate during pregnancy only. | | | | | | | | | |
| (f) | Data for 'Child's mother sought advice or information about pregnancy or child birth' was only collected from birth mothers (excludes other child proxies). For this indicator only, proportions are based on the population of birth mothers (53000). | | | | | | | | | |
| (g) | Other includes 'At a birthing centre', 'At a general medical clinic or facility', 'At home' and 'Other'. | | | | | | | | | |

| Responding population | % | — | — | — | — | — | — | — | — | — |

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population.

(c) Child born late (42 weeks or more). Child born on time (37-41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33-36 weeks).

(d) Data for 'Child's mother sought advice or information about pregnancy or child birth' was only collected from birth mothers (excludes other child proxies). For this indicator only, proportions are based on the population of birth mothers (42 800).

(e) Other includes 'At a birthing centre', 'At a general medical clinic or facility', 'At home' and 'Other'.

|-----|--|---------------------|-----------------------|-----------------------|-------------------------|---------------|--------------------|---------------------|------------------|
| (a) | Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. | | | | | | | | |
| (b) | Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population. | | | | | | | | |
| (c) | Child born late (42 weeks or more). Child born on time (37–41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33–36 weeks). | | | | | | | | |
| (d) | This information was only collected from birth mothers (excludes other child proxies) so proportions are based on this population (42 800). | | | | | | | | |
| (e) | Other includes 'At a birthing centre', 'At a general medical clinic or facility', 'At home' and 'Other'. | | | | | | | | |
| | – Nil or rounded to zero. np Not published. | | | | | | | | |

(a) Women who gave birth and identified as Aboriginal or Torres Strait Islander.

TABLE 6A.2.1

Table 6A.2.1 **Tobacco smoking during pregnancy by Aboriginal and Torres Strait Islander women, 2005 to 2018, (crude per cent) (a), (b), (c)**

| <i>Unit</i> | <i>NSW</i> | <i>Vic</i> (d), (e) | <i>Qld</i> | <i>WA</i> | <i>SA</i> (f), (g) | <i>Tas</i> | <i>ACT</i> | <i>NT</i> (d), (g) | <i>Total</i> (h) | <i>Total</i> (excl Vic) (i) |
|-------------|------------|------------------------|------------|-----------|-----------------------|------------|------------|--------------------|------------------|--------------------------------|
|-------------|------------|------------------------|------------|-----------|-----------------------|------------|------------|--------------------|------------------|--------------------------------|

(b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.

(c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during the first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. Prior to 2010, the question used is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers.

(d) Data are not available for Vic and NT prior to 2009.

(e) Due to data system reforms the Victorian Perinatal Data Collection for 2009, 2010 and 2011 are provisional.

(f) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(g) For women who gave birth in SA and the NT, smoking status in the first 20 weeks of pregnancy was recorded at the first antenatal visit.

(h) Total includes all jurisdictions that provided data in a given year. This total should not be used for comparisons over time.

(i) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data.

(j) Excludes women whose smoking status was not stated.

– Nil or rounded to zero. **na** Not available.

Table 6A.2.2 **Tobacco smoking during pregnancy by Aboriginal and Torres Strait Islander women, by remoteness, 2011 to 2018 (crude per cent) (a), (b), (c), (d), (e), (f)**

| <i>Unit</i> | <i>NSW</i> | <i>Vic (g)</i> | <i>Qld</i> | <i>WA</i> | <i>SA (h), (i)</i> | <i>Tas</i> | <i>ACT</i> | <i>NT (i)</i> | <i>Total (j)</i> |
|--|------------|----------------|------------|-----------|--------------------|------------|------------|---------------|------------------|
| (a) Women who gave birth and identified as Aboriginal or Torres Strait Islander. Excludes women whose smoking status was not stated. | | | | | | | | | |
| (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated. | | | | | | | | | |
| (c) In 2011, Remoteness area are based on the ABS 2006 Australian Standard Geographical Classification (ASGC). Between 2012 and 2016, Remoteness area are based on the ABS 2011 Australian Statistical Geography Standard (ASGS). From 2017, Remoteness area are based on the ABS 2016 ASGS. Because of differences in remoteness classifications used, care must be taken when comparing data over time. A small number of births were missing the remoteness classification and hence were excluded. | | | | | | | | | |
| (d) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during the first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. | | | | | | | | | |
| (e) Results based on very small numbers (fewer than 5 events) are not published (np). | | | | | | | | | |
| (f) Results based on denominators of less than 100 are not published (np) for reliability reasons. | | | | | | | | | |
| (g) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional. | | | | | | | | | |
| (h) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit. | | | | | | | | | |
| (i) For women who gave birth in SA and the NT, smoking status in the first 20 weeks of pregnancy was recorded at the first antenatal visit. | | | | | | | | | |
| (j) Total includes all jurisdictions that provided data in a given year. This total should not be used for comparisons over time. | | | | | | | | | |
| .. Not applicable. np Not published. | | | | | | | | | |

- (a) Women who gave birth. Excludes women whose Aboriginal and Torres Strait Islander status was not stated; and women whose smoking status was not stated.
- (b) Data are by place of usual residence of the mother. Table excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. Prior to 2010, the question used is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers.

Table 6A.2.3 **Tobacco smoking during pregnancy, by Indigenous status, 2007 to 2018 (age-standardised per cent) (a), (b), (c), (d)**

| | <i>Unit</i> | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> (e), (f) | <i>Qld</i> | <i>WA</i> | <i>SA</i> (g), (h) | <i>Tas</i> | <i>ACT</i> | <i>NT</i> (e), (h) | <i>Total (i)</i> | <i>7-state total (j)</i> |
|-----|---|-------------|------------|------------------------|------------|-----------|-----------------------|------------|------------|-----------------------|------------------|------------------------------|
| (d) | Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np). | | | | | | | | | | | |
| (e) | Data are not available for Vic and NT prior to 2009. | | | | | | | | | | | |
| (f) | Due to data system reforms the Victorian Perinatal Data Collection for 2009, 2010 and 2011 are provisional. | | | | | | | | | | | |
| (g) | For women who gave birth in SA 'Smoked' includes women who quit before the first antenatal visit. | | | | | | | | | | | |
| (h) | For women who gave birth in SA and the NT, smoking status was recorded at the first antenatal visit. | | | | | | | | | | | |
| (i) | Total includes all jurisdictions that provided data in a given year. This total should not be used for comparisons over time. | | | | | | | | | | | |
| (j) | Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data. | | | | | | | | | | | |
| (k) | Rate ratio is the directly age-standardised Aboriginal and Torres Strait Islander smoking proportion divided by the directly age-standardised non-Indigenous smoking proportion. | | | | | | | | | | | |
| (l) | Rate difference is the directly age-standardised Aboriginal and Torres Strait Islander smoking proportion less the directly age-standardised non-Indigenous smoking proportion. | | | | | | | | | | | |

(a) Women who gave birth. Excludes women whose Indigenous status was not stated and women whose smoking status was not stated. A small number of women were missing the remoteness classification and hence were excluded.

(b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.

(c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during the first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy.

(d) Data are directly age-standardised using the 2001 Australian female Estimated Resident Population (ERP) as the standard population. In accordance with NIRA PIMG agreed principles for reporting directly age-standardised rates for administrative data, age-standardised rates cannot be calculated if any age-stratified group has fewer than 30 individuals (np).

(e) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional.

(f) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(g) For women who gave birth in SA and the NT, smoking status was recorded at the first antenatal visit.

(h) Total includes NSW, Qld, WA, SA, Tas, the ACT and the NT only to allow comparison with historical data.

np Not published. **na** Not available. – Nil or rounded to zero. .. Not applicable.

Source: AIHW analysis of the National Perinatal Data Collection.

TABLE 6A.3.1

Table 6A.3.1 **Number and birth rate for Aboriginal and Torres Strait Islander women (aged less than 20 years), by age of mother, by state and territory, 2004–2018 (a), (b), (c)**

| | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust (d)</i> |
|---------------------------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-----------------|
| 2005 | 17.3 | 3.6 | 14.9 | 32.0 | 21.5 | 10.7 | – | 82.8 | 23.8 |
| 2004 | 16.5 | 13.0 | 19.9 | 36.5 | 16.4 | 23.4 | 13.2 | 37.0 | 22.2 |
| Average birth rate 2004 to 2018 | 13.4 | 10.0 | 17.9 | 33.5 | 18.0 | 9.5 | 6.9 | 52.8 | 20.5 |

(a) The denominator for this measure is the number of women aged between 15 and 19 years of age.

(b) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(c) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

(d) Includes other territories.

– Nil or rounded to zero.

|---|---------------------------|-----------------|-----------------|-----------------|-----------------|---------------------------|
| (a) Aboriginal and Torres Strait Islander births to teenage mothers comprise births where either parent identifies as being of Aboriginal and Torres Strait Islander origin. | | | | | | |
| (b) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. | | | | | | |
| (c) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014. | | | | | | |
| (d) Includes other territories. | | | | | | |
| – Nil or rounded to zero. np Not published. | | | | | | |

|-----|---|-----------------|-----------------|-----------------|-----------------|---------------------------|
| (a) | From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. | | | | | |
| (b) | Previously supplied data for Births to Non-Indigenous Teenage Mothers used the wrong denominator. This data has been corrected for all years supplied and therefore randomisation has been applied to all years for this data item. | | | | | |
| (c) | Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014. | | | | | |
| (d) | Includes other territories. | | | | | |
| | – Nil or rounded to zero. | | | | | |

(a) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

TABLE 6A.3.6

Table 6A.3.6 **Births, by Indigenous status, by age of mother, 1998–2018 (a), (b), (c)**

| <i>Aboriginal and Torres Strait Islander births</i> | | | | | | <i>Births to Aboriginal and Torres Strait Islander mothers</i> | | | | | | <i>Births to non-Indigenous mothers</i> | | | | | |
|---|----|----|----|----|-----|--|----|----|----|----|-----|---|----|----|----|----|-----|
| <16 | 16 | 17 | 18 | 19 | 20+ | <16 | 16 | 17 | 18 | 19 | 20+ | <16 | 16 | 17 | 18 | 19 | 20+ |

(b) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014 which may affect national trends.

(c) Excludes births to mothers whose age was not stated.

(a) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(b) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014 which may impact national trends.

(c) Aboriginal and Torres Strait Islander births to teenage mothers comprise births where either parent identifies as being of Aboriginal and Torres Strait Islander origin.

– Nil or rounded to zero.

(b) From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation.

(c) Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014.

(d) Father can be Aboriginal and Torres Strait Islander or non-Indigenous.

– Nil or rounded to zero. **np** Not published.

| Total births to non-Indigenous teenage mothers | no. | 5 165 | 2 207 | 1 236 | 154 | 54 |

(a) Teenage mothers comprise women aged less than 20 who have given birth.

Table 6A.3.9 **Births to mothers (aged less than 20 years), by Indigenous status of mother, by age of father, by remoteness, 2005–2018 (a), (b), (c), (d)**

| | <i>Unit</i> | <i>Major cities</i> | <i>Inner regional</i> | <i>Outer regional</i> | <i>Remote</i> | <i>Very remote</i> |
|-----|--|---------------------|-----------------------|-----------------------|---------------|--------------------|
| (b) | Births which could not be assigned to an Statistical Area Level 2 cannot be allocated to a Remoteness Area and have been excluded from this table. Therefore Remoteness Area totals will differ from state level totals. | | | | | |
| (c) | From 2013, cells with small values have been randomly adjusted to protect confidentiality. Some totals will not equal the sum of their components. Cells with 0 values have not been affected by confidentialisation. | | | | | |
| (d) | Temporary processing delays have contributed to the low number of births registered in New South Wales for 2014 which may affect national trends. | | | | | |
| (e) | Father can be Aboriginal and Torres Strait Islander or non-Indigenous. | | | | | |
| | – Nil or rounded to zero. | | | | | |

TABLE 6A.4.1

Table 6A.4.1 **Low birthweight among live born singleton babies, Australia, by Indigenous status of mother, 2007 to 2018 (a), (b), (c)**

| | <i>Proportion of babies with low birthweight (<2500g)</i> | | <i>Number of babies with low birthweight (<2500g)</i> | | <i>Rate ratio (d)</i> | <i>Rate difference (e)</i> |
|------|--|-----------------------|--|-----------------------|-----------------------|----------------------------|
| | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous</i> | | |
| 2018 | 10.2 | 4.9 | 1 371 | 13 669 | 2.1 | 5.3 |
| 2017 | 10.7 | 4.9 | 1 415 | 13 768 | 2.2 | 5.8 |
| 2016 | 10.2 | 4.8 | 1 354 | 13 901 | 2.1 | 5.4 |
| 2015 | 10.4 | 4.8 | 1 323 | 13 500 | 2.2 | 5.6 |
| 2014 | 10.5 | 4.7 | 1 315 | 13 381 | 2.3 | 5.8 |
| 2013 | 10.9 | 4.6 | 1 313 | 12 984 | 2.4 | 6.3 |
| 2012 | 10.5 | 4.5 | 1 252 | 13 044 | 2.3 | 5.9 |
| 2011 | 11.2 | 4.6 | 1 275 | 12 657 | 2.5 | 6.6 |
| 2010 | 10.7 | 4.5 | 1 205 | 12 407 | 2.4 | 6.2 |
| 2009 | 10.9 | 4.5 | 1 199 | 12 247 | 2.4 | 6.4 |
| 2008 | 11.2 | 4.4 | 1 218 | 12 083 | 2.5 | 6.7 |
| 2007 | 11.2 | 4.5 | 1 186 | 12 100 | 2.5 | 6.8 |

- (a) Data relate to live births. Data exclude multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.
- (b) Data are by place of usual residence of the mother. Data exclude Australian non-residents, residents of external territories and records where State/Territory of residence was not stated.
- (c) Births with not stated maternal Indigenous status were excluded. Data on Aboriginal and Torres Strait Islander births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.
- (d) Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.
- (e) Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.

(a) Data relate to live births. Data exclude multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.

(b) Data are by place of usual residence of the mother. Data exclude Australian non-residents, residents of external territories and records where State/Territory of residence was not stated.

(c) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in Tas and the ACT should be viewed with caution as they are based on small numbers of births.

(d) Includes births to mothers whose Indigenous status was not stated.

(e) Rate ratio is the proportion of babies born to Aboriginal and Torres Strait Islander mothers with low birthweight divided by the proportion of babies born to non-Indigenous mothers with low birthweight.

(a) Data relate to live births. Data excludes multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded.

(b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where State/Territory of residence was not stated.

(c) Results based on very small numbers (fewer than 5 events) are not published (np).

(d) Results based on denominators of less than 100 are not published (np) for reliability reasons.

(e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in Tas and the ACT should be viewed with caution as they are based on small numbers of births.

(f) Includes births to mothers whose Indigenous status was not stated.

.. Not applicable. **np** Not published.

- (a) Data relate to live births. Data excludes multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published here by place of residence.
- (d) Results based on very small numbers (fewer than 5 events) are not published (np).
- (e) Results based on denominators of less than 100 are not published (np) for reliability reasons.
- (f) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in Tas and the ACT should be viewed with caution as they are based on small numbers of births.
- (g) Includes births to mothers whose Aboriginal and Torres Strait Islander status was not stated.
- Nil or rounded to zero. .. Not applicable. **np** Not published.

- (a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded from the totals.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated state/territory of residence.
- (c) Totals for each state and territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.
- (d) Results based on very small numbers (fewer than 5 events) are not published (np).
- (e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing Tasmania and in the ACT are based on small numbers of births and should be viewed with caution.
- (f) Data on Aboriginal and Torres Strait Islander births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and exclude babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

- (a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded from the totals.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated state/territory of residence.
- (c) Totals for each state and territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.
- (d) Results based on very small numbers (fewer than 5 events) are not published (np).
- (e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in the ACT and Tasmania are based on small numbers of births and should be viewed with caution.

Table 6A.4.10 **Incidence of low birthweight among live born singleton babies, by Indigenous status of the mother, by remoteness, 2013 (a), (b), (c), (d)**

- (a) Data relate to live births. Data excludes multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Results based on very small numbers (fewer than 5 events) are not published (np).
- (d) Results based on denominators of less than 100 are not published (np) for reliability reasons.
- (e) Birthweight data on babies born to Aboriginal and Torres Strait Islander mothers residing in Tas and the ACT should be viewed with caution as they are based on small numbers of births.
- (f) Rate ratio is the proportion of babies born to Aboriginal and Torres Strait Islander mothers with low birthweight divided by the proportion of babies born to non-Indigenous mothers with low birthweight.

Table 6A.4.13 **Incidence of low birthweight among live born singleton babies, by Indigenous status of the mother, by remoteness, 2016–2018 (a), (b), (c), (d)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas (e)</i> | <i>ACT (e)</i> | <i>NT</i> | <i>Aust</i> |
|-----|---|------------|------------|------------|-----------|-----------|----------------|----------------|-----------|-------------|
| (g) | Rate difference is the proportion of babies born to Aboriginal and Torres Strait Islander mothers with low birthweight less the proportion of babies born to non-Indigenous mothers with low birthweight. | | | | | | | | | |

.. Not applicable. **np** Not published.

- (a) Data relate to live births. Data excludes multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Indigenous status of the baby is included in the Perinatal NMDS from July 2012. Date of implementation varies across jurisdictions. Caution should be used when interpreting these numbers.
- (d) Birthweight data on Aboriginal and Torres Strait Islander babies born to mothers residing in Tas and the ACT should be viewed with caution as they are based on small numbers of births.
- (e) Includes babies whose Indigenous status was not stated.
- (f) Rate ratio is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight divided by the proportion of non-Indigenous babies with low birthweight.
- (g) Rate difference is the proportion of Aboriginal and Torres Strait Islander babies with low birthweight less the proportion of non-Indigenous babies with low birthweight.
- (h) WA and SA did not provide data for Indigenous status of the baby until 2012.
- (i) In 2011, Australian total includes all jurisdictions that provided data in a given year. This total should not be used for comparisons over time.

- (a) Data relate to live births. Data excludes multiple births, stillbirths and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection. The denominator is the total number of live births in each remoteness and Indigenous category. A small number of births were missing the remoteness classification and hence were excluded.
- (b) Data are by place of usual residence of the mother. Data excludes Australian non-residents, residents of external territories and records where state/territory of residence was not stated.
- (c) Totals for each state and territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published here by place of residence.
- (d) Results based on very small numbers (fewer than 5 events) are not published (np).
- (e) Birthweight data on Aboriginal and Torres Strait Islander babies born to mothers residing in Tasmania and the ACT should be viewed with caution as they are based on small numbers of births.
- (f) Includes babies whose Aboriginal and Torres Strait Islander status was not stated.
- Nil or rounded to zero. .. Not applicable. **np** Not published.

(a) Data relate to live births. Data exclude stillbirths; births less than 20 weeks gestation (where gestation is known); and multiple births. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated state/territory of residence.

(c) Totals for each state and territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Results based on very small numbers (fewer than 5 events) are not published.

(e) Indigenous status of the baby is included in the Perinatal NMDS from July 2012. Date of implementation varies across jurisdictions. Caution should be used when interpreting these numbers.

(f) Birthweight data on Aboriginal and Torres Strait Islander babies born to mothers residing in Tasmania and the ACT should be viewed with caution as they are based on small numbers of births.

(g) Includes births whose Indigenous status was not stated.

.. Not applicable. **np** Not published

- (a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic; and multiple births.
- (b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated state/territory of residence.
- (c) Totals for each state and territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.
- (d) Data on Indigenous status of the baby is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data on Indigenous status of the baby was available for available for NSW, Vic, Qld, Tas, the ACT and the NT only. Women who gave birth in NSW, Vic, Qld, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers. Table excludes women who gave birth in WA and SA where Indigenous status of the baby was not available.
- (e) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.
- (f) Birthweight data on Aboriginal and Torres Strait Islander babies born to mothers residing in Tasmania and the ACT should be viewed with caution as they are based on small numbers of births.
- (g) Includes births whose Indigenous status was not stated.

| 2004–2006 | 47 350 | 6.1 | 7 873 | 1.0 | 3 425 | 0.4 |
| 2003–2005 | 45 096 | 6.1 | 7 375 | 1.0 | 3 199 | 0.4 |
| 2002–2004 | 43 974 | 6.1 | 7 275 | 1.0 | 3 182 | 0.4 |
| 2001–2003 | 43 485 | 6.1 | 7 267 | 1.0 | 3 176 | 0.4 |
| 2000–2002 | 43 606 | 6.1 | 7 350 | 1.0 | 3 154 | 0.4 |
| 1999–2001 | 42 418 | 6.0 | 7 192 | 1.0 | 3 126 | 0.4 |
| 1998–2000 (d) | 44 503 | 6.0 | 7 519 | 1.0 | 3 261 | 0.4 |

(a) Data are presented in three year groupings due to small numbers.

(b) Data relate to live births. Data excludes stillbirths, births with an unknown birth status and births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.

(c) Births with not stated maternal Indigenous status were excluded. Data on Aboriginal and Torres Strait Islander births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(d) 'Not stated' Indigenous status was not collected in 1998. For the period 1998–2000, 'Births to non-Indigenous mothers' includes mother's whose Indigenous status was unknown.

| 2004–2006 | 4 353 | 78.2 | 3 668 | 65.9 | 3 283 | 59.0 |
| 2003–2005 | 3 407 | 74.2 | 2 769 | 60.3 | 2 398 | 52.2 |
| 2002–2004 | 3 822 | 76.7 | 3 219 | 64.6 | 2 858 | 57.4 |
| 2001–2003 | 3 671 | 76.2 | 3 083 | 64.0 | 2 732 | 56.7 |
| 2000–2002 | 3 660 | 76.6 | 3 041 | 63.7 | 2 674 | 56.0 |
| 1999–2001 | 3 609 | 76.0 | 2 949 | 62.0 | 2 583 | 55.0 |
| 1998–2000 (d) | 3 715 | 74.7 | 2 971 | 59.7 | 2 588 | 52.0 |

(a) Data are presented in a three year grouping due to small numbers.

(b) Data relate to stillbirths. Data excludes births of less than 20 weeks gestation. Births both less than 20 weeks gestation and less than 400 grams birthweight are not included in the National Perinatal Data Collection.

(c) Births with not stated maternal Indigenous status were excluded. Data on Aboriginal and Torres Strait Islander births relate to babies born to Aboriginal and Torres Strait Islander mothers only, and excludes babies born to non-Indigenous mothers and Aboriginal and Torres Strait Islander fathers. Therefore, the information is not based on the total count of Aboriginal and Torres Strait Islander babies.

(d) 'Not stated' Indigenous status was not collected in 1998. For the period 1998–2000, 'Births to non-Indigenous mothers' includes mother's whose Indigenous status was unknown.

TABLE 6A.4.25

Table 6A.4.25 **Women who gave birth, selected birth outcomes, by Indigenous status, 2006–2008, 2015–2017, and 2016–2018 (a), (b)**

| | | Women aged less than 20 years | | Women aged more than 20 years | |
|----------------------|------|---------------------------------------|----------------|---------------------------------------|----------------|
| | Unit | Aboriginal and Torres Strait Islander | Non-Indigenous | Aboriginal and Torres Strait Islander | Non-Indigenous |
| Rate per 1000 births | | | | | |
| Neonatal deaths | rate | 4.9 | 4.4 | 6.8 | 2.4 |

(a) Data are for mothers who gave birth to a live born baby.

(b) For multiple births, the birth status and baby outcome of the first-born baby was used.

(c) Pre-term is defined as born at 36 weeks or less.

(d) Low birthweight is defined as less than 2,500 grams.

(e) Apgar scores are clinical indicators of a baby's condition shortly after birth, with a total score between 0 and 10 points. An Apgar score of 7 or more at 5 minutes after birth indicates the baby is adapting well to the environment, while a score of less than 7 indicates complications for the baby.

| Total aged 0–3 years | 6.0 | .. | .. | .. | 41.7 | .. | .. | .. |

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval (CI) is also reported against each estimate.

(b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions for use of alcohol, tobacco and illicit substances during pregnancy have therefore been calculated on the responding population.

| Other hospitalisations (d) | 0.7 | 0.7 | 0.7 | 0.8 | 0.8 | 1.0 | 1.0 | 1.1 | 1.1 |
| Total hospitalisations | 1.1 | 1.1 | 1.1 | 1.2 | 1.2 | 1.2 | 1.3 | 1.4 | 1.4 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis only.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements
- (d) 'Other hospitalisations' includes: C00–D48 Neoplasms; D50–D89 Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism; F00–F99 Mental and behavioural disorders; H00–H59 Diseases of the eye and adnexa; I00–I99 Diseases of the circulatory system; M00–M99 Diseases of the musculoskeletal system and connective tissue; O00–O99 Pregnancy, childbirth and the puerperium; and, Not reported.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (f) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. The population denominator used in calculating rates is a weighted sum of June 30 population estimates for the two years spanned by the reference period. For 2018–19 this includes 50 per cent of the population as at 30 June 2018 and 50 per cent of the population at 30 June 2019.
- (g) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis only.

(b) This table includes data for residents of six jurisdictions only (NSW, Victoria, Queensland, WA, SA and the NT).

(c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements

(d) 'Other hospitalisations' includes: C00–D48 Neoplasms; D50–D89 Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism; F00–F99 Mental and behavioural disorders; H00–H59 Diseases of the eye and adnexa; I00–I99 Diseases of the circulatory system; M00–M99 Diseases of the musculoskeletal system and connective tissue; O00–O99 Pregnancy, childbirth and the puerperium; and, Not reported.

(e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(f) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. The population denominator used in calculating rates is a weighted sum of June 30 population estimates for the two years spanned by the reference period. For 2018–19 this includes 50 per cent of the population as at 30 June 2018 and 50 per cent of the population at 30 June 2019.

(g) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

Table 6A.5.2 **Hospitalisations for children (aged 0–4 years), by Indigenous status, by principal diagnosis chapter, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2010-11 to 2018-19 (a), (b), (c)**

| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99) | 572 | 445 | np | 3 992.6 | 1 867.7 | 2.1 |
| Injury, poisoning and certain other consequences of external causes (S00–T98) | 481 | 463 | np | 3 357.4 | 1 943.3 | 1.7 |
| Total (top 6 diagnoses) | 5 848 | 3 788 | 23 | 40 819.5 | 15 898.6 | 2.6 |
| Other hospitalisations (j) | 1 808 | 1 299 | 12 | 12 620.0 | 5 452.0 | 2.3 |
| Total hospitalisations | 7 656 | 5 087 | 35 | 53 439.4 | 21 350.6 | 2.5 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis only.

(b) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018.

(c) Total Australia Data are from public and private hospitals in all jurisdictions.

(d) Data for individual jurisdictions exclude hospitalisations from private hospitals in the NT, Tasmania and the ACT.

(e) Data are reported by place of usual residence of the patient.

(f) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements.

(g) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June 30 population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(h) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(i) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

TABLE 6A.5.3

Table 6A.5.3 **Hospitalisations for children (aged 0–4 years), by Indigenous status, by principal diagnosis chapter, by state and territory, 2016–2018 (a), (b), (c), (d), (e), (f), (g)**

| Factors influencing health status and contact with health services (Z00–Z99) | 306 | 269 | – | 2 027.0 | 1 210.6 | 1.7 |
| Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99) | 408 | 332 | np | 2 702.7 | 1 494.1 | 1.8 |
| Injury, poisoning and certain other consequences of external causes (S00–T98) | 503 | 394 | np | 3 332.0 | 1 773.2 | 1.9 |
| Total (top 6 diagnoses) | 5 360 | 3 031 | 9 | 35 506.1 | 13 640.9 | 2.6 |
| Other hospitalisations (j) | 1 759 | 1 103 | 16 | 11 652.1 | 4 964.0 | 2.3 |
| Total hospitalisations | 7 119 | 4 134 | 25 | 47 158.2 | 18 604.9 | 2.5 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis only.

(b) Numbers of hospitalisation are total hospitalisations for two year periods. For 2010–2012, data include hospitalisations from 1 July 2010 to 30 June 2012.

(c) Total Australia Data are from public and private hospitals in all jurisdictions.

(d) Data for individual jurisdictions exclude hospitalisations from private hospitals in the NT, Tasmania and the ACT.

(e) Data are reported by place of usual residence of the patient.

(f) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements.

(g) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June 30 population estimates. For 2010–2012 this includes 50% of the population as at 30 June 2010, 100% of the population as at 30 June 2011 and 50% of the population at 30 June 2012.

(h) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

TABLE 6A.5.4

Table 6A.5.4 **Hospitalisations for children (aged 0–4 years), by Indigenous status, by principal diagnosis chapter, by state and territory, 2010–2012 (a), (b), (c), (d), (e), (f), (g)**

| | <i>Hospitalisations (no.)</i> | | | <i>Age specific rate</i> | | <i>Rate ratio (i)</i> |
|--|--|-------------------------------|-------------------|--|-------------------------------|---------------------------|
| | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (h)</i> | <i>Not stated</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (h)</i> | |

- (i) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.
- (j) 'Other hospitalisations' includes: C00–D48 Neoplasms; D50–D89 Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism; E00–E89 Endocrine, nutritional and metabolic diseases; F00–F99 Mental and behavioural disorders; G00–G99 Diseases of the nervous system; H00–H59 Diseases of the eye and adnexa; H60–H95 Diseases of the ear and mastoid process; I00–I99 Diseases of the circulatory system; K00–K93 Diseases of the digestive system; L00–L99 Diseases of the skin and subcutaneous tissue; M00–M99 Diseases of the musculoskeletal system and connective tissue; N00–N99 Diseases of the genitourinary system; O00–O99 Pregnancy, childbirth and the puerperium; Q00–Q99 Congenital malformations, deformations and chromosomal abnormalities; and, Not reported.

– Nil or rounded to zero. **np** Not published.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis only.

TABLE 6A.5.5

Table 6A.5.5 Hospitalisations for children (aged 0–4 years), by Indigenous status, by principal diagnosis chapter, by remoteness, 2010–2012 and 2016–2018 (a), (b), (c), (d), (e), (f)

| <i>Aboriginal and Torres Strait Islander</i> | | | | <i>Non-indigenous (g)</i> | | | |
|--|---------------------------------|-------------------------------|----------------------------|---------------------------|---------------------------------|-------------------------------|----------------------------|
| <i>Major cities</i> | <i>Inner and outer regional</i> | <i>Remote and very remote</i> | <i>Total Australia (h)</i> | <i>Major cities</i> | <i>Inner and outer Regional</i> | <i>Remote and very remote</i> | <i>Total Australia (h)</i> |

- (b) Data are from public and private hospitals in all jurisdictions.
- (c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements.
- (d) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018. For 2010–2012, data include hospitalisations from 1 July 2010 to 30 June 2012.
- (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June 30 population estimates. For 2010–2012 this includes 50% of the population as at 30 June 2010, 100% of the population as at 30 June 2011 and 50% of the population at 30 June 2012.
- (f) Disaggregation by remoteness area is based on the 2006 Australian Statistical Geographical Classification - Remoteness Area for 2010-12 and the 2011 & 2016 Australian Statistical Geography Standard (ASGS) for 2016-18 and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.
- (g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (h) Total includes migratory areas and separations with unknown remoteness area.
- (i) 'Other hospitalisations' includes: C00–D48 Neoplasms; D50–D89 Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism; E00–E89 Endocrine, nutritional and metabolic diseases; F00–F99 Mental and behavioural disorders; G00–G99 Diseases of the nervous system; H00–H59 Diseases of the eye and adnexa; H60–H95 Diseases of the ear and mastoid process; I00–I99 Diseases of the circulatory system; K00–K93 Diseases of the digestive system; L00–L99 Diseases of the skin and subcutaneous tissue; M00–M99 Diseases of the musculoskeletal system and connective tissue; N00–N99 Diseases of the genitourinary system; O00–O99 Pregnancy, childbirth and the puerperium; Q00–Q99 Congenital malformations, deformations and chromosomal abnormalities; and, Not reported.
- (j) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.
.. Not applicable.

| Total potentially preventable hospitalisations | 1.3 | 1.4 | 1.5 | 1.4 | 1.5 | 1.5 | 1.6 | 1.7 | 1.6 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). For the breakdown of 'Injury, poisoning and certain other consequences of external causes', only the first external cause is counted.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

Table 6A.6.1 **Hospitalisations for injury and potentially preventable diseases for children (aged 0–4 years), by Indigenous status, Australia, 2010-11 to 2018-19 (a), (b), (c), (d)**

| | 2010-11 | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 |
|--|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| (f) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate. | | | | | | | | | |

(a) This table includes data for six jurisdictions only (NSW, Victoria, Queensland, WA, SA and the NT). From 2004-05 to 2009-10, only these jurisdictions were considered to have acceptable quality of Indigenous identification in hospitalisation data.

(b) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). For the breakdown of 'Injury, poisoning and certain other consequences of external causes', only the first external cause is counted.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.

(f) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous persons hospitalisation rate.

TABLE 6A.6.3

Table 6A.6.3 **Hospitalisations for injury and potentially preventable diseases for children (aged 0–4 years), by Indigenous status, by state and territory, 2016–2018 (a), (b), (c), (d), (e), (f)**

| ICD-10-AM code and description | <i>Hospitalisations (no.)</i> | | <i>Age specific rate</i> | | <i>Rate ratio (h)</i> |
|--------------------------------|--|-------------------------------|--|-------------------------------|---------------------------|
| | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (g)</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (g)</i> | |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). For the breakdown of 'Injury, poisoning and certain other consequences of external causes', only the first external cause is counted.

(b) Data exclude private hospitals from ACT, Tas and NT.

(c) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018.

(d) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(f) Data are reported by place of usual residence of the patient.

(g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(h) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

.. Not applicable. **np** Not published. – Nil or rounded to zero.

TABLE 6A.6.4

Table 6A.6.4 **Hospitalisations for injury and potentially preventable diseases for children (aged 0–4 years), by Indigenous status, by state and territory, 2010–2012 (a), (b), (c), (d), (e)**

| ICD-10-AM code and description | <i>Hospitalisations (no.)</i> | | <i>Age specific rate</i> | | <i>Rate ratio (g)</i> |
|--------------------------------|--|-------------------------------|--|-------------------------------|---------------------------|
| | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (f)</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous (f)</i> | |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). For the breakdown of 'Injury, poisoning and certain other consequences of external causes', only the first external cause is counted.

(b) Data exclude private hospitals from ACT, Tas and NT.

(c) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of [June?] year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(e) Data are reported by place of usual residence of the patient.

(f) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(g) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

.. Not applicable. **np** Not published. – Nil or rounded to zero.

| | <i>Major cities</i> | <i>Inner and outer regional</i> | <i>Remote and very remote</i> | <i>Total Australia</i> | <i>Major cities</i> | <i>Inner and outer regional</i> | <i>Remote and very remote</i> | <i>Total Australia</i> |
| Assault (X85–Y09) | 21 | 55 | 60 | 136 | 169 | 138 | 10 | 326 |
| Complications of medical and surgical care (Y40–Y84) | 70 | 110 | 69 | 252 | 3 753 | 1 215 | 84 | 5 075 |
| Other (X60–X84; Y10–Y39; Y85–Y98) | 8 | 16 | 11 | 35 | 158 | 85 | 12 | 255 |
| Total potentially preventable hospitalisations | 5 651 | 10 223 | 10 160 | 26 102 | 191 369 | 78 235 | 6 076 | 276 816 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). For the breakdown of 'Injury, poisoning and certain other consequences of external causes', only the first external cause is counted.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018. For 2010–2012, data include hospitalisations from 1 July 2010 to 30 June 2012.
- (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.
- (f) Disaggregation by remoteness area is based on the 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.
- (g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (h) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.
- .. Not applicable. **np** Not published. – Nil or rounded to zero.

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006–15 (final), 2016 (revised) and 2017–18 (preliminary).
- (b) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (c) Data based on reference year.
- (d) Some totals and figures may not compute due to the effects of rounding.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Aboriginal and Torres Strait Islander across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.
- (g) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (h) Care should be taken when interpreting deaths data for Queensland as they were affected by changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.
- (i) Deaths where the Indigenous status of the deceased was not stated are excluded.

TABLE 6A.6.6

Table 6A.6.6 Deaths from external causes and preventable diseases for children (aged 0–4 years), by Indigenous status, NSW, Queensland, WA, SA and NT, 2009–2013 and 2014–2018 (a), (b), (c), (d), (e), (f), (g)

| | <i>Unit</i> | <i>NSW</i> | <i>Qld (h)</i> | <i>WA</i> | <i>SA</i> | <i>NT</i> | <i>Total (i)</i> |
|---|-------------|------------|----------------|-----------|-----------|-----------|------------------|
| (j) The ICD-10 codes included in External Causes and Preventable Diseases are: Certain infectious and parasitic diseases (A00-B99); Nutritional anaemias (D50-D53) and malnutrition (E40-E46); Diseases of the ear and mastoid process (H60-H95); Diseases of the respiratory system (J00-J99); Diseases of the oral cavity, salivary glands and jaws (K00-K14); Diseases of the skin and subcutaneous tissue (L00-L99); Transport accidents (V01-V99); Other external causes of accidental injury (W00-X59); Assault (X85-Y09); Complications of medical and surgical care (Y40-Y84); Other (X60-X84, Y10-Y39, Y85-Y98). | | | | | | | |
| (k) Crude rates calculated per 100 000 Estimated Resident Population for children aged less than 5 years for the average of the period 2009–2013 and 2014–2018. | | | | | | | |
| (l) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031 (ABS Cat. no. 3238.0, series B, 2016 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated. | | | | | | | |
| (m) Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals. | | | | | | | |

| 4–14 | 7 121 | 5.6 | 2.1 | 19.0 | 81 604 | 2.9 | 0.7 | 11.6 | 1.9 |
| Total 0–14 | 10 323 | 5.8 | 1.9 | 16.9 | 111 339 | 2.9 | 0.5 | 8.9 | 2.0 |
| Total with ear/hearing problems (e) | | | | | | | | | |
| 0–3 | 3 604 | 7.3 | 3.1 | 21.6 | 36 279 | 3.7 | 0.8 | 10.7 | 2.0 |
| 4–14 | 16 226 | 12.8 | 2.8 | 11.1 | 140 974 | 5.0 | 0.7 | 6.7 | 2.6 |
| Total 0–14 | 19 830 | 11.2 | 2.3 | 10.3 | 177 252 | 4.7 | 0.5 | 5.6 | 2.4 |

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate. Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander children by the corresponding rate for non-Indigenous children.

(c) Includes partial hearing loss and deafness in one ear. Includes Complete deafness and Partial deafness and hearing loss (not elsewhere classified).

(d) Includes Otitis Media, Tinnitus, Meniere's disease/Vertiginous syndrome and type of hearing problem not known. Data for 2008 also includes Otitis externa. Includes Diseases of the middle ear and mastoid (Otitis media, Other diseases of the middle ear and mastoid), Diseases of the inner ear (Menieres disease, Other diseases of the inner ear), and Other diseases of the ear.

(e) Components may not add to total as people may have reported more than one type of ear/hearing problem.

np Not published.

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. A 95 per cent confidence interval is also reported against each estimate. Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Non-remote comprises major cities and inner and outer regional areas.
- (c) Remote comprises remote and very remote areas. NHS 2017-18 excludes Very remote areas and discrete Indigenous communities.
- (d) Includes Tinnitus, Meniere's disease/Vertiginous syndrome and type of hearing problem not known. Includes Other diseases of the middle ear and mastoid, Diseases of the inner ear (Menieres disease, Other diseases of the inner ear), and Other diseases of the ear.
- (e) Components may add to more than total as people may have reported more than one type of ear/hearing problem.

TABLE 6A.7.6

Table 6A.7.6 **Age specific hospitalisations where the principal diagnosis was diseases of the ear and mastoid process, by Indigenous status, Australia, 2010-11 to 2018-19 (a), (b), (c)**

| | 2010-11 | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 |
|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
| Total | 767.8 | 742.9 | 721.0 | 686.1 | 711.9 | 695.5 | 702.7 | 670.7 | 646.0 |

- (a) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements.
- (d) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. The population used is specific to the population age group being analysed (children aged 0–3 years, 4–14 years, and 0–14 years). The population denominator used in calculating rates is a weighted sum of June 30 population estimates for the two years spanned by the reference period. For 2018–19 this includes 50 per cent of the population as at 30 June 2018 and 50 per cent of the population at 30 June 2019.

– Nil or rounded to zero. **np** Not published.

(a) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) This table includes data for residents of six jurisdictions only (NSW, Victoria, Queensland, WA, SA and the NT).

(c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements.

(d) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

Table 6A.7.7 **Age specific hospitalisations where the principal diagnosis was diseases of the ear and mastoid process, by Indigenous status, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2018-19 (a), (b), (c)**

|---|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. The population used is specific to the population age group being analysed (children aged 0–3 years, 4–14 years, and 0–14 years). The population denominator used in calculating rates is a weighted sum of June 30 population estimates for the two years spanned by the reference period. For 2018–19 this includes 50 per cent of the population as at 30 June 2018 and 50 per cent of the population at 30 June 2019. | | | | | | | | | | | | | | | |

TABLE 6A.7.8

Table 6A.7.8 **Hospitalisation for children (aged 0–14 years) where the principal diagnosis was diseases of the ear and mastoid process, by Indigenous status, by remoteness, 2010–2012 and 2016–2018 (a), (b), (c), (d), (e)**

| | <i>Aboriginal and Torres Strait Islander</i> | | | | <i>Non-indigenous (f)</i> | | | |
|---|--|---------------------------------|-------------------------------|----------------------------|---------------------------|---------------------------------|-------------------------------|----------------------------|
| | <i>Major cities</i> | <i>Inner and Outer regional</i> | <i>Remote and Very remote</i> | <i>Total Australia (g)</i> | <i>Major cities</i> | <i>Inner and Outer regional</i> | <i>Remote and Very remote</i> | <i>Total Australia (g)</i> |
| (a) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). | | | | | | | | |
| (b) Data are from public and private hospitals in all jurisdictions. | | | | | | | | |
| (c) Data exclude hospitalisations in WA with a contracted patient status of 'Inter-hospital contracted patient to private sector hospital', to adjust for separations recorded on both sides of contractual care arrangements. | | | | | | | | |
| (d) Numbers of hospitalisation are total hospitalisations for two year periods. For 2016–2018, data include hospitalisations from 1 July 2016 to 30 June 2018. For 2010–2012, data include hospitalisations from 1 July 2010 to 30 June 2012. | | | | | | | | |
| (e) Disaggregation by remoteness area is based on the 2006 Australian Statistical Geographical Classification - Remoteness Area for 2010-12 and the 2011 & 2016 Australian Statistical Geography Standard (ASGS) for 2016-18 and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area. | | | | | | | | |
| (f) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated). | | | | | | | | |
| (g) Total includes migratory areas and separations with unknown remoteness area. | | | | | | | | |
| (h) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June 30 population estimates. For 2016–2018 this includes 50 per cent of the population as at 30 June 2016, 100 per cent of the population as at 30 June 2017 and 50 per cent of the population at 30 June 2018. | | | | | | | | |
| (i) Rate ratio is the Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate. | | | | | | | | |

- (a) Financial year data is determined by the date the service was processed by Medicare Australia.
- (b) Location is determined according to the address (at the time of claiming) of the patient to whom the service was rendered.
- (c) Includes claims for Medicare Benefits Schedule (MBS) Items 715 and 228 (Aboriginal and Torres Strait Islander People's Health Assessment, available from 1 May 2010 and from 1 July 2018, respectively) for children aged 0–4 years in the reference period. MBS item 715 relates to health checks provided by a general practitioner (GP), while item 228 relates to health checks provided by a medical practitioner (excluding specialist or consultant physicians). For earlier years, data also includes data for MBS Item 708 (Aboriginal and Torres Strait Islander Child Health Check, available to 30 April 2010).
- (d) Data for on the number of assessments received under the MBS Aboriginal and Torres Strait Islander Health Assessment understate the total number of health assessments received by Aboriginal and Torres Strait Islander children. Other health assessments received by Aboriginal and Torres Strait Islander children, not counted in these data, including assessments: billed as another MBS Item (such as a standard consultation); provided outside Medicare (such as health services provided by State and Territory funded services (for example maternal and child health services) or the Australian Royal Flying Doctor Service); or, provided by hospital doctors.
- (e) Aboriginal and Torres Strait Islander population denominator are series B population projections based on the 2016 Census using the average of two years of projections.
- Nil or rounded to zero

7 Education and training

Strategic areas for action

Education is a life-long activity, beginning with learning and development in the home and in communities and continuing through to the more formal settings of school education, vocational education and training and higher education. Education and training aims to develop the capacities and talents of children so that they have the necessary knowledge, understanding, skills and values they need to participate in the economy and in society — contributing to every aspect of their wellbeing (Education Council 2019). There are strong links between higher levels of education and improved physical and mental health. Actions in this strategic area can help to strengthen communities and regions both economically and socially.

The indicators in this chapter cover some of the key factors that contribute to positive education and training outcomes.

- Teacher quality (section 7.1) — while there is no nationally agreed measure of teacher quality, research suggests that teachers can positively influence Aboriginal and Torres Strait Islander student outcomes. Teacher quality includes recognising and valuing Aboriginal and Torres Strait Islander cultures and maintaining positive expectations of individual students' capability and success.
- School engagement (section 7.2) — student engagement with school and learning is important to achieve positive learning outcomes. While there is currently no nationally agreed definition of school engagement, three measures of school engagement have been identified: behavioural, emotional and cognitive engagement.
- Transition from school to work (section 7.3) — young people's successful transitions from school to further education, training and employment are important for establishing and maintaining social connections, and for their economic prospects and physical and mental health and wellbeing.

Several COAG targets and headline indicators reflect the importance of education and training:

- early childhood education (section 4.3)
- reading, writing and numeracy (section 4.4)
- Year 1 to 10 attendance (section 4.5)
- Year 12 attainment (section 4.6)
- post-secondary education — participation and attainment (section 4.8).

Other COAG targets and headline indicators can be directly influenced by education and training outcomes:

- employment (section 4.7)
- household and individual income (section 4.10).

Outcomes in the education and training area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- governance, leadership and culture — governance capacity and skills (chapter 5)
- early child development — basic skills for life and learning, ear health (chapter 6)
- healthy lives — access to primary health care and fewer potentially preventable hospitalisations will affect education outcomes, while education outcomes can influence both tobacco consumption and harm and obesity and nutrition (chapter 8)
- economic participation — employment and occupation, and home ownership (chapter 9).

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, ‘table 7A.1.1’). These tables can be found on the web page (www.pc.gov.au/oid2020).

7.1 Teacher quality¹

Box 7.1.1 Key messages

- Teacher quality is considered the most important ‘in-school’ influence on student educational outcomes. While there is no nationally agreed measure of teacher quality, research suggests that teachers can positively influence the outcomes for Aboriginal and Torres Strait Islander students through a range of broad qualities. These qualities include recognising and valuing Aboriginal and Torres Strait Islander cultures and maintaining positive expectations of individual students’ capability and success.
- Increasing the number of Aboriginal and Torres Strait Islander teachers is one potential mechanism to improve teacher quality. Aboriginal and Torres Strait Islander teachers can provide cultural knowledge to non-Indigenous teachers and facilitate understanding between all teachers, students and the students’ families. For non-Indigenous teachers, more experience working with Aboriginal and Torres Strait Islander students during their teacher education may increase their confidence in teaching Aboriginal and Torres Strait Islander students in future.

Student school achievement is influenced by a range of factors. These include ‘in-school’ factors such as teacher quality and school resourcing (Sullivan, Perry and McConney 2013). These also include other factors such as family life, student motivation and ability (Biddle and Cameron 2012), and health outcomes (like hearing loss) (PC 2016).

Teacher quality is the single most important ‘in-school’ influence on student achievement (Hattie 2009); it is a product of the school context, professional practices, and the attributes and capabilities of teachers and school leaders (Bahr and Mellor 2016). Teacher quality can influence student educational outcomes, both directly and indirectly, by fostering a positive, inclusive and safe learning environment (Boon 2011; Riley 2015). Improving teacher quality is therefore an important precondition for improving achievement (PC 2012).

Improving and maintaining teacher quality for Aboriginal and Torres Strait Islander students requires:

- understanding what quality means for Aboriginal and Torres Strait Islander students and their parents
- implementing effective strategies to build teacher quality
- evaluating these measures and monitoring of quality on an ongoing basis.

¹ The Steering Committee notes its appreciation to Dr Lynette Riley, University of Sydney, who reviewed a draft of this section of the Report.

Quality teaching entails a broad set of qualities that apply for all children and contexts...

Quality teaching entails a broad set of qualities that apply for all children and contexts. Quality teachers work closely with their peers and other school workers, recognise the diverse ways in which students learn, challenge them by setting high expectations, provide them with continuous feedback and bring to the classroom a deep knowledge of the subject matter (PC 2012). The key elements of quality teaching are described in the *Australian Professional Standards for Teachers* (AITSL 2011) which articulate that teachers should:

- know students and how they learn
- know the content and how to teach it
- plan for and implement effective teaching and learning
- create and maintain supportive and safe learning environments
- assess, provide feedback and report on student learning
- engage in professional learning
- engage professionally with colleagues, parents/carers and the community.

...and for Aboriginal and Torres Strait Islander students, teachers must embrace Aboriginal and Torres Strait Islander cultural identities and provide safe learning environments

There is also evidence of the elements of teacher quality that positively influence outcomes for Aboriginal and Torres Strait Islander students specifically, particularly from the perspectives of Aboriginal and Torres Strait Islander parents and students (Krakouer 2015; Lewthwaite et al. 2017; Riley 2015). Quality teachers for Aboriginal and Torres Strait Islander students are culturally competent, and:

- recognise and value Aboriginal and Torres Strait Islander cultures, languages and perspectives. Valuing Aboriginal and Torres Strait Islander children's cultural perspectives can improve the relationships between the school, teachers and Aboriginal and Torres Strait Islander students. It can also improve school attendance and student engagement, which have been linked to improved academic outcomes (Baxter and Meyers 2016; Gillan, Mellor and Krakouer 2017; Mooney et al. 2016)
- understand the adjustments required by Aboriginal and Torres Strait Islander children entering the school environment. Quality teaching adapts to children's identities and languages, and implements culturally relevant curricula (Miller et al. 2019)
- build positive relationships with students as a foundation for learning and maintain positive expectations of students' capability and success (Lewthwaite et al. 2017; Lloyd et al. 2015; PC 2012). Teachers' expectations of students' capability and success are critical to whether students progress well or not (OECD 2017). However, teachers can

implicitly or explicitly attribute low ability to Aboriginal and Torres Strait Islander students, thereby influencing their academic achievement (Riley 2019).

Australian governments have agreed that ‘Australia’s education system must embrace Aboriginal and Torres Strait Islander cultural identities and provide Aboriginal and Torres Strait Islander people with safe learning environments’ (Education Council 2019, p. 16). According to the *Australian Professional Standards for Teachers*, proficient teachers:

- design and implement effective teaching strategies that are responsive to the local community and cultural setting, linguistic background and histories of Aboriginal and Torres Strait Islander students
- provide opportunities for students to develop understanding of and respect for Aboriginal and Torres Strait Islander histories, cultures and languages (AITSL 2011).

Ensuring that teachers are well qualified and undertake ongoing professional development is a key strategy governments have adopted to improve teacher quality...

The OECD (2018) has found that high-performing education systems:

... emphasise clinical education as part of initial teacher education; they provide bespoke opportunities for in-service teachers’ professional development; and they put teacher-appraisal mechanisms in place that have a strong focus on teachers’ continuous improvement. (p. 4)

Ensuring that teachers are well qualified initially (through university and pre-service training) and that current teachers undertake ongoing professional development and assessment against the *Australian Professional Standards for Teachers* is a key strategy Australian governments have adopted to improve teacher quality. In particular, training and development includes teachers building their knowledge and understanding of Aboriginal and Torres Strait Islander cultures, histories and languages as outlined in the *Australian Professional Standards for Teachers*.

For individual schools, retaining experienced staff and reducing turnover may also be a strategy to improve the quality of teaching. Schools in remote and/or disadvantaged areas (where Aboriginal and Torres Strait Islander children are overrepresented) often report persistent difficulties in attracting and retaining well-qualified teachers who can confidently engage with Aboriginal and Torres Strait Islander people and understand and respect their cultures; these difficulties can impede student learning (Halsey 2018; Hudson et al. 2016; Jorgensen 2017; PC 2012; Thomson and Hillman 2019).

...however, teacher qualifications and experience are only part of the picture...

Teacher qualifications and experience are only part of the picture, as these data do not show what actually happens in the work of teaching (ACER 2017). Guenther, Disbray and

Osborne (2016, p. 77) found that what matters ‘is not as much about the qualifications or experience of the teacher, as it is about the qualities the teacher brings to the context’ — that is, the in-class qualities of teachers. In a review of literature relating to teachers’ Aboriginal and Torres Strait Islander cultural competency, Krakouer (2015) noted the importance of teachers’ abilities to teach to the strengths of their students and adapt their teaching style to suit individual Aboriginal and Torres Strait Islander learners.

Assessment of in-class teacher qualities (either as self-assessed, or as assessed by principals and/or students) can provide important information to teachers, schools and school systems (ACER 2017; Thomson and Hillman 2019). Aspects of teacher quality will be similar for all students, but Aboriginal and Torres Strait Islander students and their families also require that teachers recognise and value Aboriginal and Torres Strait Islander perspectives and incorporate them into their teaching (Baxter and Meyers 2016; Guenther, Disbray and Osborne 2016; Mooney et al. 2016).

...and there is little information available for monitoring teacher quality

No nationally agreed measure or data set that monitors teacher quality currently exists, either in general or specifically for Aboriginal and Torres Strait Islander students.

Data on teacher qualifications, experience, recent training, and accreditation against the professional standards are not currently available, although data being collected by the Australian Institute of Teaching and School Leadership (AITSL) may in future include measures related to initial teacher registration and progression through career stages (AITSL 2020).

Similarly, there are no nationally comparable data on the perceptions of teachers themselves about their preparedness and ability to teach Aboriginal and Torres Strait Islander students. Available research provides some indication of the extent to which recent teacher graduates felt prepared for teaching in a culturally competent manner:

- A sample of pre-service teachers across two states found that most prospective teachers believed they had an understanding of how students learn (98 per cent) and understood the intellectual development of students (90 per cent). However, only 60 per cent felt that they could engage Aboriginal and Torres Strait Islander students and only 70 per cent felt they could demonstrate understanding for teaching Aboriginal and Torres Strait Islander students (Hudson et al. 2016). Supporting qualitative analysis indicated that a lack of experience with Aboriginal and Torres Strait Islander students impacted prospective teachers’ confidence in practice (Hudson et al. 2016).
- Evidence from the Longitudinal Teacher Education and Workforce Study indicated that about half the sample of 2011 teacher graduates believed that their teacher education program prepared them to teach ‘culturally, linguistically and socio-economically diverse learners’ (Mayer et al. 2014, p. 215).

Increasing the number of Aboriginal and Torres Strait Islander teachers is one potential way to improve teacher quality

Increasing the number of Aboriginal and Torres Strait Islander teachers is one potential way to improve teacher quality, as Aboriginal and Torres Strait Islander teachers can provide cultural knowledge to non-Indigenous teachers and facilitate understanding between teachers, students and families (Baxter and Meyers 2016; Buckskin 2016; House of Representatives Standing Committee on Indigenous Affairs 2017). In particular, local staff are considered important for remote and very remote schools (Guenther, Disbray and Osborne 2016). However, expecting Aboriginal and Torres Strait Islander teachers to know and teach all aspects of culture in all Aboriginal and Torres Strait Islander communities, and be responsible for Aboriginal and Torres Strait Islander education issues from curriculum to pastoral care, can substantially increase their workload. This can in turn lead to ‘burnout’ and stress; Aboriginal and Torres Strait Islander teachers, particularly at the early stage of their careers, should be provided with professional development and support (Santoro et al. 2011; Santoro and Reid 2006).

Data on the number of Aboriginal and Torres Strait Islander teachers and their roles may provide some ‘proxy’ information on the overall quality of the teaching profession. Available data indicate that the number of Aboriginal and Torres Strait Islander teachers is increasing. The More Aboriginal and Torres Strait Islander Teachers Initiative found that there were 3100 Aboriginal and Torres Strait Islander school teachers nationally in 2015, a net increase of 439 teachers from 2012 (MATSITI 2017). Of these teachers, 83 per cent were classroom teachers, 7 per cent were deputy principals and 3 per cent were principals (Buckskin 2016).

Section 5.6 *Indigenous cultural studies* contains further information on the Aboriginal and Torres Strait Islander education workforce.

Future directions in data

The AITSL is currently developing the Australian Teacher Workforce Data (ATWD); however, these data are not yet publically available. The ATWD will provide nationally consistent data on the number of teachers, their characteristics (including qualifications, registration and employment status), and teacher training and career paths (AITSL 2020). Collecting good quality data on the Indigenous status of teachers as part of the ATWD could provide valuable insights into the experiences of Aboriginal and Torres Strait Islander teachers.

In addition, data on the extent to which teachers are meeting the *Australian Professional Standards for Teachers*, their prior teaching experience, where they are teaching now and their length of service at a school (particularly for schools in remote and very remote areas) may help to show whether Aboriginal and Torres Strait Islander children have access to quality teachers. This may include whether they have access to teachers with effective teaching strategies that are responsive to the needs of Aboriginal and Torres Strait Islander

students, and who have an understanding of their students' local community and cultural setting, linguistic background and histories.

While teacher qualifications, experience and/or recent training are often used as proxies, these only make up part of the picture and do not focus attention on what actually happens in the work of teaching (Bahr and Mellor 2016). Research studies consistently show that school students are responsible and reliable sources of information about the quality of teaching, and are more reliable than other teachers or school principals (ACER 2017). The Centre for Education Statistics and Evaluation (CESE 2016) notes that data from student surveys and questionnaires are highly reliable for broad populations, for instance at the school level. However, there is not currently a national data source for student surveys.

7.2 School engagement²

Box 7.2.1 Key messages

- Student engagement with school and learning ('school engagement') is important for achieving positive learning outcomes.
- School engagement means more than student attendance. While there is currently no nationally agreed definition or measure of school engagement, three elements of school engagement have been identified: behavioural, emotional and cognitive engagement.
- There are currently no national data available on cognitive engagement, but some data are available on behavioural and emotional engagement with school:
 - Aspects of *behavioural engagement* are measured in section 4.5 *Year 1 to 10 attendance* and section 4.6 *Year 12 attainment*. Data show that Aboriginal and Torres Strait Islander students' retention to Years 10 and 12, and Year 12 attainment, are both increasing — although these and school attendance rates at all year levels remain below those of their non-Indigenous peers
 - One aspect of *emotional engagement* is the sense of belonging. Data reported in this section show that for both Aboriginal and Torres Strait Islander and non-Indigenous students 'Sense of belonging at school' has been decreasing since 2003.
- Students' sense of belonging at school is affected by a range of factors including: the relationship a student has with their teacher; the relationship between the school, parents and the community; and individual positive characteristics (such as optimism, self-efficacy, healthy self-esteem, coping skills, adaptability, pro-social goals and the ability to make and keep friends).
- Valuing Aboriginal and Torres Strait Islander children's cultural perspectives can improve relationships between schools, Aboriginal and Torres Strait Islander students, and the students' families.

High levels of school engagement are important for improved learning outcomes. Students who have emotional and cognitive engagement with school — which includes a sense of belonging, perseverance, motivation and self-esteem — can make the most of available opportunities, irrespective of their 'level of aptitude' (OECD 2017).

Conversely, children who become disengaged are more likely to miss school, be disruptive in class, become depressed or anxious at school, or feel low connection to the school — which are all associated with poor school outcomes (Hancock and Zubrick 2015). Rather than characterising these children as problematic, these behaviours provide the school with a signal that these children need assistance, with school communities key in supporting them and building their engagement with school (Allen 2020).

² The Steering Committee notes its appreciation to Dr Lynette Riley, University of Sydney, who reviewed a draft of this section of the Report.

Addressing school engagement is important. Australian and international research has demonstrated that students' level of emotional, behavioural, and cognitive engagement with school is connected with a range of positive outcomes, including:

- higher academic achievement
- improved rates of attendance and year 12 attainment
- better mental health and job status later in life (Allen and McKenzie 2015; CESE 2017, 2019; Gemici and Lu 2014; Goss, Sonnermann and Griffiths 2017; OECD 2019; Riley 2015).

However, the relationship between school engagement and student outcomes is complex. School engagement can positively affect performance but, conversely, improvements in performance also positively affect engagement (CESE 2017). In a study of NSW students, Turner and Pale (2019) found that some elements of school engagement (for example, resilience, effort, and attitudes to attendance) positively affected student academic outcomes, while there was no significant relationship for other factors (such as, motivation and interest, learning confidence, sense of connectedness and inclusion).

Several factors can make school engagement particularly challenging for Aboriginal and Torres Strait Islander children. These factors include Aboriginal and Torres Strait Islander children becoming discouraged by a history of low expectations, children and their communities being conditioned to see themselves as the cause of their educational failure, and racism — all of which can lead children to believe that school is not relevant for them, which in turn can reduce school engagement (Sarra et al. 2018; Stronger Smarter Institute Limited 2014). A study of Aboriginal and Torres Strait Islander primary school students, using data from wave 6 of the Longitudinal Study of Indigenous Children (LSIC), found that negative feelings about Indigenous identity were negatively associated with feeling engaged with schooling (Dunstan, Hewitt and Tomaszewski 2017).

School engagement means more than student attendance

School engagement is difficult to define and measure (Appleton, Christenson and Furlong 2008; Axelson and Flick 2011; Fredricks and McCloskey 2012). Even though Australian governments have agreed on the importance of school engagement for all students, including Aboriginal and Torres Strait Islander learners (Education Council 2019; MCEECDYA 2010), there is no nationally agreed definition or measure of school engagement. An evaluation of the *Sporting Chance Program* by the Australian Council for Educational Research (ACER) in 2011 proposed measures against the four dimensions it identified as important to Aboriginal and Torres Strait Islander students' school engagement (Lonsdale et al. 2011 and table 7A.2.1); however, data sources for reporting against this framework have not been identified.

Outlined below are three components commonly referred to as comprising school engagement and are also contained within the proposed ACER (Lonsdale et al. 2011)

framework for Aboriginal and Torres Strait Islander school engagement. These are based on the model developed by Fredricks, Blumenfeld and Paris (2004), with additional material from Dunstan, Hewitt and Tomaszewski (2017) and Appleton, Christenson and Furlong (2008).

- *Behavioural engagement.* This may be measured by identifiable or observable behaviours at school (such as participation in school activities or classroom behaviours) and by attendance, attainment and retention. Aspects of behavioural engagement are measured in sections 4.5 *Year 1 to 10 attendance* and 4.6 *Year 12 attainment*. Data in these sections show that Aboriginal and Torres Strait Islander children's rates of school enrolment and retention to Year 12 have been increasing, although school attendance and Year 12 attainment rates remain below those of their non-Indigenous peers.
- *Emotional engagement* — also referred to as affective engagement. This describes the emotional response to school or affective connections at school. It may be analysed by seeking students' attitudes to learning and school, one element of which is sense of belonging (included in this section), and their feelings about involvement with school including whether school is a worthwhile pursuit.
- *Cognitive engagement.* This has been less frequently measured in a classroom setting, but research studies have used measures such as students' perceptions of intellectual challenge, effort or interest and motivation. No measures of cognitive engagement are presented in this Report.

The relationship between these components is complex, and they are likely to be interrelated. For example, students may skip school or arrive late for school because they are academically disengaged or do not feel they belong at school (OECD 2019). However, the factors that influence whether a child attends school (their behavioural engagement) may differ from the factors that influence how a child feels about school (their emotional engagement). For example, Dunstan, Hewitt and Tomaszewski's (2017) analysis of LSIC data found that poorer socioeconomic circumstances were not associated with a child's emotional engagement with school, but noted other research suggesting they were associated with behavioural engagement. By contrast, Dunstan, Hewitt and Tomaszewski (2017) found evidence that the environment within the school (such as positive peer and teacher relationships) may be more important than the environment outside the school for emotional engagement.

Most Aboriginal and Torres Strait Islander students feel attached to, and socially connected within, their school...

Data from the Programme for International Student Assessment (PISA) — a triennial survey of 15-year-old students conducted by the Organisation for Economic Cooperation and Development (OECD) — indicate that in 2018 most Aboriginal and Torres Strait Islander

students felt attached to, and socially connected within, their school (figure 7.2.1).³ However, in some ways their sense of belonging at school is below that reported by non-Indigenous students (figure 7.2.1). As part of the PISA, students are asked for their responses to six statements that are considered to reflect their sense of belonging at school. Compared with non-Indigenous students, Aboriginal and Torres Strait Islander students reported a lower sense of belonging at school across three of the six statements. The largest gap with non-Indigenous students related to ‘I feel like I belong at school’, with less than two-thirds of Aboriginal and Torres Strait Islander students agreeing with the statement (figure 7.2.1).

Figure 7.2.1 **Sense of Belonging at School, 2018^{a,b}**

■ = The proportion of Aboriginal and Torres Strait Islander students who agree with the statement is not statistically different from the proportion for non-Indigenous students.

↓ = The proportion of Aboriginal and Torres Strait Islander students who agree with the statement is lower, and is statistically different from the proportion for non-Indigenous students.

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See table 7A.2.2 for detailed definitions, footnotes and caveats.

Source: Australian Council for Educational Research (ACER) (unpublished); table 7A.2.2.

³ The Programme for International Student Assessment (PISA) collects information on one aspect of emotional engagement: students’ sense of belonging at school (OECD 2019). It should be noted that the construct for this measure has not been validated for Aboriginal and Torres Strait Islander children and should so be used with caution when attributing ‘sense of belonging’ to Aboriginal and Torres Strait Islander children.

...but this has decreased over time, particularly when it comes to feeling they belong at school

Students' level of agreement to the six statements are combined to construct a Sense of Belonging at School Index. Higher scores on the Index indicate that students feel a greater sense of belonging at school, while a negative score on the Index indicates the result is below the 2003 PISA OECD average.⁴ In 2018, the Sense of Belonging at School Index score for Aboriginal and Torres Strait Islander students was -0.32 (table 7.2.1) — below the score for non-Indigenous students, which was also negative (-0.18) (table 7.2.1).

Table 7.2.1 Sense of Belonging at School Index, by Indigenous status, 2018^{a,b}

| | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|---------------------------------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
| Aboriginal and Torres Strait Islander | -0.39 ±0.12 | -0.39 ±0.32 | -0.22 ±0.16 | -0.18 ±0.22 | -0.26 ±0.19 | -0.44 ±0.23 | -0.40 ±0.42 | -0.35 ±0.21 | -0.32 ±0.07 |
| Non-Indigenous | -0.17 ±0.04 | -0.12 ±0.05 | -0.23 ±0.05 | -0.25 ±0.04 | -0.23 ±0.07 | -0.36 ±0.09 | -0.26 ±0.08 | -0.25 ±0.16 | -0.18 ±0.02 |

^a The table includes the 95 per cent confidence interval associated with each point estimate (for example, -0.32 ±0.07). ^b See table 7A.2.3 for detailed definitions, footnotes and caveats.

Source: Australian Council for Educational Research (ACER) (unpublished); table 7A.2.3.

Students' sense of belonging at school declined significantly, for both Aboriginal and Torres Strait Islander and non-Indigenous students, between PISA 2003 and 2018 (table 7A.2.3). Over the 15-year period, the proportion of Aboriginal and Torres Strait Islander students who reported positive views declined significantly across all six statements relating to a sense of belonging. In particular, between PISA 2003 and 2018, there was a 25 percentage point decrease in Aboriginal and Torres Strait Islander students reporting 'I feel like I belong at school' (table 7A.2.2).

Aboriginal and Torres Strait Islander students' sense of belonging at school is affected by a range of factors

A number of factors may influence Aboriginal and Torres Strait Islander students' affective engagement with school.

- *The relationship a student has with their teacher* — Students report a greater sense of belonging when they feel that teachers respect and value them (Allen et al. 2018; Dunstan, Hewitt and Tomaszewski 2017; Turner and Pale 2019).

A school that values Aboriginal and Torres Strait Islander children's cultural perspectives can improve the relationships between its teachers and Aboriginal and

⁴ The index, when it was originally constructed in PISA 2003, was standardised to have a mean of 0 and a standard deviation of 1 across OECD countries (De Bortoli 2018).

Torres Strait Islander students (Fogarty, Schwab and Lovell 2015; Gillan, Mellor and Krakouer 2017; Mooney et al. 2016). Conversely, if an Aboriginal and Torres Strait Islander child does not feel that the school and their teacher values their cultural perspective, or feels that they exhibit racist attitudes or behaviours, their level of school engagement may decline (Mooney et al. 2016).

- *The relationship between the school, parents and the community* — A parent's relationship with the school and the value and level of support they are able to provide are important to student outcomes. Local schools that engage parents in their children's education improve the children's educational attainment and engagement (Barker and Harris 2020; Higgins and Morley 2014).

Researchers have highlighted that for some Aboriginal and Torres Strait Islander parents, the history of school education has not been positive and has been associated with a racist and systematic disruption of Aboriginal and Torres Strait Islander people's ways of life (Benveniste et al. 2014; Ockenden 2014; Sarra et al. 2018). To address their concerns regarding student safety and cultural wellbeing, schools need to engage with Aboriginal and Torres Strait Islander parents and caregivers as partners in education; this should help improve levels of home-based support and school engagement (PM&C 2018; Purdie and Buckley 2010; Zubrick et al. 2006).

- *Familiarity and comfort at school* — Aboriginal and Torres Strait Islander children who feel accepted or have strong peer relations and ties within the school environment are more likely to want to engage and achieve well at school (Dunstan, Hewitt and Tomaszewski 2017; Riley 2015).

Unlike for behavioural engagement, Dunstan, Hewitt and Tomaszewski's (2017) analysis suggests that socioeconomic factors (such as parental employment, household income or area-level socioeconomic circumstances) are not significantly associated with affective engagement.

With regards to the first two factors above, research has found that (in both urban and remote areas) Aboriginal and Torres Strait Islander teachers and support staff — and the involvement and engagement of community elders — can play an important role by providing cultural knowledge to non-Indigenous teachers and facilitating understanding between all teachers, students and their families (Baxter and Meyers 2016; Guenther and Disbray 2015; House of Representatives Standing Committee on Indigenous Affairs 2017). However, it has also been noted that Aboriginal and Torres Strait Islander teachers are expected to know and teach all aspects of culture in all Aboriginal and Torres Strait Islander communities, and are often also responsible for Aboriginal and Torres Strait Islander education issues from curriculum to pastoral care. These high expectations and this increased workload often lead to 'burnout' and stress — and so Aboriginal and Torres Strait Islander teachers, particularly in the early stage of their careers, should be provided with professional development and support (Santoro et al. 2011; Santoro and Reid 2006).

For many Aboriginal and Torres Strait Islander children the language spoken at home is a traditional language, a regional Kriol, or Aboriginal English (House of Representatives

Standing Committee on Indigenous Affairs 2017) (see sections 5.5 *Indigenous language revitalisation and maintenance* and 6.8 *Basic skills for life and learning*). This can present barriers for students who are expected to learn in standard Australian English. Studies suggest that when quality bilingual or culturally appropriate instructional approaches (which support students speaking English as a second language) are adopted, family and community support for schooling and student engagement may increase (House of Representatives Standing Committee on Indigenous Affairs 2017; Silburn et al. 2011).

While academy-style programs do not replace the need for schools to work with students and their communities, they can be an effective way of engaging and supporting students at school

Australian governments fund a number of ‘academy-style’ engagement programs that have the specific goal of increasing participants’ school engagement (Gillan, Mellor and Krakouer 2017; House of Representatives Standing Committee on Indigenous Affairs 2017). Often using sport as a ‘hook’, these programs partner with schools and aim to strengthen engagement at school by: providing culturally safe spaces; providing health and nutrition education; building resilience and self-esteem; providing opportunities for community engagement and leadership; and encouraging and supporting academic and post-school goals. While these programs do not replace the need for schools to engage with students and their communities, there is evidence that some have ‘proven to be an effective way of engaging and supporting students at school’ (House of Representatives Standing Committee on Indigenous Affairs 2017, p. 76). However, there have been concerns raised that programs for girls and non-sports based programs do not receive the same recognition or funding (House of Representatives Standing Committee on Indigenous Affairs 2017).

Future directions in data

Further work is required to determine the definitions, appropriateness and method of collating and reporting data on Aboriginal and Torres Strait Islander students’ engagement with school, and on the interaction of the various engagement components.

A number of jurisdictions collect their own data on school engagement and/or wellbeing (SCRGSP 2020, section 4). Their surveys collect information from students across the behavioural, emotional, and cognitive domains of engagement; however, they are not conducted on a consistent basis and only limited data are available publicly (particularly with respect to Aboriginal and Torres Strait Islander students). The suitability of the measures proposed in the ACER framework for Aboriginal and Torres Strait Islander school engagement (Lonsdale et al. 2011 and table 7A.2.1) should be assessed and, if they are found suitable, appropriate data sources should be identified for national reporting.

Further work is also required to investigate the factors affecting the link between school engagement and learning outcomes.

7.3 Transition from school to work⁵

Box 7.3.1 Key messages

- The successful transition of young people from school to further education, training and employment is important for establishing and maintaining social connections, and for their economic prospects and physical and mental health and wellbeing.
- While there are increasing numbers of Aboriginal and Torres Strait Islander young people completing Year 12, this does not appear to be translating into higher levels of Aboriginal and Torres Strait Islander young people being fully engaged in employment, education and training when they leave school. Nationally in 2018–19, 36 per cent of Aboriginal and Torres Strait Islander 17–24 year olds were fully engaged — similar to the rate in 2002. And while the rate for non-Indigenous young people has declined since 2002, it is still double the rate of Aboriginal and Torres Strait Islander young people.
- For those with higher level post-school qualifications, this is associated with improved employment outcomes. Nationally in 2017–19, among people aged 18–64 years with a Bachelor degree or above, labour force participation and employment rates for Aboriginal and Torres Strait Islander people (87 per cent and 80 per cent respectively) were similar to those for non-Indigenous people. But for Aboriginal and Torres Strait Islander people with lower qualification levels, the labour force and employment outcomes were below that of non-Indigenous people with similar qualification levels.
- However, not being fully engaged may not mean disengagement or being unproductive. Many young Aboriginal and Torres Strait Islander people may be engaged with employment, education and training on a part time basis, or be involved in other activities (such as volunteering or caring for others). In 2016, more than 40 per cent of Aboriginal and Torres Strait Islander young women who were not fully engaged in employment, education and training had a child, compared to 20 per cent of young non-Indigenous women.
- For Aboriginal and Torres Strait Islander young people able and wanting to transition to full time employment, education and training, there are additional barriers when compared to non-Indigenous young people. Barriers include poorer educational outcomes from schooling, lower levels of English literacy, poorer health, greater family responsibilities, and less access to resources to find employment, education and training opportunities. Residents in remote areas face additional challenges with more limited employment, education and training opportunities in their local areas, which disproportionately affects Aboriginal and Torres Strait Islander people.

⁵ The Steering Committee notes its appreciation to Dr Lynette Riley, University of Sydney, who reviewed a draft of this section of the Report.

Box 7.3.2 Measures of transition from school to work

There are two main measures for this indicator:

- *Successful transition from school* is defined as the proportion of young people aged 17–24 years no longer enrolled at school who are fully engaged in post-school education or training or are employed.
- *Labour force status and employment-to-population ratio of people aged 18–64 years who have achieved a qualification of Certificate level III or above* is defined as the proportion of people aged 18–64 years with a qualification of Certificate level III or above who are (a) in the labour force and (b) employed.

Data for both measures are sourced from the ABS National Aboriginal and Torres Strait Islander Health Survey/National Aboriginal and Torres Strait Islander Social Survey, with the most recent available data for 2018-19 (engagement by remoteness; employment status by sex; remoteness; jurisdiction). Comparable data for the non-Indigenous population are available from the ABS National Health Survey/General Social Survey, with the most recent available data for 2017-18.

- Supplementary data are also reported from the ABS Census of Population and Housing (Census), with the most recent available data for 2016 (remoteness; all jurisdictions). Survey and Census data are not directly comparable.

The successful engagement of young people in employment and further education and training is crucial for personal economic prospects and wellbeing (such as mental and physical health). Young people that are engaged in employment, education and training are more trusting of others and engaged with society and their communities (OECD 2016).

Australian and international research shows that a person that experiences periods of educational or economic inactivity can suffer damaging long-term consequences for future employment (Anlezark 2011; Dorsett and Lucchino 2018). For Aboriginal and Torres Strait Islander people, accumulated labour market disadvantage during their youth can lead to significant differences in work experience once they are in their thirties, relative to non-Indigenous people (Venn 2018). As well as the economic impact, there is evidence that inactivity among young people is associated with a greater dissatisfaction about their personal situation and more pessimism about the future (OECD 2016).

Like most young people, Aboriginal and Torres Strait Islander young people want to be able to contribute positively to their communities and society. While there are a range of motivating factors for individuals, for many Aboriginal and Torres Strait Islander young people their education and employment aspirations are influenced by their culture, and desire to be with and care for their family and kin. Parkes, McRae-Williams and Tedmanson (2015) found that Aboriginal and Torres Strait Islander young people in remote locations were ‘motivated by the dream of being with family, caring for others and being cared for’, and therefore value pathways and options that maintain and strengthen relationships with family rather than remove them from family.

Increasing rates of Year 12 attainment does not appear to be translating to increased rates of young people in employment, post-school education and training

While there are increasing numbers of Aboriginal and Torres Strait Islander young people completing Year 12 (see section 4.6 *Year 12 attainment*), this does not appear to be translating into higher levels of Aboriginal and Torres Strait Islander young people being fully engaged in employment, education and training when they leave school. Nationally in 2018-19, 36 per cent of Aboriginal and Torres Strait Islander people aged 17–24 years, who were no longer attending school, were ‘fully engaged’ in employment or post-school education and training — similar to the rate in 2002 (figure 7.3.1).⁶ The rate of non-Indigenous young people who are fully engaged in employment, education and training has declined since 2002, but has remained approximately double the rate of Aboriginal and Torres Strait Islander young people (figure 7.3.1).

Figure 7.3.1 Proportion of people aged 17–24 years not in school who are fully engaged in full time employment, education and training, by Indigenous status, 2002 to 2017–2019^{a,b}

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See table 7A.3.1 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) National Aboriginal Torres Strait Islander Health Survey (various years); ABS (unpublished) National Aboriginal Torres Strait Islander Social Survey (various years) ABS (unpublished) National Health Survey (various years); ABS (unpublished) General Social Survey (various years); table 7A.3.1.

⁶ To be *fully engaged* a person is defined as being: ‘Engaged through full time study *and* full time employment’, ‘Primarily engaged through full time study’, ‘Primarily engaged through full time employment’, or ‘Engaged through part time study *and* part time employment’.

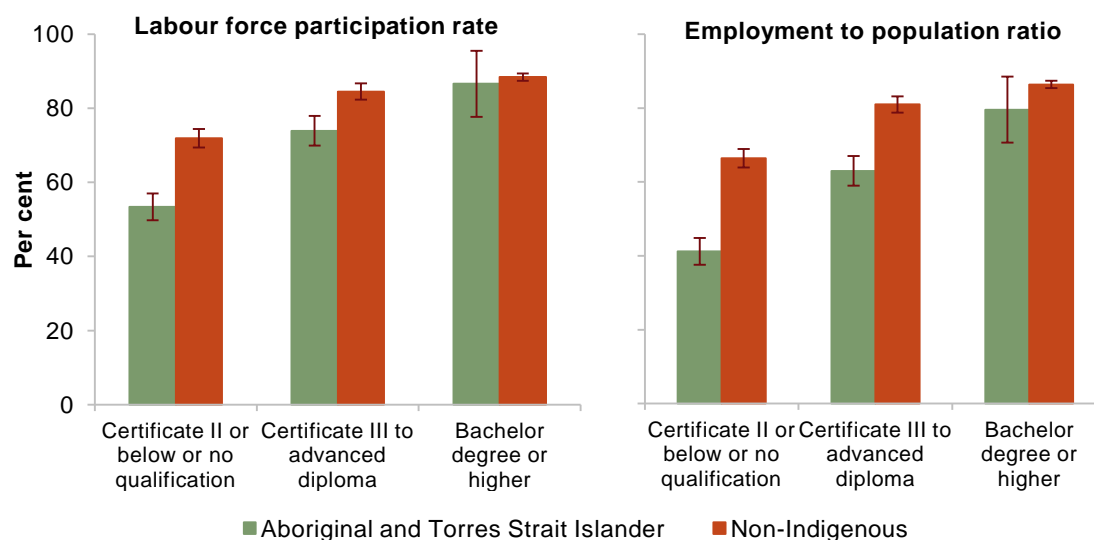

The likelihood of Aboriginal and Torres Strait Islander young people being fully engaged in employment, education or training is influenced by remoteness. In 2018-19, around half of all Aboriginal and Torres Strait Islander people aged 17–24 years in major cities were fully engaged in employment, education and training, which was higher than all other remoteness areas (tables 7A.3.1-2). Census data for 2016 showed that the proportion of Aboriginal and Torres Strait Islander young people fully engaged in employment, education and training declined with remoteness, with very remote areas having the lowest proportion (table 7A.3.6). In contrast, the proportion of non-Indigenous young people who are fully engaged does not vary as much by remoteness. In very remote areas the proportion who are fully engaged is similar to major cities, and although the proportions are lower in regional and remote areas, they do not decline to the same extent as the rates for Aboriginal and Torres Strait Islander people (table 7A.3.6).

The outcomes for remote areas may be related in part to the fewer employment, education and training opportunities in remote areas (compared to non-remote areas), which may disproportionately impact Aboriginal and Torres Strait Islander people as a larger proportion live in remote areas compared to non-Indigenous people (see sections 4.7 *Employment* and 4.8 *Post-secondary education*).

Post-school education is associated with better employment outcomes, and this is particularly so for Aboriginal and Torres Strait Islander people

Adults with post-school education and training have better employment outcomes, and this is particularly so for Aboriginal and Torres Strait Islander people. Nationally in 2018-19, among people aged 18–64 years with a Bachelor degree or above, labour force participation and employment rates for Aboriginal and Torres Strait Islander people (87 per cent and 80 per cent respectively) were similar to those for non-Indigenous people (in 2017-18) (figure 7.3.2). However, if Aboriginal and Torres Strait Islander people had post-school qualifications of Certificate level II or below or none at all, labour force participation and employment rates fell significantly (to 53 per cent and 41 per cent, respectively), and were also significantly below the rates of non-Indigenous people at the same qualification level (figure 7.3.2). Further discussion on Aboriginal and Torres Strait Islander people's participation in post-school education and training is provided in section 4.8 *Post-secondary education*.

Figure 7.3.2 **Level of highest non-school qualification and employment status (aged 18–64 years), by Indigenous status, 2017–19^{a,b}**

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See table 7A.3.3 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) National Aboriginal Torres Strait Islander Health Survey 2018-19; ABS (unpublished) National Health Survey 2017-18; table 7A.3.3.

Some Aboriginal and Torres Strait Islander young people not ‘fully’ participating in employment, education and training are engaged with other activities

There remains a large proportion of Aboriginal and Torres Strait Islander young people who are not fully engaged in employment, education and training. However, not being fully engaged may not mean disengagement or being unproductive.

- Nationally in 2016, about 25 per cent of Aboriginal and Torres Strait Islander people aged 17–24 years not fully engaged were employed or studying part time, indicating a level of engagement with the labour force and post-school education and training. For young non-Indigenous people it was about 50 per cent.⁷
- Young Aboriginal and Torres Strait Islander people, like non-Indigenous people, may be engaged in other productive and/or developmental activities, such as caring for family members, caring for Country, travelling, or volunteering (see sections 4.9 *Disability and chronic disease*, 5.7 *Participation in community activities*, and 5.8 *Access to traditional lands and waters* and Venn 2018). Nationally in 2016, about 12 per cent of Aboriginal and Torres Strait Islander people aged 17–24 years not fully engaged provided unpaid assistance to people with disability, about 10 per cent volunteered for an organisation or

⁷ Data derived from ABS TableBuilder data: ABS 2018, *Census of Population and Housing*, 2016.

group, and 30 per cent provided care to a child. For young non-Indigenous people these proportions were about 7 per cent, 15 per cent and 20 per cent respectively.⁸

- Young Aboriginal and Torres Strait Islander females (in particular) may be engaged with child care responsibilities. Nationally in 2016, the proportion of Aboriginal and Torres Strait Islander females aged 17–24 years who are fully engaged in employment, education and training was 6 percentage points lower than males (this contrasts with young non-Indigenous people, where there is minimal difference between male and female rates). This may partially be attributed to child care responsibilities resulting from higher birth rates amongst young Aboriginal and Torres Strait Islander females. Nationally in 2016, over 40 per cent of Aboriginal and Torres Strait Islander females aged 17–24 years not fully engaged in employment, education and training had a child, compared to about 20 per cent for young non-Indigenous females.⁹ (See also section 6.3 *Teenage birth rate*.)

Aboriginal and Torres Strait Islander young people face additional barriers in their transition from school to post-school employment, education and training

The transition from school to employment or further education or training can be difficult for any young person, but there are additional barriers for Aboriginal and Torres Strait Islander people (discussed in detail elsewhere in this Report, but summarised here) such as:

- lower educational outcomes achieved through the school education system (section 4.4 *Reading, writing and numeracy*), which place them at a disadvantage when attempting to transition to the workplace or to post-school education and training (Gray, Hunter and Lahoar 2012)
- lower socioeconomic status (access to resources), poorer health status and family responsibilities can limit the range of opportunities to employment, education and training to which they can transition (Cuervo, Barakat and Turnbull 2015)
- for Aboriginal and Torres Strait Islander young people whose first language is not ‘standard Australian English’, a lack of recognition of Aboriginal languages can impact their educational outcomes and act as a barrier to accessing and engaging in employment opportunities and post-school education and training (Rutherford, McCalman and Bainbridge 2019; Thomas et al. 2014; Watts, Gardner and Mushin 2019).

Transitions from school to employment and further education and training can be smoother for young Aboriginal and Torres Strait Islander people if institutions are seen to value and support their cultures and accommodate their cultural obligations (Ackehurst, Polvere and Windley 2017).

⁸ Data derived from ABS TableBuilder data: ABS 2018, *Census of Population and Housing, 2016*.

⁹ Derived from ABS TableBuilder data: ABS 2018, *Census of Population and Housing, 2016*.

In addition, exposure to Aboriginal and Torres Strait Islander role models and accessibility to information on experiences with post-secondary institutions and workplaces, have also been identified as important facilitators of educational and employment aspirations (Gore et al. 2017). See sections 4.7 *Employment* and 4.8 *Post-secondary education*.

The barriers are greater for Aboriginal and Torres Strait Islander young people living in remote and very remote communities. In a systematic review of research Rutherford, McCalman and Bainbridge (2019) found several factors affected young people's transition into employment and post-school education in these areas. While these factors are relevant to all young people in remote and very remote areas, they disproportionately affect Aboriginal and Torres Strait Islander young people overall as they are more likely to live in these areas.

- A shortage of suitable local jobs and the large geographic distance to service centres can negatively influence student aspirations and post-school transitions to work and employment (Hunter and Gray 2001; Rutherford, McCalman and Bainbridge 2019; Savvas, Boulton and Jepsen 2011).
- Government policies often take a 'one size fits all' strategy for addressing education and employment opportunities for young people in remote communities, which limits communities' abilities to drive local solutions (Rutherford, McCalman and Bainbridge 2019). In a review of Vocational Education and Training programs in remote areas Guenther et al. (2017) note that what defines 'successful' program for many Aboriginal and Torres Strait Islander people in remote communities was 'local community ownership' of the program, that is, the extent to which the community felt they'd had input into its development and whether it reflected community culture. The context of the remote community also needs to be considered to enable the identification of local opportunities relevant to those communities (Jordan 2016; McRae-Williams et al. 2016).

Future directions in data

Further work is required to understand the post-school pathways of Aboriginal and Torres Strait Islander young people.

Several jurisdictions collect data on student destinations within their own jurisdiction (SCRGSP 2020, section 4). These surveys collect information from students in the year following their departure from schooling. However, these data are not collected on a consistent basis, are often only for government schools, and limited data are publically available (particularly with respect to Aboriginal and Torres Strait Islander young people).

The availability of longitudinal data for Aboriginal and Torres Strait Islander young people could assist to understand their choices post school, including reasons for disengagement from education, training and employment, those wanting to engage and not being able to, alternative pathways being attempted, and transitions between vocational education, higher education, employment and other activities. As the cohorts in the Longitudinal Study of

Indigenous Children get older, this data collection could assist to answer some of these questions.

In addition, further research would be useful on the impact of programs aimed at supporting young Aboriginal and Torres Strait Islander people in their transition from school to work (such as school-based traineeships, work readiness programs, career guidance/support, connecting with mentors/role models).

TABLE 7A.2.2

Table 7A.2.2 **Programme for International Student Assessment (PISA) Australian Sense of Belonging at School, by Indigenous status, 2003, 2015 and 2018 (a), (b), (c)**

| | <i>Unit</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous</i> | <i>Nature of difference</i> | <i>Australia</i> | <i>OECD (d)</i> |
|--|-------------|--|-----------------------|-----------------------------|------------------|-----------------|
| I feel like an outsider (or left out of things) at school (disagree) | % | 86.4 ±7.9 | 92.5 ±0.6 | ■ | 92.4 ±0.6 | 90.1 ±0.2 |
| I feel awkward and out of place at my school (disagree) | % | 82.9 ±7.9 | 91.4 ±0.7 | ↓ | 91.2 ±0.6 | 85.4 ±0.2 |
| I feel lonely at school (disagree) | % | 88.3 ±7.9 | 93.6 ±0.6 | ■ | 93.5 ±0.6 | 91.9 ±0.2 |
| Sense of Belonging index (e) | Index | -0.03 ±0.09 | 0.04 ±0.03 | ↓ | 0.04 ±0.03 | 0.00 ±0.00 |

Nature of differences.

- ↑ Proportion/index for Aboriginal and Torres Strait Islander students is higher and is statistically significantly different from non-Indigenous students.
- Proportion/index for Aboriginal and Torres Strait Islander students is not statistically different from non-Indigenous students.
- ↓ Proportion/index for Aboriginal and Torres Strait Islander students is lower and is statistically significantly different from non-Indigenous students.

- (a) In 2018, PISA surveyed approximately 5.5 per cent of Australian 15 year old students (including 683 Aboriginal and Torres Strait Islander students).
In 2015, PISA surveyed approximately 5.7 per cent of Australian 15 year old students (including 2807 Aboriginal and Torres Strait Islander students).
In 2003, PISA surveyed approximately 5.3 per cent of Australian 15 year old students (including 815 Aboriginal and Torres Strait Islander students).
- (b) In PISA 2018, Australian students were asked to identify whether they were of Indigenous background when they completed the Student Questionnaire. This method of identification differed from previous cycles of PISA when Indigenous students were identified from information provided by their schools.
- (c) The proportions/indexes reported in this table include 95 per cent confidence intervals (for example, 79.4 per cent ± 0.9 per cent) for the reporting year.
- (d) Refers to the average across the 36 Organisation for Economic Cooperation and Development (OECD) countries in PISA 2018, 35 OECD countries in PISA 2015 and 30 OECD countries in PISA 2003.
- (e) Students' responses to the six statements were combined to construct a 'Sense of Belonging' index. The index, when it was originally constructed in PISA 2003, was standardised to have a mean of 0 and a standard deviation of 1 across OECD countries. Higher scores on the index are illustrative of students feeling a greater sense of belonging at school.

| (a) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | |
| (b) | Data on Aboriginal and Torres Strait Islander people exclude people enrolled in a school institution. Data on non-Indigenous people exclude people who were in school-level education. | | | | | | | | |
| (c) | Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. | | | | | | | | |

| (a) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | |
| (b) | Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. | | | | | | |
| (c) | Remoteness area classification are based on: the 2016 Australian Statistical Geography Standard (ASGS) for NATSIHS 2018-19 and NHS 2017-18; the 2011 ASGS for 2014-15 NATSISS, 2014-15 GSS, 2012-13 NATSIHS and 2011-13 AHS; and the Australian Statistical Geography Classification (ASGC) for the NATSISS 2008 and NHS 2007-18. | | | | | | |
| (d) | Data on Aboriginal and Torres Strait Islander people exclude people enrolled in a school institution. Data on non-Indigenous people exclude people who were enrolled in secondary school. | | | | | | |
| (e) | Excludes people who did not state their Indigenous status. | | | | | | |
| na Not available. .. Not applicable. – Nil or rounded to zero. np Not published. | | | | | | | |

RSE = Relative Standard Error. CI = Confidence Interval.

TABLE 7A.3.3

Table 7A.3.3 Level of highest non-school qualification and employment status of people (aged 18–64 years), by Indigenous status, by sex, 2002, 2004-05, 2008, 2011–13, 2014-15, and 2017–19 (a), (b)

| | <i>Employment to population ratio (c)</i> | | | <i>Labour force participation rate (d)</i> | | |
|-----|--|-------------------|----------------|--|-------------------|----------------|
| | <i>Proportion (%)</i> | <i>95% CI (±)</i> | <i>RSE (%)</i> | <i>Proportion (%)</i> | <i>95% CI (±)</i> | <i>RSE (%)</i> |
| (a) | Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. | | | | | |
| (b) | Data excludes people enrolled in secondary schools and studying for only a school-level qualification. | | | | | |
| (c) | The number of employed people expressed as a percentage of the total population in the same group. | | | | | |
| (d) | The number of employed and unemployed people expressed as a percentage of the total population in the same group. | | | | | |
| (e) | Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma. | | | | | |
| (f) | Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Degree. | | | | | |
| (g) | Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification (includes secondary school educational attainment and no non-school qualification). | | | | | |
| (h) | Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined. | | | | | |

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

TABLE 7A.3.4

Table 7A.3.4 **Level of highest non-school qualification and employment status, Aboriginal and Torres Strait Islander people (aged 18–64 years), by remoteness, 2002, 2004-05, 2008, 2012-13, 2014-15, and 2018-19 (a), (b), (c), (d)**

| <i>Employment to population ratio (e)</i> | | | <i>Labour force participation rate (f)</i> | | |
|---|-------------------|----------------|--|-------------------|----------------|
| <i>Proportion (%)</i> | <i>95% CI (±)</i> | <i>RSE (%)</i> | <i>Proportion (%)</i> | <i>95% CI (±)</i> | <i>RSE (%)</i> |

RSE = Relative Standard Error. CI = Confidence Interval.

- (a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.
- (d) Remoteness area classification are based on: the 2016 Australian Statistical Geography Standard (ASGS) for NATSIHS 2018-19; the 2011 ASGS for 2014-15 NATSIHS and 2012-13 NATSIHS; and the Australian Statistical Geography Classification (ASGC) for the NATSIHS 2008.
- (e) The number of employed people expressed as a percentage of the total population in the same group.
- (f) The number of employed and unemployed people expressed as a percentage of the total population in the same group.
- (g) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.
- (h) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate.
- (i) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification.
- (j) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

np Not published.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

RSE = Relative Standard Error. CI = Confidence Interval.

- (a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.
- (d) The number of employed people expressed as a percentage of the total population in the same group.
- (e) The number of employed and unemployed people expressed as a percentage of the total population in the same group.
- (f) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.
- (g) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Degree.
- (h) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification (includes secondary school educational attainment and no non-school qualification).
- (i) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

np Not published. – Nil or rounded to zero.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

(a) Data excludes people enrolled in secondary schools and studying for only a school-level qualification.

TABLE 7A.3.6

Table 7A.3.6 People (aged 17–24 years) who are fully engaged in post-school education, training or employment, by Indigenous status, by remoteness, 2001, 2006, 2011, and 2016 (a), (b), (c), (d), (e)

| | <i>Unit</i> | <i>Major cities</i> | <i>Inner regional</i> | <i>Outer regional</i> | <i>Remote</i> | <i>Very remote</i> | <i>Aust (f)</i> |
|-----|---|---------------------|-----------------------|-----------------------|---------------|--------------------|-----------------|
| (b) | The Census does not collect level of current study, but does collect institution attended, therefore all people identified as studying (excluding those studying at a school institution) are included in the calculations for this indicator. This may include some people in non-formal education or school level education not at school institutions. | | | | | | |
| (c) | People whose labour force status was not stated and who were not identified as studying full-time, are excluded. People whose student status was not stated and who were not identified as employed full-time, are also excluded. | | | | | | |
| (d) | People whose labour force status could not be determined between full time or part time employed and who were not identified as studying are excluded. People who had stated attending an educational institution (but whose student status was not stated) and who were identified as not employed are excluded. | | | | | | |
| (e) | People who did not state their labour force status and did not state their student status are excluded. | | | | | | |
| (f) | Australia includes 'Other territories'. | | | | | | |
| (g) | Excludes people who did not state their Indigenous status. | | | | | | |
| (h) | People who were engaged in a combination of education or training and employment, but whose full-time/part-time student status or their full-time/part-time employment status was not identified are included in 'Total Fully Engaged'. | | | | | | |

8 Healthy lives

Strategic areas for action

Aboriginal and Torres Strait Islander people's understanding of health is holistic and encompasses physical, mental, cultural and spiritual health. Good health and wellbeing depends on the network of individuals, family, kin, and community, and it recognises an individual's connection to land (which is central to wellbeing), culture, spirituality and ancestors. If the harmony of these interrelations is disrupted, it can lead to Aboriginal and Torres Strait Islander ill health.

Health outcomes directly affect the quality of people's lives, including their ability to socialise with family and friends, to participate in the community and to work and earn an income. Physical health outcomes reflect such things as a healthy living environment and access to and use of health and community services. Mental health outcomes are related to a complex range of medical issues, historical and lifestyle factors, and the stressors associated with entrenched disadvantage and drug and substance misuse.

Culture is central to Aboriginal and Torres Strait Islander people's health and wellbeing; their health outcomes are inextricably linked to their history and the impacts of trauma across generations (see chapter 1 *About this report* and chapter 4 *COAG targets and headline indicators*, section 4.1 *Life expectancy*). Barriers to health service access due to remoteness or cultural safety, and racism within health and other service systems, can also affect health and wellbeing. Place-based approaches that are community led and designed and delivered by Aboriginal and Torres Strait Islander people could provide better outcomes in the long run (Commonwealth of Australia 2017).

The following indicators are included in the ‘Healthy lives’ strategic area:

- access to primary health care (section 8.1) — the first point of contact with the health system enables prevention, early intervention, case management and ongoing care. It can also help to address health risk behaviours
- potentially preventable hospitalisations (section 8.2) — many hospital admissions could be prevented if more effective non-hospital care were available, either at an earlier stage in disease progression or as an alternative to hospital care
- potentially avoidable deaths (section 8.3) — access to, and use of, quality health care can make a substantial contribution to reducing potentially avoidable deaths
- tobacco consumption and harm (section 8.4) — despite progress, smoking is still the single biggest contributor to the burden of preventable ill health and death
- obesity and nutrition (section 8.5) — maintaining a healthy body weight protects against infection, and reduces the risk of chronic disease and premature death
- oral health (section 8.5) — oral health is an important part of a person’s overall health and wellbeing and reflects diet, dental hygiene and access to dental services
- mental health (section 8.7) — mental health plays an important role in social and emotional wellbeing; it includes mental illness and the overall mental wellbeing of an individual, with the latter influenced by a range of factors including domestic violence, substance misuse, imprisonment and family breakdown
- suicide and self-harm (section 8.8) — suicide and self-harm cause great grief, with mental illness the largest risk factor for suicide.

Several COAG targets and headline indicators reflect the importance of healthy lives:

- life expectancy (section 4.1)
- young child mortality (section 4.2)
- disability and chronic disease (section 4.9).

Other headline indicators can be directly influenced by health outcomes:

- employment (section 4.7)
- household and individual income (section 4.10).

Outcomes in the healthy lives area can be affected by outcomes in all other strategic areas, and can influence outcomes in other areas.

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, ‘table 8A.1.1’). These tables can be found on the web page (www.pc.gov.au/oid2020).

8.1 Access to primary health care¹

Box 8.1.1 Key messages

- Primary health care is generally the first contact a person has with Australia's health system, when health care is needed.
- Primary health care access and use can help to improve and maintain people's health through health promotion, prevention and early intervention services as well as the treatment of illness, and the management of chronic conditions.
- The proportion of Aboriginal and Torres Strait Islander people reporting their health as excellent or very good in 2018-19 (45 per cent) is largely unchanged from 2002 (44 per cent) following a decrease in 2012-13 (39 per cent). While there is no clinical benchmark on the ideal level, the proportion for Aboriginal and Torres Strait Islander people is lower than for non-Indigenous people.
- What is more, while there were no substantial differences across Indigenous regions for those reporting their health status as excellent or very good, this was not the case for the proportions reporting their health status as fair or poor, which ranged from 13 to 31 per cent in 2018-19.
- Aboriginal and Torres Strait Islander people's health status is affected by a range of factors — including access to and uptake of health checks, vaccinations, and other primary health services.
- Over time, immunisation rates and health checks for Aboriginal and Torres Strait Islander people have increased, but there is scope for further improvement.
- In 2018-19, most (87 per cent) Aboriginal and Torres Strait Islander adults visited a primary health care professional such as a general practitioner (GP), specialist, nurse, sister and/or Aboriginal and Torres Strait Islander health worker at least once in the previous 12 months. Fewer (about one in four) went to a dentist in the previous six months.
- However, several known barriers limit Aboriginal and Torres Strait Islander people from accessing these services when needed. In 2018-19, about one in five Aboriginal and Torres Strait Islander adults had not visited a GP/clinic doctor and about one in four had not visited a dentist on at least one occasion when needed in the previous 12 months. Half of those who needed to go to a GP/clinic doctor or dentist but didn't, reported not going for personal reasons, including being too busy, discrimination and culturally unsafe services. Logistics (geography and time) were another important reason for not going to the GP/clinic doctor (29 per cent) and cost was a factor for not going to the dentist (42 per cent).
- Removing barriers to access and providing culturally safe primary healthcare services is key to improving the health of Aboriginal and Torres Strait Islander people. Research suggests that Aboriginal Community Controlled Health Services (ACCHS) may improve both uptake of, and continued engagement with, health care services for Aboriginal and Torres Strait Islander people.

¹ The Steering Committee notes its appreciation to Dr Sanchia Shibasaki, Lowitja Institute, who reviewed a draft of this section of the Report.

Box 8.1.2 Measures of access to primary health care

Access to healthcare is a complex concept, involving both sufficient supply of services, and the ability to utilise available services (which may be influenced by affordability, physical accessibility and acceptability of the services, and need). There is no single measure of access that encompasses all these aspects. Five proxy measures are reported.

- *Self-assessed health status* is defined as the proportion of the population aged 15 years or over reporting their health status as very good or excellent (all jurisdictions; age; sex; remoteness; selected characteristics). Data for self-assessed health status are sourced from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2018-19. Data for the non-Indigenous population are sourced from the ABS 2017-18 National Health Survey (NHS).
- *Aboriginal and Torres Strait Islander people's use of primary health care services* is defined as the proportion of the population not visiting a GP/doctor at a clinic, or a dentist when they needed (national; remoteness). These are reported for people aged 18 years or over. Data for use of primary health care services are sourced from the NATSIHS with the most recent available data for 2018-19 (data for the non-Indigenous population are sourced from the NHS with the most recent available data for 2017-18). Additional data on children are reported from the 2008 and 2014-15 NATSISS.
- *Health checks* funded through Medicare, which Aboriginal and Torres Strait Islander people are eligible to receive on an annual basis and whose purpose is to detect and treat early common conditions that cause ill health and early death. Data are sourced from the Department of Health, Medicare Benefits Schedule (MBS) data collection.
- *Immunisation rates* are defined as vaccination coverage rates for selected diseases for children (reported at one, two and five years of age) and adult immunisation rates for those aged 50 years or over. Data for children are derived from the Australian Childhood Immunisation Register (ACIR), with the most recent data for 2018 (all jurisdictions; age). Data for Aboriginal and Torres Strait Islander adults are available from the 2018-19 NATSIHS (national; age). Data are not available for non-Indigenous adults.
- *Aboriginal and Torres Strait Islander health workforce* is defined as the share of health-related professionals aged 15 years and older who are Aboriginal and Torres Strait Islander. Data for this report are sourced from the ABS Census of Population and Housing (the Census), with the most recent data for 2016 (national; remoteness).
- *Expenditure on health care services* is defined as total recurrent health expenditure and per-person expenditure on primary and secondary/tertiary health care. 'Expenditure' refers to funding from multiple government and non-government sources, including private health insurance. Supplementary data for 2015-16 about total direct per capita expenditure on health services from government and non-government sources (including insurance) are available from the Indigenous Expenditure Report (IER) 2017 and included in table 8A.1.32.

Aboriginal and Torres Strait Islander people's understanding of health is holistic: to be healthy is to be well physically, spiritually and emotionally and to be connected with family, community, culture, language, and Country (AIHW 2018; Butler et al. 2019; Gee et al. 2014). While it includes the physical and mental wellbeing of the individual, it is also about the social, emotional and cultural wellbeing of the whole community. Given this holistic understanding, access to primary health care (along with other health services), can meet some, but not all of Aboriginal and Torres Strait Islander people's health needs.

Primary health care is generally the first contact a person has with Australia's health system. It aims to improve health and can reduce the need for specialised services, which involve a referral within the health system or a hospital admission. It is often the gatekeeper or referral point for specialist services.

Box 8.1.3 Primary health care services

What is the scope of primary health care services?

Primary health care services are varied and provided by a range of practitioners in a range of settings. The services include health promotion, prevention and early intervention, the treatment of illness, and the management of chronic conditions (AIHW 2016).

Who are the people who provide these services?

They are provided by local general practitioners (GP), nurses (such as general practice nurses, community nurses and nurse practitioners), allied health professionals, midwives, pharmacists, dentists, and Aboriginal and Torres Strait Islander health workers.

In what settings are primary health care services provided?

Primary health care is provided in many different settings including at home (most recently via telehealth services)², in general practices and at community health services (such as the local maternal health service).

What primary health care services are provided to Aboriginal and Torres Strait Islander people?

Primary health care services for Aboriginal and Torres Strait Islander people are provided by people in a range of professions and in a range of settings. These services are often designed for all people, but there are services specifically designed for Aboriginal and Torres Strait Islander people. These services are referred to as Indigenous specific primary health care services (ISPHCSs) and while funded by governments, they can be provided, administered and run by the following different organisations:

- Aboriginal community-controlled health organisations (ACCHOs)
- State, territory and local governments
- Non-government organisations (AIHW 2020).

² Telehealth services use telecommunications technologies to provide health advice via telephone, video consultations and remote monitoring of health metrics through electronic devices.

As the focus of this section is on access to primary health care services, it should be considered in conjunction with other sections that focus on health outcomes, including disability and chronic health conditions (section 4.9 *Disability and chronic disease*), potentially avoidable deaths (section 8.3 *Potentially avoidable deaths*), child mortality (section 4.2 *Young child mortality*) and life expectancy (section 4.1 *Life expectancy*).

For over 15 years, the proportion of Aboriginal and Torres Strait Islander people reporting their health as excellent or very good has remained about 45 per cent ...

Better self-assessed health status is associated with many other positive outcomes. For example, in 2018-19 the proportion of Aboriginal or Torres Strait Islander adults rating their health status as excellent or very good was higher for those:

- with Year 12 as their highest year of schooling, compared with those for whom it was Year 9
- who were employed, compared with those who were unemployed or out of the labour force
- in the higher household income quintile, compared with those in the lowest
- who mainly spoke a language other than English at home, compared with those who mainly spoke English (table 8A.1.7).

The proportion of Aboriginal and Torres Strait Islander people reporting their health as excellent or very good has not changed significantly since almost two decades ago (figure 8.1.1). Having remained at 44 per cent between 2002 and 2008, the proportion decreased in 2012-13 and 2014-15, before increasing to 45 per cent in 2018-19 (table 8A.1.1). And while greater proportions of Aboriginal and Torres Strait Islander people in younger age groups than in older age groups report their health as excellent or very good, this gap is starting to narrow (table 8A.1.5).

While maximising the proportion of people reporting their health status as excellent/very good is optimal, a smaller proportion of people reporting their health as poor or fair (which could mean ‘moving to good’) is a sign of progress. However, as above, there has been no significant change in these proportions nationally over time (figure 8.1.1).

However, results can vary considerably at the regional level. In 2018-19, while there were no substantial differences across Indigenous regions in the proportions of Aboriginal and Torres Strait Islander people reporting their health status as excellent or very good, this was not the case for the proportions reporting their health status as fair or poor—which ranged from 13 to 31 per cent (figure 8.1.2).

Figure 8.1.2 Proportion of Aboriginal and Torres Strait Islander people reporting their health status as fair or poor, 2018-19^a

^a Small area estimates for Tasmania and the ACT are not available for publication.

Source: ABS (2020) *National Aboriginal and Torres Strait Islander Health Survey: Small Area Estimates, Australia 2018-19*. Cat. no. 4715.0, table 43.1.

... and remains lower than for non-Indigenous people

The proportion of Aboriginal and Torres Strait Islander people reporting their health status as excellent or very good is lower than for non-Indigenous people. In 2018-19, after adjusting for differences in population age structures, the gap was about 17 percentage points — similar to the previous smallest gap of 19 percentage points in 2008 (table 8A.1.5).

The gap in reported health outcomes varied by age group (figure 8.1.3). While the proportion of people reporting their health status as excellent or very good decreased with age for both Aboriginal and Torres Strait Islander people and non-Indigenous people — and the proportion reporting their health status as poor or very poor increased with age for both — the gap was largest for people aged 55 years or over.

Figure 8.1.3 **Proportion of people rating their health as very good or excellent, by Indigenous status and age group, 2017–19^{a,b}**

^a See table 8A.1.5 for detailed definitions, footnotes and caveats. ^b A-S rate is the age-standardised rate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2018-19; ABS (unpublished) National Health Survey 2017-18; table 8A.1.5.

Aboriginal and Torres Strait Islander people's health status is affected by a range of factors, one of which is access to and use of primary health care services

The ongoing effects of colonisation — including intergenerational trauma, sociocultural and economic impacts — as well as the removal of Aboriginal and Torres Strait Islander children from their families, and the persisting and institutional racism, continue to affect Aboriginal and Torres Strait Islander people (Canuto et al. 2018; Department of Health 2016;

Paradies 2016) who ascribe their health to macrosocial factors, including traditional lands, kinship, languages and cultures (Shepherd, Li and Zubrick 2012). As a result, Aboriginal and Torres Strait Islander people often have higher rates of the risk factors that lead to poorer health than non-Indigenous people (such as increased substance use and smoking rates, see section 11.1 *Alcohol consumption and harm*) and their need for health care services is therefore also higher.

Access to, and use of, culturally safe and affordable primary health care services is one of the keys to improving Aboriginal and Torres Strait Islander people's health status (AIHW 2019a). But the health system in isolation cannot address all the complex and intersecting risk factors associated with health outcomes; this requires collaboration with many sectors, including education, child protection, justice and employment (Department of Health 2016).

Preventive services like health checks and vaccinations can maintain and improve health, and rates have been increasing for Aboriginal and Torres Strait Islander people

Across all age groups, more Aboriginal and Torres Strait Islander people are having MBS health checks than a decade ago³ (figure 8.1.4). In 2018-19, just over 25 per cent of people aged 0–54 years and 37 per cent of people aged 55 years and older had health checks, up from about one in ten in 2009-10 (table 8A.1.18).

Although more Aboriginal and Torres Strait Islander people are getting a health check, the proportion remains relatively low. This may be due to low uptake of the MBS health check item by practitioners who have concerns with content and are uncertain about the process of the check, as found in one urban ACCHS (Jennings, Spurling and Askew 2014). That said, the low proportion may be an underestimate, due to both a lack of awareness of the specific MBS item number for recording Indigenous-specific health checks (Schütze, Pulver and Harris 2016), and the fact that some people may receive a health check outside Medicare. As such, greater clarity within the health sector and greater promotion by primary health care service practitioners and others may increase further the uptake of the health care check.

To improve health outcomes, primary health care services need to follow-up on any issues identified in health checks (Bailie et al. 2014; Dutton, Stevens and Newman 2016). The proportion of Indigenous health check patients who had an Indigenous-specific follow-up service within 12 months of their check increased from 12 per cent to 40 per cent between 2010–11 and 2016–17 (AIHW 2019b).

³ Aboriginal and Torres Strait Islander people can receive an annual health check funded through Medicare (Department of Health 2016). The aim of this health check is to detect early and treat common conditions that cause ill health and early death — for example, diabetes and heart disease. The doctor can also refer the person to other health care professionals for follow-up care as needed — for example, physiotherapists, podiatrists or dieticians.

Figure 8.1.4 Proportion of Aboriginal and Torres Strait Islander people who received a MBS health check, by age group 2009-10 to 2018-19^a

^a See table 8A.1.18 for detailed definitions, footnotes and caveats.

Source: Department of Health unpublished, MBS data collection; ABS various years, Australian Demographic Statistics, Cat. no. 3201.0; ABS (2019) Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031, Cat. No. 3238.0; table 8A.1.18.

Immunisation rates⁴ for Aboriginal and Torres Strait Islander children have increased over the past decade, and in 2018 ranged from 89 to 97 per cent (table 8A.1.19). The largest increase occurred for five-year-olds, with the rate in 2018 surpassing that for other children (table 8A.1.19). Rates for one- and two-year-olds were within three percentage points of the rates for other children (table 8A.1.19).

Data on vaccinations for older Aboriginal and Torres Strait Islander people are currently only available from population surveys, and indicate that rates are below those for children. For influenza, around two-thirds of Aboriginal and Torres Strait Islander people aged 50 years and older reported that they had had a vaccination in 2018-19, an increase of ten percentage points from 2012-13 (when this proportion was 57 per cent). By age, the proportion was higher for those aged 65 years or over (84 per cent) than for those aged 50-64 years (62 per cent) (table 8A.1.27).

⁴ Immunisation is effective in preventing sickness and death from vaccine preventable diseases. The Australian Childhood Immunisation Register (ACIR) assesses children for immunisation coverage at 12-15 months (one year), 24-27 months (two years) and 60-63 months (five years), by Indigenous status, for all jurisdictions.

And while most Aboriginal and Torres Strait Islander adults visit providers for medical and support services, fewer visit the dentist

The majority of Aboriginal and Torres Strait Islander adults visit primary health care services. In 2018-19, 87 per cent of Aboriginal and Torres Strait Islander adults had visited a primary health care professional for medical and support services in the previous 12 months — an increase from 76 per cent in 2001.⁵ Much of this increase appears to have occurred in remote areas (table 8A.1.8), which may suggest increased access to primary health care professionals in these areas and/or increased need.

The health services most usually visited are doctors or Aboriginal Medical Services and community clinics (table 8A.1.14). For these service types, patterns of use have varied by location. In non-remote areas, doctors were more commonly visited, with 63 per cent of Aboriginal and Torres Strait Islander adults and children using their services (tables 8A.1.14 and 8A.1.17); however, in remote areas, Aboriginal Medical Services and other community clinics were more commonly visited (with about 65 per cent visiting) (tables 8A.1.14 and 8A.1.17).

Visits to the dentist are far less common. In 2018-19, just over one in four Aboriginal and Torres Strait Islander people had been to the dentist in the previous six months, with 34 per cent reporting having visited a dentist in the previous six months to two years, and a further 12 per cent reporting never having visited a dentist (table 8A.1.11). The proportion of people going to a dentist on a timely basis has remained relatively unchanged in recent times (table 8A.1.11). See section 8.6 *Oral health* for further information on oral health.

One in five Aboriginal and Torres Strait Islander adults did not see a doctor when needed, rising to one in four for the dentist — and the reasons for not doing so are varied

About one in five Aboriginal and Torres Strait Islander adults did not go to the doctor and about one in four had not gone to the dentist when needed; this proportion remained unchanged between 2012-13 and 2018-19. In 2018-19, 19 per cent of Aboriginal and Torres Strait Islander adults had not visited a GP or clinic doctor (table 8A.1.9) and 28 per cent had not visited a dentist (table 8A.1.12) on at least one occasion when they had a health or dental problem in the previous 12 months. These proportions were lower in remote areas (tables 8A.1.9 and 8A.1.12).

⁵ The data available about visits to primary health care services vary by remoteness. In non-remote areas, they include visits to GPs and/or specialists, while in remote areas they also include visits to nurses, sisters and Aboriginal and Torres Strait Islander health workers.

The reasons for not visiting a GP/clinic doctor or dentist when needed are multifaceted and differ by service type and location. The most commonly reported reasons in 2018-19:

- for not visiting GPs/clinic doctors, were personal reasons (53 per cent) — including being too busy, discrimination, and services not being culturally safe or adequate — and logistical reasons (29 per cent, and 43 per cent in remote areas), including geographical and timely access to services (table 8A.1.10). However, 30 per cent ultimately decided not to seek care (there is no information available on why they decided not to).
- for not visiting dentists, in non-remote areas were personal reasons (49 per cent) and cost (44 per cent), while in remote areas they were logistical reasons (52 per cent) (table 8A.1.13).

A key step towards improving Aboriginal and Torres Strait Islander health is better access to primary health care, which involves overcoming barriers to access and providing culturally safe services

Overcoming barriers to access and providing culturally safe primary healthcare services is key to improving the health of Aboriginal and Torres Strait Islander people. Primary health care services are accessible and appropriate if they are not only affordable, timely, and situated within easy reach, , but also support the social and cultural norms of the communities they serve, ultimately leading people to engage and stay connected with these services (Davy et al. 2016).

Increasing access to ACCHSs may improve both uptake of, and continued engagement with, health services for Aboriginal and Torres Strait Islander people. Aboriginal and Torres Strait Islander people report that relative to other health services, ACCHSs influence their health more positively (Campbell et al. 2018) as they are:

- accessible, with welcoming social spaces and additional services
- appropriate, as care is responsive to holistic needs
- culturally safe (Gomersall et al. 2017) — that is, they are services that patients feel safe attending (AIHW 2019a).⁶

The role of culture is the greatest distinction between other models of care and Aboriginal and Torres Strait Islander health care service delivery models, including ACCHSs. In Aboriginal and Torres Strait Islander service models, culture underpins all aspects of care in that it ensures community participation, ownership and control, a flexible approach to care and a culturally appropriate and skilled workforce (Harfield et al. 2018). Another particular

⁶ Culturally safe health care systems are established through cultural awareness, cultural sensitivity (the acknowledgement and respect of difference) and cultural competence (which focuses on skills, knowledge and attitudes of practitioners) (NCCIH 2013). Cultural respect is achieved when the health system is accessible, responsive and safe for Aboriginal and Torres Strait Islander people, and cultural values, strengths and differences are respected (Australian Health Ministers' Advisory Council's National Aboriginal and Torres Strait Islander Health Standing Committee 2016).

strength of the community controlled model is that services can respond to the local situation, and incorporate local community and cultural knowledge into service delivery (Holland 2016). Services provided by ACCHS are valued by their clients for these reasons (Mackey, Boxall and Partel 2014).

Supporting health professionals to develop cultural competence through skills, knowledge and attitudes is another way to increase acceptance and uptake of, and engagement with, primary health services (Bainbridge et al. 2015). For some Aboriginal and Torres Strait Islander people, culturally competent health professionals are those who engage in ‘good talk’ — which is to say that they demonstrate respect and care, and communicate effectively with the client (Jennings, Bond and Hill 2018). Establishing trust can be difficult owing to historical experience of the practices of Australian health services, incorrect assumptions and racism (Conway, Tsourtos and Lawn 2017; Dwyer et al. 2015). Hiring and retaining an Aboriginal and Torres Strait Islander local workforce aided by training and development opportunities for all staff are key to increasing cultural competence of health professionals (Harfield et al. 2018), and establishing trust, maintaining confidentiality and minimising shame for Aboriginal and Torres Strait Islander people (Warwick et al. 2019).

Despite the importance of increasing the Aboriginal and Torres Strait Islander workforce as a contributor to the provision of culturally competent services, Aboriginal and Torres Strait Islander people are underrepresented in the health workforce. According to the most recent population-level data, Aboriginal and Torres Strait Islander people comprised two per cent of people working in health-related occupations in 2016 (table 8A.1.28), although they made up three per cent of the adult Australian population (derived from (ABS 2018)). In 2016, Aboriginal and Torres Strait Islander people comprised 19 per cent of the health professionals working in remote areas and two per cent of those working in non-remote areas (table 8A.1.29). Additional data on employment in health-related occupations are reported in tables 8A.1.30–8A.1.31.

More accessible culturally safe primary care services are needed for Aboriginal and Torres Strait Islander people living in remote areas. While nearly all Aboriginal and Torres Strait Islander people in major cities live close to an ISPHCS, only 47 per cent of Aboriginal and Torres Strait Islander people in very remote areas live within an hour’s drive of their nearest ISPHCS (AIHW 2015). And in 2018–19, approximately 65 per cent of ISPHCS were ACCHSs (AIHW 2020).

Future directions in data

Better data on influenza vaccination coverage are needed. At present, data are only available from population level surveys for children and older people. The Australian Immunisation Register (AIR) collects administrative data on notification of influenza vaccinations people have received. However, there is significant underreporting in the AIR data, particularly for the older population, as a large proportion of vaccinations provided to individuals are not notified to the AIR.

National data on the health status of Aboriginal and Torres Strait Islander people aged 0–14 years has historically been collected in the NATSIHS, but was not collected in 2018–19. Data from this survey on the timely use of primary health care services were also unavailable for this age group. These are critical information gaps at the population level for Aboriginal and Torres Strait Islander children.

The data collection in the NATSIHS on reasons for not using health care services when needed could be of greater use if the underlying reasons for the ‘did not seek care’ response are pinpointed.

Reporting on the uptake of Indigenous-specific health checks by Indigenous-specific health service provider (ACCHS and non-ACCHS) would support analysis of potential barriers to specific health services providers and associated outcomes.

8.2 Potentially preventable hospitalisations⁷

Box 8.2.1 Key messages

- Potentially preventable hospitalisations are hospital admissions for conditions that may have been prevented or addressed earlier in primary or community health care. They are a proxy measure for the effectiveness of health system prevention activities and primary or community health care services, particularly for chronic, acute and vaccine-preventable conditions.
- For Aboriginal and Torres Strait Islander people, rates of hospitalisation for chronic, acute and vaccine-preventable conditions have increased over time and are higher than for non-Indigenous people.
- For potentially preventable chronic and acute conditions, about three-quarters of the gap to non-Indigenous people is explained by six conditions: chronic obstructive pulmonary disease (COPD), cellulitis, diabetes complications, convulsions/epilepsy, urinary tract infections and congestive cardiac failure.
- While rates for rheumatic heart disease (RHD) and bronchiectasis are relatively low, the disparity for Aboriginal and Torres Strait Islander people is very large. In remote areas, for example, both conditions have hospitalisation rates that are 17 times that of non-Indigenous people.
- Other hospitalisations for Aboriginal and Torres Strait Islander people that could potentially have been prevented relate to injury, poisoning or other external causes and sexually transmitted infections, and have all increased over time.
- Decreasing the rates of potentially preventable hospitalisations for Aboriginal and Torres Strait Islander people will involve improving the availability and appropriateness of primary health care services, providing culturally safe support to those delaying seeking health care due to caring responsibilities and designing systems that empower Aboriginal and Torres Strait Islander people with the self-efficacy to manage their own health affairs.
- Appropriate and ongoing management of chronic illness can improve a person's ability to participate in cultural life and kinship, particularly when flexible treatment options enable them to remain on Country.

⁷ The Steering Committee notes its appreciation to Dr. Sanchia Shibasaki, of the Lowitja Institute, who reviewed a draft of this section of the Report.

Box 8.2.2 Measures of potentially preventable hospitalisations

Potentially preventable hospitalisations are those admissions that may have been prevented through appropriate preventive health interventions and early disease management, usually delivered in primary care and community-based care settings.

There are three main measures for this indicator, relating to the rate of hospitalisation per 100 000 population for:

- potentially preventable chronic conditions — diseases that typically persist for at least six months (including specific tables on type 2 diabetes mellitus)
- potentially preventable acute conditions — diseases that cause serious short-term illness that could possibly be prevented, or their severity minimised
- vaccine-preventable conditions — including influenza and pneumonia.

Data for all measures are sourced from the AIHW National Hospital Morbidity Database, with the most recent data available for 2018-19 (national) and 2016–2018 (by remoteness). Additional data are reported on the rate of hospitalisation for injury, poisoning and other external causes and sexually transmitted conditions that could potentially have been prevented (nationally by remoteness).

Potentially preventable hospitalisations are hospital admissions for conditions that may have been prevented if addressed earlier in primary or community health care (AIHW 2020b).

- Preventative measures, such as health care checks, vaccinations and addressing health risk factors can reduce the development of these conditions. The following health risk factors are discussed elsewhere in this report: tobacco use (section 8.4 *Tobacco consumption and harm*), obesity (section 8.5 *Obesity and nutrition*), alcohol use (section 11.1 *Alcohol consumption and harm*) and drug consumption (section 11.2 *Drug and other substance use and harm*).
- Early intervention and coordination of care in primary or community health settings are also key factors in reducing the rate of potentially preventable hospitalisations (AIHW 2018).

Therefore, potentially preventable hospitalisations for selected conditions are a proxy measure for the effectiveness of health system prevention activities and primary or community health care services (AIHW 2020b).

The conditions most relevant in this context are:

- chronic conditions, such as diabetes, chronic obstructive pulmonary disease (COPD) and rheumatic heart disease
- acute conditions, such as cellulitis, urinary tract infections and ear nose and throat infections
- vaccine-preventable conditions, such as influenza and pneumonia.

While these hospitalisations are a proxy measure for whether services were accessible when conditions were easier to manage, increasing hospitalisations for these conditions may also

represent better access to hospital services, which is a key to reducing deaths from these conditions (see section 8.3 *Potentially avoidable deaths*).

Hospitalisation rates for Aboriginal and Torres Strait Islander people for chronic, acute and vaccine-preventable conditions have increased over time

Hospitalisation rates have increased for Aboriginal and Torres Strait Islander people for chronic, acute and vaccine-preventable conditions. From 2010–2012 to 2016–2018, after adjusting for changes in the age distribution, the largest proportional increase in the hospitalisation rate was for vaccine-preventable conditions, which doubled (figure 8.2.1). Although potentially preventable hospitalisation rates for chronic and acute conditions are still higher.

Rates of potentially preventable hospitalisation for chronic, acute and vaccine-preventable conditions are highest in remote and very remote areas (figure 8.2.1). However, over time the rate of hospitalisation in non-remote areas has increased more steeply than in remote areas (from 2010–2012 to 2016–2018), and this has resulted in a narrowing in the gap between remote and non-remote areas for these conditions (table 8A.2.1).

Figure 8.2.1 **Potentially preventable hospitalisations for Aboriginal and Torres Strait Islander people (age-standardised rates), by condition type, over time and by remoteness^a**

^a See table 8A.2.1 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 8A.2.1.

Hospitalisation rates for Aboriginal and Torres Strait Islander people for these conditions are higher than for non-Indigenous people

Potentially preventable hospitalisation rates for Aboriginal and Torres Strait Islander people are higher than for non-Indigenous people for chronic, acute and vaccine-preventable conditions, with the proportional disparity highest for vaccine-preventable conditions. In 2018-19, after adjusting for differences in population age structures, the hospitalisation rate for Aboriginal and Torres Strait Islander people for:

- chronic conditions was 3.1 times the rate for non-Indigenous people (table 8A.2.4)
- acute conditions⁸ was 2.4 times the rate for non-Indigenous people (table 8A.2.8)
- vaccine-preventable conditions was 3.5 times the rate for non-Indigenous people (table 8A.2.10).

The proportional disparity in outcomes for vaccine-preventable conditions is particularly large in remote Australia, where Aboriginal and Torres Strait Islander people are around 12 times as likely to be hospitalised for vaccine-preventable pneumonia and around five times as likely to be hospitalised for other vaccine-preventable conditions (table 8A.2.11). Further information on vaccinations can be found in section 8.1 *Access to primary health care*.

For potentially preventable chronic and acute conditions, about three-quarters of the gap is explained by six conditions

For potentially preventable hospitalisations for chronic and acute conditions, about three-quarters of the gap to non-Indigenous people is explained by six conditions (figure 8.2.2). These conditions also represent 65 per cent of potentially preventable hospitalisations for Aboriginal and Torres Strait Islander people for chronic and acute conditions (tables 8A.2.5 and 8A.2.9).

Chronic obstructive pulmonary disease (COPD)⁹ is the most common cause of potentially preventable hospitalisations for chronic conditions for both Aboriginal and Torres Strait Islander people and non-Indigenous people (table 8A.2.5). However, the rate for Aboriginal and Torres Strait Islander people is over four and a half times the rate for non-Indigenous people (table 8A.2.5). The prevalence of COPD amongst Aboriginal and Torres Strait Islander people is concerning because it is associated with comorbidities such as arthritis, asthma and behavioural conditions (AIHW 2019), and increases susceptibility to coronaviruses (Lippi and Henry 2020).

⁸ Relate to serious short-term illness and could possibly be prevented or severely minimised, through access to effective primary health care services.

⁹ Chronic obstructive pulmonary disease (COPD) is an umbrella term used to describe progressive lung diseases. In the vast majority of cases, lung damage caused by smoking (including second-hand smoke) is the cause of COPD. However, not all smokers develop COPD and it may also be related to air pollution, long term exposure to hazards in the workplace or genetic susceptibility (Mayo Clinic 2020).

Figure 8.2.2 **Potentially preventable hospitalisations for six key chronic and acute conditions (age-standardised rates and rate ratio), 2016–2018^a**

COPD = Chronic obstructive pulmonary disease

^a See tables 8A.2.5 and 8A.2.9 for detailed definitions, footnotes and caveats.

Source: AIHW (unpublished) National Hospital Morbidity Database; tables 8A.2.5 and 8A.2.9.

Cellulitis¹⁰ is the most common cause of potentially preventable hospitalisation for an acute condition for Aboriginal and Torres Strait Islander people (table 8A.2.9) (AIHW 2020a). Cellulitis is of particular concern in remote and very remote regions, where it represents about 30 per cent of hospitalisations for acute conditions for Aboriginal and Torres Strait Islander people, and the rate is three and a half times that for non-Indigenous people in remote and very remote areas (table 8A.2.9).

While rates of rheumatic heart disease and bronchiectasis are relatively low, the disparity for Aboriginal and Torres Strait Islander people is large, particularly in remote areas

There are two additional chronic conditions for which hospitalisation rates are relatively low, but the disparity between Aboriginal and Torres Strait Islander people and non-Indigenous people is large, particularly in remote areas. These are:

- rheumatic heart disease (RHD) — caused by an untreated bacterial infection of the throat and skin, and can result in permanent damage to the heart. Aboriginal and Torres Strait Islander people are hospitalised at about six times the rate of non-Indigenous people,

¹⁰ Cellulitis is a bacterial skin infection that can develop from an open wound on any part of the body, but most commonly affects the lower leg (AIHW 2020a).

increasing to 17 times the rate in remote areas (table 8A.2.5). Aboriginal and Torres Strait Islander people have among the highest rates of RHD in the world (AHMAC 2017).

- bronchiectasis — the abnormal widening of the airways in the lungs, and is usually caused by damage to the airway walls and often from a lung infection. Aboriginal and Torres Strait Islander people are hospitalised at more than three times the rate of non-Indigenous people, rising to more than 17 times the rate in remote areas (table 8A.2.5).

Other hospitalisations that could potentially have been prevented relate to external causes and sexually transmitted infections — these have also increased over time though more so for Aboriginal and Torres Strait Islander people

From 2010-11 to 2018-19, the age-standardised rate of hospitalisations of Aboriginal and Torres Strait Islander people for infections with a predominately sexual mode of transmission increased by 19 per cent, compared to 3 per cent for non-Indigenous people (table 8A.2.12). However, most of this increase occurred between 2010-11 and 2011-12. The increase is likely attributable to a syphilis epidemic affecting Aboriginal and Torres Strait Islander young people living in remote areas (Department of Health 2020).

The age-standardised rate of hospitalisations of Aboriginal and Torres Strait Islander people for external causes (including injury and poisoning)¹¹ increased by 31 per cent from 2010-11 to 2018-19, with an increase of 17 per cent for non-Indigenous people (table 8A.2.14). The biggest contributor to the increased rate of hospitalisations (for both Aboriginal and Torres Strait Islander and non-Indigenous people) appears to be an increase in hospitalisations from falls, particularly in major cities (table 8A.2.15). The greatest proportional disparity in rates was for assaults, with Aboriginal and Torres Strait Islander people hospitalised at about 14 times the rate for non-Indigenous people in 2016–2018 (table 8A.2.15).

How can potentially preventable hospitalisation rates be decreased for Aboriginal and Torres Strait Islander people?

The increasing rates of potentially preventable hospitalisations of Aboriginal and Torres Strait Islander people for chronic, acute and vaccines-preventable conditions may be a key to the declining death rates for these conditions (see section 8.3 *Potentially avoidable deaths*). However, preventing these conditions from developing to the point that people need hospitalisation should also be a key focus. Appropriate and ongoing management of chronic

¹¹ The complete list of ICD-10-AM codes included in this category and all other categories of potentially preventable hospitalisations can be found in table 8A.2.3.

illness can improve a person's ability to participate in cultural life and kinship, particularly when flexible treatment options enable them to remain on Country (Conway et al. 2018).

Strategies to decrease potentially preventable hospitalisation rates for chronic, acute and vaccine-preventable conditions should focus on improving the effectiveness of health system prevention and primary health care services for Aboriginal and Torres Strait Islander people. Approaches to achieve this are covered elsewhere in this report, but include:

- eliminating barriers to accessing primary health care services and preventative health checks (see section 8.1 *Access to primary health care* and section 8.3 *Potentially avoidable deaths*)
- ensuring the cultural safety of primary health care services, so when they are accessible they are also appropriate to the needs of Aboriginal and Torres Strait Islander people. This includes increasing and supporting the Aboriginal and Torres Strait Islander health workforce, which plays an important role in providing culturally safe primary and tertiary care. Health services that provide a culturally unsafe experience are less likely to be used as they can alienate a patient and result in a person disengaging from the health system altogether (Lavery, McDermott and Calma 2017)
- designing treatment plans that are realistic and achievable within the circumstances of each patient, and in doing so, empowering patients with the knowledge that they can influence their health outcomes through their own positive actions (Seear et al. 2019).

Increasing access to Aboriginal Community Controlled Health Services (ACCHSs) may address these challenges, but improving access to other health services and ensuring their cultural safety is also likely to be required to address the needs of Aboriginal and Torres Strait Islander people (see section 8.1 *Access to primary health care*).

Delays in seeking primary health care can lead to deteriorating health and hospitalisation. Aboriginal and Torres Strait Islander people have good reasons to delay contact with primary health care professionals, such as the accessibility and appropriateness of services. However, a person's responsibilities around caring for others may be another key explanation for this delay. The decision to prioritise one's own health in the context of caring responsibilities and significant other challenges (discussed elsewhere in this report) is difficult. And ultimately, caring responsibilities can affect the ability of the carer to maintain their health and manage their own chronic conditions (Ristevski et al. 2020; Eades et al. 2020).

Aboriginal and Torres Strait Islander people, and women in particular, bear more caring responsibilities for children and people with disability than their non-Indigenous counterparts (ABS 2016). Some medical practitioners have reported that caring for others may explain the late presentation of Aboriginal and Torres Strait Islander women seeking care for themselves (Marcusson-Rababi et al. 2019).

To address this issue, it is important that culturally safe carer support and respite care programs are accessible in both metropolitan and remote Australia. For example, as Aboriginal and Torres Strait Islander people often consider 'caring' responsibilities as a

wider part of ‘family’ responsibilities, it would not be unusual to expect that an entire family would require respite services they could access together (Department of Health & Human Services 2020).

8.3 Potentially avoidable deaths¹²

Box 8.3.1 Key messages

- Reducing potentially avoidable deaths contributes significantly to increasing life expectancy.
- The rate of potentially avoidable deaths has decreased over time for Aboriginal and Torres Strait Islander people. Between 1998 and 2018, it fell 40 per cent and contributed to about half the overall reduction in deaths.
- However, Aboriginal and Torres Strait Islander people remain about three times as likely to die of potentially avoidable deaths than non-Indigenous people.
- In the five year period 2014–2018, the rate of potentially avoidable deaths for Aboriginal and Torres Strait Islander people represented 60 per cent of overall mortality, was higher for males than females, and increased rapidly from the age of 15 years, particularly for males.
- In this same period, ischaemic heart disease caused just over one in five potentially avoidable deaths of Aboriginal and Torres Strait Islander people. This, along with diabetes, and intentional self-harm combined, equated to 44 per cent of these deaths.
- Access to, and use of, health care can make a substantial contribution to reducing potentially avoidable deaths. While it is improving for Aboriginal and Torres Strait Islander people it remains below that of non-Indigenous people.
- Research suggests that access to and use of health care may be improved through increased access to Aboriginal Community Controlled Health Services (ACCHSs), more Aboriginal and Torres Strait Islander health workers and building the cultural competence of the health workforce.
- Reductions in potentially avoidable deaths could also be achieved by providing holistic approaches to support people to reduce personal risk factors, such as obesity, and tobacco, alcohol and drug consumption.

Box 8.3.2 Measures of potentially avoidable deaths

There is one main measure for this indicator.

- *Potentially avoidable deaths* is defined as the number and rate of deaths from potentially preventable and treatable conditions for people aged less than 75 years (data is available for NSW, Queensland, WA, SA and the NT and by age and sex). As of 2019, deaths were classified as potentially avoidable based on their International Statistical Classification of Diseases and Related Health Problems (ICD-10 code).¹³

Data for this measure are sourced from the ABS Causes of Death collection, with the most recent available data for 2018. People aged 75 years or over are excluded due to difficulty in assigning a cause of death that can be clearly defined as avoidable or unavoidable.

¹² The Steering Committee notes its appreciation to Dr Sanchia Shibasaki, Lowitja Institute, who reviewed a draft of this section of the Report.

¹³ A list of causes for potentially avoidable deaths is available in table 8A.3.6.

Reducing potentially avoidable deaths contributes to increasing life expectancy (section 4.1 *Life expectancy*). Potentially avoidable deaths are those that occur due to conditions that are preventable or treatable such as diabetes, heart failure, asthma, transport accidents and assault (see table 8A.3.6 for the full list). These conditions can often be treated through access to and use of primary health care (section 8.1 *Access to primary health care*), mental health services (section 8.7 *Mental health*) and hospital care (section 8.2 *Potentially preventable hospitalisations*). Some of these conditions can be prevented through health prevention activities such as health care checks and reductions in personal risk factors, such as obesity (section 8.5 *Obesity and nutrition*) and tobacco (section 8.4 *Tobacco consumption and harm*), alcohol (section 11.1 *Alcohol consumption and harm*) and drug consumption (section 11.2 *Drug and other substance use and harm*).

The rate of potential avoidable deaths for Aboriginal and Torres Strait Islander people has fallen over the past 20 years, contributing substantially to the lives being saved...

The potentially avoidable deaths rate in NSW, Queensland, WA, SA and the NT for Aboriginal and Torres Strait Islander people fell by 40 per cent between 1998 and 2018 (figure 8.3.1).¹⁴ This 20-year decline contributed almost 50 per cent to the reduction in Aboriginal and Torres Strait Islander people's overall mortality rate (section 4.1 *Life expectancy*). The initial rate of decline in potentially avoidable deaths was rapid for the first decade but slowed to a cumulative decline of 10 per cent over the ten years since 2008 (which corresponds to around 30 fewer deaths per 100 000 population) (table 8A.3.4).

...but more needs to be done to reduce the gap...

Even though the rate of potentially avoidable deaths for Aboriginal and Torres Strait Islander people has fallen, in 2018 it remained 3.1 times the rate for non-Indigenous people (table 8A.3.4). This rate ratio is slightly higher than that in 1998, due to a larger percentage decline in the rate for non-Indigenous people over this period (45 per cent decrease, compared to a 40 per cent decrease for Aboriginal and Torres Strait Islander people) (table 8A.3.4).

...and over half of Aboriginal and Torres Strait Islander deaths continue to be potentially avoidable

In 2014–2018, the deaths of 7072 Aboriginal and Torres Strait Islander people in NSW, Qld, WA, SA and NT were potentially avoidable (table 8A.3.1). Those deaths represented

¹⁴ Avoidable mortality is not available for other states and territories due to low numbers of Aboriginal and Torres Strait Islander people.

60 per cent of the number of Aboriginal and Torres Strait Islander who died (table 8A.3.5). In that five-year period, the avoidable mortality rate (age-standardised) for Aboriginal and Torres Strait Islander people in NSW, Qld, WA, SA and NT was around three times the rate for non-Indigenous people (table 8A.3.1). Data reported by selected states and territories are available in table 8A.3.1.

Figure 8.3.1 Avoidable mortality for Aboriginal and Torres Strait Islander people, NSW, Queensland, WA, SA, and the NT combined, by sex, 1998 to 2018 (age-standardised)^a

^a See table 8A.3.4 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Causes of Death, Cat no. 3303.0; ABS (unpublished) Estimated Resident Population, cat. no 3101.0; ABS (2019) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006–2031*, Cat. no. 3238.0; table 8A.3.4.

As with overall mortality, potentially avoidable mortality for Aboriginal and Torres Strait Islander people is relatively high for children aged under one year of age, falling to the lowest rate for children aged 1–4 years and 5–14 years, but from 15 years of age increases rapidly — with rates higher for males compared to females (figure 8.3.2). This pattern is consistent with that for non-Indigenous people, but the rates of avoidable mortality are significantly lower across all age groups and the increase from 15 years of age is much slower, particularly for women (table 8A.3.2).

In 2014–2018, the top three causes of potentially avoidable deaths for Aboriginal and Torres Strait Islander people were ischaemic heart disease (21 per cent), diabetes (12 per cent), and intentional self-harm (11 per cent). These three causes combined were responsible for 44 per cent of all potentially avoidable deaths — similar to a decade earlier (table 8A.3.3). However, there were differences across disease categories over this period, with age-standardised mortality rates from ischaemic heart disease decreasing, mortality

associated with diabetes remaining unchanged, and mortality from intentional self-harm increasing (see section 8.8 *Suicide and self-harm*).

For non-Indigenous people, ischaemic heart disease and intentional self-harm were also major causes of potentially avoidable deaths — these, along with cancer which is the top cause, led to over one in two potentially avoidable deaths for non-Indigenous people (table 8A.3.3).¹⁵ However, the age-standardised mortality rates associated with all causes of potentially avoidable deaths (other than cancer) were significantly higher for Aboriginal and Torres Strait Islander people than non-Indigenous people.

Figure 8.3.2 Avoidable mortality for Aboriginal and Torres Strait Islander people, by sex, by age group, NSW, Queensland, WA, SA and the NT combined, 2014–2018^a

^a See table 8A.3.2 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Causes of Death, Cat. no. 3303.0; ABS (unpublished) Estimated Resident Population, Cat. no. 3101.0; ABS (2019) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006–2031*, Cat. no. 3238.0; table 8A.3.2.

Strategies to further reduce potentially avoidable deaths of Aboriginal and Torres Strait Islander people need to consider the many social, economic and cultural factors contributing to health outcomes

Strategies to reduce potentially avoidable deaths need to take into account the social, economic and cultural reasons for health-related behaviours and outcomes (Cockburn, Gartner and Ford 2018; Lovett, Thurber and Raglan 2017). Colonisation impacted on connection to Aboriginal and Torres Strait Islander people’s culture and led to

¹⁵ Not all types of cancers are included in potentially avoidable deaths. See table 8A.3.6 for details.

sociocultural-dislocation, economic dispossession and intergenerational trauma (Reading and Wien 2009). The ongoing effects of colonisation, the continual removal of Aboriginal and Torres Strait Islander children from their families, and the persistent personal and institutional racism, continue to affect Aboriginal and Torres Strait Islander people (Canuto et al. 2018; Department of Health 2016; Paradies 2016). As a result, Aboriginal and Torres Strait Islander people often have high rates of the personal risk factors that lead to poorer health and the greater need for health care (AIHW 2016).

Increased levels of health care access and use can make a substantial contribution to reducing avoidable deaths for Aboriginal and Torres Strait Islander people (AIHW 2019; Korda et al. 2007). This includes primary health care (section 8.1 *Access to primary health care*), mental health service (section 8.7 *Mental health*) and hospital care (section 8.2 *Potentially preventable hospitalisations*). For example, increased levels of primary care utilisation by Aboriginal and Torres Strait Islander people in remote communities in the NT led to a 60–75 per cent reduction in deaths from common chronic diseases such as renal disease, chronic obstructive pulmonary disease, diabetes and ischaemic heart disease (Zhao et al. 2014).

However, there are a significant number of Aboriginal and Torres Strait Islander people who are not able to access or do not use health care services when needed. For example, in 2018-19, 19 per cent of Aboriginal and Torres Strait Islander people aged 18 years or over reported that they did not see a GP/doctor at a clinic when needed on at least one occasion in the last 12 months (21 per cent in non-remote areas and 11 per cent in remote areas) with the main reason being personal which includes being too busy, discrimination, and services that are not culturally safe or adequate (section 8.1 *Access to primary health care*, tables 8A.1.9-10).

Further improvements are required to eliminate barriers to accessing health care services and to the experience of patients once in the service. Research suggests that the uptake of, and continued engagement with, health care services for Aboriginal and Torres Strait Islander people may be improved with increased access to ACCHSs (Campbell et al. 2018), more Aboriginal and Torres Strait Islander health workers and building the cultural competence of the overall health workforce as a step to ensure cultural safety in health services (see sections 8.1 *Access to primary health care* and 8.7 *Mental health*).

Reductions in personal risk factors are also important to reduce potentially avoidable deaths and can be achieved with holistic approaches that support Aboriginal and Torres Strait Islander people. These approaches may include, but are not limited to:

- improving socioeconomic conditions (AHMAC 2015; AIHW 2015; Cairney et al. 2017)
- health promotion strategies (AHMAC 2017), including empowering individuals with knowledge and skills to improve their health
- other instruments such as taxes and subsidies that provide monetary incentives to support healthy lifestyles (Greenhalgh, Scollo and Winstanley 2020).

These approaches are more likely to deliver better outcomes if they are culturally safe and are designed and implemented by Aboriginal and Torres Strait Islander people. For more information on this and other approaches to reduce personal risk factors, such as obesity, and tobacco, alcohol and drug consumption see sections 8.4 *Tobacco consumption and harm*, 8.5 *Obesity and nutrition* and 11.1 *Alcohol consumption and harm*.

Future directions in data

Currently, data about potentially avoidable mortality are only able to be reported at the jurisdictional level for NSW, Queensland, WA, SA and the NT. Further work is required to enable reporting separately for all states and territories (subject to limitations imposed by the small number of Aboriginal and Torres Strait Islander deaths in some jurisdictions). Reporting of potentially avoidable mortality by remoteness and Indigenous status would support analysis of potential barriers to health services and associated outcomes.

8.4 Tobacco consumption and harm¹⁶

Box 8.4.1 Key messages

- Despite considerable progress in reducing smoking rates, tobacco consumption remains the biggest contributor to the burden of preventable ill health and death for Australian adults.
- Over the past 20 years, the proportion of Aboriginal and Torres Strait Islander adults who do not smoke has increased. Between 2001 and 2018-19, the daily smoking rate declined so about 60 per cent of Aboriginal and Torres Strait Islander adults did not smoke in 2018-19. This means 50 000 fewer smokers in 2018-19 than would have been the case if smoking had remained at the 2001 level.
- Smoking rates have also decreased for non-Indigenous adults. However, as they have decreased from a lower base, the 'gap' ratio has increased. In 2001, the smoking rate for Aboriginal and Torres Strait Islander adults was just over twice that for non-Indigenous adults, but by 2017–19 the rate was three times that for non-Indigenous adults.
- Most of the decline in smoking rates for Aboriginal and Torres Strait Islander adults has occurred in non-remote areas, where health regulations to reduce tobacco consumption are likely to have had the largest impact.
- The biggest reduction has been for young Aboriginal and Torres Strait Islander adults in non-remote areas. For adults aged 25–34 years in non-remote areas, smoking rates fell by 23 percentage points between 1995 and 2018-19. This is likely to lead to reductions in tobacco-related deaths over time, although it may take decades.
- In remote areas, where Aboriginal and Torres Strait Islander adults' smoking rates are highest, research indicates that local solutions to reduce smoking rates could be beneficial. However, more evidence is needed on the impacts of smoking cessation programs for Aboriginal and Torres Strait Islander people in different contexts.

Box 8.4.2 Measures of tobacco consumption and harm

There is one main measure for this indicator (aligned with the associated National Indigenous Reform Agreement (NIRA) indicator) — rates of current daily smokers¹⁷, measured by the proportion of people aged 18 years or over who are current daily smokers (all jurisdictions; remoteness; age; sex).

Smoking rate data are available from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) or National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available from the 2018-19 NATSIHS. Data for the non-Indigenous population are sourced from the ABS National Health Survey (NHS), with the most recent data available from the 2017-18 NHS.

Public health measures to decrease tobacco consumption have played a role in reducing smoking prevalence among Australian adults (Wakefield et al. 2014). These measures

¹⁶ The Steering Committee notes its appreciation to Dr Sanchia Shibasaki, Lowitja Institute, who reviewed a draft of this section of the Report.

¹⁷ Current daily smokers are people who smoked one or more cigarettes (or pipes or cigars) per day at the time of their survey interview.

include smoke-free laws, tobacco taxes, plain packaging of products, graphic health warnings on packets, support for smokers to quit and greater exposure to mass media campaigns (Wakefield et al. 2014). The Tackling Indigenous Smoking Program has also contributed to reduced smoking rates among Aboriginal and Torres Strait Islander people through a regional grants program driving growth in partnerships and community engagement, multi-level and locally relevant health promotion, and increased access to culturally appropriate quitting support (Mitchell, Bandara and Smith 2018).

Despite these efforts, smoking is still the single biggest contributor to the burden of preventable ill health and death in Australia (section 4.1 *Life Expectancy* has further information on cancer-related deaths), leading to over 20 000 premature deaths in 2015 (AIHW 2019). Smoking affects health in many ways — including by increasing the risk of many cancers, most notably lung cancer, and other chronic diseases such as heart disease, stroke, diabetes and oral health problems (Greenhalgh 2015; Wilson et al. 2017). Smoking in pregnancy (section 6.2 *Health behaviours during pregnancy* has further information on health behaviours during pregnancy) can lead to miscarriage, stillbirth or premature birth — and second-hand smoke can cause disease in non-smoking adults and children, including sudden infant death syndrome (Colonna et al. 2020; Graham et al. 2007; Greenhalgh 2015).

Over time, the proportion of Aboriginal and Torres Strait Islander adults who do not smoke has increased, and particularly for younger adults...

Over time, the rates of Aboriginal and Torres Strait Islander adults who are not smoking have increased. Between 2001 and 2018-19, the crude daily smoking rate for Aboriginal and Torres Strait Islander adults declined from 51 to 40 per cent (table 8A.4.1). About 60 per cent of Aboriginal and Torres Strait Islander adults now do not smoke, which means 50 000 fewer smokers than would have been the case if the proportion had remained at the 2001 level.

The majority of the increase in those who do not smoke was in non-remote areas, where people are likely to have benefited more from the smoking regulations that banned smoking from office workplaces and hospitality venues (Williams and Allan 2019). Crude daily smoking rates in remote and very remote areas remained relatively stable, and higher than in major cities and inner regional areas (figure 8.4.1).

In particular, the rates of younger Aboriginal and Torres Strait Islander adults in non-remote areas who are not smoking have increased. Between 1995 and 2018-19, the greatest reduction in smoking rates was in non-remote areas for adults aged 25–34 years (dropping 23 percentage points) (table 8A.4.14). In future, this is likely to lead to reductions in tobacco-related deaths, but it may take decades (see section 4.1 *Life Expectancy*).

Figure 8.4.1 **Current daily smoking, Aboriginal and Torres Strait Islander adults, by remoteness area, 2001 to 2018-19 (crude rates)^{a,b}**

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See tables 8A.4.2–7 for detailed definitions, footnotes and caveats.

Source: National Aboriginal Torres Strait Islander Health Survey (various years); ABS (unpublished) National Aboriginal Torres Strait Islander Social Survey (various years); tables 8A.4.2–7.

...but smoking rates remain higher than for non-Indigenous adults...

Smoking rates for non-Indigenous adults have decreased by a similar percentage point amount. However, as they have decreased from a lower base, the ratio for Aboriginal and Torres Strait Islander adults and non-Indigenous adults has increased. In 2001, the smoking rate for Aboriginal and Torres Strait Islander adults was just over twice the rate for non-Indigenous adults, but by 2017–19 the rate was three times that for non-Indigenous adults (table 8A.4.8).

... with the higher rates influenced by a range of factors

Smoking rates are influenced by ease of access to tobacco, economic and socio-cultural factors. People from lower socio-economic groups are more likely to start smoking earlier, and to continue smoking (Greenhalgh 2015). Areas with a high concentration of people experiencing disadvantage are also more likely to have higher tobacco outlet densities, which is positively associated with smoking (Barnes et al. 2016; Marashi-Pour 2015). Smoking rates are also likely to be related to social stress and economic hardship that arise from the experiences of disadvantage. Not being able to find employment, could constitute a substantial social stressor that promotes smoking as a coping strategy (Carroll et al. 2019).

Social networks can expose people to smoking and sharing cigarettes which can make it difficult to quit, although these networks can also provide support when quitting (Thomas et al. 2019a; Wright 2018). In some communities, smoking is a socio-cultural norm, and women in a small number of communities still chew pituri and other native tobacco as a cultural practice (Cockburn, Gartner and Ford 2018; Greenhalgh 2015; Lovett, Thurber and Raglan 2017). There are little data on the use of electronic cigarettes, but preliminary research indicates that fewer Aboriginal and Torres Strait Islander people, compared to all Australians, have tried e-cigarettes (Thomas et al. 2019b).

Aboriginal and Torres Strait Islander people who smoke are aware of the health impacts. However, in addition to the above factors Aboriginal and Torres Strait Islander people face, other structural barriers to reducing tobacco consumption include not being able to access or, in some cases, not being aware of quit programs (Nicholson et al. 2015; Robertson et al. 2013; Wright 2018).

Evidence on approaches that reduce Aboriginal and Torres Strait Islander people's smoking rates is scant, but programs that use local solutions are promising

The evidence on how to design effective services for reducing smoking by Aboriginal and Torres Strait Islander people is scant (Williams and Allan 2019). More evaluation of smoking cessation initiatives and their impact on Aboriginal and Torres Strait Islander people in different contexts is needed.

However, the results in this section and identified research suggest that Aboriginal and Torres Strait Islander adults in remote communities could benefit from more localised solutions to prevent the uptake of smoking and support people to quit (Carroll et al. 2019). Available research indicates that community-based programs that use local approaches to support Aboriginal and Torres Strait Islander people to quit smoking should involve Aboriginal and Torres Strait Islander people, their leaders and communities in developing, implementing and evaluating multi-faceted interventions and support services that take account of cultural practices, traditions and language (Carroll et al. 2019; Williams and Allan 2019; World Health Organization 2005). As an example, the Tackling Indigenous Smoking (TIS) program, through its flexible design, facilitates local solutions. Under the program there has been a growth in partnerships and community engagement, the delivery of local health promotion for tobacco control, increased access to culturally relevant quitting support, and an increase in the use of evidence to inform program design and improvement (Mitchell, Bandara and Smith 2018)¹⁸. While not an evaluation of the outcomes of the TIS, research conducted by the ABS has found that, although there has been some decline in smoking rates since the commencement of targeted measures, it takes about 10 years for smoking reduction programs to have an effect (ABS 2017).

¹⁸ An outcomes evaluation of the Tackling Indigenous Smoking program is in progress, but results are not yet available (Department of Health unpublished).

Future directions in data

There is little information comparing the direct effects of community-controlled and non-community controlled responses on smoking cessation. While some research suggests that community-controlled smoking cessation programs are more effective in reducing smoking rates — as Williams and Allan (2019) concluded from their history of anti-smoking initiatives in Australia — there is no available quantitative assessment of the effectiveness of community-controlled approaches relative to other approaches. One way to facilitate outcome evaluations, as suggested in the evaluation of the TIS program, is for Quitline to collaborate and share data with recipients of TIS regional grants and for the Department to create a baseline for further evaluation (Mitchell, Bandara and Smith 2018).

8.5 Obesity and nutrition¹⁹

Box 8.5.1 Key messages

- A healthy weight reduces the risk of heart disease, some cancers and other health conditions, whereas obesity leads to poor health and reduces average life expectancy.
- Obesity and overweight rates are increasing for both Aboriginal and Torres Strait Islander adults and non-Indigenous adults. The rates increased at a similar pace from 2011–13 to 2017–19, but remain higher for Aboriginal and Torres Strait Islander adults (74 per cent, and around 1.2 times the rate for non-Indigenous adults after adjustments for differences in population age structures).
- The higher overweight and obesity rates for Aboriginal and Torres Strait Islander adults are due to higher rates for females at all ages, and for younger males. A higher proportion of Aboriginal and Torres Strait Islander adults under the age of 45 are overweight and obese, than non-Indigenous adults in this age range. But, by the age of 45, the proportion of non-Indigenous males who are overweight and obese is similar to the proportions for Aboriginal and Torres Strait Islander males and females in this age range.
- Rates of obesity and overweight may be influenced through structural measures to improve nutrition or increase physical activity or by reducing vulnerability to personal risk factors:
 - Structural measures to improve nutrition or increase physical activity include improving the supply of affordable healthy food options relative to unhealthy ones, and increasing options for fresh food preparation and storage, particularly in remote areas. However, evidence on the effectiveness of structural measures to reduce obesity rates is limited.
 - Reducing personal risk factors related to poor nutritional choices and sedentary lifestyles, can reduce obesity in adults. Programs that address these risk factors, such as providing education and advice, are most successful if there has been Aboriginal and Torres Strait Islander community involvement in the design and delivery.
- A small proportion of Aboriginal and Torres Strait Islander children and non-Indigenous children (around 6 per cent for both) have an adequate daily intake of vegetables. The average adequate daily intake of fruit is much higher than vegetables for both Aboriginal and Torres Strait Islander children (69 per cent) and non-Indigenous children (76 per cent).
- As with obesity and overweight in adults, nutrition issues for children can be addressed through multifaceted approaches to improve individual knowledge and skills, as well as strategies to improve access to healthy food options.

¹⁹ The Steering Committee notes its appreciation to Dr Sanchia Shibasaki from The Lowitja Institute, who reviewed a draft of this section of the Report.

Box 8.5.2 Measures of obesity and nutrition

There is one main measure for this indicator (aligned with the associated NIRA indicator). Overweight and obese is defined as the number of people aged 18 years or over with a Body Mass Index (BMI) in the range 25.0–29.9 (overweight) or 30 or higher (obese) as a proportion of the total population (table 8A.5.1)²⁰. Additional data are also reported for people with a BMI of 18.5–24.9 (normal weight) and with a BMI of less than 18.5 (underweight) (all jurisdictions; remoteness; sex; age).

Data are also provided for two supplementary measures:

- the proportion of Aboriginal and Torres Strait Islander people (aged 18 years or over) at increased risk of developing chronic disease because their waist measurement is greater than 94 cm for men and 80 cm for women
- the proportion of children aged 2–14 years meeting the recommended average daily fruit and vegetable consumption guidelines (national; remoteness; age).

The data source for these measures is the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) with the most recent data for 2018-19. Data for the non-Indigenous population are sourced from the National Health Survey (NHS) with the most recent data for 2017-18. BMI data for 2018-19 and 2012-13 are not directly comparable with earlier data for 2004-05.

Maintaining a healthy body weight can protect against infection, and reduce the risk of chronic disease and premature deaths. Whereas obesity leads to poor health, increasing the risk of an individual developing, among other things, cardiovascular disease, Type 2 diabetes, some musculoskeletal conditions and some cancers (including oesophageal, stomach, colon and rectum cancers) (AIHW 2019; Wilson et al. 2018), which reduce average life expectancy (Zhao et al. 2013).

Good nutrition and physical activity assist in maintaining a healthy body weight, whereas poor nutrition and a sedentary lifestyle can lead to obesity. However, the underlying causes of obesity are complex and not necessarily lifestyle related; for example, obesity is linked to other factors such as low income, low education levels, disability and complex health needs — although the evidence on the link with low income is mixed, with low income and related food insecurity also associated with lower BMI (NHMRC 2013; OECD 2017; Ride and Burns 2020; Thurber and Bell 2019). Racial discrimination in childhood is associated with increased BMI and waist circumference (Priest et al. 2020), and obesity in childhood is associated with an increased risk of obesity in adulthood (Salmon et al. 2019).

Population data on overweight/obesity are commonly based on measurements of BMI, as is the case with the national survey data used in this section. However, it is important to note that abdominal obesity or elevated waist circumference has been identified as having a potentially stronger association with cardiovascular disease, diabetes and all-cause mortality, than BMI, particularly for Aboriginal and Torres Strait Islander people who have a different

²⁰ Body Mass Index is the calculation of a person's weight (kilograms) divided by the square of their height (metres).

body fat distribution and fat mass for their given body weight (Adegbija et al. 2017; Avery, Taylor and Dal Grande 2015; Bambrick 2005; Piers et al. 2003; Wang et al. 2007). In 2018-19, about 9 percent of Aboriginal and Torres Strait Islander people with an elevated waist circumference were not overweight or obese (table 8A.5.17).

Obesity is increasing across the Australian population, for both non-Indigenous adults and Aboriginal and Torres Strait Islander adults

Obesity is increasing across the Australian population. The crude rate of Aboriginal and Torres Strait Islander adults who were overweight or obese increased from 69 per cent in 2012-13 to 74 per cent in 2018-19 (table 8A.5.15). After adjusting for differences in population age structures, the rate of overweight/obesity increased at a similar pace for both Aboriginal and Torres Strait Islander adults and non-Indigenous adults from 2011-13 to 2017-19, with the rate for Aboriginal and Torres Strait Islander adults around 1.2 times the rate for non-Indigenous adults (tables 8A.5.2-3).

Higher overweight and obesity rates for Aboriginal and Torres Strait Islander adults compared to non-Indigenous adults are due to higher rates for females at all ages, and for younger males. A higher proportion of Aboriginal and Torres Strait Islander adults under the age of 45 years are overweight and obese than non-Indigenous adults in this age range (for both males and females). But, by the age of 45, the proportion of non-Indigenous males who are overweight and obese is similar to the proportions for Aboriginal and Torres Strait Islander males and females in this age range (figure 8.5.1).

In 2018-19, a higher proportion of Aboriginal and Torres Strait Islander people were overweight and obese in major cities (80 per cent) and inner regional areas (83 per cent) than in very remote areas (67 per cent) (table 8A.5.5). Data for rates of overweight and obesity by State and Territory and by remoteness area are available in tables 8A.5.2-10 (age-standardised) and 8A.5.14-16 (crude rates).

Figure 8.5.1 **Overweight and obese adults, by Indigenous status, by age, by sex, 2017–19^a**

^a See table 8A.5.11 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) National Aboriginal Torres Strait Islander Health Survey 2018-19, ABS (unpublished) National Health Survey 2017-18; table 8A.5.11.

Rates of obesity and overweight may be influenced through structural measures to improve nutrition or increase physical activity or reducing personal risk factors

Overweight and obesity rates may be influenced through structural measures to facilitate changes to nutrition and/or physical activity.

- Measures to facilitate improvement in nutrition might include improving or maintaining the supply of affordable healthy food options relative to unhealthy ones, and increasing options for fresh food preparation and storage, particularly in remote areas.
 - Increasing the supply of affordable healthy options in remote communities could be facilitated by subsidising the cost of healthy foods (Crowle and Turner 2010) through community stores (which in some communities provide the only food source) (Lee et al. 2016) or, encouraging the development of community gardens (Fawcett 2013; Ride and Burns 2020). Furthermore, in remote areas where healthy food options include those sourced from local resources, such as fishing in the Torres Strait Islands (section 12.1 *Outcomes for Torres Strait Islander people*), the sustainability or maintenance of these resources through environmental protection may be required.
 - Improving the standard of housing could in turn improve the facilities to store and prepare nutritious food (Ride and Burns 2020, section 10.2 *Rates of disease*

associated with poor environmental health and section 10.3 Access to clean water and functional sewerage and electricity services).

- Measures to increase physical activity might include improving access to exercise programs and facilities (Crowle and Turner 2010) that are culturally safe (Macniven and Esgin 2020).

However, evidence on whether these structural measures facilitate improved nutrition and increased physical activity is limited (Crowle and Turner 2010). One study in the Anangu Pitjantjatjara Yankunytjatjara (APY) lands found that while healthy food options have become more available and affordable over time, there continues to be high intake of unhealthy food items as they are still cheaper than healthy food and some houses have inadequate cooking facilities to make healthier alternatives (Lee et al. 2016).

Reducing personal risk factors related to poor nutritional choices and sedentary lifestyles, for example through education programs to improve knowledge and skills, can also play a role in reducing overweight and obesity. Programs designed with strong community involvement have been shown to be the most successful in reducing BMI (Browne et al. 2017; Schembri et al. 2016). Culturally safe programs led by Aboriginal and Torres Strait Islander facilitators and health workers may have more success than mainstream programs in effectively addressing the personal risk factors that can lead to obesity for Aboriginal and Torres Strait Islander people, as they recognise:

- the importance of relationships, connection to lands, environment, family and community, a sense of identity, self-determination and culture (Salmon et al. 2019).
- obesity as multi-factorial, influenced by physiological, behavioural, psychological and environmental drivers and the impact of colonisation (Bell et al. 2017).

For all children, adequate daily consumption of fruit and vegetables by children remains below the recommended guidelines

Consumption of unhealthy foods, such as sugar-sweetened beverages and high fat foods (including takeaway and convenience foods) contribute to childhood obesity. The NHMRC Australian dietary guidelines are designed for the general population and recommend eating a wide variety of nutritious food (vegetables, legumes, fruits, cereals, lean meat, fish, poultry, and reduced fat dairy products), drinking plenty of water and limiting consumption of saturated fat, salt, alcohol and sugars. Data reported for 2018-19 are based on the 2013 NHMRC daily food consumption guidelines (NHMRC 2013). However, they do not necessarily reflect the particular dietary needs of people with illnesses such as diabetes or regional dietary preferences (Ward and Best 2020).

In 2018-19, 69 per cent of Aboriginal and Torres Strait Islander children aged 2–14 years across all areas met the guidelines for adequate daily fruit consumption; lower than the rate for non-Indigenous children (76 per cent) (table 8A.5.18). The proportions meeting the guidelines for adequate daily vegetable intake were much lower for all children — around

6 per cent for Aboriginal and Torres Strait Islander children and non-Indigenous children (table 8A.5.18). Between 2011–13 and 2017–19, the only significant change in usual fruit and vegetable intake was an increase in usual fruit intake for non-Indigenous children (tables 8A.5.18–20).

As with obesity and overweight in adults, nutrition issues for children can be addressed through multifaceted approaches addressing improving individual knowledge and skills, as well as strategies that improve access to healthy food options. Programs to improve nutritional choices, are most successful among Aboriginal and Torres Strait Islander people where they have strong community involvement in their design and delivery (Browne et al. 2017; Schembri et al. 2016). The consistent inclusion of culturally safe nutrition education and advice into maternal and child healthcare services may also improve Aboriginal and Torres Strait Islander children’s nutrition (Browne et al. 2017).

8.6 Oral health²¹

Box 8.6.1 Key messages

- Good oral health has many benefits including the ability to chew, swallow smile and speak with confidence, which are important for people's overall health and wellbeing. Good oral health also prevents the most common chronic oral diseases that cause discomfort, including tooth decay and tooth loss.
- Data available for 2012–14 show that Aboriginal and Torres Strait Islander children had twice as many decayed, missing or filled tooth surfaces, on average, as non-Indigenous children. But non-Indigenous adults had more decayed, missing or filled teeth than Aboriginal and Torres Strait Islander adults (in 2017-18), due in part to their older age profile.
- Poor oral health outcomes are associated with lower incomes. Aboriginal and Torres Strait Islander children's overrepresentation in lower income families may therefore be a key factor in why the oral health of Aboriginal and Torres Strait Islander children is poorer than that of non-Indigenous children. There may also be other structural factors, such as the lack of fluoridated water in some rural and remote areas.
- Aboriginal and Torres Strait Islander peoples' higher rates of preventable oral health disease are likely to lead to higher rates of potentially preventable hospitalisations for dental conditions.
- Oral disease may negatively affect productivity through time lost that would otherwise be spent working or studying. Many dental conditions could be prevented through regular care and early intervention — but, because of delays to treatment, end up imposing greater costs.

Box 8.6.2 Measures of oral health

There are two main measures for this indicator:

- *Child dental health* is defined as the proportion of children with no decayed, missing or filled teeth surfaces (dmfs/DMFS)²² for children aged 5–10 years (infant teeth) and 6–15 years (permanent teeth). The most recent data for children aged 5–10 years (infant teeth) and 6–14 years (permanent teeth) are sourced from *Oral Health of Australian Children: the National Child Oral Health Study 2012-14* (Do and Spencer 2016). Until 2010, data were sourced from the AIHW Child Dental Health Survey and were for decayed, missing and filled teeth (DMFT/dmft).
- *Adult dental health* is defined as the number of decayed, missing and filled teeth (DMFT) for people aged 15 years or over. The most recent data are sourced from the *National Survey of Adult Oral Health, 2017–2018*.

(continued next page)

²¹ The Steering Committee notes its appreciation to Dr Sanchia Shibasaki, Lowitja Institute, who reviewed a draft of this section of the Report.

²² DMFS/dmfs: uppercase denotes permanent (adult) teeth, and lowercase deciduous (infant) teeth. 'DMFS'/'dmfs' is the sum of decayed, missing and filled teeth surfaces.

Box 8.6.2 (continued)

Supplementary data for the main measures are reported from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data for 2018-19 for people aged 15 years or over (data are based on self-report). Non-Indigenous comparator data are not available.

A supplementary measure is reported on the hospitalisation rate for dental health conditions per 100 000 population (by age and by remoteness)²³.

Good oral health has many benefits including the ability to smile, speak, chew and swallow with confidence, which are important for people's overall health and wellbeing (Glick et al. 2016). Oral health refers to the condition of a person's teeth and gums, as well as the health the muscles and bones in the mouth (AHMAC 2017).

Dental hygiene (or regular tooth brushing and flossing), good nutrition and regular dental visits (every six months) all support oral health. Tooth brushing and flossing are important, and can be encouraged through education and modelling by adults in the home environment and/or education outside the home (Jamieson, Armfield and Roberts-Thomson 2007). Reducing how often sugar is consumed (more so than the quantity) is also a factor, as sugar consumption increases the risk of dental caries; children who fall asleep with bottles of milk or juice in their mouth are at a greater risk of permanent tooth decay (Yacoub and Karmally 2017). Regular dental visits to manage issues and for routine check-ups are vital for good oral health, and can result in lower prevalence of dental decay (Australian Indigenous HealthInfoNet 2020).

The public health policy of fluoridation also supports good oral health. Fluoride in the water supply is one of the most effective ways to prevent dental caries for children and adults (Spencer, Do and Ha 2018; Yacoub and Karmally 2017), and has been shown to reduce tooth decay by 26–44 per cent (NHMRC 2017). However, the proportion of the population with access to fluoridated water varies across states and territories (table 8.6.1).

Good oral health also prevents the most common chronic oral diseases that cause discomfort (Yacoub and Karmally 2017). These diseases include dental caries (tooth decay), periodontal disease, tooth loss, and cancers of the lips and oral cavity (AHMRC 2016; Peres et al. 2019). If left untreated, they can have significant consequences, including:

- pain and sepsis leading to poorer quality of life, lost school days, disruption to family life, and decreased work productivity (Peres et al. 2019)
- reduced nutritional intake arising from tooth loss, especially in older populations (Yacoub and Karmally 2017)

²³ Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have an acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisation data for all jurisdictions from 2010-11 to 2018-19, as well as data for those six jurisdictions from 2004-05 to 2018-19.

- when occurring during pregnancy, low and very low birth weight babies, preeclampsia, and gestational diabetes. Bacteria associated with dental caries can also be transmitted to the child, increasing the risk of childhood caries (Cobb et al. 2017; Hartnett et al. 2016).

Table 8.6.1 Population with access to fluoridated water (February 2017)^a

| <i>State or Territory</i> | <i>Proportion of population with access to fluoridated water</i> |
|---------------------------|--|
| NSW | 93 per cent |
| Victoria | 90 per cent |
| Queensland | 76 per cent |
| WA | 92 per cent |
| SA | 92 per cent |
| ACT | 100 per cent |
| Tasmania | 90 per cent |
| NT | 78 per cent |

^a In some jurisdictions, the proportion of the population with access to fluoridated water is higher than the number given. This is because some Australian drinking water supplies, particularly those relying on bore water, contain naturally occurring fluoride at a concentration of around 0.5 mg/L.

Source: NHMRC (2017) *Water Fluoridation and Human Health in Australia*, Canberra.

Good oral health may also contribute to preventing other chronic diseases, although the relationship is complex. There is evidence of the link between poor oral health and chronic diseases, such as cardiovascular disease and diabetes; people with diabetes are three times more likely to get periodontitis (Seitz et al. 2019; Yacoub and Karmally 2017). However, periodontal disease is also associated with smoking, alcohol intake, and obesity (Yacoub and Karmally 2017), all of which are in turn related to chronic diseases.

Data from 2012–14 show that Aboriginal and Torres Strait Islander children had more oral health issues than non-Indigenous children, but this pattern changes in adulthood

Data from 2012–14 show that Aboriginal and Torres Strait Islander children had twice as many decayed, missing or filled tooth surfaces (dmfs/DMFS), on average, as non-Indigenous children. The average number of dmfs/DMFS:

- in the infant teeth of Aboriginal and Torres Strait Islander children aged 5–10 years was 6, compared with 3 surfaces for non-Indigenous children (table 8A.6.1)
- in the permanent teeth of Aboriginal and Torres Strait Islander children aged 6–14 years was 1.3, compared with 0.7 surfaces for non-Indigenous children (table 8A.6.2).

But the pattern of oral health issues changes in adulthood, with the average number of DMFT for Aboriginal and Torres Strait Islander adults (aged 15 years or over) lower than for non-Indigenous adults. In 2017–18, the average number of DMFT in the teeth of Aboriginal

and Torres Strait Islander dentate²⁴ adults was 7.5 compared with 11.3 for non-Indigenous dentate people (table 8A.6.8). However, because these data have not been adjusted for differences in population age structures, the difference may be because a greater proportion of non-Indigenous people were in the older age bracket of 75 years or over (predisposing them to have a larger average number of DMFT).

Lower incomes may be a key reason why the oral health of Aboriginal and Torres Strait Islander people is poorer than that of non-Indigenous people, but other structural factors may also have a role

The association between good oral health and higher income levels is well known. Oral diseases, like many non-communicable diseases, are more likely in children living in poverty and socially marginalised groups. This pattern points to the role of social factors as determinants of dental caries and the population's use of dental services (Do and Spencer 2016; Peres et al. 2019). For example, the average number of dmfs/DMFS in 2012–14 was lowest both among children aged 5–10 years (with infant teeth) and children aged 6–14 years (with permanent teeth) for those in families on high incomes, and highest for those in families on low incomes (tables 8A.6.1-2).

This association also exists within Aboriginal and Torres Strait Islander communities, with the extent of dental issues for children and adults varying according to household income level. In 2012–14, the proportion of Aboriginal and Torres Strait Islander children aged 5–8 years who had dmfs>0 was 29 per cent in high income households, increasing to 64 per cent in low income households (tables 8A.6.3); for children aged 9–14 years, the DMFS proportions were 41 per cent for high income households and 51 per cent for low income households (table 8A.6.4). Similarly, the majority of Aboriginal and Torres Strait Islander adults in 2018-19 who experienced complete tooth loss came from the most disadvantaged quintile — and Aboriginal and Torres Strait Islander people who were employed, had completed year 12 or equivalent, were non-smokers, or had no heart disease or diabetes were more likely to have no tooth loss (table 8A.6.12).

People at all income levels are more likely to skip the dentist than other types of health care, but the cost of care mostly affects people on low incomes (Duckett, Cowgill and Swerrison 2019). The cost of dental health combined with lower average income levels may mean that preventative dental care is not accessed as regularly as needed by Aboriginal and Torres Strait Islander people, but instead is delayed until a problem develops. In 2014-15, among Aboriginal and Torres Strait Islander children aged 0–14 years with teeth or gum problems, only 71 per cent had had a dental check-up within the previous year (table 8A.6.6), — and cost was the major reason why many members of this age group had not seen the dentist (28 per cent) (table 8A.6.7).

²⁴ Dentate means people who have one or more teeth.

Although the cost of dental care may be a key factor, the association between low average incomes for Aboriginal and Torres Strait Islander people and poor oral health is complex. Preventative oral health behaviours such as tooth brushing and flossing are developed mainly through education and modelling by adults in the home environment, and dental hygiene practices such as brushing teeth twice a day (as recommended) are more common among children in households where parents have higher levels of education or income (Do and Spencer 2016). In 2018-19, 40 per cent of Aboriginal and Torres Strait Islander children aged 2–14 years brushed their teeth twice a day or more, and another 43 per cent brushed their teeth at least once a day (table 8A.6.13). Comparable data for non-Indigenous children are not available. However, in 2012–14, just over two-thirds of children reported brushing their teeth twice or more per day; for Aboriginal and Torres Strait Islander children, the figure was then 54 per cent (Do and Spencer 2016).

There are also other structural factors that prevent Aboriginal and Torres Strait Islander people (children and adults) obtaining good oral health, such as:

- A higher proportion of Aboriginal and Torres Strait Islander people live in areas where the water remains non-fluoridated, or they are more likely to drink non-fluoridated bottled water (AHMRC 2016; AMA 2019; Do and Spencer 2016). However, the number of dental caries in Aboriginal and Torres Strait Islander people compared with non-Indigenous people is not necessarily always explained by lower access to water fluoridation (Lalloo et al. 2015).
- Aboriginal and Torres Strait Islander people may have limited or no access to culturally safe dental services (Durey et al. 2016). Health outcomes for Aboriginal and Torres Strait Islander patients have been found to be better when they are treated by Aboriginal and Torres Strait Islander health professionals, but Aboriginal and Torres Strait Islander people are under-represented in the oral health workforce (AMA 2019).
- A specific lack of culturally safe dental services in rural and remote areas (AMA 2019). In 2017-18, people in capital cities were more likely (61 per cent) to usually visit a dental professional than those in other places (51 per cent) (table 8A.6.9), and this disparity disproportionately affects Aboriginal and Torres Strait Islander people (AHMRC 2016; AMA 2019).
- Access to transport, the level of priority that oral health is given by the community (relative to other priorities), and competing family responsibilities may all prevent Aboriginal and Torres Strait Islander people from accessing dental services (Tynan et al. 2020).

Addressing these structural issues may go some way towards improving Aboriginal and Torres Strait Islander people's oral health. Associated data on dental health issues are available in section 8.1 *Access to primary health care*, tables 8A.1–12.

Aboriginal and Torres Strait Islander people's higher rates of preventable oral health disease are likely to lead to higher rates of potentially preventable hospitalisations for dental conditions

Many dental conditions could be prevented through regular care and early intervention. However, because of the cost of private dental care and the way in which public dental waiting lists are managed, oral health can deteriorate through delay — resulting in potentially avoidable conditions and in greater hospital and GP costs (Duckett, Cowgill and Swerrison 2019; PC 2017).

Aboriginal and Torres Strait Islander peoples' hospitalisation rates for potentially preventable oral health diseases have increased over time, while the rates for non-Indigenous people have remained similar. In 2018-19, after adjusting for differences in population age structures, hospitalisations for dental conditions were around 382 per 100 000 population for Aboriginal and Torres Strait Islander people — up from 308 per 100 000 population in 2010-11, and 1.4 times the rate for non-Indigenous people (compared with 1.1 times the rate in 2010-11) (table 8A.6.14).

However, the results differ for Aboriginal and Torres Strait Islander children across age groups and remoteness areas. Children aged less than 10 years had higher rates of hospitalisation for dental health conditions than non-Indigenous children in the same age group, but for older Aboriginal and Torres Strait Islander children aged 10–14 years the reverse is reported (table 8A.6.17). For those aged less than 10 years, the gap in rates widened as remoteness increased (table 8A.6.19).

Future directions in data

For data on child oral health, the AIHW last conducted its Child Dental Health Survey in 2010 and the University of Adelaide conducted its National Child Oral Health Study between 2012 and 2014. Neither the AIHW nor the University of Adelaide have current plans to conduct further national surveys. Ongoing and more regular data collection nationally on dental health for Aboriginal and Torres Strait Islander children is needed. Amongst other things, data collections (and linkage) should explore the complex association between levels of income and oral health.

8.7 Mental health²⁵

Box 8.7.1 Key messages

- For Aboriginal and Torres Strait Islander people, social and emotional wellbeing is the foundation for both physical and mental health. It is a holistic concept reflecting the interconnectedness of individuals, family, kin and community, and it recognises an individual's connection to land (central to wellbeing), culture, spirituality and ancestors. When the harmony of these interrelations is disrupted, ill health persists.
- Aboriginal and Torres Strait Islander people are resilient. Despite experiencing significant challenges, in 2018-19 over two-thirds of adults reported low or medium levels of psychological distress.
- Factors that protect Aboriginal and Torres Strait Islander people and enable them to feel strong and resilient include being socially connected and having a sense of belonging, connection to land and culture, living on their traditional lands, self-determination, and strong community governance.
- However, one in three Aboriginal and Torres Strait Islander adults reported high/very high levels of psychological distress, and this is more than double the rate for non-Indigenous adults. There are likely to be many reasons why, but having to deal with racism can be a key source of stress and affects the mental health of Aboriginal and Torres Strait Islander people and families.
- The rates at which Aboriginal and Torres Strait Islander people receive clinical mental health services are not commensurate with their rates of high/very high distress. Aboriginal and Torres Strait Islander people are overrepresented in hospitalisations and deaths from mental health and behavioural conditions.
- Few programs to support Aboriginal and Torres Strait Islander people's mental health have been evaluated, and those that have rarely provide insight into the participants' perspectives. Some of the existing findings suggest that cultural safety, respect and trust, and sharing experiences (including yarning and story-telling) are valued elements for Aboriginal and Torres Strait Islander people.
- Increasing the number of Aboriginal and Torres Strait Islander primary mental health workers (including Aboriginal Health Workers dedicated to children and young people) and building the cultural competence of the overall mental health workforce are also considered important in supporting Aboriginal and Torres Strait Islander people's mental health.

²⁵ The Steering Committee notes its appreciation to Dr Graham Gee, Murdoch Children's Research Institute, who reviewed a draft of this section of the Report.

Box 8.7.2 Measures of mental health

There is one main measure for this indicator:

- *Psychological distress*²⁶ is defined as the proportion of people aged 18 years or over reported as experiencing high/very high levels of psychological distress (all jurisdictions; national data by remoteness, age and stressors). 'Psychological distress' refers to a combination of symptoms that are grouped in a way that is intended to reflect 'non-specific' psychological distress rather than a specific mental health disorder. Data for the main measure are available from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2018-19. Data for the non-Indigenous population are sourced from the ABS National Health Survey (NHS), with the most recent data for 2017-18.

Three supplementary measures are also reported:

- *Treatment rate* is defined as the rate of patients treated for mental health by emergency departments (national), community and residential mental health care (all jurisdictions), and general practitioners (national).
- *Hospitalisation rate* is defined as the rate of hospitalisations for mental and behavioural disorders per 100 000 population (all jurisdictions: sex and remoteness).
- *Deaths from potentially avoidable mental and behavioural disorders* is defined as the rate of deaths from mental and behavioural disorders per 100 000 population (NSW, Queensland, WA, SA and the NT: age and sex). Data are available only for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Indigenous identification and numbers of deaths to support analysis.

Mental health is important to everyone. Although the term can mean different things to different people at different points in their lives — but the capacities to enjoy life, cope with stress and be resilient in response to adversity, set and fulfil goals, and build and maintain relationships are key aspects of being mentally healthy and participating in the community (PC 2019).

- Mental health is a state of *wellbeing* in which an individual realises their own potential, can cope with the normal stresses of life, can work productively and fruitfully, and is able to make a contribution to their community. Mental health can be affected by a broad range of factors, including domestic violence (see section 4.12 *Family and community violence*), alcohol and substance misuse (see sections 11.1 *Alcohol consumption and harm* and 11.2 *Drug and other substance use and harm*), physical health problems, incarceration (see section 4.13 *Imprisonment and youth detention*), family breakdown and social disadvantage.
- Mental *illness* describes a range of behavioural and psychological conditions that can affect an individual's mental health functioning and quality of life, including educational attainment (see section 4.6 *Year 12 attainment*) and income (see section 4.10 *Household and individual income*). The most common mental illnesses are anxiety, affective

²⁶ Based on Kessler Psychological Distress Scale 10 (K10) modified to five questions (K5) which measure an individual's level of psychological distress in the past four weeks.

disorders (including depression) and substance use disorders (AIHW 2019). Mental illness also includes low prevalence conditions such as schizophrenia, other types of psychoses, and severe personality disorder.

- People experiencing a mental illness are more likely to have high or very high levels of psychological distress. Research shows an association between higher levels of psychological distress and lower levels of education, employment, income or home ownership (Cunningham and Paradies 2012). High psychological distress also has a strong association with morbidity and physical disability (McNamara et al. 2018).

For Aboriginal and Torres Strait Islander people, social and emotional wellbeing is the foundation for both physical and mental health (Commonwealth of Australia 2017; Dudgeon et al. 2016, 2020; Dudgeon, Milroy and Walker 2014; Marmor and Harley 2018). It is a holistic concept that includes mental health, but also reflects the interconnectedness of individuals, family, kin, and community, and it recognises an individual's connection to land (central to wellbeing), culture, spirituality and ancestors — as illustrated in figure 8.7.1. When the harmony of these interrelations is disrupted, ill health persists (Dudgeon, Milroy and Walker 2014).

Figure 8.7.1 A model of social and emotional wellbeing from the perspective of an Aboriginal and Torres Strait Islander person

Source: Gee, Dudgeon, Schultz, Hart and Kelly (2013) in Dudgeon P, Milroy M, and Walker R (eds.) (2014) *Working together: Aboriginal and Torres Strait Islander Mental Health and Wellbeing Principles and Practice*, Commonwealth of Australia, Canberra.

Aboriginal and Torres Strait Islander people are resilient — despite the many challenges they face, two-thirds of Aboriginal and Torres Strait Islander adults reported low or medium levels of distress...

Aboriginal and Torres Strait Islander people are resilient. Despite the many challenges Aboriginal and Torres Strait Islander people face (as outlined in other sections of this Report), two-thirds of adults reported low or medium levels of psychological distress in 2018-19 (table 8A.7.1). Furthermore, on a range of selected indicators of positive wellbeing, almost 80 per cent of Aboriginal and Torres Strait Islander people described themselves as calm and peaceful and full of life, with 87 per cent describing themselves as happy (table 8A.7.6).

Many factors protect Aboriginal and Torres Strait Islander people from feeling distressed and unhappy, and enable them to be strong and resilient in challenging circumstances. These factors include being socially connected and having a sense of belonging, connection to land and culture, living on their traditional lands, self-determination, and strong community governance (Beyond Blue Australia 2020). For example, in one study, Aboriginal and Torres Strait Islander children were found to have an inner strength or fortitude despite challenging circumstances. A strong sense of cultural identity and safe, stable and supportive family environments promoted these resilient behaviours (Young et al. 2017). In a study involving Aboriginal and Torres Strait Islander prisoners, cultural engagement was associated with lower levels of psychological distress (Shepherd et al. 2018).

... but one in three reported high/very high levels of psychological distress, more than double the rate for non-Indigenous adults

In 2018-19, about one-third (31 per cent) of Aboriginal and Torres Strait Islander adults reported high/very high levels of psychological distress, an increase from 27 per cent in 2004-05 (table 8A.7.1). After adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander adults experiencing high/very high levels of psychological distress was more than twice the proportion for non-Indigenous adults (figure 8.7.2). Analysis of 2014-15 data show that Aboriginal and Torres Strait Islander people who were removed from their families as part of the stolen generation are 1.5 times, and their descendants 1.3 times, as likely to have poor mental health as those who were not removed (AIHW 2018).

A higher proportion of Aboriginal and Torres Strait Islander women experience high/very high levels of psychological distress than Aboriginal and Torres Strait Islander men; this pattern is also observed for non-Indigenous people, though from a lower base of distress (figure 8.7.2). There were no significant differences by age and no clear patterns in the data in relation to remoteness (tables 8A.7.1 and 8A.7.3). However, research suggests that living in areas where Aboriginal or Torres Strait Islander people are in the majority (as is the case in some remote communities) may mitigate the risk of psychological distress (Cunningham and Paradies 2012).

Figure 8.7.2 **Adults with high/very high psychological distress, by Indigenous status, by sex, 2017–19 (age-standardised)^a**

^a See table 8A.7.5 for detailed definitions, footnotes and caveats.

Source: ABS (2019) *National Aboriginal and Torres Strait Islander Health Survey, 2018-19*, cat. no. 4715.0; table 8A.7.5.

Aboriginal and Torres Strait Islander people are more likely to report high/very high levels of psychological distress and mental ill health, due to:

- unique risk factors, which are also intergenerational — including the grief, loss and trauma relating to the removal of children over many generations, separation from culture and identity, and discrimination based on race (Beyond Blue Australia 2020; Calma, Dudgeon and Bray 2017).
 - Racism can be a key source of stress and can affect the mental health of Aboriginal and Torres Strait Islander people and families (Calma, Dudgeon and Bray 2017; Temple, Kelaher and Paradies 2020). A Victorian study suggests that Aboriginal and Torres Strait Islander people who experience racism are more likely than those who do not experience racism to be above the threshold for high or very high psychological distress (Ferdinand, Paradies and Kelaher 2013; Kelaher, Ferdinand and Paradies 2014). Racism can be internalised as negative concepts of self at an early age, leading to lower self-esteem, higher anxiety, stress and depression (Macedo et al. 2020; Priest et al. 2019).
- greater exposure to commonly documented risk factors associated with high levels of psychological distress — including poverty, unemployment and homelessness (AIHW 2019).

-
- Aboriginal and Torres Strait Islander children and youth who live in out-of-home care and/or have carers who are chronically ill or unemployed, are more likely to present at hospital for mental health conditions (Williamson et al. 2018).

The cumulative nature of these factors can wear down resilience and have a detrimental impact on Aboriginal and Torres Strait Islander people's mental health (Calma, Dudgeon and Bray 2017).

The proportion of Aboriginal and Torres Strait Islander people receiving clinical mental health services is not commensurate with the proportions of those reporting high/very high levels of psychological distress...

With higher rates of psychological distress, higher rates of people receiving clinical mental health services could be expected. However, whilst a higher proportion for Aboriginal and Torres Strait Islander people (compared with non-Indigenous people) accessed specialised public mental health services in 2017-18, there was no difference in the proportion who accessed services from the Medicare Benefits Schedule (which make up the majority of services used) (table 13A.17 in section 13 of SCRGSP 2020).

Even assuming that individuals counted as accessing public mental health services do not access Medicare-funded services the proportion counted as accessing services is about 16 per cent — compared with the one-third of Aboriginal and Torres Strait Islander people experiencing high/very high levels of distress (table 13A.17 in section 13 of SCRGSP 2020). For non-Indigenous people the proportion of people using mental health services is around 12 per cent, a similar proportion to the 13 per cent with high/very high levels of distress (table 8A.7.1, and table 13A.17 in SCRGSP 2020).

... and Aboriginal and Torres Strait Islander people continue to be overrepresented in hospitalisations and deaths from mental health and behavioural conditions

In line with the higher proportion of Aboriginal and Torres Strait Islander adults with high/very high levels of psychological distress, Aboriginal and Torres Strait Islander people are overrepresented in hospitalisations for mental and behavioural disorders. For Aboriginal and Torres Strait Islander people, there were around 2650 hospitalisations for every 100 000 people in the community in 2016–2018 (table 8A.7.27). After adjusting for differences in population age structures, the Aboriginal and Torres Strait Islander hospitalisation rate for mental and behavioural disorders was almost twice the rate for non-Indigenous people (table 8A.7.23). For both Aboriginal and Torres Strait Islander and non-Indigenous people, the hospitalisation rate was higher in major cities than in regional and remote areas (table 8A.7.26).

The main component of the higher hospitalisation rates from mental and behavioural disorders for Aboriginal and Torres Strait Islander people was substance use disorder. In 2016–2018, substance use disorders accounted for 40 per cent of hospitalisations for Aboriginal and Torres Strait Islander people, and after adjusting for differences in population age structures the hospitalisation rate for this subset was almost four times the rate for non-Indigenous people (table 8A.7.27).

The rate of deaths from mental and behavioural disorders for Aboriginal and Torres Strait Islander people was around 13 per 100 000 people in the community (table 8A.7.30). After adjusting for differences in population age structures, this rate was 1.4 times the rate for non-Indigenous people (table 8A.7.30). The majority of deaths for both Aboriginal and Torres Strait Islander and non-Indigenous people were among people aged 45 years or over — 94 per cent and 99 per cent respectively (table 8A.7.31).

What is known about programs and services that facilitate improved mental health for Aboriginal and Torres Strait Islander people?

Healing practices for physical, mental, emotional and spiritual wellbeing have been integral to Aboriginal and Torres Strait Islander cultures for many thousands of years. In the last few decades, there has been a resurgence in traditional therapeutic practice as the mental health movement has aligned with efforts to strengthen policy and service delivery toward greater self-determination (Dudgeon and Bray 2018). There is anecdotal evidence that traditional healing practices support mental health and wellbeing, but a stronger evidence base would provide further support. By supporting access to person-centred mental health services, cultural healers and culturally informed and evaluated healing methods, in addition to clinical practice, a better standard of mental health for Aboriginal and Torres Strait Islander people can be achieved (Dudgeon et al. 2016; Dudgeon and Bray 2018).

Few programs to support Aboriginal and Torres Strait Islander people's mental health have been evaluated and those that have rarely provide insight into the participants' perspectives (Murrup-Stewart et al. 2019). Findings from two studies asking about participants' perspectives in mental health programs both identified sharing experiences (including yarning and story-telling) as valued elements, with one also identifying cultural safety, respect and trust (Carlin, Atkinson and Marley 2019; Murrup-Stewart et al. 2019). Likewise, there is little research into treatment pathways that meet the particular needs of Aboriginal and Torres Strait Islander children and young people (Kilian and Williamson 2018).

A systematic review by Perdacher, Kavanagh and Sheffield (2019) focused on colonised countries under a Western model of health and justice, found only five evaluations globally of mental health and wellbeing interventions for Indigenous people in custody. While none quantitatively assessed mental health and wellbeing outcomes, the authors found that culturally-based interventions showed some promise. This is an important finding given the overrepresentation of Aboriginal and Torres Strait Islander people in prison (see section 4.13 *Imprisonment and youth detention*), and the evidence that, at least some

Aboriginal and Torres Strait Islander Community Controlled Health Organisations, face barriers to providing health services (including mental health services) to prisoners (Pettit et al. 2019).

The research available indicates that having Aboriginal and Torres Strait Islander health workers working alongside doctors and building the cultural competence of the overall mental health workforce are both considered important in supporting the mental wellbeing of Aboriginal and Torres Strait Islander people (Kalucy et al. 2019).

8.8 Suicide and self-harm²⁷

Box 8.8.1 Key messages

- Suicide is one of the most serious public health challenges and causes substantial grief, pain and loss within and across communities.
- At least 2390 Aboriginal and Torres Strait Islander people have died from suicide in the 20 years to 2018, with three-quarters of them male.
- The suicide rate for Aboriginal and Torres Strait Islander people remains about twice the rate for non-Indigenous people, a ratio unchanged for the past six years.
- Suicide rates vary across age groups; they are higher for Aboriginal and Torres Strait Islander people across all age groups except the oldest age group (aged 45 years or over), in which rates are higher for non-Indigenous people.
- Hospitalisation rates for intentional self-harm have increased over time for Aboriginal and Torres Strait Islander people and are higher than for non-Indigenous people.
- Aboriginal and Torres Strait Islander women are more likely to be hospitalised for self-harm than Aboriginal and Torres Strait Islander men, but are less likely to die from that self-harm — mirroring the pattern seen for non-Indigenous people.
- A range of interrelated factors contribute to the higher rate of intentional self-harm in Aboriginal and Torres Strait Islander communities. They include the intergenerational trauma attributable to colonisation and dispossession, exposure to multiple and cumulative life stressors, higher levels of psychological distress, exposure to suicide of other family members, poorer access to mental health services for people who are at risk of suicide, higher rates of alcohol use, and the use of illicit substances.
- The common factor in successful approaches to preventing Aboriginal and Torres Strait Islander suicide is their development and implementation with Aboriginal and Torres Strait Islander leadership and in partnership with local Aboriginal and Torres Strait Islander communities.

²⁷ The Steering Committee notes its appreciation to the Dr Graham Gee, Murdoch Children's Research Institute, who reviewed a draft of this section of the Report.

Box 8.8.2 Measures of suicide and self-harm

There is one main measure for this indicator. *Suicide deaths* is defined as the number of deaths from intentional self-harm per 100 000 population (NSW, Queensland, WA, SA and NT; age; sex). Data for this measure are sourced from the ABS Causes of Death collection, with the most recent available data for 2018.

Data are only available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

Data are also provided for one supplementary measure, the *number of non-fatal hospitalisations from intentional self-harm per 100 000 population* (all jurisdictions; sex; remoteness). Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have adequate identification of Aboriginal and Torres Strait Islander people in hospitalisation data. Hospitalisation data for all jurisdictions are reported from 2010-11 to 2018-19; data for the six jurisdictions are reported for 2004-05 to 2018-19.

Suicide is one of the most serious public health challenges and the leading cause of death for young people (including young Aboriginal and Torres Strait Islander people) (AIHW 2019). However, preventing suicide is possible with the right approaches (Mendoza and Rosenberg 2010; WHO 2014).

Suicide causes substantial grief, pain and loss within and across communities. For every suicide death, many other people are affected — particularly close friends and family, who can suffer from intense grief for many years (Cerel et al. 2019; Comans, Visser and Scuffham 2013; Silburn et al. 2014). Suicides can occur in clusters within a community over a limited period; these clusters have particularly negative effects on communities due to the risk of further suicides, significant grief reactions and the ongoing trauma and ‘bereavement overload’, which in turn can contribute to future suicidal behaviours (AHA 2014; Hanssens 2016; Robinson et al. 2016; Too et al. 2017).

Suicide often occurs among people suffering from mental health challenges or illnesses; however, it can also happen impulsively in moments of crisis, such as when people have health or financial problems or after exposure to other suicides (Hanssens 2010; Robinson et al. 2016; WHO 2014). Self-harm and suicidal ideation are signals of considerable emotional distress and are associated with a higher risk of eventual death by suicide (Bergen et al. 2012; Hawton et al. 2015; Ribeiro et al. 2016). Section 8.7 *Mental health* reports on mental health in more detail.

At least 2390 Aboriginal and Torres Strait Islander people have died from suicide in the past 20 years, with three-quarters of them male

Over the two decades to 2018, at least 2390²⁸ Aboriginal and Torres Strait Islander people died from intentionally harming themselves (table 8A.8.1).

As with non-Indigenous people, suicide is more common among Aboriginal and Torres Strait Islander men than women. Between 2008 and 2018, after adjusting for differences in population age structures, the suicide rate for Aboriginal and Torres Strait Islander males was about three-and-a-half times that of females (and this ratio is rising); this ratio was also similar to that between non-Indigenous males and females (figure 8.8.1 and table 8A.8.1).

Figure 8.8.1 **Suicide for Aboriginal and Torres Strait Islander people, NSW, Queensland, WA, SA and the NT combined, by sex (age-standardised rates)^a**

^a See table 8A.8.1 for detailed definitions, footnotes and caveats.

Source: AIHW and ABS analysis of National Mortality Database; table 8A.8.1.

The suicide rate for Aboriginal and Torres Strait Islander people remains at about twice the rate for non-Indigenous people

Aboriginal and Torres Strait Islander people have higher death rates from suicide than non-Indigenous people (figure 8.8.2). For the period 2013 to 2018, after adjusting for differences in population age structures, the rate of deaths for Aboriginal and Torres Strait Islander people due to suicide remained about twice the rate for non-Indigenous people (table 8A.8.1).

²⁸ This number does not include suicides recorded in Victoria, Tasmania and the ACT.

Figure 8.8.2 Rates of suicide, NSW, Queensland, WA, SA and the NT combined, by Indigenous status, by year (age-standardised rates)^a

^a See table 8A.8.1 for detailed definitions, footnotes and caveats.

Source: AIHW and ABS analysis of the National Mortality Database; table 8A.8.1.

Suicide rates vary across age groups, with rates higher for younger Aboriginal and Torres Strait Islander adults

Suicide rates vary considerably by age group. For the period 2014–2018 for NSW, Queensland, WA, SA and the NT combined (and individually with the exception of SA), the suicide rate was highest for Aboriginal and Torres Strait Islander people aged 25–34 years (at 47 per 100 000 population overall), and was over three times the rate for non-Indigenous people of the same age (figure 8.8.3). Interestingly, for Aboriginal and Torres Strait Islander adults in the oldest age group (age 45 years or over), the suicide rate is significantly lower and rates are less than, or on par with, the rates for non-Indigenous people (figure 8.8.3).

Figure 8.8.3 Rates of suicide, NSW, Queensland, WA, SA and the NT combined, by Indigenous status and age group, 2014–2018^a

^a See table 8A.8.3 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Causes of Death collection; table 8A.8.3.

For Aboriginal and Torres Strait Islander people, after adjusting for differences in population age structures, the difference in the rates outside of and within capital cities is less than 1 death per 100 000 people (with both at around 23–24 deaths per 100 000 people). For non-Indigenous people, the difference across these areas is greater, with around 11 deaths per 100 000 people in capital cities compared with 15 deaths per 100 000 people in other areas (table 8A.8.4).

Aboriginal and Torres Strait Islander women have a higher incidence of hospitalisation for self-harm than Aboriginal and Torres Strait Islander men, but are less likely to die from that self-harm; the same is seen for non-Indigenous people

Nationally, Aboriginal and Torres Strait Islander women have the highest rates of hospitalisations for intentional self-harm, higher than for Aboriginal men and for non-Indigenous men and women (table 8A.8.5).

If hospitalisations for intentional self-harm are considered alongside rates of suicide, Aboriginal and Torres Strait Islander women have the highest incidence of self-harming behaviour but are less likely to die from self-harm than Aboriginal and Torres Strait Islander men. The same can be seen for non-Indigenous people (tables 8A.8.1 and 8A.8.6).

Hospitalisation rates for intentional self-harm have increased over time for Aboriginal and Torres Strait Islander people

Hospitalisations for intentional self-harm are increasing for Aboriginal and Torres Strait Islander people. Since 2004-05, after adjusting for differences in population age structures, the rate has more than doubled for females and has increased by 85 per cent for males (table 8A.8.6). By contrast, hospitalisations for intentional self-harm for non-Indigenous people have remained relatively stable (albeit higher for females than males) — and so the rate for Aboriginal and Torres Strait Islander people has increased from 1.5 to 3.2 times the rate for non-Indigenous people (with the ratio 3.5:1 for males and 3.0:1 for females in 2018-19) (figure 8.8.4).

Figure 8.8.4 Rates of hospitalisations for self-harm, NSW, Queensland, WA, SA and the NT combined, by Indigenous status and sex (age-standardised rates)^a

^a See table 8A.8.6 for detailed definitions, footnotes and caveats..

Source: ABS (unpublished) Causes of Death collection; table 8A.8.6.

Over time, the rates for Aboriginal and Torres Strait Islander people have increased by more in major cities and regional areas, whereas for non-Indigenous people there have been greater increases in rates in regional and remote areas (table 8A.8.7).

What factors lead to higher rates of suicide for Aboriginal and Torres Strait Islander people, and how can these rates be reduced?

Understanding the reasons why Aboriginal and Torres Strait Islander people may end their lives is key to developing effective suicide and self-harm prevention approaches.

Contributing factors to suicide that are particularly relevant to Aboriginal and Torres Strait Islander people include:

- the intergenerational trauma attributable to colonisation, dispossession and assimilation policies that forcibly removed children from their families and traditional lands, all of which contributed to a breakdown in community functioning (Dudgeon, Calma and Holland 2017; Fogliani 2019; Silburn et al. 2014)
- exposure to multiple and cumulative life stressors such as childhood abuse, the death of family members, ill health, being incarcerated and unemployment (Coroners Court of Victoria 2020; Dudgeon, Calma and Holland 2017; Fogliani 2019).
- higher rates of use of alcohol and illicit substances that are risk factors for suicides (Coroners Court of Victoria 2020; Dickson et al. 2019) (see sections 11.1 *Alcohol consumption and harm* and 11.2 *Drug and other substance use and harm*)
- higher levels of psychological distress (Calma, Dudgeon and Bray 2017; Temple, Kelaher and Paradies 2020), with racism a key source of stress affecting the mental health of Aboriginal and Torres Strait Islander people (Dickson et al. 2019; Dudgeon, Calma and Holland 2017)
- inadequate access to mental health services for those at risk of suicide, given their needs. Research shows that of 400 Aboriginal and Torres Strait Islander people who took their own life by suicide in Queensland between 1994 and 2006, three-quarters had never received treatment from a mental health professional in their lifetime (De Leo et al. 2011). While this research is more than a decade old, recent data from a coronial inquiry into 13 suicides of young people in the Kimberley region of WA shows similar results (Fogliani 2019). Other data (see section 8.7 *Mental health*) also indicate that clinical mental health services are not meeting needs, with the proportion of Aboriginal and Torres Strait Islander people receiving these services not commensurate with the rates of those with high/very high levels of psychological distress
 - Adequate access does not just mean enough services for the numbers of people at risk, but also the right services to meet their needs. The cultural safety of those services is key for Aboriginal and Torres Strait Islander people.
- exposure to suicide, including suicide attempts and suicide within families or by people who are close associates (Fogliani 2019) — common factors in suicide clusters (Dudgeon, Calma and Holland 2017; Hanssens 2016).

As the factors that contribute to suicide in Aboriginal and Torres Strait Islander communities are numerous and interrelated, suicide rates need to be addressed at multiple levels.

While the evidence-base for the effectiveness of suicide prevention programs and activities remains limited (WHO 2014), approaches to reduce suicide in the context of Aboriginal and Torres Strait Islander communities (Dudgeon et al. 2016) have been suggested at three levels:

- Community-wide — aimed at increasing community-wide protective factors, such as increasing employment and improving mental health and reducing risk factors, such as

incarceration. These include approaches to strengthen social and emotional wellbeing and culture (see section 8.7 *Mental health*), to promote healing and increasing resilience in individuals, families and communities and to prevent or reduce alcohol and drug use (see sections 11.1 *Alcohol consumption and harm* and 11.2 *Drug and other substance use and harm*), and reducing child abuse and family violence (see section 4.12 *Family and community violence*) (Coroners Court of WA 2019). They could also include community forums providing education to support help-seeking behaviour for those who need it, or to help other community members to identify those who need support and how they might support them (Dudgeon et al. 2016; Westerman and Sheridan 2020, Coroners Court of WA 2019).

- For at-risk groups — aimed at groups who are most at risk of suicide. As noted above, Aboriginal and Torres Strait Islander young adults are at higher risk of suicide than other age groups. Some of the successful approaches include teaching Aboriginal and Torres Strait Islander cultures in schools (see section 5.6 *Indigenous cultural studies*), promoting engagement with programs such as sport (see section 5.7 *Participation in community activities*) and connecting to cultures/Country/Elders (see section 5.8 *Access to traditional lands and waters*) (Dudgeon et al. 2016; Hanssens 2016).
- For at-risk individuals — aimed at individuals identified as being at risk of suicide, or who have attempted suicide, but not died. This might mean increasing the accessibility of mental health and other support services that provide timely therapeutic treatment in a culturally safe environment with access to Aboriginal and Torres Strait Islander staff or culturally competent staff (see section 8.7 *Mental health*), including through Aboriginal Community Controlled Health Services (ACCHSs) (Dudgeon et al. 2016; Dudgeon, Calma and Holland 2017). Aboriginal and Torres Strait Islander people report that ACCHSs influence their health more positively than other health services as they are more welcoming, holistic in responding to needs and culturally safe (see section 8.1 *Access to primary health care*).

The common factor in successful approaches to preventing suicide among Aboriginal and Torres Strait Islander people, across these three levels, is their development and implementation with Aboriginal and Torres Strait Islander leadership and in partnership with the local Aboriginal and Torres Strait Islander communities (Dudgeon et al. 2016).

(a) Information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(c) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

— Nil or rounded to zero.

(a) Information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.

(b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

- (a) Information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Includes self-assessed health status 'not stated'.

(a) In NATSIHS, information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.

(b) Age-standardised proportions have been age-standardised using the 2001 Australian population to account for differences in the age structure of the population.

Table 8A.1.4 **Self-assessed health status of people (aged 15 years or over), by Indigenous status, by sex, 2004-05, 2008, 2011-13, 2014-15 and 2017-19 (age-standardised) (a), (b), (c)**

| | <i>Males</i> | | | | <i>Females</i> | | |
|--|--------------|--|-----------------------|-----------------------|--|-----------------------|-----------------------|
| | <i>Unit</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous</i> | <i>Rate ratio (d)</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non-Indigenous</i> | <i>Rate ratio (d)</i> |

(c) Cells in this table from 2011-12 onwards have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(d) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander people by the corresponding rate for non-Indigenous people.

- (a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (b) Data for Aboriginal and Torres Strait Islander children aged 0-14 years, and for some young people aged 15-17 years, were obtained from an adult proxy. For the majority of Aboriginal and Torres Strait Islander and non-Indigenous people aged 15 years or over, responses were self-reported.
- (c) For NHS data from 2011-12 onwards, cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (d) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander people by the corresponding rate for non-Indigenous people.
- .. Not applicable. **na** not available. .

- (a) In NATSIHS, information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.
- (b) For NHS data from 2011-12 onwards, cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Age-standardised proportions have been age-standardised using the 2001 Australian population to account for differences in the age structure of the population.
- (d) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander people by the corresponding rate for non-Indigenous people.

- (a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (b) Information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years or over, data were self-reported.
- (c) For NHS data from 2011-12 onwards, cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (d) age-standardised proportions have been age-standardised using the 2001 Australian population to account for differences in the age structure of the population.
- (e) The rate ratio is calculated by dividing the rate for Aboriginal and Torres Strait Islander people by the corresponding rate for non-Indigenous people.
- (f) People aged 18 years or over.
- (g) Includes people not at school.
- (h) Includes people who never attended school.
- (i) Household income from NHS 2017-18 is not comparable to NATSIHS 2018-19.
- (i) Very remote areas of Australia were out of the scope of the 2004-05 and 2007-08 National Health Surveys therefore non-Indigenous data for remote areas are unavailable.

- (a) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001).
- (b) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (c) Includes 'remote' and 'very remote' categories of the ASGS.
- (d) Includes 'major city', 'inner regional' and 'outer regional' categories of the ASGS.

TABLE 8A.1.8

Table 8A.1.8 Time since Aboriginal and Torres Strait Islander people (aged 18 years or over) last consulted a health care professional (medical/support related), by remote/non-remote, 2001, 2004–05, 2012–13 and 2018–19 (a), (b)

(e) Data in 2018-19 are directly age-standardised to the 2001 Australian Estimated Resident Population based on the 2001 Census, starting from 2-4 years, then using 10 year age groups up to 55+.

(f) 2018-19 NATSIHS data is not directly comparable to 2012-13 NATSIHS data due to a change in questions.

(g) For non-remote areas, this includes both those who saw a GP in the last two weeks, and those who saw a specialist but not a GP in the last 2 weeks. In remote areas, this includes those who saw a nurse, sister, Aboriginal and Torres Strait Islander health worker and/or a GP in the last two weeks.

(h) Includes 'time since last consultation' not known.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) 'Did not go to GP when they had a health problem' is a derived data item equal to total persons aged 18 years and older less total persons that did not have need or problem with access. RSE values have been restimated accordingly.

(c) Did not have a problem with access' when they visited the GP/clinic doctor when needed.

(d) The data are not strictly comparable between 2012-13 and 2018-19 due to changes to questions or sequences of questions asked. In 2018-19, the question is about whether during the last 12 months there was ever a time when the respondent needed to go to a GP (or a doctor at a clinic) but did not. In 2012-13 the question is about whether during the last 12 months there was ever a time when the respondent needed to go to a doctor but did not.

– Nil or rounded to zero. **np** Not published.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

| (a) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | | | | |
| (b) | Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001). | | | | | | | | | | | |
| (c) | Includes 'remote' and 'very remote' categories of the ASGS. | | | | | | | | | | | |
| (d) | Includes 'major cities', inner regional' and 'outer regional' categories of the ASGS. | | | | | | | | | | | |
| (e) | Includes: too busy (work, personal or family responsibilities), discrimination, service not culturally appropriate, language problems, dislikes service or health professional, afraid, embarrassed, does not trust this health service provider, or felt service would be inadequate. | | | | | | | | | | | |
| (f) | Includes transport/distance, service not available in area, waiting time too long, or service not available at the time required. | | | | | | | | | | | |
| (g) | Components may not add to total as people may have reported more than one reason for not going to a GP. | | | | | | | | | | | |
| | – Nil or rounded to zero. | | | | | | | | | | | |

- (a) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001).
- (b) Proportions/estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportion/estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (c) Includes 'remote' and 'very remote' categories of the ASGS.
- (d) Includes 'major city', 'inner regional' and 'outer regional' categories of the ASGS.
- (e) In 2018-19 RSEs and CIs of age-standardised Data are calculated using the crude numbers rather than the standardised ones.
- (f) Includes 'time since last consultation' not known.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Did not see dentist when they needed' is a derived data item equal to total persons aged 18 years or over less total persons that did not have need to go or who did not have a problem with access (visited the dentists when needed). RSE values have been restimated accordingly.

(c) Did not have a problem with access' when they attended the dentist when needed.

– Nil or rounded to zero. **np** Not published.

TABLE 8A.1.13

Table 8A.1.13 Reasons for not going to a dentist in the past 12 months when Aboriginal and Torres Strait Islander people (aged 18 years or over) had a dental problem, by remoteness, 2004-05, 2012-13 and 2018-19 (a), (b)

| | <i>Remote (c)</i> | | | | <i>Non-Remote (d)</i> | | | | <i>Total</i> | | | |
|-----|--|-----------------|----------------|-------------------|-----------------------|-----------------|----------------|-------------------|--------------|-----------------|----------------|-------------------|
| | <i>'000</i> | <i>Rate (%)</i> | <i>RSE (%)</i> | <i>95% CI (±)</i> | <i>'000</i> | <i>Rate (%)</i> | <i>RSE (%)</i> | <i>95% CI (±)</i> | <i>'000</i> | <i>Rate (%)</i> | <i>RSE (%)</i> | <i>95% CI (±)</i> |
| (a) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | | | | |
| (b) | Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001). | | | | | | | | | | | |
| (c) | Includes 'remote' and 'very remote' categories of the ASGS. | | | | | | | | | | | |
| (d) | Includes 'major cities', 'inner regional' and 'outer regional' categories of the ASGS. | | | | | | | | | | | |
| (e) | Includes: too busy (work, personal or family responsibilities), discrimination, service not culturally appropriate, language problems, dislikes service or health professional, afraid, embarrassed, does not trust the dentist, or felt service would be inadequate. | | | | | | | | | | | |
| (f) | Includes transport/distance, service not available in area, waiting time too long, or service not available at the time required. | | | | | | | | | | | |
| (g) | Components may not add to total as people may have reported more than one reason for not going to a dentist. | | | | | | | | | | | |
| | – Nil or rounded to zero. | | | | | | | | | | | |

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (c) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the *Information Papers ABS Views on Remoteness, 2001* (Cat. no. 1244.0) and *Outcomes of ABS Views on Remoteness Consultation, Australia* (Cat. no. 1244.0.00.001).

Table 8A.1.14 Health care services usually used by Aboriginal and Torres Strait Islander people when they have a health problem, by remoteness, 2012-13 and 2018-19 (a), (b), (c)

| | <i>All ages</i> | | | | <i>18 years or over</i> | | |

TABLE 8A.1.15

Table 8A.1.15 Reasons for not going to other health professionals in the last 12 months when Aboriginal and Torres Strait Islander people (18 years or over) needed to go, by remoteness, 2004-05, 2012-13 and 2018-19 (a), (b), (c)

| | <i>Remote (d)</i> | | | | <i>Non-remote (e)</i> | | | | <i>Total</i> | | | |
|-----|--|-----------------|------------|-------------------|-----------------------|-----------------|------------|-------------------|--------------|-----------------|------------|-------------------|
| | <i>'000</i> | <i>Rate (%)</i> | <i>RSE</i> | <i>95% CI (±)</i> | <i>'000</i> | <i>Rate (%)</i> | <i>RSE</i> | <i>95% CI (±)</i> | <i>'000</i> | <i>Rate (%)</i> | <i>RSE</i> | <i>95% CI (±)</i> |
| (a) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | | | | |
| (b) | Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001). | | | | | | | | | | | |
| (c) | Other health professionals include Aboriginal health workers, accredited counsellors, acupuncturists, alcohol and drug workers, audiologists/audiometrists, chemists, chiropodists/podiatrists, chiropractors, dieticians/nutritionists, herbalists, hypnotherapists, naturopaths, nurses, occupational therapists, opticians/optometrists, osteopaths, physiotherapists/hydrotherapists, psychologists, social workers/welfare officers, speech therapists/pathologists, and traditional healers. | | | | | | | | | | | |
| (d) | Includes 'remote' and 'very remote' categories of the ASGS. | | | | | | | | | | | |
| (e) | Includes 'major cities', inner regional' and 'outer regional' categories of the ASGS. | | | | | | | | | | | |
| (f) | Includes: too busy (work, personal or family responsibilities), discrimination, service not culturally appropriate, language problems, dislikes service or health professional, afraid, embarrassed, does not trust this health service provider, or felt service would be inadequate. | | | | | | | | | | | |
| (g) | Includes transport/distance, service not available in area, waiting time too long, or service not available at the time required. | | | | | | | | | | | |
| (h) | Components may not add to total as people may have reported more than one reason for not going to other health professionals. Total excludes people who did have need or have problem with access. | | | | | | | | | | | |
| | – Nil or rounded to zero. | | | | | | | | | | | |

Table 8A.1.16 Health care services usually used by Aboriginal and Torres Strait Islander children (aged 0–14 years), by state and territory, 2008, 2014-15 and 2018-19 (a), (b), (c), (d)

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----------------------------------|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| Does not usually seek health care | % | 42.8 | 48.3 | np | 40.3 | np | np | np | 45.6 | 28.0 |

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

(b) Information collected about types of health services used for child were collected from an adult proxy on behalf of the child.

(c) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(d) These data are not directly comparable with previously supplied NATSISS data (2014-15 and 2008) due to changes in output items. Eg Aboriginal Medical Service and Community Clinic is combined 2018-19.

(e) Including casualty, outpatients or emergency area.

(f) Outside Aboriginal Medical Service, health clinic or hospital.

(g) Includes a maternal and child health centre, traditional healer, chemist, a relative or other community person and other health professional (e.g. naturopath, dietitian).

np Not published. – Nil or rounded to zero.

- (a) Excludes services that qualify under the DVA National Treatment Account and services provided in public hospitals.
- (b) Allocation of patients to state/territory based on the final claim processed for each patient in the reference period. Data are for number of patients receiving a health assessment/check rather than number of health assessments/checks provided. Indigenous status is determined by self-identification.
- (c) Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Aboriginal and Torres Strait Islander people. Data are therefore likely to understate the proportion who access health assessments.
- (d) Target population is the derived population of Aboriginal and Torres Strait Islander people in the age group at 31 December, computed by averaging the estimates/projections at 30 June at each end of the reference year.
- (e) Includes other territories.
- (f) Aboriginal and Torres Strait Islander people aged 75 years or over may have received a health assessment available to 'all older people'. This is considered unlikely to affect overall proportions significantly, due to the relatively low average life expectancy of Aboriginal and Torres Strait Islander people.

| 2001 | 82.2 | 90.0 | 87.3 | 86.6 | na | na | na | na |

(a) Age calculated as at 31 December 2018.

(b) The population is children enrolled in Medicare, which is different from the population estimated by ABS.

(c) From 2008, fully vaccinated status for children aged 5 years is reported in place of that for children aged 6 years, due to changes in reporting practices.

(d) National data for all years uses annualised four quarters of data. National vaccination data up to 2015 in all other tables are based on one-quarter of data as at 31 December of the year.

(e) Aboriginal and Torres Strait Islander and Other rates are double rounded in this table. When they are compared with those in other tables, there can be a minor discrepancy due to different rounding practices.

(f) From December 2013 the definition of the term 'fully immunised' includes pneumococcal for Australian Immunisation Register coverage reporting purposes, for children aged 1 year.

(g) Changes to the immunisation schedule affect the reported coverage rates. The inclusion of immunisations to the coverage calculation in March 2017 (dose 4 DTP) and December 2014 (Men C, dose 2 MMR and dose 1 varicella) caused a drop in the coverage rates for children aged 2 years.

(h) From July 2018, fully vaccinated status for children aged 1 year no longer includes dose 3 of the pneumococcal vaccine and it was included in fully vaccinated status for 2 year olds. This may cause an increase for 1 year olds and a decrease for 2 year olds in 2018.

Table 8A.1.19 **Vaccination coverage for children fully immunised at age 1, 2, 5 and 6 years of age, by Indigenous status, 2001 to 2018 (a), (b), (c), (d), (e)**

| Varicella | na | na | na | na | na | na |
| All vaccines | 84.1 | 92.0 | 87.1 | 91.1 | 78.2 | 82.8 |

DTP = diphtheria, tetanus, pertussis. HIB = Haemophilus influenzae type b. MMR = measles, mumps, rubella. Men C = Meningococcal C.

- (a) The population is children enrolled in Medicare.
- (b) 1 year includes children aged 12-<15 month; 2 year includes children aged 24-<27 months and 5 year include children aged 60-<63 months. Age calculated as at 31 December 2018.
- (c) National data for all years up to 2015 in this table are based on one-quarter of data as at 31 December of the year. The data in table 8A.1.19 uses annualised four quarters of data.
- (d) Assessment for children aged 5 years does not include hepatitis B, Hib, pneumococcal, MMR, varicella or Men C vaccine.
- (e) From July 2018, dose 3 of the pneumococcal vaccine was no longer measured at 1 year old and instead measured at 2 years old. This may have caused an increase in pneumococcal coverage for 1 year olds. Data for pneumococcal coverage for 2 year olds is not published due to the changes to the schedule occurring mid-period. Prior to July 2018, data were not collected for children aged 2 years who receive a pneumococcal vaccine.
- (f) Assessment for children aged 1 year does not include MMR, varicella or Men C vaccine.

DTP = diphtheria, tetanus, pertussis. HIB = Haemophilus influenzae type b. MMR = measles, mumps, rubella. Men C = Meningococcal C.

- (a) The population is children enrolled in Medicare. National data for all years up to 2015 in this table are based on one-quarter of data as at 31 December of the year. The data in table 8A.1.19 uses annualised four quarters of data.
- (b) 2 year includes children aged 24-<27 months.
- (c) From July 2018, dose 3 of the pneumococcal vaccine began being measured at 2 years old. Data for 2 year olds for pneumococcal coverage is not published due to the changes to the schedule occurring mid period. Prior to July 2018, data were not collected for children aged 2 years who receive a pneumococcal vaccine.
- (d) Data from Queensland, Tasmania and the ACT have not been included in this measure because Indigenous status data from these jurisdictions' service providers were not routinely reported or transferred to the Australian Childhood Immunisation Register in this year.

DTP = diphtheria, tetanus, pertussis. HIB = Haemophilus influenzae type b. MMR = measles, mumps, rubella. Men C = Meningococcal C.

- (a) The population is children enrolled in Medicare. National data for all years up to 2015 in this table are based on one-quarter of data as at 31 December of the year. The data in table 8A.1.19 uses annualised four quarters of data.
- (b) 5 year include children aged 60-<63 months.
- (c) Data are not collected for children aged 5 years who receive a hepatitis B, HIB, pneumococcal, varicella or meningococcal C vaccine.
- (d) From December 2017, MMR was removed from the definition of 'fully immunised' for children aged 5 years.
- (e) Data from Queensland, Tasmania and the ACT have not been included in this measure because Indigenous status data from these jurisdictions' service providers were not routinely reported or transferred to the Australian Childhood Immunisation Register in this year.

na Not available.

| Never had vaccination for pneumococcus | % | 2.9 | 8.2 | 2.8 |
| Total number | no. | 0.2 | 0.7 | – |

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

(b) Includes not known if ever had influenza vaccination.

(c) Includes not known if ever had pneumococcus vaccination.

– Nil or rounded to
