Nationally in 2018-19, between 96 and 98 per cent of Aboriginal and Torres Strait Islander households reported working facilities for washing people and washing clothes and bedding, and a working sewerage system — consistent with or higher than for 2008. For preparing and storing food, the proportion was lower at 91 per cent, which was a decrease since 2008 (table 10A.3.2).

Aboriginal and Torres Strait Islander households in very remote areas reported worse access to working household facilities across all categories (figure 10.3.1).

¹⁴ ‘Decentralised water solutions’ refers to systems that supply water resources that are sourced from the local area.

¹⁵ These benefits include more robust and long-lasting decisions, relationship-building and trust between government and community members, and capacity building and empowerment for local people.

Figure 10.3.1 **Aboriginal and Torres Strait Islander households with access to working household facilities, by remoteness, 2018-19^{a,b}**

^a See table 10A.3.3 for detailed footnotes and caveats. ^b Error bars represent 95 per cent confidence intervals around the estimate.

...but one in three Aboriginal and Torres Strait Islander households lived in dwellings with major structural problems

Nationally in 2018-19, one in three Aboriginal and Torres Strait Islander households lived in a dwelling with major structural problems (33 per cent) (table 10A.3.4). The proportion had increased by seven percentage points, from 26 per cent in 2014-15 (tables 10A.3.4-5). The most commonly reported problem was major cracks in walls or floors (12 per cent) (figure 10.3.2).

Across the ten categories of major structural problems, the proportion of Aboriginal and Torres Strait Islander households reporting problems between 2014-15 and 2018-19:

- increased for four of the categories (walls or windows not straight increased by 4 percentage points, while rising damp, sinking or moving foundations and other major structural problems all increased by 2 percentage points)
- there were no statistically significant changes for the remaining six categories (figure 10.3.2).

Figure 10.3.2 **Aboriginal and Torres Strait Islander households reporting major structural problems, by problem, 2014-15 and 2018-19^{a,b}**

^a Error bars represent 95 per cent confidence intervals around the estimate. ^b See tables 10A.3.4-5 for detailed footnotes and caveats.

How can the quality of housing be improved for Aboriginal and Torres Strait Islander households?

Poor quality housing can result from initial issues with structure and set up, the impact of overcrowding and a lack of regular repair and maintenance.

Initial investment in suitable housing design, material and construction methods can improve the safety, amenity and durability of remote houses, and reduce recurrent maintenance costs (Australian Government 2017).

Overcrowding in Aboriginal and Torres Strait Islander housing can result in more wear and tear on the housing infrastructure than the infrastructure was built for (AHURI 2017). For example, having more people using an oven will mean more wear and tear on the oven, and so the oven may need to be replaced sooner. Reducing overcrowding will help to maintain houses at an acceptable standard (Australian Government 2017). Overcrowding and ways to reduce overcrowding are addressed in section 10.1 *Overcrowding in housing*.

Regularly repairing and maintaining properties is a direct way to maintain their quality. Repairs and maintenance are more challenging in remote contexts, but it is essential for

housing departments and housing service providers to continue working to develop systems and strategies that proactively manage assets (Foster and Hall 2019; Habibis et al. 2016). As well as developing systems and strategies, expanding or engaging a local workforce to undertake the repairs may reduce travel and repair costs and time delays (Habibis et al. 2016; Hunt 2018; Johnston et al. 2013).

Future directions in data

Recent data on access to water, sewerage and electricity services are not available. The Community Housing and Infrastructure Needs Survey (CHINS) was conducted in 1994, 2001 and 2006. There is currently no date for the next CHINS. New data, whether from the CHINS or a comparable national survey, are critical to enable ongoing reporting on Aboriginal and Torres Strait Islander people's access to water, sewerage and electricity services.

| (b) Proportions/Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions/Estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | | |
| (c) Households requiring at least one additional bedroom, based on the Canadian National Occupancy Standard for Housing Appropriateness. | | | | | | | | | |
| (d) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001). | | | | | | | | | |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Proportions/Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions/Estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

TABLE 10A.1.5

Table 10A.1.5 Aboriginal and Torres Strait Islander people (all ages) living in overcrowded households, by selected housing tenure, 2008, 2012-13, 2014-15, and 2018-19 (a), (b), (c), (d)

| | <i>Unit</i> | <i>Owned with or without a mortgage (e)</i> | <i>Renter</i> | <i>Other (f)</i> | <i>Total (g)</i> |
|--|-------------|---|---------------|------------------|------------------|
| (c) 'Housing tenure' refers to the nature of a household's legal right to occupy the dwelling in which the household members usually reside. Tenure is determined according to whether any person living in the household owns the dwelling outright, owns the dwelling but has a mortgage or loan secured against it, is paying rent to live in the dwelling, or has some other arrangement to occupy the dwelling. | | | | | |
| (d) Households requiring at least one additional bedroom, based on the Canadian National Occupancy Standard for Housing Appropriateness. | | | | | |
| (e) Comprises participants in rent/buy schemes and those living in a household in which payments were being made on mortgages or secured loans towards the purchase of the dwelling. | | | | | |
| (f) Includes those occupying households rent free, boarders, other tenure and those under a life tenure scheme. | | | | | |
| (g) Includes tenure type not stated. | | | | | |

| Relative standard error | ± | 5.3 | 2.3 | 2.4 | 2.4 | 9.0 | 9.2 | 7.0 | 2.6 |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Proportions/Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions/Estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

(c) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001).

(d) This data was not collected in the 2018-19 survey.

| | <i>Unit</i> | <i>Households with Aboriginal and Torres Strait Islander members (b)</i> | <i>Other households (c)</i> | <i>All households</i> |
|---|-------------|--|-----------------------------|-----------------------|
| 2016 | | | | |
| Average household size (d) | no. | 3.2 | 2.6 | 2.6 |
| Average number of persons per bedroom (e) | no. | 1.0 | 0.8 | 0.9 |
| 2011 | | | | |
| Average household size (d) | no. | 3.3 | 2.6 | 2.6 |
| Average number of persons per bedroom (e) | no. | 1.2 | 1.1 | 1.1 |
| 2006 | | | | |
| Average household size (d) | no. | 3.4 | 2.6 | 2.6 |
| Average number of persons per bedroom (e) | no. | 1.0 | 0.8 | 0.8 |
| 2001 | | | | |
| Average household size (d) | no. | 3.5 | 2.6 | 2.6 |
| Average number of persons per bedroom (e) | no. | 1.3 | 0.8 | 0.8 |

(a) Cells in this table have been randomly adjusted to avoid the release of confidential data.

(b) A household with Aboriginal and Torres Strait Islander members is any household that at least one person of any age as a resident at the time of the Census who identified as being of Aboriginal and/ or Torres Strait Islander origin.

(c) Includes households which did not have at least one person of any age as a resident at the time of the Census who identified as being of Aboriginal and/ or Torres Strait Islander origin.

(d) Average household size is the number of people usually resident in occupied private dwellings. Includes partners, and co-tenants (in group households) who were temporarily absent on Census night. A maximum of three temporary absentees can be counted in each household. Excludes 'visitor only' and 'Other not classifiable' households.

(e) Average number of persons per bedroom is applicable to occupied private dwellings. Excludes 'Visitor only' and 'Other not classifiable' households.

Note: 2016 and 2011 Census data are sourced by the Productivity Commission from TableBuilder.

(a) Proportions/Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions/Estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

Table 10A.1.8 People living in overcrowded households, by Indigenous status, by state and territory, by remoteness, 2001, 2006, 2011, and 2016 (a), (b), (c), (d)

| <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust (e)</i> |
|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-----------------|
|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-----------------|

(b) Cells in this table have been randomly adjusted to avoid the release of confidential data.

(c) Excludes persons who were not enumerated at their place of usual residence.

(d) Housing overcrowding is based on the Canadian National Occupancy Standard for housing appropriateness.

The measure assesses the bedroom requirements of a household by specifying that:

- there should be no more than two persons per bedroom
- children less than 5 years of age of different sexes may reasonably share a bedroom
- children 5 years of age or older of opposite sex should have separate bedrooms
- children less than 18 years of age and of the same sex may reasonably share a bedroom
- single households members 18 years or over should have a separate bedroom, as should parents or couples.

Households living in dwellings where this standard cannot be met are considered to be overcrowded.

(e) Australia total includes Other Territories.

(f) Includes 'Aboriginal', 'Torres Strait Islander', 'Both Aboriginal and Torres Strait Islander'.

(g) Total for Australia also includes Migratory/Offshore and No Usual Address. For 2001 also includes inadequately described/not stated.

(h) Persons living in overcrowded households as a proportion of all Family, Lone Person and Group Households.

- Nil or rounded to zero.

Note: 2016 Census data are sourced by the Productivity Commission from TableBuilder.

Source: ABS (unpublished) derived from the 2001, 2006, 2011 and 2016 Census of Population and Housing.

(a) Proportions/Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions/Estimates with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

(b) Housing overcrowding is based on the Canadian National Occupancy Standard for housing appropriateness.

The measure assesses the bedroom requirements of a household by specifying that:

- there should be no more than two persons per bedroom
- children less than 5 years of age of different sexes may reasonably share a bedroom
- children 5 years of age or older of opposite sex should have separate bedrooms
- children less than 18 years of age and of the same sex may reasonably share a bedroom
- single households members 18 years or over should have a separate bedroom, as should parents or couples.

Households living in dwellings where this standard cannot be met are considered to be overcrowded.

(c) Cells in this table have been randomly adjusted to avoid the release of confidential data.

- Nil or rounded to zero.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Any diagnosis was used to select the infectious diseases (ICD-10-AM codes A00-B99), principal diagnosis was used to select the other conditions. There may therefore be overlap between the 'Intestinal infectious diseases' and other categories.
- (b) Data include separations from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years or over.
- (g) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.
- Nil or rounded to zero. **np** Not published.

- (a) This table includes data for six jurisdictions only (NSW, Victoria, Queensland, WA, SA and the NT). From 2004-05 to 2009-10, only these jurisdictions were considered to have acceptable quality of Indigenous identification in hospitalisation data.
- (b) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Any diagnosis was used to select the infectious diseases (ICD-10-AM codes A00-B99), principal diagnosis was used to select the other conditions. There may therefore be overlap between the 'Intestinal infectious diseases' and other categories.

TABLE 10A.2.2

Table 10A.2.2 Hospitalisation rates for selected types of environmentally based diseases for Aboriginal and Torres Strait Islander people, NSW, Victoria, Queensland, WA, SA and NT, 2004-05 to 2018-19 (a), (b), (c), (d)

| | 2004-05 | 2005-06 | 2006-07 | 2007-08 | 2008-09 | 2009-10 | 2010-11 | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 |
|-----|--|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| (c) | Data are from public and private hospitals in NSW, Victoria, Queensland, WA, SA and from public hospitals only in the NT. From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA. | | | | | | | | | | | | | | |
| (d) | Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. | | | | | | | | | | | | | | |
| (e) | 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated). | | | | | | | | | | | | | | |
| (f) | Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years or over. | | | | | | | | | | | | | | |
| (g) | Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the 'Other' persons hospitalisation rate. | | | | | | | | | | | | | | |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Any diagnosis was used to select the infectious diseases (ICD-10-AM codes A00-B99), principal diagnosis was used to select the other conditions. There may therefore be overlap between the 'Intestinal infectious diseases' and other categories.

(b) Data are from public and private hospitals in all jurisdictions.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

TABLE 10A.2.3

Table 10A.2.3 **Hospitalisation rates for selected types of environmentally based diseases for persons, by Indigenous status, by age, 2010–2012 and 2016–2018 (a), (b), (c), (d)**

| Aboriginal and Torres Strait Islander | | | | | | | | Non-Indigenous (e) | | | | | | | |
|---------------------------------------|-------|-------|-------|----------|------------------------|--------|--|--------------------|-------|-------|-------|----------|------------------------|--------|--|
| 0–14 | 15–24 | 25–44 | 45–64 | 65 years | <i>Total Australia</i> | | | 0–14 | 15–24 | 25–44 | 45–64 | 65 years | <i>Total Australia</i> | | |
| years | years | years | years | + | Crude rate | AS (f) | | years | years | years | years | + | Crude rate | AS (f) | |

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years or over.

- Nil or rounded to zero. **np** Not published.

TABLE 10A.2.4

Table 10A.2.4 **Hospitalisations for selected types of environmentally based diseases, by Indigenous status, by remoteness, 2010–2012 and 2016–2018 (a), (b), (c), (d)**

| | Aboriginal and Torres Strait Islander | | | | Non-Indigenous (e) | | | | Rate Ratio (f) | | | |
|--------------|---------------------------------------|-----------------------------------|---------------------------------|-----------------|--------------------|-----------------------------------|---------------------------------|-----------------|----------------|-----------------------------------|---------------------------------|-----------------|
| | Major cities | Inner and outer regional combined | Remote and very remote combined | Total Australia | Major cities | Inner and outer regional combined | Remote and very remote combined | Total Australia | Major cities | Inner and outer regional combined | Remote and very remote combined | Total Australia |
| Total | 1 679.8 | 2 502.1 | 6 900.4 | 3 047.9 | 1 428.0 | 1 644.9 | 1 702.8 | 1 498.8 | 1.2 | 1.5 | 4.1 | 2.0 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Any diagnosis was used to select the infectious diseases (ICD-10-AM codes A00-B99), principal diagnosis was used to select the other conditions. There may therefore be overlap between the 'Intestinal infectious diseases' and other categories.

(b) Data are from public and private hospitals in all jurisdictions.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) from 2012-13 onward and the Australian Standard Geographical Classification (ASGC) prior to 2012-13, and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(f) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(g) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(h) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years or over.

- Nil or rounded to zero. **np** Not published. **na** Not available.

| Total (k) | 42.5 | 38.1 | 40.0 | 27.3 | 23.1 | 25.0 |

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2009–15 (final), 2016 (revised) and 2017–18 (preliminary). For further information see Explanatory Notes 52–54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in Causes of Death, Australia, 2014 (cat. no. 3303.0).

(b) ICD-10 codes for deaths from conditions associated with poor environmental health include: intestinal infectious diseases (A00–A09); tuberculosis (A15–A19); bacterial disease (A20–A49); trachoma (A71); acute hepatitis A (B15); acute hepatitis B (B16); scabies (B86); acute rheumatic fever (I00–I02); chronic rheumatic heart diseases (I05–I09); acute upper respiratory infections (J00–J06); influenza and pneumonia (J09–J18); asthma (J45) and lung disease due to external agents (J60–J70).

(c) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Data are presented in five year groupings due to the volatility of small numbers each year.

TABLE 10A.2.5

Table 10A.2.5 Deaths from diseases associated with poor environmental health, age-standardised death rates, by Indigenous status, by State and Territory, 2009–2013 and 2014–2018 (a), (b), (c), (d), (e), (f)

| | <i>Aboriginal and Torres Strait Islander (g), (h)</i> | | | <i>Non-Indigenous (i)</i> | | |
|---|---|----------------|--------------|---------------------------|----------------|--------------|
| | <i>Males</i> | <i>Females</i> | <i>Total</i> | <i>Males</i> | <i>Females</i> | <i>Total</i> |
| <p>(e) Age-standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.</p> <p>(f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.</p> <p>(g) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.</p> <p>(h) Although most deaths of Aboriginal and Torres Strait Islander people are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these data are likely to underestimate the Aboriginal and Torres Strait Islander all causes mortality rate.</p> <p>(i) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031 (ABS Cat. no. 3238.0, series B, 2016 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.</p> <p>(j) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.</p> <p>(k) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.</p> | | | | | | |

- (a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (b) Acceptable standard is defined as a household with four working facilities (for washing people, for washing clothes/bedding, for storing/preparing food and sewerage) and not more than two major structural problems.
- (c) Balance of state estimates for ACT are not separately available.
- (d) Includes not stated.
- na Not available. Np. Not published.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from the Expanded Confidentialised Unit Record File (CURF), DataLab.

TABLE 10A.3.2

Table 10A.3.2 Aboriginal and Torres Strait Islander households' access to facilities, by state and territory, 2002, 2008, 2012-13, 2014-15 and 2018-19 (a), (b)

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|--|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
|--|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|

(b) There were differences in the question methodology between NATSISS 2002, 2008 and AATSIHS 2012-13 when asking about functional household facilities. In 2002, households were asked about the presence of working facilities and in 2008 and 2012-13 households were asked about the absence of working facilities.

(c) In 2002, households were asked if they had adequate kitchen cupboard space as part of the food preparation facilities question. Households were not asked this in 2008 and 2012-13. Therefore, when comparing the proportion of households with working facilities for preparing food between 2002, 2008 and 2012-13, caution should be used.

.. Not applicable – Nil or rounded to zero.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) There were differences in the question methodology between NATSISS 2002, 2008, 2014-15 and AATSIHS 2012-13 when asking about functional household facilities. In 2002, households were asked about the presence of working facilities and in 2008, 2012-13 and 2014-15 households were asked about the absence of working facilities.

(c) In 2002, households were asked if they had adequate kitchen cupboard space as part of the food preparation facilities question. Households were not asked this in 2008, 2012-13 and 2014-15. Therefore, when comparing the proportion of households with working facilities for preparing food between 2002 and 2008, 2012-13 and 2014-15, caution should be used.

.. Not applicable – Nil or rounded to zero.

(b) In the National Aboriginal and Torres Strait Islander Social Survey, an Aboriginal and Torres Strait Islander household is defined as an occupied private dwelling where at least one permanent resident identifies as being of Aboriginal or Torres Strait Islander origin.

(c) Data are not comparable with the 2008 National Aboriginal and Torres Strait Islander Social Survey.

(d) Sum of components may exceed total as households may have reported more than one type of structural problem.

(e) Includes households that did not state if they had structural problems.

| Other major structural problems | ± | 1.2 | 1.1 | 1.0 | 0.7 | 1.4 | 2.0 | 1.3 | 0.6 |
| Total with structural problems (f) | ± | 3.6 | 4.6 | 4.1 | 2.3 | .. | .. | .. | .. |
| Total with structural problems (excluding rising damp) (f) (g) | ± | 3.7 | 4.4 | 4.0 | 2.3 | 7.3 | 6.4 | 4.4 | 2.1 |
| Non-Indigenous households | | | | | | | | | |
| Total with structural problems | ± | 1.4 | 2.2 | 3.4 | 1.0 | 9.2 | .. | .. | 1.0 |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

(b) In the National Aboriginal and Torres Strait Islander Social Survey and the Australian Aboriginal and Torres Strait Islander Health Survey, an Aboriginal and Torres Strait Islander household is defined as an occupied private dwelling where at least one permanent resident identifies as being of Aboriginal or Torres Strait Islander origin. In the Survey of Income and Housing a non-Aboriginal and Torres Strait Islander household is defined as a household containing no permanent residents who identified as being of Aboriginal or Torres Strait Islander origin.

(c) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001).

(d) Households in collection districts defined as 'very remote' were excluded from the 2007-08 Survey of Income and Housing.

(e) Includes households that did not state if they had structural problems.

(f) Sum of components may exceed total as households may have reported more than one type of structural problem.

(g) Excludes households that had rising damp as a major structural problem.

TABLE 10A.3.8

Table 10A.3.8 **Dwellings with major structural problems, by Indigenous status, by remoteness, 2007-08, 2012-13 and 2014-15**
(a), (b), (c)

| | <i>Unit</i> | <i>Major cities</i> | <i>Inner regional</i> | <i>Outer regional</i> | <i>Total non-remote</i> | <i>Remote</i> | <i>Very remote (d)</i> | <i>Total remote</i> | <i>Australia</i> |
|--|-------------|---------------------|-----------------------|-----------------------|-------------------------|---------------|------------------------|---------------------|------------------|
|--|-------------|---------------------|-----------------------|-----------------------|-------------------------|---------------|------------------------|---------------------|------------------|

(h) In the 2011-12 Survey of Income and Housing (SIH), data on dwellings with major structural problems was not collected. In the SIH this data is collected as part of the additional housing content that is collected every six years. The additional housing content was collected in the 2007-08 and 2013-14 SIH.

.. Not applicable. – Nil or rounded to zero.

(a) Data not collected in 'administered' communities. An administered community in the CHINS surveys is a discrete Indigenous community that has a population of less than 50 people and is linked to a larger parent discrete Indigenous community or a Resource Agency for the provision and maintenance of services such as housing, water, power supplies and sewerage.

(b) In the previous 12 months.

(c) Components may not add to totals as more than one response may be specified.

(d) Proportions have been calculated by the Steering Committee for the Review of Government Service Provision. The denominator for all proportions includes administered communities. Proportions are not available for communities with populations less than 50 or the all communities total because data was not collected in 'administered' communities.

— Nil or rounded to zero. **na** Not available.

(a) In the previous 12 months.

(b) Components may not add to totals as more than one response may be specified.

(c) Proportions have been calculated by the Steering Committee for the Review of Government Service Provision. The denominator for all proportions includes administered communities. Proportions are not available for electricity interruptions for communities with populations less than 50 or the all communities total because data was not collected in 'administered' communities.

(d) Data not collected in 'administered' communities. An administered community in the CHINS surveys is a discrete Indigenous community that has a population of less than 50 people and is linked to a larger parent discrete Indigenous community or a Resource Agency for the provision and maintenance of services such as housing, water, power supplies and sewerage.

11 Safe and supportive communities

Strategic areas for action

Safe and supportive families and communities provide a resilient, caring and protective environment, promoting a range of positive outcomes. However, the history of colonisation and intergenerational trauma has deeply affected Aboriginal and Torres Strait Islander people as individuals and communities in many ways. This trauma has contributed to family and community disruption, alcohol and drug misuse, violence and harm, and contact with the justice system.

The indicators in this strategic area for action focus on the key factors that affect the safety and supportiveness of communities:

- alcohol consumption and harm (section 11.1) — excessive alcohol consumption increases an individual’s risk of death, disease and injury. Alcohol also contributes to family and community related problems, such as child abuse and neglect, work or financial problems, family breakdown, violence and crime
- drug and other substance use and harm (section 11.2) — drug and other substance misuse contributes to illness and disease, accident and injury, violence and crime, and family and social disruption
- youth diversions (section 11.3) — diversionary alternatives in the juvenile justice system are aimed at reducing reoffending and the negative labelling and stigmatisation associated with formal contact with the criminal justice system
- repeat offending (section 11.4) — it is important that those who have had contact with the criminal justice system have the opportunity to integrate back into the community and lead positive and productive lives
- community functioning (section 11.5) — individual wellbeing is influenced by community wellbeing, and vice versa. Strong communities, as defined by Aboriginal and Torres Strait Islander people, will improve social, emotional and economic wellbeing.

Safe and supportive communities can have a positive influence across all the COAG targets and headline indicators. Three headline indicators are particularly associated with breakdown in family and community relationships:

- substantiated child abuse and neglect (section 4.11)
- family and community violence (section 4.12)
- imprisonment and youth detention (section 4.13).

Outcomes in this strategic area can be affected by outcomes in other strategic areas, or can influence outcomes in other areas:

- governance, leadership and culture (chapter 5)
- early child development (chapter 6)
- education and training (chapter 7)
- healthy lives (chapter 8)
- economic participation (chapter 9)
- home environment (chapter 10).

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, ‘table 11A.1.1’). These tables can be found on the web page (www.pc.gov.au/oid2020).

11.1 Alcohol consumption and harm¹

Box 11.1.1 Key messages

- Drinking alcohol at harmful levels comes with social and financial burden to the drinker, their families, and the people and community around them. Alcohol contributes to disability and death, family violence and the burden of disease.
- More than one-quarter of Aboriginal and Torres Strait Islander adults abstain from alcohol, with the proportion significantly higher in very remote areas. In 2018-19, 26 per cent reported not consuming alcohol in the previous 12 months (including those who have never consumed alcohol). The proportion of abstainers in very remote areas (43 per cent) was double that in major cities (19 per cent).
- But some Aboriginal and Torres Strait Islander adults put themselves at risk of harm by exceeding alcohol consumption guidelines. In 2018-19, 20 per cent reported exceeding lifetime alcohol risk guidelines (drinking an average of more than two standard drinks per day in the last week) and 53 per cent reported exceeding single occasion risk guidelines (drinking more than four standard drinks on a single occasion) on at least one occasion in the last twelve months.
- A higher proportion of Aboriginal and Torres Strait Islander adults abstain from alcohol than non-Indigenous adults, but in turn a higher proportion of Aboriginal and Torres Strait Islander adults exceed alcohol risk guidelines.
- In line with the higher proportion of Aboriginal and Torres Strait Islander adults exceeding alcohol risk guidelines, they are overrepresented in hospitalisations and in deaths from alcohol-related conditions – though with considerably lower numbers, and noting hospitalisations and deaths cover all ages. After adjusting for differences in population age structures, for both alcohol-related hospitalisations and alcohol-induced deaths, the rate for Aboriginal and Torres Strait Islander people was around four times the rate for non-Indigenous people.
- The main component of the higher hospitalisation rates of Aboriginal and Torres Strait Islander people from alcohol-related conditions was hospitalisations in remote areas for acute intoxication — in 2016–2018 this rate was more than four times the rate in 2010–2012, and is now 18 times the rate for non-Indigenous hospitalisations.
- Programs and services to manage structural and individual risks for people who drink alcohol at risky levels can include restricting access to alcohol, inhibiting the appeal of alcohol and improving people's mental wellbeing.
- In 2017-18, the proportion of Aboriginal and Torres Strait Islander homicides involving both the victim and offender having consumed alcohol at the time of the offence (55 per cent — 11 out of 20) was higher than the proportion for non-Indigenous homicides (16 per cent — 22 out of 135). But for homicides where neither the victim nor offender drank, less than seven per cent were Aboriginal and Torres Strait Islander homicides, indicating overrepresentation for non-Indigenous people (albeit from very small numbers).

¹ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the Report.

Box 11.1.2 Measures of alcohol consumption and harm

There is one main measure for this indicator:

- *Levels of risky alcohol consumption* is defined as the proportion of people aged 18 years or over who consume alcohol at risky/high risk levels (more than two standard drinks on any day, based on the concept of 'Lifetime risk of alcohol harm' in the National Health and Medical Research Council [NHMRC] 2009 guidelines)².

The most recent available data are from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) for 2018-19 (all jurisdictions and remoteness). Data are provided for the population aged 18 years or over (for the main measure, which aligns with the National Indigenous Reform Agreement³) with supplementary data provided on the population aged 15 years or over.

Three supplementary measures are also reported:

- Alcohol related hospitalisations (all jurisdictions; sex; remoteness)⁴
- Alcohol induced deaths (NSW, Queensland, WA, SA and the NT; sex)
- Alcohol involvement in homicides (national).

Data on hospitalisations are from the AIHW National Hospital Morbidity Database. Latest data are for 2018-19. Data on deaths are from the ABS Causes of Death collection and latest data are for 2018. Data on homicides are from the Australian Institute of Criminology National Homicide Monitoring Program and latest data are for 2017-18.

Australian adults drink alcohol for a range of societal and cultural reasons, and most do not drink at levels that place them at risk of harm. For children and young people under the age of 18 years there is no 'safe' or 'no-risk' level of drinking alcohol (NHMRC 2019). In Australia, people under the age of 18 years are prohibited from purchasing or consuming alcohol, and people who sell or supply liquor to minors are committing an offence.

Drinking alcohol at harmful levels can create social and financial burdens both to the drinker, their families, and the people and community around them (Commonwealth of Australia 2019; NHMRC 2019). Alcohol consumption at harmful levels:

- contributes to violence within communities, and disability and death through accidents, assaults, suicide and homicide (AIHW 2020; Commonwealth of Australia 2019; Snijder et al. 2020). Alcohol consumption and family violence is discussed in section 4.12 *Family and community violence*.

² The 2009 NHMRC guidelines advise that, for healthy men and women, drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury, and drinking no more than four standard drinks on a single occasion reduces the risk arising from that occasion.

³ The National Indigenous Reform Agreement was in effect at the time of drafting this report.

⁴ Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include hospitalisations data for all jurisdictions from 2010-11 to 2018-19, as well as data for the six jurisdictions from 2004-05 to 2018-19.

-
- contributes to the burden of disease including alcohol use disorders, multiple types of cancer, chronic liver disease and cognitive impairment (Commonwealth of Australia 2019; Gao, Ogeil and Lloyd 2014).
 - during pregnancy may cause physical and neurocognitive disorders termed ‘fetal alcohol spectrum disorders’ (Fitzpatrick et al. 2012; Gray et al. 2018). Alcohol consumption during pregnancy is discussed in section 6.2 *Health behaviours during pregnancy*.

People who engage in risky alcohol consumption, are not only at risk of harming themselves but also harming others. Research suggests that alcohol-related harm affects the population in different ways:

- women are more likely to be harmed by household members and relatives
- men are more likely to be harmed by friends, co-workers or strangers, and
- young people who drink are at an increased risk of harm, and young men are more likely to be harmed by their friends (Callinan and Livingstone 2019).

Over one-quarter of Aboriginal and Torres Strait Islander adults abstain from alcohol, with the proportion in very remote areas significantly higher...

An increasing proportion of Aboriginal and Torres Strait Islander adults are abstaining from alcohol.⁵ In 2018-19, 26 per cent of Aboriginal and Torres Strait Islander adults abstained, an increase from 23 per cent in 2012-13 (table 11A.1.1).

Aboriginal and Torres Strait Islander adults’ rates of abstinence are significantly higher in very remote areas. In 2018-19, the proportion of Aboriginal and Torres Strait Islander adults abstaining from alcohol in very remote areas (43 per cent) was twice the proportion for those in major cities (19 per cent) (table 11A.1.2).

A higher proportion of Aboriginal and Torres Strait Islander adults abstain from drinking alcohol than non-Indigenous adults. Nationally in 2017–19, after adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander adults abstaining was 1.4 times the proportion of non-Indigenous adults abstaining (figure 11.1.1).

⁵ Report not consuming alcohol in the previous 12 months or having never consumed alcohol.

Figure 11.1.1 **Adults abstaining from alcohol by remoteness area, by Indigenous status, 2017–19 (age-standardised rate)^{a,b,c}**

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See table 11A.1.3-4 for detailed definitions, footnotes and caveats. ^c The total for non-Indigenous adults does not include very remote areas as data were not collected in these areas for non-Indigenous people.

Source: ABS (2019) *National Aboriginal and Torres Strait Islander Health Survey, 2018-19*, Cat. no. 4715.0, Canberra; tables 11A.1.3-4.

... but some Aboriginal and Torres Strait Islander adults put themselves at risk of harm by exceeding alcohol consumption guidelines

High levels of alcohol consumption can increase the risk of lifetime harm. This happens when more than two standard drinks are consumed on average every day. Risky alcohol consumption can also occur on a single occasion, when more than four standard drinks are consumed.

The proportion of Aboriginal and Torres Strait Islander adults exceeding the alcohol consumption guidelines has remained stable for lifetime risk, but has increased slightly for single occasion risk. Nationally in 2018-19, the proportion of Aboriginal and Torres Strait Islander adults who exceeded lifetime risk guidelines in the last week was 20 per cent (similar to 2012-13). The proportion exceeding the single occasion risk guidelines on at least one occasion in the previous 12 months decreased from 57 per cent in 2012-13 to 53 per cent in 2018-19, with this decrease driven by a decrease in those exceeding less often than once a week (the proportion exceeding less often than once a week decreased from 37 per cent to 34 per cent) (table 11A.1.1).

Men are more likely to exceed the risk guidelines for alcohol than women. For Aboriginal and Torres Strait Islander people aged 15 years or over in 2018-19, the proportion of males exceeding lifetime risk guidelines in the last week (28 per cent) was nearly three times the

proportion of females (10 per cent) and the proportion of males exceeding single occasion risk guidelines on at least one occasion in the previous 12 months (61 per cent) was also significantly higher than the proportion of females (40 per cent) (table 11A.1.5).

After adjusting for differences in age structures, the proportions exceeding the alcohol consumption guidelines were higher for Aboriginal and Torres Strait Islander adults compared to non-Indigenous adults, except for the proportions exceeding the single occasion risk guidelines less often than once a week (both around 30 per cent) (table 11A.1.3).

Single occasion risky alcohol consumption is more prevalent amongst young people, especially after 18 years, once alcohol consumption is not prohibited. People that begin drinking hazardously at a young age are at increased risk of developing alcohol use disorders later in life (Freyer, Morley and Haber 2016). Aboriginal and Torres Strait Islander young adults are the age group with the highest proportion of those exceeding single occasion risk guideline at least once in the last year, with 65 per cent of young people aged 18–24 years and 62 per cent of young people aged 25–34 years old exceeding the guidelines at least once, compared to 54 per cent for all Aboriginal and Torres Strait Islander people aged 18 years or over (table 11A.1.6).

How can the levels of risky alcohol consumption be reduced?

Risky alcohol consumption is associated with structural and individual risk factors. Most of the research that looks at how to address these factors and related harms does not specifically relate to Aboriginal and Torres Strait Islander people. However, the following approaches may be relevant.

- Restricting access to alcohol is one approach, noting that there can be unintended consequences with increases in ‘sly grog’ (Robertson, Fitts and Clough 2017). Restrictions can include the number of take away outlets (Smith et al. 2019) or by using liquor permits and alcohol management plans that determine the sale, timing and distribution of alcohol. These measures are in use in some, mainly Aboriginal, communities in WA, Queensland and the NT. The effectiveness of permits depends on the broader liquor management system including the agencies and procedures required to have a permit (d’Abbs and Crundall 2019)
- Reducing the demand for alcohol is another approach. This can be achieved by:
 - inhibiting the appeal of alcohol — alcohol marketing and advertising has been found to induce young people to drink alcohol and engage in risky drinking (Jernigan et al. 2017) and to encourage young people under the age of 18 to drink (Sargent and Babor 2020)
 - improving people’s mental wellbeing — alcohol use disorders⁶ often co-occur with mental health disorders (Freyer, Morley and Haber 2016; Wood et al. 2020) and

⁶ Alcohol Use Disorder is a diagnosis described in the Diagnostic and Statistical Manual of Mental Disorders, 5th edition (DSM-5).

people who die by suicide have a higher risk of an alcohol-use disorder at the time of death (Chong et al. 2020; Kolves et al. 2017). Mental health programs to improve mental wellbeing may have a role in reducing alcohol consumption

- engaging Aboriginal and Torres Strait Islander young people in education or employment through mentoring, sport or music programs provided by Aboriginal community controlled organisations may also reduce demand for alcohol and other drugs, however there is little research that provides evidence for this as an alcohol demand reduction strategy.

Culturally safe services or programs that are designed and implemented by Aboriginal and Torres Strait Islander people may deliver better outcomes in reducing risky alcohol consumption levels (Cass 2019; Gray et al. 2018; Harrison et al. 2019; Shanthosh et al. 2018). A global systematic review of Indigenous-led alcohol controls (including six Australian initiatives) concluded that these could be effective in improving health and social outcomes (Muhunthan et al. 2017). On the flipside, there is evidence that for some communities the impact of government policies and programs aimed at reducing alcohol consumption have had unintended (and negative) consequences (d’Abbs, Burlayn and Jamijin 2019; Robertson, Fitts and Clough 2017).

Aboriginal and Torres Strait Islander people are overrepresented in hospitalisations and deaths from alcohol-related conditions

In line with the higher proportion of Aboriginal and Torres Strait Islander adults exceeding alcohol risk guidelines, Aboriginal and Torres Strait Islander people are overrepresented in hospitalisations from alcohol-related conditions, though at considerably lower numbers. In 2016–2018, after adjusting for differences in population age structures, the rate of alcohol-related hospitalisations for Aboriginal and Torres Strait Islander people was almost four times the rate for non-Indigenous people (table 11A.1.18). Putting this in context with those exceeding alcohol risk guidelines, the numbers of alcohol-related hospitalisations and deaths in 2016–2018 is less than 2 per cent of the number of people who exceeded the single occasion alcohol risk guidelines in 2018-19 (tables 11A.1.19 and 11A.1.5).

The main component of the higher hospitalisation rates of Aboriginal and Torres Strait Islander people from alcohol-related conditions is hospitalisations in remote areas for acute intoxication — in 2016–2018 this rate was almost twice the rate in 2010–2012, and is now 18 times the rate for equivalent non-Indigenous hospitalisations (table 11A.1.19).

Over the past 20 years, the age-standardised rate of Aboriginal and Torres Strait Islander deaths related to alcohol has decreased, though is still around four times the rate for equivalent non-Indigenous deaths (table 11A.1.23). Liver diseases leading to cirrhosis are among the most common contributor to the mortality gap between Indigenous and other Australian adults (Valery et al. 2020). In 2014–2018, of the 467 deaths of Aboriginal and Torres Strait Islander people related to alcohol use, more than half were from alcoholic liver disease (table 11A.1.21). However, a decrease in hospitalisations for alcoholic liver disease

is occurring (from an age standardised rate of 100 to 67 per 100 000 population) (table 11A.1.15).

People with alcohol use disorders tend to wait until significant harm to their health has occurred before they seek help, and Aboriginal and Torres Strait Islander people experience barriers which further delay the help they need, including racism, and a lack of culturally appropriate services and resources (Islam et al. 2018). This may mean that Aboriginal and Torres Strait Islander people are more likely to be hospitalised when their needs could have originally been met by a primary and community health service.

Alcohol appears to be a contributing factor to homicides involving Aboriginal and Torres Strait Islander people as victim and offender

Nationally in 2017-18, there were 196 homicide incidents resulting in 202 victims of homicide (section 4.12 *Family and community violence*, tables 4A.12.24 and 4A.12.26), of which the Indigenous status of victims and offenders were known in 167 incidents. Among these 167 incidents, 20 involved Aboriginal and Torres Strait Islander people as both victims and offenders. In 11 of these incidents (55 per cent), both the victim and offender had consumed alcohol at the time of the offence. In comparison, of the 135 homicide incidents involving only non-Indigenous victims and offenders, 22 (16 per cent) involved both the victim and offender consuming alcohol (table 11A.1.24).

Future directions in data

The NHMRC guidelines on which the indicator for alcohol consumption and harm is based are currently being reviewed. The draft guideline recommendations differ from the 2009 NHMRC guidelines and, if implemented, this will alter the comparability of historical data.

Data on alcohol use are derived from surveys which are limited by sampling, survey administration and questionnaire design and may underestimate actual consumption (Gray and Wilkes 2010; Lee et al. 2014). Results of previous ABS surveys and administrative data collections on use of alcohol and illegal drugs suggest a tendency for respondents to underreport actual consumption levels (ABS 2016), and whilst national surveys may provide a broad indication of the prevalence of alcohol use, any significant regional variation is concealed. Reliable population estimates of alcohol use are fundamental to inform funding and the design of initiatives to prevent and treat harmful use (Lee et al. 2014).

11.2 Drug and other substance use and harm⁷

Box 11.2.1 Key messages

- Misuse of legal and illegal substances can negatively affect the lives of individuals, families and communities. Users are more susceptible to illness and accident, and injecting drug users who share needles are at a greater risk of blood-borne diseases.
- Illicit substance use often co-occurs with mental illness and psychological distress. It can contribute to the onset of, and prevent recovery from, mental illness and is a major risk factor for suicide.
- The majority of Aboriginal and Torres Strait Islander adults do not illicitly use substances. In 2018-19, 70 per cent reported not illicitly using in the past 12 months.
- But the proportion who report that they are illicitly using is increasing over time. Most illicit use is use of marijuana, hashish or cannabis resin (different forms of the cannabis plant), and its increase in recent years is driven by increases in regional and very remote areas. In 2018-19, there were no significant differences across remoteness areas.
- In line with reported use, the proportion of drug-related hospitalisations has also increased over time — and more so for Aboriginal and Torres Strait Islander people than for non-Indigenous people.
- In 2018-19, more than half of all drug-related hospitalisations were related to mental and behavioural disorders. For Aboriginal and Torres Strait Islander people, this proportion was larger, at 60 per cent.
- Responding to the needs of Aboriginal and Torres Strait Islander people who illicitly use substances requires an understanding of what is driving demand. It appears that there is limited research on this and, therefore, a lack of evidence on whether programs are effective in addressing the drivers of demand.
- While reducing the supply of some substances can reduce illicit substance use, if the drivers of illicit use are not also addressed there can be unintended consequences (such as the use of alternative substances).

⁷ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the Report.

Box 11.2.2 Measures of drug and other substance use and harm

There is one main measure for this indicator. *Illicit use of substances* is defined as the proportion of adults who reported using illicit substances or misusing licit substances in the previous 12 months.⁸ Data are sourced from the ABS National Aboriginal and Torres Strait Islander Health Survey (NATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2018-19 from the NATSIHS (all jurisdictions; sex; age). Data were not available for remote areas in the 2004-05 survey, or for non-Indigenous people.

Three supplementary measures are also reported by Indigenous status:

- Drug-related hospitalisations (all jurisdictions; sex; remoteness)
- Drug-induced deaths (NSW, Queensland, WA, SA and the NT; sex)
- Drug involvement in homicides (national).

Data on hospitalisations are from the AIHW National Hospital Morbidity Database.⁹ The latest data are for 2018-19. Data on deaths are from the ABS Causes of Death collection, and the latest data are for 2018. Data on homicides are from the Australian Institute of Criminology National Homicide Monitoring Program and the latest data are for 2017-18.

Misuse of legal and illegal drugs can negatively affect the lives of individuals, families and communities. People who misuse substances are more susceptible to illness (including mental illness — see section 8.7 *Mental health*) and accident, and injecting drug users who share needles are at a greater risk of blood-borne diseases such as HIV and hepatitis (Baldock and Lindsay 2020; Teoh, Moses and McCullough 2019; Treloar, Mao and Wilson 2016).

Substance misuse is also a factor in suicide across the Australian population (Agrawal et al. 2017; Zahra et al. 2020), and specifically for Aboriginal and Torres Strait Islander people (Dickson et al. 2019). A study of a group of Aboriginal and Torres Strait Islander prisoners in Queensland found that mental illness and lifetime suicide thoughts and attempts were significantly more likely among those with a substance use disorder (Heffernan et al. 2016). Suicide and self-harm are discussed in section 8.8 *Suicide and self-harm*.

Illicit substance use by parents can affect children both pre- and post-birth. Pregnant women who take drugs can affect the health and wellbeing of their unborn children, and some babies are born with addiction issues. Prenatal exposure to volatile substances (when people deliberately inhale chemical vapours to produce altered states) can lead to birth prematurity, delays in development, neuro-behavioural problems and physical malformations (Marel, MacLean and Midford 2015). And parents who misuse substances can find caring for children more difficult. Use of illicit substances during pregnancy and when caring for

⁸ In this section, the terms ‘illicit substance use’ or ‘substance misuse’ refer to use of substances that are illegal to possess (such as heroin) and misuse of substances that are legally available (such as petrol, glue, paint and prescription drugs). Misuse of legal substances (volatile substance use) can result in sudden death, asphyxiation or neurological and cognitive effects.

⁹ Data on hospitalisations only cover illnesses and conditions directly attributable to drug use that result in admission to a hospital. They do not include conditions for which drug use may be a contributing factor but where the link is not direct and immediate.

children is discussed in section 6.2 *Health behaviours during pregnancy* and section 4.11 *Substantiated child abuse and neglect*.

Illicit substance use is often associated with crime (and therefore imprisonment) and violence (from methamphetamine users in particular) (Goldsmid and Willis 2016; Macrae and Hoareau 2016; Marel, MacLean and Midford 2015). Use of illicit substances is also discussed in section 4.12 *Family and community violence*.

Most Aboriginal and Torres Strait Islander adults do not illicitly use substances, but use of marijuana, hashish and cannabis is increasing...

Most Aboriginal and Torres Strait Islander adults do not illicitly use substances. In 2018-19, 70 per cent of Aboriginal and Torres Strait Islander adults reported not illicitly using substances in the last 12 months (table 11A.2.1). For those illicitly using substances, the use occurs most commonly in young adult men. For Aboriginal and Torres Strait Islander men aged 25–34 years, half reported illicitly using substances in the last 12 months (table 11A.2.6).

The majority of illicit substance use (around 85 per cent) is of marijuana, hashish or cannabis resin (table 11A.2.1). The proportion of Aboriginal and Torres Strait Islander adults illicitly using these substances has increased over time: it was around 18–20 per cent from 2002 to 2014-15, before increasing to 24 per cent in 2018-19 (table 11A.2.3). This increase has been driven by increasing proportions of users in regional and very remote areas in the last four years (figure 11.2.1).

... and hospitalisations and deaths from drug-related issues are also increasing

While the rate of drug-related hospitalisations has increased for all Australians over the past decade, it has increased more for Aboriginal and Torres Strait Islander people. The rate of drug-related hospitalisations for Aboriginal and Torres Strait Islander people has more than doubled (from 391 per 100 000 population in 2010-11 to 777 per 100 000 population in 2018-19), compared with a 20 per cent increase for non-Indigenous people. After adjusting for differences in population age structures, the drug-related hospitalisation rate for Aboriginal and Torres Strait Islander people was more than three times the rate for non-Indigenous people (up from a ratio of around 2:1 in 2010-11) (table 11A.2.8).

Around half of all drug-related hospitalisations for non-Indigenous people are related to mental and behavioural disorders (the remainder are related to poisoning, including accidental poisoning, and other). But for Aboriginal and Torres Strait Islander people this proportion is larger, at 60 per cent. In 2018-19, after adjusting for population age structures, Aboriginal and Torres Strait Islander people were hospitalised for drug-related mental and behavioural disorders at four times the rate of non-Indigenous people (table 11A.2.8).

Figure 11.2.1 Marijuana, hashish or cannabis resin use for Aboriginal and Torres Strait Islander adults, by remoteness, by year^{a,b,c}

^a Error bars represent the 95 per cent confidence interval associated with each point estimate. ^b See table 11A.2.3 for detailed definitions, footnotes and caveats. ^c Data are not available for remote and very remote areas in 2004-05.

Source: ABS (unpublished) National Aboriginal Torres Strait Islander Health Survey (various years); table 11A.2.3.

The increase in the rate of drug-related hospitalisations is seen across all remoteness areas and for all people, but is more pronounced for Aboriginal and Torres Strait Islander people in major cities and regional areas (table 11A.2.11).

Drug-induced deaths¹⁰ have also increased for both Aboriginal and Torres Strait Islander and non-Indigenous people. In 2014–2018, after adjusting for differences in population age structures, the drug-induced death rate for Aboriginal and Torres Strait Islander people was around twice the rate for non-Indigenous people, up from a ratio of 1.6:1 in 2009–2013 (table 11A.2.14). The largest increase in the age-standardised rate over this period was for Aboriginal and Torres Strait Islander males (from 12 to 17 per 100 000 population) (table 11A.2.14).

Data on drug involvements in homicides are included in table 11A.2.15. The number of Aboriginal and Torres Strait Islander homicide incidents and the influence of drugs on the victims and/or offenders are small and difficult to interpret. Numbers have fluctuated, with no clear trend over the period 1999-2000 to 2017-18.

¹⁰ For NSW, Queensland, WA, SA and the NT only (as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis).

More evidence is required on the drivers of use to effectively respond

Responding to the needs of Aboriginal and Torres Strait Islander people who illicitly use substances requires an understanding of what drives demand, but the evidence on this is sparse (see Leske et al (2016) and Snijder et al (2020)¹¹). For example, one study on cannabis use found that peers potentially had an impact on use (Geia et al. 2018; Intergovernmental Committee on Drugs 2014), while another found that use was linked to perceived calming or self-regulating benefits (Graham and Clough 2019). But these findings do not explain what the underlying drivers are that make a person more likely to be influenced by peers, or why they need a substance to calm them.

When Aboriginal and Torres Strait Islander people use substances for relief, this must be considered within the context of trauma and its continuing intergenerational impacts as a result of colonisation, dispossession and economic exclusion (Calma, Dudgeon and Bray 2017; Macrae and Hoareau 2016). For example, in research on Aboriginal use of methamphetamine, participants identified historical trauma, contemporary disadvantage and racism, along with incarceration and other social factors (such as those related to education, employment and housing) as the cause of the market for ice and other drugs within Aboriginal and Torres Strait Islander communities (MacLean, Hengsen and Stephens 2017; Snijder and Kershaw 2019).

A recent study of a residential drug and alcohol treatment program for young Aboriginal and Torres Strait Islander people found that culturally relevant modes of treatment, and taking a harm-minimisation and holistic approach to the factors in the young person's life, saw a reduction in the levels of self-harm, substance misuse, and arrests (Nathan et al. 2020).

In addition to addressing the demand for substances, there is also a need to reduce the supply of substances for illicit use. But unintended consequences, such as the use of replacement substances, need to be considered. For example, the Government replaced regular unleaded petrol with low aromatic fuel in a number of regional and remote locations, which significantly reduced petrol sniffing; however, some petrol sniffers have moved to alcohol or cannabis instead (d'Abbs et al. 2019).

Future directions in data

Data on illicit substance use in Australia are based on self-reported survey data. The data may under-estimate consumption, because these drugs are illegal to possess (Macrae and Hoareau 2016) and this may affect respondents' willingness to respond honestly. Results of previous ABS surveys and administrative data collections on the use of alcohol and illegal drugs suggest a tendency for respondents to underreport actual consumption levels (ABS 2016) — and, whilst national surveys may provide a broad indication of the prevalence of drug use, any significant regional variation is concealed. The National Aboriginal and

¹¹ Leske et al (2016) and Snijder et al (2020) both conducted international systematic reviews which included Australia.

Torres Strait Islander Peoples' Drug Strategy 2014–2019 (Intergovernmental Committee on Drugs 2014) prioritises the establishment of meaningful performance measures with effective data collection to support community-led monitoring and evaluation. Given the rise in cannabis use in conjunction with tobacco by Aboriginal and Torres Strait Islander young people, data to support an understanding of this mix would be useful.

11.3 Youth diversions¹²

Box 11.3.1 Key messages

- Youth diversion provides an opportunity for the criminal justice system to identify and respond to the complex needs of young people so that they are prevented from entering and re-entering the system, which can fundamentally change their life trajectory.
- Aboriginal and Torres Strait Islander young people are less likely to be diverted than non-Indigenous young people. Rates of diversions for Aboriginal and Torres Strait Islander young people were between 39 and 88 per cent of the rates for non-Indigenous young people.
- Data are not comparable across states and territories, but for most jurisdictions the average diversion rate for Aboriginal and Torres Strait Islander and non-Indigenous young people over the last four years (2015-16 to 2018-19) was lower or the same as in the preceding four years (2010-11 to 2014-15), indicating a trend nationally towards less diversion.
- Aboriginal and Torres Strait Islander young people are more likely to have various risk factors, which therefore contribute to lower rates of diversion for them. Personal risk factors include cognitive and intellectual impairment, poor mental health, and previous negative experiences (for Aboriginal and Torres Strait Islander young people or their families) with police. Structural risk factors include a lack of supports for children who are in out-of-home care or homeless, a lack of diversionary programs in rural and remote areas, and mandatory sentencing.
- For police services specifically, evidence suggests that race may be a factor in decisions to approach individuals before an offence has occurred. Past negative experiences between Aboriginal and Torres Strait Islander people and police may lead some Aboriginal and Torres Strait Islander young people to be less willing to cooperate, which would in turn contribute to lower rates of diversion.
- Increasing diversion rates for Aboriginal and Torres Strait Islander young people will involve addressing personal and structural risk factors and the way in which police deal with these young people. Diversionary programs and approaches to increasing diversion rates for Aboriginal and Torres Strait Islander young people need to be designed and implemented by (or with) Aboriginal and Torres Strait Islander people to be most beneficial.

¹² The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the Report.

Box 11.3.2 Measures of youth diversions

There is one main measure for this indicator. *Youth diversions* is defined as the proportion of all alleged young offenders who are diverted from court proceedings (that is, from the formal criminal justice system). These data do not include young people who are diverted by a court.

State and Territory governments are responsible for youth diversions (and table 11A.3.1 outlines the relevant legislation for each jurisdiction). Differences in programs and data collection mean that data are not comparable across jurisdictions.

The most recent available data are for 2018-19 (or the 2019 calendar year for some jurisdictions) (NSW, Victoria, Queensland, WA, SA, the NT and the ACT; sex). Data disaggregated by Indigenous status are not available for Tasmania.

Youth diversion programs are designed for young people with little or no history of offending who are alleged to have committed non-serious crimes. Diversion can prevent young people from entering the criminal justice system or getting a criminal record, and can also lead to lower rates of reoffending (particularly for minor offences) (Shirley 2017; Wang and Weatherburn 2019).

Diversion can save money and deliver better social outcomes (Shanahan, Hughes and McSweeney 2017). Diversion is also an opportunity to identify the many complex needs of each offender (such as family, behavioural and health problems including substance use), and to connect the alleged offender with services that will support young people.

Diversion can occur at any point following initial contact with police — pre-arrest, pre-trial, pre-sentence, post-sentence and pre-release. While ‘diversion’ describes any process that prevents young people from entering or continuing in the formal criminal justice system, it typically involves pre-court processes such as police cautioning or conferencing (Allard et al. 2010; Juodo 2008; Richards 2010).

Diversions with cautioning and conferencing are typically available to first time and non-serious offenders. Sufficient evidence to establish that an offence took place, an admission of guilt, and the young person’s consent to engage in the cautioning or conferencing process are all required for a diversion to occur (Allard et al. 2010).

While youth diversion data are not comparable across states and territories, some of the key findings are similar

Governing legislation and the scope of youth diversions differ significantly across states and territories (table 11A.3.1) — as do diversionary programs. Diversionary programs can include opportunities for the alleged young offender to take responsibility for their actions, understand the harm their actions have caused, engage in restorative justice, or receive case management and support. As a result, data for youth diversion are not comparable across states and territories. However, the key findings across states and territories are similar and include that:

-
- Aboriginal and Torres Strait Islander young people were less likely to be cautioned or diverted out of the criminal justice system than non-Indigenous young people. For the most recent year of reporting, rates of diversion were between two-fifths (39 per cent) and nine-tenths (88 per cent) of the rates for non-Indigenous young people (table 11A.3.2)
 - the diversion rates for both Aboriginal and Torres Strait Islander and non-Indigenous young people have fluctuated over time, but the average over the last four years (2015-16 to 2018-19) was lower or the same as for the previous four years (2011-12 to 2014-15) — this was the case for all jurisdictions except young people in SA and the NT, Aboriginal and Torres Strait Islander young people in WA, and non-Indigenous young people in NSW and the ACT, for whom diversion rates have gone up (table 11A.3.2)
 - the most common types of offence category for which both Aboriginal and Torres Strait Islander and non-Indigenous young people were diverted (broadly grouped according to crimes against the person, crimes against property, drug offences and other offences) were crimes against property or theft (tables 11A.3.5, 11A.3.8, 11A.3.25, 11A.3.39, 11A.3.41 and 11A.3.57), while the offence category for which diversion was least common for Aboriginal and Torres Strait Islander young people was drug offences.

Lower rates of diversion for Aboriginal and Torres Strait Islander young people could be one reason why they are overrepresented in the criminal justice system.

What factors affect the rates of youth diversions for Aboriginal and Torres Strait Islander young people?

A range of personal and structural risk factors affect the rates of diversion, and many of these disproportionately affect Aboriginal and Torres Strait Islander young people.

- Young people who are homeless or in out-of-home care are more likely to offend, and also more likely to experience custodial remand rather than diversion (McFarlane 2018; Sentencing Advisory Council 2020). (See section 4.11 *Substantiations for child abuse and neglect*.) Diversion may not be accessible for young people who are homeless or in out-of-home care if the diversion program requires participation by family members, such as in a family group conference, and the relationship with (or absence of) a caregiver does not provide the required level of support.
- Young people with cognitive or intellectual impairments or mental health issues are more likely than their peers to be arrested and less likely to be considered for diversion (Blagg, Tulich and Bush 2017). For many of these youth, diversionary programs are necessary to avoid indefinite detention when they are found unfit to stand trial (Blagg and Tulich 2018).
- Access to diversion programs can be limited in some rural and remote areas. The range of diversion options and referral processes differs across states and territories, and in some areas young people do not have access to diversion (Green et al. 2016). As a consequence of the lack of diversion programs in rural and remote areas, Aboriginal and

Torres Strait Islander young people may be more likely to be detained (Papalia et al. 2019).

- Mandatory sentencing means that options are limited if an alleged offender has committed a particular crime on several occasions. Mandatory sentencing will disproportionately affect Aboriginal and Torres Strait Islander offenders, as they are more likely to be charged for offences that have mandatory sentences attached (ALRC 2017).

Furthermore, youth diversion conferencing may be less effective in reducing recidivism for Aboriginal and Torres Strait Islander young people if not undertaken as part of a holistic approach. This is because restorative justice approaches (such as in youth diversion conferencing) tend to elicit accountability through ‘shaming’ but do not address the risk factors associated with youth offending, such as substance use and low socioeconomic status (Little, Stewart and Ryan 2018). However, there is little research that explores the effectiveness of youth diversion conferencing for Aboriginal and Torres Strait Islander young people.

The extent to which diversionary outcomes reflect institutional racism has not been evaluated. However, as it is primarily police who assess young people and determine their eligibility for pre-court diversion (Green et al. 2020), past negative experiences between Aboriginal and Torres Strait Islander people and police, compounded by policing practices that can be racialised (such as stop and search or move on powers where no offending behaviour is apparent) can mean that Aboriginal and Torres Strait Islander young people may feel harassed or threatened (Cunneen 2019). In these circumstances, these young people may be less willing to cooperate, and this can in turn prevent police from considering diversion as an option (Blagg and Anthony 2020; Papalia et al. 2019).

How can diversion rates for Aboriginal and Torres Islander young people be increased?

Given the factors leading to the lower rates of diversion outlined above, strategies for increasing the diversion rates for Aboriginal and Torres Strait Islander young people may include:

- designing and implementing diversion programs that address the particular needs of young people who are homeless or in out-of-home care, and at risk of transitioning to juvenile justice, so that they are not unfairly treated by the criminal justice system (see Barreng Moorop, for example, in JSS 2018)
- building the cultural competency of police in relating to Aboriginal and Torres Strait Islander young people (Coffin, Kennedy and Owen 2018), including that the policies relating to police practice are responsive to local communities and contexts (Fleming in Putt 2010, p. 4)
- providing families with Aboriginal and Torres Strait Islander children who are in or at risk of entering the criminal justice system with the support they need to interact with

and navigate the system (including accessible and culturally appropriate legal advice) (DHHS 2020).

Incorporating elements into youth diversion programs that address the risk factors for Aboriginal and Torres Strait Islander youth offending, such as illicit substance use, poor impulse control and childhood trauma, may increase the programs' effectiveness in reducing repeat offending (Little, Stewart and Ryan 2018). And more evaluation of programs to assess their effectiveness is needed.

To ensure that youth diversion programs or approaches for Aboriginal and Torres Strait Islander young people are as beneficial as possible, they need to be designed and implemented by (or with) Aboriginal and Torres Strait Islander people (Blagg, Tulich and Bush 2017).

Future directions in data

Nationally comparable and complete data on youth diversions are not available, and have not been available over the two decades of this Report. Whilst data are collected on alleged offenders in the ABS Recorded Crime Offenders collection, the data quality for diversions by Indigenous status is currently not sufficient for national reporting purposes.

To assist in explaining the differences in diversion rates between Aboriginal and Torres Strait Islander and non-Indigenous youth, information is also required on why alleged offenders were denied diversion (for example, not meeting eligibility criteria, unavailability of diversion programs and/or declining to participate in diversion).

11.4 Repeat offending¹³

Box 11.4.1 Key messages

- While most Aboriginal and Torres Strait Islander people do not have contact with the justice system, the higher rates of incarceration among Aboriginal and Torres Strait Islander people compared to non-Indigenous people are strongly linked to higher rates of repeat offending.
- Aboriginal and Torres Strait Islander youth enter the criminal justice system at a younger age than non-Indigenous youth, which is a factor in their rates of return.
- Of all young people under sentenced supervision in 2018-19 and for whom their first supervision was at 10–13 years of age, 70 per cent were Aboriginal and Torres Strait Islander. Over the period 2000-01 to 2018-19, 55 per cent of Aboriginal and Torres Strait Islander young people in sentenced supervision had more than one supervised sentence, compared to 34 per cent for non-Indigenous young people.
- The proportions of adult prisoners with prior adult imprisonment have increased for both Aboriginal and Torres Strait Islander and non-Indigenous prisoners. In 2019, 78 per cent of Aboriginal and Torres Strait Islanders prisoners had known prior adult imprisonment compared to 50 per cent of non-Indigenous prisoners, a ratio of 1.5 that has remained relatively unchanged for the last 20 years.
- Risk factors that disproportionately affect Aboriginal and Torres Strait Islander people relative to non-Indigenous people and contribute to their overrepresentation in return to supervision and re-incarceration include:
 - experience prior to prison
 - ... the higher prevalence of personal and situational risk factors for offending behaviours such as unstable housing, substance abuse and involvement with child protection services
 - ... institution and structural risk factors, from within and outside the criminal justice system
 - prison-life and post-prison experiences
 - ... limited culturally safe prison programs to address offending behaviours (including through healing past traumas)
 - ... lack of support services to facilitate transition back into the community on release.
- For prisons, there is evidence that re-incarceration of Aboriginal and Torres Strait Islander prisoners may be reduced through prison-provided support programs that are accessible, culturally safe, trauma-informed and:
 - have been developed and delivered by Aboriginal and Torres Strait Islander people
 - extend beyond the prison environment to combine with health, legal and family support services.
- Enabling prisoners to remain connected with their community while in prison, such as through prison visits, can also reduce the risk of re-offending and re-incarceration.

¹³ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the Report.

Box 11.4.2 Measures of repeat offending

There is currently no systematic national definition and data collection of repeat offending. The data for this section focuses on the re-incarceration aspect of repeat offending. There are two main measures for this indicator:

- *Adult re-incarceration* is defined as the proportion of prisoners currently under sentence with known prior adult imprisonment
- *Youth returns to sentenced supervision* is defined as the proportion of young people who return to sentenced supervision.

The most recent available data for prior adult imprisonment under sentence are from the ABS Prisoners in Australia collection for 30 June 2019 (all jurisdictions; sex). The most recent available data for young people returning to sentenced youth justice supervision are from the AIHW's Juvenile Justice National Minimum Dataset 2018-19 (national).

A supplementary measure of the proportion of offenders who were proceeded against by police is also reported (NSW, Queensland, SA, ACT and the NT; age; sex).

Repeat offending, or recidivism, refers to repetitious criminal activity. Repeat offending is difficult to measure accurately, as offences are not always detected or recorded by police, and court convictions do not necessarily result in contact with corrective services. Consequently, repeat offending is often defined as re-apprehension (in relation to police), re-conviction (in relation to courts) or re-incarceration (in relation to youth detention and adult imprisonment).

While most Aboriginal and Torres Strait Islander people do not come into contact with the justice system, the small proportion who do contribute significantly to the overrepresentation of Aboriginal and Torres Strait Islander people in the criminal justice system due to the high rates of repeat offending (AIHW & AIFS 2013; Snowball and Weatherburn 2006). Aboriginal and Torres Strait Islander youth are incarcerated at about 22 times the rate of non-Indigenous youth, and for adults it is about 12 times the rate of non-Indigenous adults (section 4.13 *Imprisonment and youth detention*).

Reducing re-incarceration is particularly important as prison has a significant impact on the lives of those who experience it, their families and communities. While imprisonment leads to social exclusion of people from their communities, repeat imprisonment further exacerbates this (Schwartz 2010), and the disadvantage ex-prisoners and their families often already experience. Their ongoing absence affects the family's ability to function without a breadwinner, without a parent or carer, and the role they had in the wider community.

While these issues are not unique to Aboriginal and Torres Strait Islander people they disproportionately affect them, as they combine with the other disadvantages they experience (at a greater rate than non-Indigenous people). Incarceration is a stronger predictor of the risk of future incarceration for Aboriginal and Torres Strait Islander people than it is for non-Indigenous people (Ryan et al. 2019; Wundersitz 2010).

Aboriginal and Torres Strait Islander youth enter the criminal justice system at a younger age than non-Indigenous youth, which is factor in their return

People first enter the justice system when they are investigated by police for allegedly committing an offence. At this time, police can warn the alleged offender, or they may be proceeded against via court or non-court actions. An offender can be proceeded against by police¹⁴ multiple times during a given period.

Aboriginal and Torres Strait Islander young offenders are proceeded against by police at a younger age than non-Indigenous offenders. In 2018-19 for jurisdictions with available data, the ratio of Aboriginal and Torres Strait Islander to non-Indigenous young offenders aged 10–14 years who were proceeded against varied. In the ACT, the rates were similar, and in the NT the rate of Aboriginal and Torres Strait Islander young offenders aged 10–14 years who were proceeded against was five times the rate of non-Indigenous young offenders (table 11A.4.6). Research indicates some level of structural and institutional racism and bias (unconscious or otherwise) in Australian police services (Dwyer 2018; Harvey 2012; OPI 2011) which may explain some of the disparity between rates of being proceeded against by police for Aboriginal and Torres Strait Islander and non-Indigenous people.

Consistent with the age difference above for police apprehensions, Aboriginal and Torres Strait Islander young people enter their first period of sentenced supervision (detention or community-based supervision) at a younger age than non-Indigenous young people¹⁵. In 2018-19, of those under sentenced supervision, 70 per cent of those whose first supervision was at ages 10–13 years were Aboriginal and Torres Strait Islander youth (AIHW 2020b).

The younger the age, the greater the proportion returning to sentenced supervision. Of sentenced children aged 10–12 years, 90 per cent of those whose first sentence was community-based returned to sentenced supervision, and 94 per cent of those whose first sentence was detention returned to sentenced supervision before the age of 18 years (AIHW 2020a). So, unsurprisingly, the rate of return to sentenced supervision is higher for Aboriginal and Torres Strait Islander youth compared to non-Indigenous youth. From 2000-01 to 2018-19, 55 per cent of Aboriginal and Torres Strait Islander young people in sentenced supervision had more than one supervised sentence, compared to 34 per cent for non-Indigenous young people (table 11A.4.3).

Within a 12-month period, the rate of return to detention is within six percentage points for Aboriginal and Torres Strait Islander youth and non-Indigenous youth (79 per cent and 75 per cent respectively for detainees returning 12 months after release in 2017-18, and 35 and 30 per cent for those released from community-based supervision) (table 11A.4.4).

¹⁴ The method of proceeding is the type of legal action (court or non-court) initiated by police against a person as a result of an investigation of an offence.

¹⁵ Sentenced supervision refers to both detention and community-based supervision. This is referenced here rather than the subset of detention as almost all first sentences are community-based, for both Aboriginal and Torres Strait Islander and non-Indigenous youth (AIHW 2019).

Aboriginal and Torres Strait Islander adult prisoners have higher rates of prior imprisonment compared with non-Indigenous prisoners

In 2018-19 for jurisdictions with available data, 38 to 50 per cent of Aboriginal and Torres Strait Islander offenders were proceeded against by police on more than one occasion, compared with 16 to 34 per cent of non-Indigenous offenders (table 11A.4.5). (While available data on the number of times an offender was proceeded against does not include their age, the data reported by age (table 11A.4.6) shows that around 80 per cent of offenders proceeded against were aged 20 years or over, indicating that the all age population is sufficiently representative of the adult population.)

At 30 June 2019, 78 per cent of Aboriginal and Torres Strait Islander adult prisoners nationally had a known prior adult imprisonment. This proportion has changed little over the past 20 years (table 11A.4.1). Having a known prior imprisonment can significantly increase the risk of further incarceration, by up to 2.7 times that of a first-time prisoner (Ryan et al. 2019). Aboriginal and Torres Strait Islander prisoners are more likely than non-Indigenous prisoners to have been in prison before. At 30 June 2019, the proportion of Aboriginal and Torres Strait Islander prisoners with prior imprisonment was 1.5 times the proportion for non-Indigenous prisoners. This ratio has remained relatively constant over the past 20 years.

National data are not available by Indigenous status on the proportion of adults who leave prison and are re-incarcerated (the above data relate to only those re-incarcerated). However, a study of Queensland adult ex-prisoners found a similar gap in re-incarceration rates across Aboriginal and Torres Strait Islander and non-Indigenous ex-prisoners (Ryan et al. 2019).

Why are rates of return to the criminal justice system higher for Aboriginal and Torres Strait Islander offenders than for non-Indigenous offenders?

Higher rates of repeat offending, as measured by repeat police apprehension, return to supervision or return to prison, for Aboriginal and Torres Strait Islander people are in part due to the reasons they are more likely to be incarcerated in the first place (see section 4.13 *Imprisonment and youth detention*), including:

- higher prevalence of personal and situational risk factors – these factors include younger age profile (younger people have a higher risk of incarceration), cognitive impairment (offenders with cognitive impairment are almost three times as likely to reoffend than those without) (Shepherd et al. 2017), unstable housing, substance abuse, family problems, child protection involvement, peer delinquency and school related problems (Lind 2011; Ringland, Weatherburn and Poynton 2015; Ryan et al. 2020; Shepherd et al. 2017)
- structural and systemic issues — such as the lack of access to affordable justice services, lack of access to secure accommodation that is a disadvantage when applying for bail,

and lack of non-custodial sentencing options in some areas, which all disproportionately affect Aboriginal and Torres Strait Islander people (ALRC 2017; Schwartz 2010).

These higher rates for Aboriginal and Torres Strait Islander offenders can also be explained in part by their treatment in prisons and on their release. The prison environment (the social, emotional, organizational and physical characteristics of a correctional institution) can support or hinder a prisoners' rehabilitation and reduce re-offending (Hall and Chong 2018) or they may be mistreated and, in the worst case, die (Commonwealth of Australia 2017; RCADIC 1991). While Australian prisons are well equipped to meet the non-criminogenic needs of most offenders, they may be less well equipped to support prisoners with other needs that are associated with re-offending and which are more likely to affect Aboriginal and Torres Strait Islander prisoners, including:

- psychological distress and mental health disorders (including healing for past trauma)
- substance abuse
- poor treatment adherence and threatening behaviours (Ryan et al. 2019; Shepherd et al. 2018; Shepherd, Ogloff and Thomas 2016).

Enabling prisoners to remain connected with their community while in prison, such as through prison visits, can also reduce the risk of re-offending and re-incarceration (Lafferty et al. 2016; Ryan et al. 2020). It is particularly important for Aboriginal and Torres Strait Islander young people as connection with community is a key part of their culture and healing (Government of South Australia 2020), and due to other factors the connection may be more difficult to maintain. For example, the more times a prisoner has been incarcerated, the less likely they are to be visited, and travel distance also decreases the likelihood of visitation. For these, and other reasons, Aboriginal and Torres Strait Islander people may be unable to maintain their community connections as readily as they would have outside of prison or to the same extent as non-Indigenous people (Ryan et al. 2020).

The lack of suitable support available for ex-offenders to re-integrate them back into community is also a factor in re-offending (Abbott et al. 2018; Standing Committee on Social Issues 2008) and these supports are likely to be needed by Aboriginal and Torres Strait Islander people more than non-Indigenous people, due to their pre-existing disadvantage. For example, suitable housing and employment are vital factors in social re-integration — people leaving prison may experience distrust by employers and rental agents (Baldry et al. 2006; Dawes et al. 2017; Ryan et al. 2019, 2020), and if this disadvantage is overlaid with racism they will have great difficulties finding employment and housing. Common reasons for Aboriginal and Torres Strait Islander prisoners returning to custody, in addition to breaching parole conditions, are unsupported health needs, lack of employment, lack of housing, substance abuse and domestic violence (Apted, Hew and Sinha 2013; Shepherd, Ogloff and Thomas 2016).

How can the cycle of reoffending and return to custody be broken for Aboriginal and Torres Strait Islander people?

Along with addressing the personal, structural and systemic risk factors that lead Aboriginal and Torres Strait Islander people to enter detention (prison) or supervision more regularly than non-Indigenous people in the first place (see section 4.13 *Imprisonment and youth detention*), the keys to reducing the overrepresentation of Aboriginal and Torres Strait Islander people in detention (prison), are by focussing on:

- rehabilitation (including healing for childhood trauma) while they are in prison
- including prisoners on remand in programs
- helping them integrate back into their communities.

In contrast to the factors that lead to supervision, incarceration (see section 4.13 *Imprisonment and youth detention*) and re-incarceration, a range of protective factors can influence the experience of Aboriginal and Torres Strait Islander prisoners in custody and their prospects when they are released. If programs are provided in prison or youth detention, that effectively address offending behaviours (including through addressing childhood trauma), rehabilitate, support and prepare people for release, the risk of repeat offending may be reduced — for example, programs that address mental health disorders and cognitive impairment and meet their complex support needs (McCausland, McEntyre and Baldry 2017). These programs need to be accessible, trauma-informed, culturally safe, developed and delivered by Aboriginal and Torres Strait Islander people, extend beyond the prison environment, and be combined with strong health, legal and family support services (ALRC 2017; Ryan et al. 2019; Shepherd, Ogloff and Thomas 2016).

Further work is needed to understand which programs will best support the wellbeing of Aboriginal and Torres Strait Islander people in prison. A recent systematic review of colonised countries (including Australia) found a lack of quality evidence on what works in prisons, noting ‘there is a moral, social and practical imperative to build a strong evidence base on this topic’ (Perdacher, Kavanagh and Sheffield 2019). However, the study did note that despite the limited evidence, culturally-based interventions delivered or supported by indigenous facilitators appeared to have potential for increased recovery from trauma, reduced alcohol-related problems and lower reoffending.

For Aboriginal and Torres Strait Islander people leaving prison, culturally safe programs to re-integrate them into community are also important (Dawes and Davidson 2019) as are programs that are accessible and timely and which address the living experience of those about to leave prison (Sheehan 2019). Seeking solutions to criminal offending outside the penal system, supporting and strengthening communities to address the social and economic causes of crime and considering alternatives to imprisonment for minor offences (Schwartz 2010) are also key to breaking the cycle of repeat offending, and justice reinvestment may also be a way of doing this (Dawes and Davidson 2019). Other approaches are discussed in section 4.13 *Imprisonment and youth detention*.

Future directions in data

The Australian Bureau of Statistics is working with corrective services agencies to explore ways to improve adult prisoner flow data to build a more accurate picture of incarceration.

The data for adults and youth are not directly comparable, as data for adults are limited in scope to those that have returned to prison. Data on the proportion of adult prisoners who are released and returned to prison or community corrections within two years of release (sourced from corrective services agencies) are available, but the data are not disaggregated by Indigenous status. This disaggregation would provide a useful comparison with youth detention data.

11.5 Community functioning¹⁶

Box 11.5.1 Key messages

- Community functioning is defined in the Aboriginal and Torres Strait Islander Health Performance Framework (ATSIHPF) as the ability and freedom of community members and communities to determine the context of their lives and to translate their capabilities into positive actions towards a valued life.
- Research shows that community functioning is strongly associated with individual wellbeing and that individuals with high levels of connectedness, resilience and safety were more likely to be satisfied with their life, and to be generally happier.
- Themes important to community functioning are: connectedness to Country, lands and history, culture and identity; resilience; leadership; having a role, structure and routine; feeling safe; and vitality. Whilst there is no overall measure of community functioning, considering outcomes across the six themes builds an overall picture.
- Aboriginal and Torres Strait Islander people's understandings of community and community functioning may differ from Western or policy-centred understandings which are confined to a geographic area. Rather, their understandings of 'community' may be defined in terms of the metaphysical, geophysical or biophysical, and across generations.

Box 11.5.2 Measures of community functioning

There is no main measure for this indicator. Community functioning is a complex concept and includes analysis of a range of factors. Descriptors and findings are reported for:

- the six themes of community functioning
- selected variables contributing to each community functioning theme.

Themes and findings are drawn from the work undertaken for the Australian Health Ministers' Advisory Council Aboriginal and Torres Strait Islander Health Performance Framework (ATSIHPF). There are no new data available for this report. The most recent available data are from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) for 2014-15 (national; remoteness).

Community functioning, in the Aboriginal and Torres Strait Islander Health Performance Framework (ATSIHPF), is defined as 'the ability and freedom of community members and communities to determine the context of their lives and to translate capability into action' (AHMAC 2017). The conversion of capabilities into functioning is influenced by the values, and personal characteristics of individuals, along with families and communities, and the environments in which they live. Different cultures will give greater or lesser priority to different aspects of functioning, and Aboriginal and Torres Strait Islander people's understandings of community, and community functioning may differ from Western

¹⁶ The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the Report.

understandings which are service or policy-oriented (Taylor et al. 2011). For example, Aboriginal and Torres Strait Islander people's understandings of community may not be place-based or confined to a geographic area but, instead, be defined in terms of the metaphysical, geophysical or biophysical, and across generations; identities that are made up of the land-sea-spirit, cultures, and people (Taylor et al. 2011).

Workshops led by Aboriginal facilitators, on behalf of the work program for the ATSIHPF report, developed the concept of community functioning with Aboriginal and Torres Strait Islander people in 2008 and 2010. Participants identified a number of key themes and weighted these according to their relative value (table 11.5.1). The multiple constructs, in combination, build an overall picture of community functioning for Aboriginal and Torres Strait Islander people. The information presented here aligns with that in the ATSIHPF report.

Research shows that community functioning is strongly associated with individual wellbeing, and that individuals with high levels of connectedness, resilience and safety were more likely to be satisfied with their life, and to be generally happier (Biddle 2017).

Findings for community functioning themes

A summary of key findings using data from the 2014-15 NATSISS, which is an individual-level survey, is outlined for each community functioning theme. Further survey results of selected variables contributing to community functioning themes are available in table 11A.5.1, with 2002 and 2008 data reported where comparable. Data by remoteness areas are in tables 11A.5.2–4 for 2014-15 and tables 11A.5.5-6 for 2008.

Connectedness to Country, lands and history, culture and identity

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 74 per cent recognised their traditional lands, similar to 72 per cent in 2008. A higher proportion of Aboriginal and Torres Strait Islander people in remote (84 per cent) and very remote (91 per cent) areas recognised their traditional lands compared with those in major cities (67 per cent)
- 62 per cent identified with a clan or language group, similar to in 2008
- 95 per cent had contact with family or friends outside the household at least once per week (similar to 2008) and 82 per cent had friends to confide in
- 90 per cent felt able to have a say with family and friends, some or more of the time. The proportion of Aboriginal and Torres Strait Islander people who felt able to have a say ranged from 91 per cent in major cities to 84 per cent in very remote areas (tables 11A.5.1–2).

Refer to sections 5.1 *Valuing Aboriginal and Torres Strait Islander people and their cultures*, 5.7 *Participation in community activities* and 5.8 *Access to traditional lands and waters* for further information.

Table 11.5.1 Themes contributing to community functioning

| <i>Measure of functioning/ Weight (per cent)</i> | <i>Descriptor</i> |
|---|--|
| Connectedness to country, land and history, culture and identity (25 per cent) | <ul style="list-style-type: none"> • Being connected to country, land, family and spirit • Strong and positive social networks with Aboriginal and Torres Strait Islander Australians • Strong sense of identity and being part of a collective (knowing where you are from, who is your family) • Sharing; giving and receiving; trust; love; looking out for others • Engaged/communicative |
| Resilience (20 per cent) | <ul style="list-style-type: none"> • Coping with the internal and external world • Power to control choices and options • Ability to proceed in public without shame • Optimising what you have • Challenge injustice and racism, stand up when required • Cope well with difference, flexibility and accommodating • Ability to walk in two worlds • Engaged in decision making • External social contacts |
| Leadership (20 per cent) | <ul style="list-style-type: none"> • Strong elders in family and community, both male and female • Role models, both male and female • Strong direction, vision • The 'rock', someone who has time to listen and advise |
| Having a role, structure and routine (15 per cent) | <ul style="list-style-type: none"> • Having a role for self: participation, contributing through paid and unpaid roles • Capabilities and skills derived through social structures and experience through non formal education • Knowing boundaries and acceptable behaviours • Sense of place — knowing your place in family and society • Being valued and acknowledged • Disciplined |
| Feeling safe (10 per cent) | <ul style="list-style-type: none"> • Lack of physical and lateral violence • Safe places • Emotional security • Cultural competency • Relationships that can sustain disagreement |

Resilience

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 86 per cent did not avoid situations due to past unfair treatment
- 89 per cent felt they were able to find general support from outside the household
- 59 per cent had provided support to someone outside their household in the last month
- 81 per cent agreed that their doctor could be trusted, and 70 per cent agreed that the local school could be trusted. A higher proportion of Aboriginal and Torres Strait Islander people in remote areas (73 per cent) and very remote areas (82 per cent) had trust in their local school, compared with people in major cities (68 per cent). There were no significant differences for trust in doctors across regions
- 20 per cent had involvement with an Aboriginal or Torres Strait Islander organisation, similar to in 2008
- 97 per cent of adults participated in sport/social/community activities in the past 12 months (tables 11A.5.1-2).

Refer to sections 5.1 *Valuing Aboriginal and Torres Strait Islander people and their cultures* and 5.7 *Participation in community activities* for further information.

Leadership

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 44 per cent of children aged 4–14 years had spent time with an Aboriginal or Torres Strait Islander leader or elder in the last week (table 11A.5.1).

Refer to section 5.4 *Case studies in governance* for further general information on leadership and governance.

Having a role, structure and routine

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 77 per cent had lived in only one dwelling in the last 12 months or longer
- 96 per cent of children aged 0–14 years had participated in informal learning activities with their main carer in the last week (table 11A.5.1).

Feeling safe

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 78 per cent had not experienced physical and/or threatened violence in the last 12 months, similar to 2008

-
- 84 per cent felt safe at home alone after dark
 - 54 per cent of children aged 2–14 years were taught Indigenous cultures at school
 - 97 per cent had not been incarcerated in the last five years (and 91 per cent had never been incarcerated in their lifetime) (table 11A.5.1).

Vitality

Nationally, in 2014-15, for Aboriginal and Torres Strait Islander people:

- 55 per cent had no disability or (restrictive) long-term health condition
- 66 per cent had a low/moderate level of psychological distress
- 72 per cent lived in a dwelling that had no major structural problems
- 75 per cent could easily get to places needed, similar to in 2008 (table 11A.5.1).

Refer to sections 4.3 *Early childhood education*, 4.4 *Reading, writing and numeracy*, 4.6 *Year 12 attainment*, 4.7 *Employment*, 4.8 *Post-secondary education*, 4.9 *Disability and chronic disease*, 4.10 *Household and individual income*, 5.3 *Engagement of services* and chapter 8 *Healthy lives* for further information on factors connected to vitality.

Future directions in data

The Mayi Kuwayu Study is a relatively new longitudinal data set that explores how the health and wellbeing of Aboriginal and Torres Strait Islander people is linked to connection to Country, cultural practices, spirituality and language use. Research using this data set is not yet available, but may quantify the associations and pathways between cultural practice and expression, social determinants of health, health behaviours, and health and wellbeing outcomes for Aboriginal and Torres Strait Islander people.

- (a) The 2009 NHMRC guidelines advise that on a single occasion of drinking, the risk of alcohol-related injury increases with the amount consumed. For healthy men and women, 'drinking no more than four standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion'. A single occasion of drinking refers to a person consuming a sequence of drinks without their blood alcohol concentration reaching zero in-between. The 2009 National Health and Medical Research Council (NHMRC) guidelines for reducing health risks associated with the consumption of alcohol state that, for healthy men and women, 'drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury'.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Estimates of proportions with a 95 per cent confidence interval that is plus or minus 10 percentage points or above (or whose interval includes 0 per cent or 100 per cent) should be used with caution.
- (d) No alcohol consumed in previous 12 months (including never consumed alcohol).
- (e) Based on responses to questions in 2018-19 NATSIHS about frequency of consumption of specified number of drinks in previous year. The number of drinks was based on the NHMRC guidelines for exceeding single occasion risk guidelines for alcohol consumption for males and females. Includes people who did not remember when they last consumed alcohol. Data excludes people who exceeded the guidelines in the last 12 months, but could not recall how often. Data are directly comparable with single occasion risk by frequency data from the 2012-13 NATSIHS and 2011-12 NHS, published in the 2012-13 NIRA performance report.
- (f) Persons who exceeded single occasion risk guidelines less than once a week in the previous 12 months.
- (g) Persons who exceeded single occasion risk guidelines at least once a week in the previous 12 months.
- (h) Persons who exceeded single occasion risk guidelines on at least one occasion in the previous 12 months.

TABLE 11A.1.1

Table 11A.1.1 Alcohol risk levels, Aboriginal and Torres Strait Islander persons (aged 18 years or over), by state and territory, 2012-13 and 2018-19 (crude rates) (a), (b), (c)

|-----|---|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (i) | Lifetime risk has been operationalised for data collection purposes as: for both males and females, an average of more than 2 standard drinks per day in the last week, that is total alcohol consumption divided by the number of days to determine average per day. Note consumption based on week before the interview, does not take into account whether consumption in that week was more, less or the same as usual. | | | | | | | | | |

- (a) The 2009 NHMRC guidelines advise that on a single occasion of drinking, the risk of alcohol-related injury increases with the amount consumed. For healthy men and women, 'drinking no more than four standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion'. A single occasion of drinking refers to a person consuming a sequence of drinks without their blood alcohol concentration reaching zero in-between. The 2009 National Health and Medical Research Council (NHMRC) guidelines for reducing health risks associated with the consumption of alcohol state that, for healthy men and women, 'drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury'.
- (b) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.
- (c) Estimates of proportions with a 95 per cent confidence interval that is plus or minus 10 percentage points or above or whose interval includes 0 per cent or 100 per cent, should be used with caution. Estimates with a 95 per cent confidence interval that is not published (that is, cells with '**') have numerators with RSEs greater than 50 per cent and therefore these rates are considered too unreliable for general use.

Table 11A.1.2 Alcohol risk levels, Aboriginal and Torres Strait Islander persons (aged 18 years or over), by state and territory, by remoteness, 2012-13 and 2018-19 (crude rates) (a), (b), (c), (d)

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----|--|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (d) | The 2018-19 NATSIHS sample frame excluded households from Remote areas in Victoria, Very remote areas in Tasmania, and Inner regional areas in the ACT. | | | | | | | | | |
| (e) | No alcohol consumed in previous 12 months (including never consumed alcohol). | | | | | | | | | |
| (f) | The number of drinks was based on the NHMRC guidelines for exceeding single occasion risk guidelines for alcohol consumption for males and females. Includes people who did not remember when they last consumed alcohol. Data includes people who exceeded the guidelines in the last 12 months, but could not recall how often. Data are not directly comparable with single occasion risk by remoteness data from the 2012-13 NATSIHS and 2011-12 NHS, published in the 2012-13 NIRA performance report, which excluded people who exceeded the guidelines, but could not recall how often. | | | | | | | | | |
| (g) | Lifetime risk has been operationalised for data collection purposes as: for both males and females, an average of more than 2 standard drinks per day in the last week, that is total alcohol consumption divided by the number of days to determine average per day. Note consumption based on week before the interview, does not take into account whether consumption in that week was more, less or the same as usual. | | | | | | | | | |

(a) Rates are age-standardised to the 2001 population.

Table 11A.1.3 Alcohol risk levels of persons (aged 18 years or over), by Indigenous status, by state and territory, 2011–13 and 2017–19 (age-standardised) (a), (b), (c), (d), (e), (f), (g)

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|---|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| <p>(b) The 2009 NHMRC guidelines advise that on a single occasion of drinking, the risk of alcohol-related injury increases with the amount consumed. For healthy men and women, 'drinking no more than four standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion'. A single occasion of drinking refers to a person consuming a sequence of drinks without their blood alcohol concentration reaching zero in-between. The 2009 National Health and Medical Research Council (NHMRC) guidelines for reducing health risks associated with the consumption of alcohol state that, for healthy men and women, 'drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury'.</p> <p>(c) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.</p> <p>(d) Estimates of proportions with a 95 per cent confidence interval that is plus or minus 10 percentage points or above (or whose interval includes 0 per cent or 100 per cent) should be used with caution.</p> <p>(e) Data for Aboriginal and Torres Strait Islander people are from the NATSIHS.</p> <p>(f) Data for non-Indigenous people are from the NHS, sourced through published comparator data in the NATSIHS.</p> <p>(g) For the 2017-18 NHS and 2018-19 NATSIHS, the 95 per cent confidence intervals and RSEs for the aged standardised rates are those for the associated crude rates.</p> <p>(h) No alcohol consumed in previous 12 months (including never consumed alcohol).</p> <p>(i) Based on responses to questions in 2018-19 NATSIHS about frequency of consumption of specified number of drinks in previous year. The number of drinks was based on the NHMRC guidelines for exceeding single occasion risk guidelines for alcohol consumption for males and females. Includes people who did not remember when they last consumed alcohol. Data excludes people who exceeded the guidelines in the last 12 months, but could not recall how often. Data are directly comparable with single occasion risk by frequency data from the 2012-13 NATSIHS and 2011-12 NHS, published in the 2012-13 NIRA performance report.</p> <p>(j) Persons who exceeded single occasion risk guidelines less than once a week in the previous 12 months.</p> <p>(k) Persons who exceeded single occasion risk guidelines at least once a week in the previous 12 months.</p> <p>(l) Persons who exceeded single occasion risk guidelines on at least one occasion in the previous 12 months.</p> <p>(m) Lifetime risk has been operationalised for data collection purposes as: for both males and females, an average of more than 2 standard drinks per day in the last week, that is total alcohol consumption divided by the number of days to determine average per day. Note consumption based on week before the interview, does not take into account whether consumption in that week was more, less or the same as usual.</p> <p>(n) Estimates are crude rates</p> | | | | | | | | | | |

Table 11A.1.3 Alcohol risk levels of persons (aged 18 years or over), by Indigenous status, by state and territory, 2011–13 and 2017–19 (age-standardised) (a), (b), (c), (d), (e), (f), (g)

|--|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
|--|-------------|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|

(o) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander proportion divided by the age-standardised non-Indigenous proportion.

(p) Rate difference is the age-standardised Aboriginal and Torres Strait Islander proportion less the age-standardised non-Indigenous proportion.

– Nil or rounded to zero.

(a) Rates are age-standardised to the 2001 population.

(b) The 2009 NHMRC guidelines advise that on a single occasion of drinking, the risk of alcohol-related injury increases with the amount consumed. For healthy men and women, 'drinking no more than four standard drinks on a single occasion reduces the risk of alcohol-related injury arising from that occasion'. A single occasion of drinking refers to a person consuming a sequence of drinks without their blood alcohol concentration reaching zero in-between. The 2009 National Health and Medical Research Council (NHMRC) guidelines for reducing health risks associated with the consumption of alcohol state that, for healthy men and women, 'drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury'.

(c) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(d) Estimates of proportions with a 95 per cent confidence interval that is plus or minus 10 percentage points or above or whose interval includes 0 per cent or 100 per cent, should be used with caution. Estimates with a 95 per cent confidence interval that is not published (that is, cells with '**') have numerators with RSEs greater than 50 per cent and therefore these rates are considered too unreliable for general use.

(e) Data for Aboriginal and Torres Strait Islander people are from the NATSIHS. The 2018-19 NATSIHS sample frame excluded households from Remote areas in Victoria, Very remote areas in Tasmania, and Inner regional areas in the ACT.

Table 11A.1.4 **Alcohol risk levels of persons (aged 18 years or over), by Indigenous status, by state and territory, by remoteness, 2011–13 and 2017–19 (age-standardised) (a), (b), (c), (d), (e), (f), (g)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----|--|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (f) | Data for non-Indigenous people are from the NHS, sourced through published comparator data in the NATSIHS. Non-Indigenous data for Outer regional and Remote areas by state and territory has been combined as data quality is not sufficient to support separate reporting of these remoteness categories. The NHS scope exclude households from Very remote areas. | | | | | | | | | |
| (g) | For the 2017-18 NHS and 2018-19 NATSIHS, the 95 per cent confidence intervals and RSEs for the aged standardised rates are those for the associated crude rates. | | | | | | | | | |
| (h) | No alcohol consumed in previous 12 months (including never consumed alcohol). | | | | | | | | | |
| (i) | The number of drinks was based on the NHMRC guidelines for exceeding single occasion risk guidelines for alcohol consumption for males and females. Includes people who did not remember when they last consumed alcohol. Data includes people who exceeded the guidelines in the last 12 months, but could not recall how often. Data are not directly comparable with single occasion risk by remoteness data from the 2012-13 NATSIHS and 2011-12 NHS, published in the 2012-13 NIRA performance report, which excluded people who exceeded the guidelines, but could not recall how often. | | | | | | | | | |
| (j) | Lifetime risk has been operationalised for data collection purposes as: for both males and females, an average of more than 2 standard drinks per day in the last week, that is total alcohol consumption divided by the number of days to determine average per day. Note consumption based on week before the interview, does not take into account whether consumption in that week was more, less or the same as usual. | | | | | | | | | |

(a) In 2018-19 NATSIHS, Abstained is defined as those who last consumed alcohol 12 months or more or never consumed alcohol. In NATSISS, Abstained is defined as those who did not drink alcohol in the previous 12 months or persons who never consumed. Data are not comparable between NATSISS and NATSIHS.

(b) Risk level calculated on exceeding the NHMRC Australian Alcohol Guidelines 2009. For short-term/single occasion risk this is 5 or more standard drinks on any day over last 2 weeks. Guideline 2: For healthy men and women, drinking no more than four standard drinks on a single occasion reduces the risk of alcohol related injury arising from that occasion.

(c) Risk level calculated on exceeding the NHMRC Australian Alcohol Guidelines 2009. For lifetime risk this is more than 2 standard drinks on any day. Guideline 1: For healthy men and women, drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury. Data are not comparable between NATSISS and NATSIHS.

Note: NATSISS 2014-15 total population excludes not stated responses. NATSIHS 2018-19 total population includes time since last consumed alcohol not known.

np Not published.

Note: 2017-18 NHS data have been sourced by the Productivity Commission from TableBuilder.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Data exclude not stated responses.

(c) Abstained is defined as those who last consumed 12 months or more ago, or never consumed. This is based on the 2009 National Health and Medical Research Council (NHMRC) alcohol guidelines. For more information see 4715.0 NATSIHS Assessing health risk factors (appendix).

Table 11A.1.8 **Alcohol risk levels, Aboriginal and Torres Strait Islander persons (15 years or over), by sex, 2002, 2008 and 2014-15 (crude rates) (a), (b)**

| Unit | Males | | | Females | | | Persons | | |
|------|-------|------|---------|---------|------|---------|---------|------|---------|
| | 2002 | 2008 | 2014-15 | 2002 | 2008 | 2014-15 | 2002 | 2008 | 2014-15 |

- (d) Risk level calculated on exceeding the National Health and Medical Research Council (NHMRC) Australian Alcohol Guidelines 2009. For short-term/single occasion risk this is 5 or more standard drinks on any day over last 2 weeks. Guideline 2: For healthy men and women, drinking no more than four standard drinks on a single occasion reduces the risk of alcohol related injury arising from that occasion.
- (e) Risk level calculated on exceeding the NHMRC Australian Alcohol Guidelines 2009. For lifetime risk this is more than 2 standard drinks on any day. Guideline 1: For healthy men and women, drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury.

| Exceeded lifetime risk guidelines (e) | % | 3.9 | 3.3 | 3.5 | 3.2 | 7.1 | 2.9 | 4.2 | 4.5 | 1.7 |

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution; estimates with a relative standard error greater than 50 per cent (reported as np) are considered too unreliable for general use.

(b) Data exclude not stated responses.

(c) Abstained is defined as those who did not drink alcohol in the previous 12 months or persons who drink one day a year or less.

Table 11A.1.12 **Alcohol risk levels, Aboriginal and Torres Strait Islander persons (15 years or over), by state and territory, 2002, 2008, 2014-15 (crude rates) (a), (b)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT</i> | <i>NT</i> | <i>Aust</i> |
|-----|--|------------|------------|------------|-----------|-----------|------------|------------|-----------|-------------|
| (d) | Risk level calculated on exceeding the National Health and Medical Research Council (NHMRC) Australian Alcohol Guidelines 2009. For short-term/single occasion risk this is 5 or more standard drinks on any day over last 2 weeks. Guideline 2: For healthy men and women, drinking no more than four standard drinks on a single occasion reduces the risk of alcohol related injury arising from that occasion. | | | | | | | | | |
| (e) | Risk level calculated on exceeding the NHMRC Australian Alcohol Guidelines 2009. For lifetime risk this is more than 2 standard drinks on any day. Guideline 1: For healthy men and women, drinking no more than two standard drinks on any day reduces the lifetime risk of harm from alcohol-related disease or injury. | | | | | | | | | |

| Alcoholic liver disease (K70) | 4.3 | 4.3 | 5.2 | 5.3 | 5.1 | 4.3 | 4.9 | 4.2 | 4.0 |
| Other inflammatory liver disease (K75) | 1.7 | 1.4 | 1.3 | 1.7 | 2.0 | 1.5 | 1.7 | 1.7 | 2.3 |
| Toxic effect of alcohol (T51) | 2.4 | 2.5 | 2.9 | 2.6 | 3.8 | 2.5 | 2.4 | 2.1 | 3.0 |
| Accidental poisoning by and exposure to alcohol (X45) | 3.5 | 2.3 | 2.8 | 3.2 | 3.3 | 2.8 | 2.8 | 2.5 | 3.4 |
| Intentional self-poisoning by and exposure to alcohol (X65) | 1.6 | 2.1 | 2.0 | 2.0 | 1.9 | 2.0 | 2.1 | 2.3 | 2.2 |
| Poisoning by and exposure to alcohol, undetermined intent (Y15) | 1.8 | 2.1 | 2.7 | 3.6 | 2.8 | 2.4 | 2.9 | 2.7 | 3.8 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes F10, K70, K75 and T51 based on principal diagnosis. External cause codes X45, X65 and Y15 based on any external cause reported. Overlapping may exist between separations by toxic effect of alcohol and separations based on external causes X45, X65, or Y15. Sub-categories may not add to total as there may be overlap between principal diagnosis and external cause categories.

(b) Data are from public and private hospitals in all jurisdictions.

Table 11A.1.15 Hospital separations related to alcohol use, by Indigenous status, 2010-11 to 2018-19 (a), (b), (c), (d)

| | 2010-11 | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 |
|--|---------|---------|---------|---------|---------|---------|---------|---------|---------|
|--|---------|---------|---------|---------|---------|---------|---------|---------|---------|

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.

(e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.

(g) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

| intoxication | use | ence | (F10.3– | (F10) | disease | liver disease | alcohol | by and | poisoning | to alcohol, |
| (F10.0) | (F10.1) | syndrome | F10.9) | | (K70) | (K75) | (T51) | exposure to | by and | undetermined |
| | | (F10.2) | | | | | | alcohol | exposure to | intent (Y15) |
| | | | | | | | | (X45) | alcohol | |
| | | | | | | | | | (X65) | |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes F10, K70, K75 and T51 based on principal diagnosis. External cause codes X45, X65 and Y15 based on any external cause reported. Overlapping may exist between separations by toxic effect of alcohol and separations based on external causes X45, X65, or Y15. Sub-categories may not add to total as there may be overlap between principal diagnosis and external cause categories.
- (b) Data exclude private hospitals from the NT.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (g) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the 'Other' persons hospitalisation rate.

TABLE 11A.1.17

Table 11A.1.17 **Hospital separations related to alcohol use, Aboriginal and Torres Strait Islander persons, by sex, 2010–2012 to 2016–2018 (a), (b), (c)**

| | Number | | | Crude rate per 100 000 (d) | | |
|---|--------------|--------------|--------------|----------------------------|--------------|--------------|
| | Males | Females | Persons (e) | Males | Females | Persons (e) |
| Other inflammatory liver disease (K75) | 34 | 51 | 85 | 4.7 | 7.1 | 5.9 |
| Toxic effect of alcohol (T51) | 62 | 39 | 101 | 8.6 | 5.4 | 7.0 |
| Accidental poisoning by and exposure to alcohol (X45) | 76 | 65 | 141 | 10.6 | 9.0 | 9.8 |
| Intentional self-poisoning by and exposure to alcohol (X65) | 222 | 295 | 517 | 30.9 | 40.8 | 35.9 |
| Poisoning by and exposure to alcohol, undetermined intent (Y15) | 59 | 37 | 96 | 8.2 | 5.1 | 6.7 |
| Total | 5 899 | 3 924 | 9 823 | 822.1 | 543.0 | 682.1 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes F10, K70, K75 and T51 based on principal diagnosis. External cause codes X45, X65 and Y15 based on any external cause reported. Overlapping may exist between separations by toxic effect of alcohol and separations based on external causes X45, X65, or Y15. Sub-categories may not add to total as there may be overlap between principal diagnosis and external cause categories.

(b) Data are from public and private hospitals in all jurisdictions.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(e) Persons data includes sex not stated and indeterminate.

| Toxic effect of alcohol (T51) | 10.6 | 3.3 | 3.2 | 5.9 | 3.2 | 1.8 | 8.1 | 3.3 | 2.5 |
| Accidental poisoning by and exposure to alcohol (X45) | 13.0 | 4.4 | 3.0 | 9.8 | 3.4 | 2.9 | 11.3 | 3.9 | 2.9 |
| Intentional self-poisoning by and exposure to alcohol (X65) | 36.1 | 17.4 | 2.1 | 46.6 | 27.0 | 1.7 | 41.5 | 22.2 | 1.9 |
| Poisoning by and exposure to alcohol, undetermined intent (Y15) | 9.7 | 4.1 | 2.4 | 5.5 | 3.7 | 1.5 | 7.6 | 3.9 | 1.9 |
| Total | 1 079.2 | 290.2 | 3.7 | 641.1 | 222.6 | 2.9 | 849.7 | 255.8 | 3.3 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes F10, K70, K75 and T51 based on principal diagnosis. External cause codes X45, X65 and Y15 based on any external cause reported. Overlapping may exist between separations by toxic effect of alcohol and separations based on external causes X45, X65, or Y15. Sub-categories may not add to total as there may be overlap between principal diagnosis and external cause categories.

(b) Data are from public and private hospitals in all jurisdictions.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(e) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.

TABLE 11A.1.18

Table 11A.1.18 **Hospital separations related to alcohol use, by Indigenous status, by sex, 2010–2012 and 2016–2018 (age-standardised rate per 100 000 population) (a), (b), (c), (d), (e)**

| <i>Males</i> | | | <i>Females</i> | | | <i>All persons (f)</i> | | |
|--|------------------------------------|---------------------------|--|------------------------------------|---------------------------|--|------------------------------------|---------------------------|
| <i>Aboriginal and Torres Strait Islander</i> | <i>Non- Indigenous (g)</i> | <i>Rate ratio (h)</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non- Indigenous (g)</i> | <i>Rate ratio (h)</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non- Indigenous (g)</i> | <i>Rate ratio (h)</i> |

(f) Persons data includes sex not stated and indeterminate.

(g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(h) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

| | Major cities | Inner and outer regional | Remote and very remote | Major cities | Inner and outer regional | Remote and very remote |
| dependence syndrome (F10.2) | 1.0 | 1.6 | 1.9 | 1.4 | 1.7 | 1.0 |
| other (F10.3–F10.9) | 5.7 | 4.7 | 5.5 | 4.1 | 3.6 | 4.8 |
| Alcoholic liver disease (K70) | 4.0 | 3.8 | 5.2 | 4.2 | 4.5 | 4.4 |
| Other hospitalisations (f) | 2.2 | 1.6 | 1.9 | 2.8 | 1.7 | 1.5 |
| Total | 2.9 | 3.3 | 6.1 | 2.9 | 3.5 | 8.0 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM (fifth edition) codes F10, K70, K75 and T51 based on principal diagnosis. External cause codes X45, X65 and Y15 based on any external cause reported. Overlapping may exist between separations by toxic effect of alcohol and separations based on external causes X45, X65, or Y15.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Disaggregation by remoteness area is based on the ABS' 2016 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area in the jurisdiction.
- (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50 per cent of the population as at 30 June 2016, 100 per cent of the population as at 30 June 2017 and 50 per cent of the population at 30 June 2018.
- (f) 'Other hospitalisations' includes Other inflammatory liver disease (K75), Toxic effect of alcohol (T51), Accidental poisoning by and exposure to alcohol (X45), Intentional self-poisoning by and exposure to alcohol (X65), Poisoning by and exposure to alcohol, undetermined intent (Y15).
- (g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (h) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (i) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

TABLE 11A.1.21

Table 11A.1.21 **Deaths related to alcohol use, by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2014–2018 (age-standardised) (a), (b), (c), (d), (e), (f), (g), (h), (i)**

| | Aboriginal and Torres Strait Islander | | | Non-Indigenous | | | Rate ratio (l) | Rate difference (m) |
|-----|--|-----------------------------|-------------------------|----------------|-----------------------------|-------------------------|-------------------|---------------------------|
| | Deaths (no.) | Rate per 100 000 (j) (k) | Variability band (±) | Deaths (no.) | Rate per 100 000 (j) (k) | Variability band (±) | | |
| (a) | All causes of death data from 2006 onward are subject to a revisions process. Once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2014-2015 (final), 2016 (revised), 2017 and 2018 (preliminary). See Explanatory Notes 59-62 in Causes of Death, Australia, 2018 (cat. no. 3303.0) and Causes of Death Revisions, 2015 Final Data (Technical Note) and 2016 Revised Data (Technical Note) in Causes of Death, Australia, 2017 (cat. no. 3303.0). | | | | | | | |
| (b) | Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Indigenous identification in mortality data. Data for these jurisdictions over-represent Indigenous populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions. | | | | | | | |
| (c) | Data are grouped for 2014–2018 because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period. | | | | | | | |
| (d) | Although most deaths of Indigenous Australians are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate the Indigenous mortality rate. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous mortality rates because of these data quality issues. | | | | | | | |
| (e) | Cells with small values have been randomly assigned to protect the confidentiality of individuals, so some totals will not equal the sum of their components. Cells with a zero value have not been affected. | | | | | | | |
| (f) | These data exclude 58 registered deaths where the Indigenous status was not stated over the period 2014–2018. | | | | | | | |
| (g) | From 2015, deaths data provided by the Queensland Registry of Births, Deaths and Marriages include information resulting in an increase in the number of deaths identified as Aboriginal and Torres Strait Islander in Queensland. | | | | | | | |
| (h) | Changes in coding processes have been applied to 2018 data. See Technical Note Updates to Iris coding software: Implementing WHO updates and improvements in coding processes, in the Causes of Death, Australia, 2018 (cat. no. 3303.0) publication | | | | | | | |
| (i) | Categories are based on the ICD-10 10th Revision (World Health Organization) and relate to the underlying cause of death. | | | | | | | |
| (j) | Directly age-standardised using the 2001 Australian standard population, by 5-year age group up to 75+. | | | | | | | |
| (k) | Population data between Census years are based on assumptions about past and future levels of fertility, mortality and migration, and have a degree of uncertainty. | | | | | | | |
| (l) | Rate ratio is the mortality rate for Indigenous Australians divided by the mortality rate for non-Indigenous Australians. | | | | | | | |

TABLE 11A.1.21

Table 11A.1.21 **Deaths related to alcohol use, by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2014–2018 (age-standardised) (a), (b), (c), (d), (e), (f), (g), (h), (i)**

| <i>Aboriginal and Torres Strait Islander</i> | | | <i>Non-Indigenous</i> | | | <i>Rate ratio</i> | <i>Rate</i> |
|--|------------------------|--------------------|-----------------------|------------------------|--------------------|-------------------|-------------------|
| <i>Deaths (no.)</i> | <i>Rate per</i> | <i>Variability</i> | <i>Deaths (no.)</i> | <i>Rate per</i> | <i>Variability</i> | <i>(l)</i> | <i>difference</i> |
| | <i>100 000 (j) (k)</i> | <i>band (±)</i> | | <i>100 000 (j) (k)</i> | <i>band (±)</i> | | <i>(m)</i> |

(m) Rate difference is the mortality rate for Indigenous Australians minus the mortality rate for non-Indigenous Australians.

Note: From the 2016 reference year, deaths with no age stated have not been pro-rated in the calculation of rates. Data grouped over several reference years which includes data for 2016 (i.e. the 2014–2018 data presented in this table), has also not been pro-rated.

TABLE 11A.1.22

Table 11A.1.22 **Deaths related to alcohol use, by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2010–2014 (age-standardised) (a), (b), (c), (d), (e), (f), (g)**

| | Aboriginal and Torres Strait Islander | | | Non-Indigenous | | | Rate ratio (j) | Rate difference (k) |
|-----|---|--------------------------|----------------------|----------------|--------------------------|----------------------|----------------|---------------------|
| | Deaths (no.) | Rate per 100 000 (h) (i) | Variability band (±) | Deaths (no.) | Rate per 100 000 (h) (i) | Variability band (±) | | |
| (a) | All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2010–12 (final), 2013 (revised) and 2014 (preliminary). For further information see Explanatory Notes 52-54 and Technical Note, Causes of Death Revisions, 2012 and 2013 in <i>Causes of Death, Australia, 2014</i> (cat. no. 3303.0). | | | | | | | |
| (b) | Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Aboriginal and Torres Strait Islander identification in mortality data. Data for these jurisdictions over-represent Aboriginal and Torres Strait Islander populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions. | | | | | | | |
| (c) | Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period. | | | | | | | |
| (d) | Although most deaths of Aboriginal and Torres Strait Islander Australians are registered, it is likely that some are not accurately identified as Aboriginal and Torres Strait Islander. Therefore, these statistics are likely to underestimate the Aboriginal and Torres Strait Islander mortality rate. It is also difficult to exactly identify the difference between the Aboriginal and Torres Strait Islander and non-Indigenous mortality rates because of these data quality issues. | | | | | | | |
| (e) | Cells with small values have been randomly assigned to protect the confidentiality of individuals, so some totals will not equal the sum of their components. Cells with a zero value have not been affected. | | | | | | | |
| (f) | These data exclude 65 registered deaths where the Indigenous status was not stated over the period 2010–14. | | | | | | | |
| (g) | Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. | | | | | | | |
| (h) | Directly age-standardised using the 2001 Australian standard population, by 5-year age group up to 75+. | | | | | | | |
| (i) | Population data between Census years are based on assumptions about past and future levels of fertility, mortality and migration, and have a degree of uncertainty. | | | | | | | |

TABLE 11A.1.23

Table 11A.1.23 **Mortality rates, rate ratios and rate differences, deaths related to alcohol use, by Indigenous status, NSW, Qld, WA, SA and NT, 2001 to 2018 (age-standardised) (a), (b), (c), (d), (e), (f), (g)**

| | | <i>Indigenous rate (per 100,000) (h), (i), (j)</i> | <i>Non-Indigenous rate (per 100,000) (h), (i), (j)</i> | <i>Rate ratio (k)</i> | <i>Rate difference (l)</i> |
|--------------------------|--------------------------|--|--|-----------------------|----------------------------|
| Long term 2001–2018 | Annual change (p) | -0.6* | 0.0* | .. | -0.6* |
| | % change over period (q) | -40.0* | -14.9* | .. | -45.1* |
| Medium term 2001–2006 | Annual change (p) | - 1 | -0.1* | .. | - 0 |
| | % change over period (q) | - 13 | -11.6* | .. | - 14 |
| Short term 2006–2018 | Annual change (p) | - 0 | 0.0 | .. | - 0 |
| | % change over period (q) | - 11 | 0.9 | .. | - 14 |

* Represents results with statistically significant increases or declines at the $p < 0.05$ level over the selected periods.

- (a) Categories are based on the ICD-10 10th Revision (World Health Organization). Deaths related to alcohol use ICD-10 codes: K.70, F.10, X45, X65, Y15, E24.4, G31.2, G62.1, G72.1, I42.6, K29.2, K86.0. From the 2013 reference year, the ABS implemented a new automated coding system called Iris. The 2013–2018 data coded in the Iris system applied an updated version of the ICD-10 (2013 version for 2013 data, 2015 version for 2014–2017 data and 2016 version for 2018 data) when coding multiple causes of death, and when selecting the underlying cause of death. For details of further impacts of this change from 2013 data onwards, please see the ABS Implementation of the Iris Software: Understanding Coding and Process Improvements Technical Note, in the Causes of Death, Australia, 2013 (cat. no. 3303.0) publication. Prior to the 2013 reference year, the 2006 version of the ICD-10 was the most recent version used for coding deaths. See Explanatory Notes 29–33 in Causes of Death, Australia, 2017 (Cat. no. 3303.0).
- (b) All causes of death data from 2006 onward are subject to a revisions process. Once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006–2015 (final), 2016 (revised), 2017 and 2018 (preliminary). See Explanatory Notes 59–62 in Causes of Death, Australia, 2018 (cat. no. 3303.0) and Causes of Death Revisions, 2015 Final Data (Technical Note) and 2016 Revised Data (Technical Note) in Causes of Death, Australia, 2017 (cat. no. 3303.0).
- (c) Care needs to be taken in interpreting figures relating to suicide. See Explanatory Notes 91–100 in Causes of Death, Australia, 2018 (cat. No. 3303.0).
- (d) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only, which are considered to have adequate levels of Indigenous identification in mortality data. Data for these jurisdictions over-represent Indigenous populations in less urbanised and more remote locations, and should not be assumed to represent the experience in the other jurisdictions.
- (e) Although most deaths of Indigenous Australians are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate the Indigenous mortality rate. It is also difficult to exactly identify the difference between the Indigenous and other mortality rates because of these data quality issues.
- (f) These data exclude 334 registered deaths where the Indigenous status was not stated over the period 1998–2018.

Table 11A.1.23 Mortality rates, rate ratios and rate differences, deaths related to alcohol use, by Indigenous status, NSW, Qld, WA, SA and NT, 2001 to 2018 (age-standardised) (a), (b), (c), (d), (e), (f), (g)

| | <i>Indigenous rate (per 100,000) (h), (i), (j)</i> | <i>Non-Indigenous rate (per 100,000) (h), (i), (j)</i> | <i>Rate ratio (k)</i> | <i>Rate difference (l)</i> |
|---|--|--|-----------------------|----------------------------|
| (g) Changes in coding processes have been applied to 2018 data. See Technical Note Updates to Iris coding software: Implementing WHO updates and improvements in coding processes, in the Causes of Death, Australia, 2018 (cat. no. 3303.0) publication. | | | | |
| (h) Directly age-standardised using the 2001 Australian standard population, by 5-year age group up to 75+. | | | | |
| (i) Population data between Census years are based on assumptions about past and future levels of fertility, mortality and migration, and have a degree of uncertainty. | | | | |
| (j) A derived Estimated Resident Population (ERP) based on the 2016 Census is used in the calculation of total population rates. Non-Indigenous ERP was derived by subtracting Aboriginal and Torres Strait Islander projections based on the 2016 Census (3238.0) from the total population ERP. Population estimates from Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031 (Cat. no. 3238.0) (based on the 2016 Census) are used to calculate Aboriginal and Torres Strait Islander rates. See Explanatory Note 49 in Causes of Death, Australia, 2018. | | | | |
| (k) Rate ratio is the age-standardised rate for Indigenous Australians divided by the age-standardised rate for non-Indigenous Australians. | | | | |
| (l) Rate difference is the mortality rate for Indigenous Australians minus the mortality rate for non-Indigenous Australians. | | | | |
| (m) From 2015, deaths data provided by the Queensland Registry of Births, Deaths and Marriages (RBDM) include information resulting in an increase in the number of deaths identified as Aboriginal and Torres Strait Islander in Queensland. | | | | |
| (n) Care should be taken when interpreting mortality rates for Queensland due to changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. | | | | |
| (o) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table. | | | | |
| (p) Annual change is determined using linear regression analysis. | | | | |
| (q) Per cent change is on the annual change over the period. | | | | |

Note: From the 2016 reference year, deaths with no age stated have not been pro-rated in the calculation of death rates. Prior to 2016, deaths with no age stated have been pro-rated in the calculation of death rates.

.. Not applicable.

Table 11A.1.24 **Alcohol involvement in Aboriginal and Torres Strait Islander and non-Indigenous homicide incidents, 1999-2000 to 2017-18 (a), (b)**

| | <i>Aboriginal and Torres Strait Islander (c)</i> | | <i>Non-Indigenous (d)</i> | | <i>Inter-racial (e)</i> | | <i>Total</i> | |
|--|--|----------|---------------------------|----------|-------------------------|----------|--------------|----------|
| | <i>no.</i> | <i>%</i> | <i>no.</i> | <i>%</i> | <i>no.</i> | <i>%</i> | <i>no.</i> | <i>%</i> |
| (a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflects information available at the time of reporting and is subject to change. | | | | | | | | |
| (b) Where an offender has been identified. Excludes Indigenous status and alcohol presence where this was unknown. In the case of multiple offenders, table includes the primary victim and offender only (based on AIC NHMP incident classification). | | | | | | | | |
| (c) Aboriginal and Torres Strait Islander homicides are where both victims and offenders of homicide are either Aboriginal and/or Torres Strait Islander Australians. | | | | | | | | |
| (d) Non-Indigenous homicides are where both victims and offenders are not Aboriginal and /or Torres Strait Islander. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders. | | | | | | | | |
| (e) Inter-racial homicides are where either the victim or the offender is Aboriginal and Torres Strait Islander Australian. Includes homicides involving: an Aboriginal and Torres Strait Islander offender and non-Indigenous victim, and non-Indigenous offender and an Indigenous victim. | | | | | | | | |
| – Nil or rounded to zero. | | | | | | | | |

| Not stated (f) | % | 21.3 | 31.6 | 17.5 | 25.8 | na | 37.6 |

(a) Cells in this table have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution; estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

TABLE 11A.2.1

Table 11A.2.1 Substance use for Aboriginal and Torres Strait Islander people (aged 18 years or over), by substance used, 2002, 2004-05, 2008, 2012-13, 2014-15, and 2018-19 (a), (b)

| | <i>Unit</i> | <i>2018-19</i> | <i>2014-15</i> | <i>2012-13</i> | <i>2008</i> | <i>2004-05</i> | <i>2002</i> |
|-----|---|----------------|----------------|----------------|-------------|----------------|-------------|
| (b) | The substance use questions are comparable across the 2002, 2008 and 2014-15 NATSISS and the 2012-13 NATSIHS. However, when comparing between surveys, it should be noted that there are differences in the proportion of people who did not accept the substance use form (6 per cent in 2002, 9 per cent in 2008, 5 per cent in 2012-13 and 9 per cent in 2014-15). Also, in 2014-15, people were only asked about their use of substances in the last 12 months and not whether they had ever used substances. | | | | | | |
| (c) | Includes pain killers, tranquilisers and sleeping pills. | | | | | | |
| (d) | Includes heroin, cocaine, petrol, LSD/synthetic hallucinogens, naturally occurring hallucinogens, ecstasy/designer drugs, and other inhalants. Includes methadone for non-medical purposes in 2008, 2012-13 and 2014-15. | | | | | | |
| (e) | Sum of components may be more than total as people may have reported more than one type of substance used. | | | | | | |
| (f) | This category comprises people who accepted the substance use form but did not state if they had ever used substances. | | | | | | |
| (g) | People who accepted the substance use form. | | | | | | |
| (h) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | |

- (b) The substance use questions are comparable across the 2002, 2008 and 2014-15 NATSISS and the 2012-13 NATSIHS. However, when comparing between surveys, it should be noted that there are differences in the proportion of people who did not accept the substance use form (6 per cent in 2002, 9 per cent in 2008, 5 per cent in 2012-13 and 9 per cent in 2014-15). Also, in 2014-15, people were only asked about their use of substances in the last 12 months and not whether they had ever used substances.
- (c) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (d) Includes pain killers, tranquilisers and sleeping pills.

TABLE 11A.2.2

Table 11A.2.2 **Substance use for Aboriginal and Torres Strait Islander people (aged 18 years or over), by sex, by substance used, 2002, 2008, 2012-13, 2014-15 and 2018-19 (a), (b)**

| | <i>Males</i> | | | | <i>Females</i> | | | | <i>Persons</i> | | |
|--|--------------|---------------|----------------|----------|----------------|---------------|----------------|--|----------------|---------------|----------------|
| | <i>Prop.</i> | <i>95% CI</i> | <i>RSE (c)</i> | | <i>Prop.</i> | <i>95% CI</i> | <i>RSE (c)</i> | | <i>Prop.</i> | <i>95% CI</i> | <i>RSE (c)</i> |
| | <i>Unit</i> | <i>%</i> | <i>±</i> | <i>%</i> | <i>%</i> | <i>±</i> | <i>%</i> | | <i>%</i> | <i>±</i> | <i>%</i> |

(e) Includes heroin, cocaine, petrol, LSD/synthetic hallucinogens, naturally occurring hallucinogens, ecstasy/designer drugs, and other inhalants. Includes methadone for non-medical purposes in 2008, 2012-13 and 2014-15.

(f) Sum of components may be more than total as people may have reported more than one type of substance used.

(g) This category comprises people who accepted the substance use form but did not state if they had ever used substances.

(h) People who accepted the substance use form.

na Not available. – Nil or rounded to zero.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

| Not stated (f) | % | 65.5 | 75.6 | 39.6 | 44.7 | 52.9 | 71.2 | 49.7 | 37.6 |

(a) Cells in this table have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution; estimates with a relative standard error greater than 50 per cent are considered too unreliable for general use.

TABLE 11A.2.3

Table 11A.2.3 **Substance use for Aboriginal and Torres Strait Islander people (aged 18 years or over), by remoteness, by substance used, 2002, 2004-05, 2008, 2012-13, 2014-15, and 2018-19 (a), (b)**

| | <i>Unit</i> | <i>Major cities</i> | <i>Inner regional</i> | <i>Outer regional</i> | <i>Non-remote total</i> | <i>Remote</i> | <i>Very remote</i> | <i>Remote total</i> | <i>Australia</i> |
|-----|--|---------------------|-----------------------|-----------------------|-------------------------|---------------|--------------------|---------------------|------------------|
| (b) | The substance use questions are comparable across the 2002, 2008 and 2014-15 NATSISS, and the 2012-13 and 2018-19 NATSIHS. However, when comparing between surveys, it should be noted that there are differences in the proportion of people who did not accept the substance use form (6 per cent in 2002, 9 per cent in 2008, 5 per cent in 2012-13, 9 per cent in 2014-15 and 11 per cent in 2018-19). In 2014-15, people were only asked about their use of substances in the last 12 months and not whether they had ever used substances. Respondents in 2014-15 in non-remote areas were able to complete the substance use form using the interviewer's laptop via computer-assisted self-enumeration, while in 2008 this was only on a paper form. In 2018-19, 'Ice' was including as an additional output to 'Amphetamines or speed'. | | | | | | | | |
| (c) | Includes pain killers, tranquilisers and sleeping pills. | | | | | | | | |
| (d) | Includes heroin, cocaine, petrol, LSD/synthetic hallucinogens, naturally occurring hallucinogens, ecstasy/designer drugs, and other inhalants. Includes methadone for non-medical purposes in 2008, 2012-13, 2014-15 and 2018-19. | | | | | | | | |
| (e) | Sum of components may be more than total as people may have reported more than one type of substance used. | | | | | | | | |
| (f) | This category comprises people who accepted the substance use form but did not state if they had ever used substances. | | | | | | | | |
| (g) | People who accepted the substance use form. | | | | | | | | |
| (h) | Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use. | | | | | | | | |

np Not published. **na** Not available. – Nil or rounded to zero.

Note: 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

- (a) Cells in this table have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.
- (b) Excludes persons aged 15–17 years who were not present for interview or answered by proxy with selected person present, and also excludes persons aged 18 years or over who answered by proxy and were not present for interview.
- (c) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.
- (d) Includes pain killers, tranquilisers and sleeping pills.
- (e) Includes heroin, cocaine, petrol, LSD/synthetic hallucinogens, naturally occurring hallucinogens, ecstasy/designer drugs, and other inhalants. Includes methadone for non-medical purposes in 2014-15.
- (f) Sum of components may be more than total as persons may have reported more than one type of substance used.
- (g) This category comprises people who accepted the substance use form but did not state if they had ever used substances.
- (h) People who accepted the substance use form.

– Nil or rounded to zero. **np** Not published

| Female | % | 11.4 | 10.9 | 10.7 | 10.4 | 10.7 | 11.1 | 12.4 | 14.5 | 5.4 |
| Persons | % | 8.2 | 6.3 | 7.3 | 7.3 | 7.5 | 7.2 | 8.1 | 8.4 | 3.8 |

(a) Cells in this table have been randomly adjusted to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals. Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.

(b) People who accepted the substance use form.

(c) Total excludes 'not stated' and persons who did not answer substance use questions.

(d) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

TABLE 11A.2.8

Table 11A.2.8 Hospital separations related to drug use, by Indigenous status, by classification, 2010-11 to 2018-19 (a), (b), (c), (d)

| | 2010-11 | 2011-12 | 2012-13 | 2013-14 | 2014-15 | 2015-16 | 2016-17 | 2017-18 | 2018-19 |
|------------------------------|---------|---------|---------|---------|---------|---------|---------|---------|---------|
| Mental/behavioural disorders | 2.8 | 2.8 | 3.0 | 2.8 | 3.0 | 3.5 | 3.7 | 3.8 | 4.0 |
| Other | 3.0 | 3.3 | 3.2 | 4.7 | 5.1 | 5.3 | 4.2 | 5.8 | 8.0 |
| Total | 2.1 | 2.3 | 2.5 | 2.5 | 2.6 | 2.9 | 3.0 | 3.2 | 3.4 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions are based on Principal diagnoses. External cause codes for accidental poisoning are based on any external cause reported. This may lead to overlap between 'accidental poisoning' and the other categories.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (g) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous hospitalisation rate.

| Total | 1.7 | 1.9 | 1.8 | 1.8 | 1.8 | 1.9 | 2.1 | 2.3 | 2.5 | 2.5 | 2.6 | 2.9 | 3.1 | 3.3 | 3.4 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions are based on Principal diagnoses. External cause codes for accidental poisoning are based on any external cause reported. This may lead to overlap between 'accidental poisoning' and the other categories.
- (b) Data exclude private hospitals from the NT.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data.
- (e) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (f) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (g) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the 'Other' persons hospitalisation rate.

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions are based on Principal diagnoses. External cause codes for accidental poisoning are based on any external cause reported. This may lead to overlap between 'accidental poisoning' and the other categories.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.
- (e) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (f) Persons data includes sex not stated and indeterminate.
- (g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (h) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

TABLE 11A.2.11

Table 11A.2.11 **Hospital separations related to drug use, by Indigenous status, by remoteness, by classification, 2010–2012 and 2016–2018 (a), (b), (c), (d), (e)**

| | 2010–2012 | | | 2016–2018 | | |
|------------------------------|----------------|--------------------------|------------------------|--------------|--------------------------|------------------------|
| | Major cities | Inner and outer regional | Remote and very remote | Major cities | Inner and outer regional | Remote and very remote |
| | Rate ratio (h) | | | | | |
| Poisoning | 2.2 | 1.5 | 1.4 | 3.4 | 2.1 | 1.3 |
| Accidental poisoning | 3.2 | 1.5 | 2.0 | 4.4 | 2.5 | 1.5 |
| Mental/behavioural disorders | 3.4 | 2.9 | 3.3 | 4.6 | 3.9 | 3.4 |
| Other | 4.7 | 2.7 | na | 7.0 | 4.3 | na |
| Total | 2.7 | 1.9 | 2.0 | 4.0 | 2.8 | 2.0 |

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions are based on Principal diagnoses. External cause codes for accidental poisoning are based on any external cause reported. This may lead to overlap between 'accidental poisoning' and the other categories.
- (b) Data are from public and private hospitals in all jurisdictions.
- (c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.
- (d) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area in the jurisdiction.
- (e) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of June year population estimates. For 2016–2018 this includes 50 percent of the population as at 30 June 2016, 100 percent of the population as at 30 June 2017 and 50 percent of the population at 30 June 2018.
- (f) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).
- (g) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.
- (h) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(b) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Drug use includes ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions based on Principal diagnoses. It also includes external cause codes for accidental poisoning based on any external cause reported.

(a) Data exclude private hospitals from the NT.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50 percent of the population as at 30 June 2016, 100 percent of the population as at 30 June 2017 and 50 percent of the population at 30 June 2018.

(e) Rates are directly age-standardised using the Australian 2001 standard population. Age groups used for age standardisation are from 0-4 years in five yearly groups up to 70-74 years old and 75 years plus.

(f) Data are reported by place of residence of the patient hospitalised.

(g) 'Non-Indigenous' only includes hospitalisations of people explicitly identified as non-Indigenous, except for WA where it includes all hospitalisations not explicitly recorded as Indigenous (WA hospitalisations data does not separately identify records as Non-indigenous or not stated).

(h) Rate ratio is the age-standardised Aboriginal and Torres Strait Islander hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

| Total | 2 944 | 3 131 | 6 075 | 410.3 | 433.3 | 421.8 |

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). ICD-10-AM codes for poisoning, mental/behavioural disorders and other conditions are based on Principal diagnoses. External cause codes for accidental poisoning are based on any external cause reported. This may lead to overlap between 'accidental poisoning' and the other categories.

(b) Data are from public and private hospitals in all jurisdictions.

(c) From 2012-13, data exclude inter-hospital contracted patients to private sector hospitals in WA.

(d) Rates per 100 000 population are calculated using population estimates and projections based on 2016 Census data. As these data span two years, the population denominator used in calculating rates is a weighted sum of mid year population estimates. For 2016–2018 this includes 50% of the population as at 30 June 2016, 100% of the population as at 30 June 2017 and 50% of the population at 30 June 2018.

(e) Persons data includes sex not stated and indeterminate.

(a) Causes of death attributable to drug-induced mortality are based on codes of the International Statistical Classification of Diseases and Related Health Problems, 10th Revision (ICD-10). See Appendix 2, Tabulation of Selected Causes of Death in *Causes of Death, Australia, 2018*, cat. no. 3303.0.

(b) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2009-2015 (final), 2016 (revised), 2017 and 2018 (preliminary). See Explanatory Notes 59-62 in *Causes of Death, Australia, 2018* (cat. no. 3303.0) and *Causes of Death Revisions, 2015 Final Data (Technical Note)* and *2016 Revised Data (Technical Note)* in *Causes of Death, Australia, 2017* (cat. no. 3303.0).

Table 11A.2.14 Drug-induced deaths, by Indigenous status, by sex, NSW, Queensland, WA, SA and the NT, 2009–2013 and 2014–2018 (a), (b), (c), (d), (e), (f), (g), (h)

| | Aboriginal and Torres Strait Islander (i) | | | | | | Non-Indigenous | | | | | |
|--|---|---------|----|----|----|-----------|----------------|---------|----|----|----|-----------|
| | NSW | Qld (j) | WA | SA | NT | Total (k) | NSW | Qld (j) | WA | SA | NT | Total (k) |

(c) Data based on reference year.

(d) Data are presented in five-year groupings due to the volatility of small numbers each year.

(e) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(f) Age-standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age-standardised by five year age group to 75 years or over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(g) Denominators used in the calculation of rates for the Aboriginal and Torres Strait Islander population are Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031 (ABS Cat. no. 3238.0, series B, 2016 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Aboriginal and Torres Strait Islander population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

(h) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(i) Data on deaths of Aboriginal and Torres Strait Islander people are affected by differing levels of coverage of deaths identified as Aboriginal and Torres Strait Islander across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Aboriginal and Torres Strait Islander and non-Indigenous data.

(j) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.

(k) Total includes data for NSW, Queensland, WA, SA and the NT only.

np Not published.

(a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflects information available at the time of reporting and is subject to change.

(b) Where an offender has been identified. Excludes cases where Indigenous status of victim or offender, or drug involvement is unknown. In the case of multiple offenders, table includes the primary victim and offender only (based on AIC NHMP incident classification).

(c) Aboriginal and Torres Strait Islander homicides are where both victims and offenders of homicide are either Aboriginal and/or Torres Strait Islanders.

(d) Non-Indigenous homicides are where both victims and offenders are not Aboriginal and Torres Strait Islander. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders.

(e) Inter-racial homicides are where either the victim or the offender is Indigenous. Includes homicides involving: an Aboriginal and Torres Strait Islander offender and non-Indigenous victim, and non-Indigenous offender and an Aboriginal and Torres Strait Islander victim.

– Nil or rounded to zero.

Section 11.3

Table 11A.3.1 **State and territory legislation on juvenile diversions**

| S/T | Legislation | Scope |
|------------|--|---|
| NSW | <i>Young Offenders Act 1997</i> | Young offenders can be diverted using warnings, police cautions and youth justice conferences. Warnings apply for the least serious offences, while more serious offences may elicit cautions, conferences and finally court for the most serious offences. Infringement notices consisting of an on the spot fine can be issued for certain offences. |
| VIC | <i>Children and Justice Legislation Amendment (Youth Justice Reform) Act 2017</i> | A statutory youth diversion scheme in which cautioning of offenders is left to the discretion of police officers. Only the courts can refer a young person to a restorative process. |
| QLD | <i>Youth Justice Act 1992 and Youth Justice and Other Legislation (Inclusion of 17-year-old Persons) Amendment Act 2016</i> | Diversionary methods include 'caution' and 'community conference' as alternatives to 'arrest', 'notice to appear', 'summons' or 'warrant'. As of February 2018, Queensland treats 17 year-olds under Youth Justice laws instead of as adults. |
| WA | <i>Young Offenders Act 1994</i> | Under the Act, police officers can issue young offenders with a formal written caution, or the matter can be transferred to a Juvenile Justice Team (JJT) via police or court referral. Where the matter is referred to a JJT, young people are held accountable for their offending behaviour through meetings with their families, victims and police. No criminal conviction is recorded against the young person. |
| SA | <i>Young Offenders Act 1993</i> | Legislates for a three tiered system of diversion, involving informal cautions, formal cautions and family conferences |
| Tas | <i>Youth Justice Act 1997</i> | Under the Act, a juvenile must agree to the convening of a community conference and must sign an undertaking to attend the conference. The juvenile, the relevant police officer and the victim (if present at the conference) must agree on the outcome of a community conference. |
| ACT | <i>Crimes (Restorative Justice) Act 2004</i> | The Act allows for juveniles to be referred by the police, during the court process, or post sentence. The Act stipulates that an offender is deemed eligible for restorative justice if they 'accept responsibility for the commission of the offence' and agree to take part in a restorative justice process. |
| NT | <i>Youth Justice Act 2005</i> | The scheme consists of verbal warnings, written warnings, formal cautions, family conferences and victim/offender conferences. |
| Source: | Based on Richards, K. (2010) <i>Police-Referred Restorative Justice for Juveniles in Australia</i> , Trends & Issues in Crime and Criminal Justice, Australian Institute of Criminology, but updated to take new legislation into account. | |

Table 11A.3.2 Youth diversions as a proportion of offenders, by Indigenous status, by state and territory (per cent) (a)

| | <i>NSW</i> (b) | <i>VIC</i> (c) | <i>Qld</i> (d) | <i>WA</i> (e) | <i>SA</i> (f) | <i>Tas</i> (g) | <i>ACT</i> (h) | <i>NT</i> (i) |
|-----|--|----------------|----------------|---------------|---------------|----------------|----------------|---------------|
| (a) | Juvenile diversion is defined as the number of juveniles who would otherwise be proceeded against (that is, taken to court) but who are diverted by police as a proportion of all juvenile offenders formally dealt with by police. The term diverted includes diversions of offenders away from the courts by way of: community conference, diversionary conference, formal cautioning by police, family conferences and other diversionary programs (for example, to drug assessment/treatment). Offenders who would not normally be sent to court for the offence detected and are treated by police in a less formal manner (for example, issued warnings or infringement notices) are excluded. | | | | | | | |
| (b) | NSW data are for calendar years. The proportion of juvenile diversions are calculated excluding infringement notices. | | | | | | | |
| (c) | Historical data for Victoria differ from previous reports. Please note the quality of recording for Standard Indigenous Question data item has declined over time and there is now a greater proportion of missing/not stated/unknown Indigenous status. Victoria Police have advised that an issue with the extraction of SIQ responses from LEAP may be contributing to the declining data quality. | | | | | | | |
| (d) | Only those offenders whose age and Indigenous status were identified are included. | | | | | | | |
| (e) | WA juvenile diversions include formal cautions and referrals to Juvenile Justice Teams. | | | | | | | |
| (f) | SA data are for calendar years. Prior to 1 July 2007, the recording of the racial identity of the alleged offender largely reflected the apprehending officer's opinion based on the physical appearance of the individual. From 1 July 2007, South Australia Police adopted the standard ABS question on Indigenous status for alleged offenders. Juvenile diversions include both formal cautions and transfers to a family conference. | | | | | | | |
| (g) | Data disaggregated by Indigenous status are not available for Tasmania. | | | | | | | |
| (h) | ACT proportion of juvenile diversions has been calculated on total recorded police contacts with juveniles comprising juvenile cautions, referrals to diversionary conferencing, juveniles taken into protective custody and charges pertaining to juveniles. | | | | | | | |
| (i) | NT data are for calendar years. Data refers to apprehension cases rather than individual persons, therefore, there may be a number of cases that relate to one person. | | | | | | | |

Table 11A.3.3 NSW, juvenile diversions for offenders (aged 10–17 years), by Aboriginal status, 2004 to 2019 (a), (b), (c), (d)

| | <i>Unit</i> | <i>Aboriginal</i> | <i>Non- Aboriginal</i> | <i>Unknown</i> | <i>Total</i> |
|--|-------------|-------------------|----------------------------|----------------|--------------|
| <p>(a) This table represents persons of interest (POIs) or alleged offenders who have come to the attention of NSW Police for a recorded criminal incident (driving offences are excluded). Some POIs are formally proceeded against to court and some are proceeded against other than to court whilst others are not proceeded against. The POIs included in the table above have all been proceeded against. POIs are not a count of unique offenders. Where an individual is involved in multiple criminal incidents throughout the year they will appear as a POI multiple times.</p> <p>(b) Under the <i>Young Offenders Act 1997</i> (NSW), when police apprehend a young person they must first consider whether the young person is entitled to be diverted under the Act by way of warning, caution or youth justice conference.</p> <p>(c) Previous reports have included juvenile offenders initially proceeded against to court by Police and then referred to Youth Justice Conference or given a caution by the court under the <i>Young Offenders Act</i>. They are now counted as being proceeded against to court by Court Attendance Notice as that was the method of proceeding used by the Police. Consequently data in this report is not comparable with data in previously published reports.</p> <p>(d) Driving offences have been excluded.</p> <p>(e) Since mid-2008, police have issued compliance notices for breaches of liquor licensing regulations/legislation. Commonly these are for relatively minor breaches eg. fail to display regulated signs.</p> <p>(f) Data on warnings is only available from January 2010 onwards due to changes in how warnings are recorded.</p> <p>– Nil or rounded to zero.</p> | | | | | |

- (a) This table represents persons of interest (POIs) or alleged offenders who have come to the attention of NSW Police for a recorded criminal incident (driving offences are excluded). Some POIs are formally proceeded against to court and some are proceeded against other than to court whilst others are not proceeded against. The POIs included in the table above have all been proceeded against. POIs are not a count of unique offenders. Where an individual is involved in multiple criminal incidents throughout the year they will appear as a POI multiple times. Correspondingly, no person of interest information will be recorded for criminal incidents in which there is no known suspect. This is very common among incidents of property crime which have a low clear up rate. It should be noted that in previous annual recorded crime reports, data on alleged offenders were categorised by date of reporting to police (or date the incident was detected by police). Given there can be a delay between an event being recorded by police and police commencing legal proceedings this resulted in fewer alleged offenders being counted, particularly during the last three months of the reporting period. For this reason, since the 2017 annual report, alleged offender data is categorised by the date the alleged offender was proceeded against. Therefore in Section 4 the year refers to the year in which alleged offenders were proceeded against. It does not refer to the year in which a criminal incident or incidents were reported to police. For example, if an incident was reported to police in 2016 but the alleged offender was not apprehended and charged until 2017, the alleged offender is counted in 2017. As such, Section 4 of this report is not comparable with alleged offender data published prior to the 2017 annual report. Comparable data for all years is available on request.
- (b) Under the *Young Offenders Act 1997* (NSW), when police apprehend a young person they must first consider whether the young person is entitled to be diverted under the Act by way of warning, caution or youth justice conference.
- (c) Previous reports have included juvenile offenders initially proceeded against to court by Police and then referred to Youth Justice Conference or given a caution by the court under the *Young Offenders Act*. They are now counted as being proceeded against to court by Court Attendance Notice as that was the method of proceeding used by the Police. Consequently data in this report is not comparable with data in previously published reports.
- (d) Driving offences have been excluded.
- (e) Since mid-2008, police have issued compliance notices for breaches of liquor licensing regulations/legislation. Commonly these are for relatively minor breaches eg. fail to display regulated signs.
- (f) Data on warnings is only available from January 2010 onwards due to changes in how warnings are recorded.

na Not available. – Nil or rounded to zero.

- (a) This table represents persons of interest (POIs) or alleged offenders who have come to the attention of NSW Police for a recorded criminal incident (driving offences are excluded). Some POIs are formally proceeded against to court and some are proceeded against other than to court whilst others are not proceeded against. The POIs included in the table above have all been proceeded against. POIs are not a count of unique offenders. Where an individual is involved in multiple criminal incidents throughout the year they will appear as a POI multiple times. Correspondingly, no person of interest information will be recorded for criminal incidents in which there is no known suspect. This is very common among incidents of property crime which have a low clear up rate. It should be noted that in previous annual recorded crime reports, data on alleged offenders were categorised by date of reporting to police (or date the incident was detected by police). Given there can be a delay between an event being recorded by police and police commencing legal proceedings this resulted in fewer alleged offenders being counted, particularly during the last three months of the reporting period. For this reason, since the 2017 annual report, alleged offender data is categorised by the date the alleged offender was proceeded against. Therefore in Section 4 the year refers to the year in which alleged offenders were proceeded against. It does not refer to the year in which a criminal incident or incidents were reported to police. For example, if an incident was reported to police in 2016 but the alleged offender was not apprehended and charged until 2017, the alleged offender is counted in 2017. As such, Section 4 of this report is not comparable with alleged offender data published prior to the 2017 annual report. Comparable data for all years is available on request.
- (b) Under the *Young Offenders Act 1997* (NSW), when police apprehend a young person they must first consider whether the young person is entitled to be diverted under the Act by way of warning, caution or youth justice conference.
- (c) Previous reports have included juvenile offenders initially proceeded against to court by Police and then referred to Youth Justice Conference or given a caution by the court under the Young Offenders Act. They are now counted as being proceeded against to court by Court Attendance Notice as that was the method of proceeding used by the Police. Consequently data in this report is not comparable with data in previously published reports.
- (d) Unknown Aboriginal status and gender have been excluded. Excluded from this table were 1 554 juvenile POIs whose status was recorded by NSW Police as 'legal process—not further classified'.
- Nil or rounded to zero.

- (a) This table represents persons of interest (POIs) or alleged offenders who have come to the attention of NSW Police for a recorded criminal incident (driving offences are excluded). Some POIs are formally proceeded against to court and some are proceeded against other than to court whilst others are not proceeded against. The POIs included in the table above have all been proceeded against. POIs are not a count of unique offenders. Where an individual is involved in multiple criminal incidents throughout the year they will appear as a POI multiple times. Correspondingly, no person of interest information will be recorded for criminal incidents in which there is no known suspect. This is very common among incidents of property crime which have a low clear up rate. It should be noted that in previous annual recorded crime reports, data on alleged offenders were categorised by date of reporting to police (or date the incident was detected by police). Given there can be a delay between an event being recorded by police and police commencing legal proceedings this resulted in fewer alleged offenders being counted, particularly during the last three months of the reporting period. For this reason, since the 2017 annual report, alleged offender data is categorised by the date the alleged offender was proceeded against. Therefore in Section 4 the year refers to the year in which alleged offenders were proceeded against. It does not refer to the year in which a criminal incident or incidents were reported to police. For example, if an incident was reported to police in 2016 but the alleged offender was not apprehended and charged until 2017, the alleged offender is counted in 2017. As such, Section 4 of this report is not comparable with alleged offender data published prior to the 2017 annual report. Comparable data for all years is available on request.
- (b) Under the *Young Offenders Act 1997* (NSW), when police apprehend a young person they must first consider whether the young person is entitled to be diverted under the Act by way of warning, caution or youth justice conference.
- (c) Unknown Aboriginal status have been excluded.
- (d) Previous reports have included juvenile offenders initially proceeded against to court by Police and then referred to Youth Justice Conference or given a caution by the court under the *Young Offenders Act*. They are now counted as being proceeded against to court by Court Attendance Notice as that was the method of proceeding used by the Police. Consequently data in this report is not comparable with data in previously published reports.
- (e) Driving offences have been excluded.

| 2004-05 | % | 20.2 | 38.5 | 74.4 | 38.1 |

(a) Indigenous status data are derived using the revised CSA most frequent recorded status of an individual as recorded by Victoria Police, and may not represent the Indigenous status recorded by police at the time of the incident.

(b) Percentages are based on the proportion of young offenders cautioned each time they are proceeded against by police in a financial year. If an alleged offender is proceeded against more than once within the financial year, they will be recorded for each incident separately.

(a) Indigenous status data are derived using the revised CSA most frequent recorded status of an individual as recorded by Victoria Police, and may not represent the Indigenous status recorded by police at the time of the incident.

(b) Percentages are based on the proportion of young offenders cautioned each time they are proceeded against by police in a financial year. If an alleged offender is proceeded against more than once within the financial year, they will be recorded for each incident separately.

na Not available. – Nil or rounded to zero.

- (a) WA juvenile diversions include formal cautions and referrals to Juvenile Justice Teams (JJT).
- (b) Juveniles can also be diverted by the issuing of a Cannabis Intervention Requirement, Drug Diversion (other), Liquor Infringement or a Criminal Code Infringement Notice (CCIN).
- (c) Statistics reflect the number of offenders who have been processed in relation to an incident but not for every offence under the incident unless the offender was processed in a different way for another offence(s).
- (d) Changes to recording and reporting practices implemented between May and November 2017 impact the crime statistics presented in this document. Due to these changes, comparison should be made with caution where it is either of data from before and after the period of recording and reporting changes, or involves data from a period overlapping May-November 2017. As a result, statistics previously provided in 2016 have been revised.
- (e) The Incident Management System (IMS) records ethnicity information using two fields; "Ethnic Appearance" and "Stated Ethnicity". "Ethnic Appearance" refers to an apparent ethnic appearance of the person, as identified by the attending officer, whilst "Stated Ethnicity" is the self-identified ethnicity provided by the person upon questioning. For the purposes of the provided tables, "Aboriginal Status" has been determined based on these IMS fields. "Stated Ethnicity" has been used where possible, with "Ethnic Appearance" used only where the "Stated Ethnicity" is unknown or missing. However, as "Ethnic Appearance" is a subjective assessment, recorded by an officer at the time, these designated ethnicities may be incorrectly attributed.
- (f) Other includes outcomes of arrest, summonsed, notice to attend, and charge preferred. Offence outcomes including the issuing of infringements or specific outcomes of statute barred; not in the public interest; not criminally responsible; fitness to hold; and offender deceased have been excluded.

| Proportion of offenders who were eligible, but declined to participate in diversion | % | na | na | na | na | na | na | na | na | na |

- (a) WA juvenile diversions include formal cautions and referrals to Juvenile Justice Teams (JJT).
- (b) Diversion reported in this table includes formal cautions and referrals to Juvenile Justice Teams. Juveniles can also be diverted by the issuing of a Cannabis Intervention Requirement, Drug Diversion (other), Liquor Infringement or a Criminal Code Infringement Notice (CCIN).
- (c) Statistics reflect the number of offenders who have been processed in relation to an incident but not for every offence under the incident unless the offender was processed in a different way for another offence(s).
- (d) Changes to recording and reporting practices implemented between May and November 2017 impact the crime statistics presented in this document. Due to these changes, comparison should be made with caution where it is either of data from before and after the period of recording and reporting changes, or involves data from a period overlapping May-November 2017. As a result, statistics previously provided in 2016 have been revised.
- (e) The Incident Management System (IMS) records ethnicity information using two fields; "Ethnic Appearance" and "Stated Ethnicity". "Ethnic Appearance" refers to an apparent ethnic appearance of the person, as identified by the attending officer, whilst "Stated Ethnicity" is the self-identified ethnicity provided by the person upon questioning. For the purposes of the provided tables, "Aboriginal Status" has been determined based on these IMS fields. "Stated Ethnicity" has been used where possible, with "Ethnic Appearance" used only where the "Stated Ethnicity" is unknown or missing. However, as "Ethnic Appearance" is a subjective assessment, recorded by an officer at the time, these designated ethnicities may be incorrectly attributed.
- (f) Total persons includes those with unknown or indeterminate gender and may not be the sum of males and females.

Table 11A.3.40 **SA, number and proportion of juvenile diversions, by Indigenous status, 2004 to 2019 (a), (b), (c)**

| | <i>Unit</i> | <i>Aboriginal and Torres Strait Islander</i> | <i>Non- Indigenous</i> | <i>Unknown</i> | <i>Total</i> |
|-------------------------------|-------------|--|----------------------------|----------------|--------------|
| 2004 | | | | | |
| Juvenile apprehensions | no. | 1 054 | 4 018 | 469 | 5 541 |
| Formal caution | no. | 200 | 1 247 | 355 | 1 802 |
| Transfer to family conference | no. | 181 | 837 | 8 | 1 026 |
| Proportion diverted | % | 36.1 | 51.9 | 77.4 | 51.0 |

- (a) Prior to 1 July 2007 the recording of the racial identity of the alleged offender largely reflected the apprehending officer's opinion based on the physical appearance of the individual. From 1 July 2007, South Australia Police adopted the standard ABS question on Indigenous status for alleged offenders.
- (b) Juvenile diversions include both formal cautions and transfers to a family conference. Juveniles referred to the Youth Court and those who were eligible, but declined to participate in diversion were not included.
- (c) This report differs to previous ones due to a different data extraction method used. The previous reports were based on OCSAR's Crime and Justice publications. The current report is based on an extract of SA Police apprehension data relating to individuals aged 10 to 17.9 at the time of the alleged offence. The classification system has also changed from previous reports. This report is based on the Australian and New Zealand Standard Offence Classification (ANZSOC). More information on ANZSOC can be found on the Australian Bureau of Statistics website <http://www.abs.gov.au/>. The counting unit is consistent with previous reports and is based on unique apprehension reports per individual.
- (d) A new crime recording system was implemented by South Australia Police in November 2018. This system change has impacted on the comparability of the data over the time series.
- (e) Numbers of juvenile apprehensions exclude those offences with an unknown method of processing and non-offence matters.

(a) A new crime recording system was implemented by South Australia Police in November 2018. This system change has impacted on the comparability of the data over the time series.

(b) The data field for the “Unknown” and Transfers to Youth Court contain differences and are not falling into the correct categories while these issues are being reviewed by South Australia Police. Users are advised to use caution when comparing published 2019 South Australian data to earlier reference periods

– Nil or rounded to zero.

| Miscellaneous offences | 33.3 | 50.0 | 83.3 | 16.7 | — | 100.0 | 6 | 0.2 |
| Total | 1 078 | 706 | 1 784 | 1 804 | 357 | | 3 945 | 100.0 |

(a) Prior to 1 July 2007 the recording of the racial identity of the alleged offender largely reflected the apprehending officer's opinion based on the physical appearance of the individual. From 1 July 2007, South Australia Police adopted the standard ABS question on Indigenous status for alleged offenders.

(b) The 'Total' includes those offenders with either a 'withdrawn' or 'unknown' outcome.

— Nil or rounded to zero.

TABLE 11A.3.56

Table 11A.3.56 **NT, proportion of alleged juvenile offenders, by whether diverted, by Indigenous status, by sex, 2014 to 2019 (a), (b), (c), (d), (e), (f)**

| | Aboriginal and Torres Strait Islander | | | Non-Indigenous | | |
|------|---------------------------------------|---------|---------|----------------|---------|---------|
| Unit | Males | Females | Persons | Males | Females | Persons |

(a) Data refers to alleged juvenile offenders rather than apprehension cases. This is not a count of unique offenders. Where an individual is involved in multiple criminal incidents throughout the year they will appear multiple times.

(b) Aboriginal and Torres Strait Islander data are based on self-identification by the juvenile.

(c) Where cases did not result in a diversion, these cases either proceeded to court or were resolved in some other manner (it is not an indicator of the number of matters referred to the courts).

(d) Offenders whose race was unknown have been excluded.

(e) Youth offenders with a traffic offence were excluded.

(f) Participation in Diversion includes: Family Conference, Victim Offender Conference, Written Warning, Verbal Warning, Drug Diversion, and Diversion Current.

(g) Offenders were denied diversion as a result of the seriousness of the offence or re-offending.

(h) Data for 2014 and 2015 has been revised and will differ from previous reports.

(a) Data refers to apprehension cases rather than individual persons, therefore, there may be a number of cases that relate to one person. Aboriginal and Torres Strait Islander data are based on self-identification by the juvenile.

(b) The cases in this column are youths awaiting assessment or undertaking diversion not listed above. Traffic offences have been excluded from this analysis.

(c) Youth offenders with unknown race have been excluded

(d) Other offences include: Crimes identified during Active Policing (does not include drug offences)

(e) Data for 2014 and 2015 has been revised and will differ from previous reports.

TABLE 11A.4.1

Table 11A.4.1 **Prisoners with known prior adult imprisonment under sentence, by Indigenous status, by state and territory, at 30 June 2013 to 2019 (number and proportion) (a), (b), (c)**

| | <i>Unit</i> | <i>NSW</i> | <i>Vic</i> | <i>Qld</i> | <i>WA</i> | <i>SA</i> | <i>Tas</i> | <i>ACT (d)</i> | <i>NT</i> | <i>Aust (e)</i> |
|----------------|-------------|------------|------------|------------|-----------|-----------|------------|----------------|-----------|-----------------|
| Non-Indigenous | % | 48.0 | 59.6 | 60.9 | 37.5 | 66.1 | 56.7 | 39.8 | 24.9 | 52.1 |

- (a) From 2016, due to perturbation, component cells may not add to published totals.
- (b) Prisoners who have had previous imprisonment in another State or Territory may not be counted as having prior imprisonment. Some states and territories may also include episodes on remand as prior imprisonment. See glossary of *Prisoners in Australia* (ABS Cat. no. 4517.0) for complete definition of prior imprisonment.
- (c) Excludes breaches of periodic detention orders greater than 3 months.
- (d) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre.
- (e) Includes prisoners whose prior imprisonment status is unknown.

(a) Due to perturbation, component cells may not add to published totals.

(b) Prisoners who have had previous imprisonment in another State or Territory may not be counted as having prior imprisonment. Some states and territories may also include episodes on remand as prior imprisonment. See glossary of *Prisoners in Australia* (ABS Cat. no. 4517.0) for complete definition of prior imprisonment.

(c) Excludes breaches of periodic detention orders greater than 3 months.

(d) Includes prisoners whose prior imprisonment status is unknown.

– Nil or rounded to zero. **np** Not published.

(a) Due to perturbation, component cells may not add to published totals. As such, published proportions may add to more or less than 100 per cent.

(b) Excludes offenders with a penalty notice as their principal method of proceeding (see Explanatory Notes), Cat. No. 4519.0.

(c) In some instances, Indigenous status was obtained by ACT Police without giving the offender the opportunity to self-identify. However, the proportion of records not obtained via self-identification was low, and the impact on the data was minimal (see ABS Explanatory Notes).

| Can easily get to places needed | 3.2 | 4.2 | 4.3 | 2.2 | 4.8 | 5.6 | 3.8 | 1.9 |
| Total persons aged 15 or over | – | – | – | – | – | – | – | – |

- (a) Unless otherwise indicated, data are for Aboriginal and Torres Strait Islander population aged 15 or over. Some data items in this table include 'not known' responses for consistency with the denominator as well as OID and published ABS tables.
- (b) Unless otherwise indicated, proportions are of the estimated total Aboriginal and Torres Strait Islander population aged 15 or over. Where another population is indicated, this has been used to calculate proportions.
- (c) Proportions calculated in relation to number of Aboriginal and Torres Strait Islander Australians aged 15 or over who identify with a clan group or language group.
- (d) People who were involved in cultural activities or ceremonies in the last 12 months
- (e) Proportions calculated in relation to number of Aboriginal and Torres Strait Islander Australians aged 15 or over who are employed.
- (f) Persons aged 15–19 years.
- .. Not applicable. **na** Not available. – Nil or rounded to zero.

12 Outcomes for Torres Strait Islander people¹

Box 12.1 Key messages

- Torres Strait Islander people are ethnically and culturally distinct from mainland Aboriginal people, and there is also great diversity in Torres Strait Islander communities, languages and traditions.
- Torres Strait Islander people live in the Torres Strait, but also on mainland Australia. While the majority of Torres Strait Islander people now live on the mainland, they often retain close ties with families and communities in the Torres Strait.
- Torres Strait Islander people are about one in ten of the Aboriginal and Torres Strait Islander population, with the majority living in Queensland. Torres Strait Islander people include people who identify as Torres Strait Islander only, and people who identified as both Aboriginal and Torres Strait Islander.
- Torres Strait Islander people have higher levels of Year 12 or equivalent attainment and comparable levels of post-secondary attainment compared to Aboriginal people. For Torres Strait Islander people, rates in very remote areas are comparable to those in regional areas while those for Aboriginal people decrease as remoteness increases.
- Rates of post-secondary attainment have increased over time for Torres Strait Islander people, with much of the growth in qualifications from Certificate III to Diploma level.
- However, this growth in Year 12 and post-secondary attainment does not appear to translate into better employment outcomes for Torres Strait Islander people, and the engagement of Torres Strait Islander people in the workforce has declined.
- Rates of home ownership are similar for Aboriginal people and Torres Strait Islander people nationally, but the rates of home ownership are lower for those in the Torres Strait Region.
- But for selected health indicators, Aboriginal and Torres Strait Islander people living in the Torres Strait Region appear to have a better quality of life than their peers on the mainland, with lower rates of substance use, long-term health conditions and psychological distress.

Torres Strait Islander people are a culturally distinct group with different histories, languages and colonial experiences from Aboriginal people. They are a separate people in origin, history and way of life, with many cultural connections to New Guinea and nearby islands (Pascoe 2018; AIATSIS 2008; Shnukal 2001). There is also great diversity in Torres Strait Islander communities, their languages and traditions.

¹ The Steering Committee notes its appreciation to Associate Professor Felecia Watkin Lui, James Cook University, who reviewed a draft of this section of the Report.

However, there are also similarities between Aboriginal people and Torres Strait Islander people. Similarities include connection to specific lands and waters, and clear principles and values that determine cultural and social responsibilities (Garvey 2007).

Torres Strait Islander people live in the Torres Strait, but also on mainland Australia. Torres Strait Islander people living on the mainland retain close ties with families and communities in the Torres Strait (Watkin Lui 2012; Watkin Lui et al. 2016).

This chapter compares results for Torres Strait Islander people on a national basis and considers their education, employment, home ownership and selected health outcomes relative to Aboriginal people. It also considers the outcomes of Aboriginal and Torres Strait Islander people living in the Torres Strait, and how these compare to Aboriginal and Torres Strait Islander people living on mainland Australia.

For those living in the Torres Strait there are some issues unique to such remote sea-locked islands, which are not considered in detail here but may affect the outcomes reported. For example, the:

- high costs associated with complex transportation arrangements for the region and the effect they have on the development of infrastructure and service delivery (TSRA 2019). This extra logistical expense is also passed on to the consumer, where the cost of necessities may exceed that on the mainland. When this issue is compounded by relatively low incomes, Aboriginal and Torres Strait Islander people who live on the Torres Strait Islands may have a higher cost of living and less disposable income
- level of reliance on resources and industries, such as fishing that are at risk from environmental degradation and climate change (Johnson and Welch 2016).

Torres Strait Islander people make up a very small proportion of the Australian population (0.3 per cent), making it difficult to report reliable data from sample surveys at a disaggregated level (ABS 2018). Hence, the majority of data in this chapter is drawn from the Census of Population and Housing (with the most recent data for 2016).

In this chapter, data reported for Torres Strait Islander people include people who identified as Torres Strait Islander only and people who identified as both Aboriginal and Torres Strait Islander. For comparison purposes, data for Aboriginal people in this chapter have been limited to people who identified as Aboriginal only.

Torres Strait Islander people are about one in ten of the Aboriginal and Torres Strait Islander population, with the majority living in Queensland

Of the estimated 650 000 people identified as being of Aboriginal and/or Torres Strait Islander origin in 2016, nearly 10 per cent identified as being of Torres Strait Islander origin.

In 2016, most Torres Strait Islander people lived outside of the Torres Strait Region (90 per cent); the majority lived in Queensland (63 per cent). The regions with the largest numbers of Torres Strait Islander people were Cairns-Atherton (15 per cent of all Torres Strait Islander people lived here), Brisbane (13 per cent) and Townsville-Mackay (12 per cent) (ABS 2016).

In 2016, about 17 per cent of the Torres Strait Islander population in Queensland lived in the Torres Strait Region (6489 people), representing 80 per cent of the population of the region². An additional 2 per cent of the population in the Torres Strait Region is of Aboriginal origin only (ABS 2018).

Rates of Year 12 or equivalent attainment and post-secondary educational attainment are increasing for Torres Strait Islander people

Year 12 or equivalent attainment rates have increased for Torres Strait Islander people from the 2011 Census to the 2016 Census. In 2016, 74 per cent of Torres Strait Islander people aged 20–24 years had Year 12 or an equivalent qualification, representing an increase of about five percentage points since 2011 (table 12A.1.12). In the Torres Strait Region, this level of attainment increased to 85 per cent (table 12A.1.12), despite the fact that the reduced availability of secondary-level education means that many students need to leave their community to attend secondary school (ABS 2018). Aboriginal people (aged 20–24 years) also had an increase in levels of attainment from 2011 to 2016, but the proportion remains lower at 64 per cent, and decreases as remoteness increases (table 12A.1.12).

Post-secondary education attainment rates have also increased for Torres Strait Islander people (aged 20–64 years), and are comparable nationally with rates for Aboriginal people (aged 20–64 years). In 2016, 39 per cent of Torres Strait Islander people and 38 per cent of Aboriginal people reported having qualifications at Certificate III level or above (figure 12.1). This followed increases in the attainment rates from 2011, though the increases came from different geographic areas. For Torres Strait Islander people, the largest proportional increase was for people in very remote areas (8 percentage points), while for Aboriginal people the largest increase was in major cities (9 percentage points) (figure 12.1).

² The Torres Strait Region (for Census purposes) includes the Torres Strait Islands, islands between Cape York and Papua New Guinea, and does not include Bamaga and Seisa (mainland Torres Strait Islander communities at the tip of Cape York).

Figure 12.1 **People aged 20–64 years with non-school qualifications at Certificate III level or above, by Aboriginal and Torres Strait Islander status, 2011 and 2016^a**

TSR = Torres Strait Region

Most of the growth in post-secondary educational attainment for Torres Strait Islander people can be attributed to growth in Certificate III to Diploma level qualifications

Most of the growth in post-secondary educational attainment for Torres Strait Islander people nationally can be attributed to growth in Certificate III to Diploma level qualifications (tables 12A.1.14-15). From 2011 to 2016 the growth was 6 percentage points (compared to less than 1 percentage point growth in the proportion with a Bachelor degree or above, and negative growth in remote areas). In 2016, Torres Strait Islander people had the highest rates of Certificate III to Diploma level attainment nationally (figure 12.2).

Figure 12.2 **People aged 20–64 years with Certificate III to diploma qualifications, by Indigenous status, 2016^a**

^a See table 12A.1.14 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) 2016 Census of Population and Housing; table 12A.1.14.

Despite growth in Year 12 and post-secondary education attainment, this does not appear to have translated into better employment outcomes for Torres Strait Islander people...

Increased attainment of Year 12 or equivalent and post-secondary qualifications does not appear to have translated into improved employment outcomes for Torres Strait Islander people (ABS 2018). In the same period as the attainment rate increased for Torres Strait Islander people (2011 to 2016), the employment rate decreased by 4 percentage points nationally, and by 19 percentage points in the Torres Strait Region (figure 12.3).

For Aboriginal people and non-Indigenous people, employment rates remained relatively unchanged from 2011 to 2016 (table 12A.1.17).

Employment data are affected by the replacement of the Community Development Employment Projects scheme (in operation in 2011) with the Community Development Program (in operation in 2016), and the associated change in classification of participants from employed to not employed (ABS 2018). This had a particular impact in remote areas where the schemes operated. A greater proportion of Torres Strait Islander people live in remote areas compared to Aboriginal and non-Indigenous people (ABS 2016). Therefore, a greater proportion of Torres Strait Islander people are likely to have been reclassified from employed in the 2011 Census to unemployed in the 2016 Census.

Figure 12.3 Employment rate for Aboriginal people and Torres Strait Islander people, aged 15–64 years, 2011 and 2016^a

^a See table 12A.1.17 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) 2016 and 2011 Census of Population and Housing; table 12A.1.17.

...and the engagement of Torres Strait Islander people in the workforce is also declining

Not only is the proportion of employed Torres Strait Islander people aged 15–64 years decreasing, but the proportion engaging with the workforce is also declining. The labour force participation rate³ of Torres Strait Islander people decreased by 3 percentage points on a national basis and by 16 percentage points in the Torres Strait Region between 2011 and 2016 (table 12A.1.17).

Decreases in participation in the labour force can occur when discouraged job seekers drop out of the workforce when there are limited opportunities available or when caring responsibilities limit their ability to participate in the workforce. This has been identified as a challenge for the Torres Strait Region, where a lack of opportunity (particularly in employment) can interfere with maintaining viable communities, as it can force people to move away from the region (TSRA 2009).

³ Includes those employed plus those who are not employed but actively looking for work.

Rates of home ownership are similar for Torres Strait Islander people and Aboriginal people nationally, but are lower for those in the Torres Strait Region

On a national basis, Torres Strait Islander people have comparable rates of home ownership to Aboriginal people, both at about 30 per cent. However, in the Torres Strait Region homeownership for Torres Strait Islander people was estimated to be 13 per cent in 2018-19 (table 12A.1.9). According to the Torres Strait Regional Authority, complex land tenure arrangements in the region and a lack of freehold land and long-tenure leasehold land remain challenges to increasing home ownership (TSRA 2019). Further, in the Torres Strait Region in 2016, around two in five Torres Strait Islander people were living in overcrowded housing (more than double the proportions for Aboriginal and non-Indigenous people) (table 12A.1.10).

But for selected health indicators, Aboriginal and Torres Strait Islander people living in the Torres Strait Region appear to have better outcomes than their peers on the mainland

While comparatively lower employment and home ownership rates persist as issues for Torres Strait Islander people in the Torres Strait Region, some health outcomes for Aboriginal and Torres Strait Islander people may be better in the Torres Strait Region than on the Australian mainland.

An analysis of 2018-19 survey data indicates that for Aboriginal and Torres Strait Islander people in the Torres Strait Region, compared with all Aboriginal and Torres Strait Islander people in Australia (as a proxy for the mainland Australia):

- the rate of substance use was lower (20 per cent compared with 29 per cent)
- the proportion with a self-assessed health status of fair or poor was lower (13 per cent compared to the 24 per cent) (see section 8.1 *Access to Primary Health Care*)
- the proportion reported as having high/very high levels of psychological distress was lower (24 per cent compared with 32 per cent)
- the proportion with a long-term health condition was lower (53 per cent compared with 67 per cent)
- rates of obesity, disability and smoker status were not statistically different (figure 12.4).

However, data were not available on access to primary health care, and access issues can result in undiagnosed and untreated conditions, especially if conditions are not well understood. Research indicates that there may be barriers to people in the Torres Strait Region in understanding and accessing treatment for chronic diseases, such as chronic hepatitis B and diabetes (Anderson, Ellard and Wallace 2016; Taylor, Thompson and McDermott 2016).

Figure 12.4 Selected survey responses for Aboriginal and Torres Strait Island people in the Torres Strait Region and all of Australia, 2018-19^{a,b}

^a Error bars are 95 per cent confidence intervals. ^b See table 12A.1.20 for detailed definitions, footnotes and caveats.

Source: ABS (2020) *National Aboriginal and Torres Strait Islander Health Survey 2018-19*, for small area estimates (Torres Strait Region) and ABS TableBuilder for national estimates; table 12A.1.20.

The effect of trauma on the members and descendants of the Stolen Generations is an important consideration for the health outcomes of Torres Strait Islander and Aboriginal people. For example, descendants of the Stolen Generations have a higher likelihood to; experience violence, make contact with the criminal justice system, have a low level of trust in the general community and generally poorer health outcomes (AIHW 2018). In 2018-19, 35 per cent of Torres Strait Islander people and 46 percent of Aboriginal people reported that they, or a relative, had been removed from their family at some point (table 12A.1.21). In the Torres Strait Region, 9 per cent of Aboriginal and Torres Strait Islander people reported an incident of removal, while on a national basis, this was closer to 45 per cent of all Aboriginal and Torres Strait Islander people (table 12A.1.21).

Future directions in data

Data collected on Torres Strait Islander people are generally grouped with data for Aboriginal people, despite the fact that Torres Strait Islander people are a culturally unique group. The disaggregation of data for Torres Strait Islander people in data collections would support further analysis on understanding why outcomes between Aboriginal people and Torres Strait Islander people may differ, particularly those observed between the Torres Strait Region and mainland Australia.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Estimates with an RSE of 25 per cent to 50 per cent should be interpreted with caution. Estimates with an RSE greater than 50 per cent are considered too unreliable for general use.

(c) Persons aged 18 years or over reporting personal income excludes not known and not stated.

(d) Data for 2017-19 are for the 15+ cohort and not directly comparable.

(e) Includes people who identified as being of both Aboriginal and Torres Strait Islander origin.

(f) Queensland includes the Torres Strait Region.

(g) Includes people who identified as being of Aboriginal origin only.

(b) Housing suitability (HOSD) is a derived item based on a comparison of the number of bedrooms in a dwelling with a series of household demographics, such as the number of usual residents, their relationship to each other, age and sex. The criteria are based on the Canadian National Occupancy Standard.

(c) "Torres Strait Islander people" includes people who identified as being of both Aboriginal and Torres Strait Islander origin.

(d) "Aboriginal people" includes people who identified as being of Aboriginal origin only.

(e) "Overcrowded" is defined as requiring one or more extra bedrooms with the current level of occupancy.

(f) Queensland includes the Torres Strait Region.

Note: Census data have been sourced by the Productivity Commission from TableBuilder.

RSE = Relative standard error. **CI** = Confidence interval.

(a) Long term health conditions are based on International Classification of Diseases (ICD). Data on long term health conditions from the ABS NATSISS (2008 and 2014-15) are based on a short module and are not comparable to data from the ABS health surveys which use the long module and provide a better estimate of prevalence.

(b) Includes people who identified as being of both Aboriginal and Torres Strait Islander origin.

(c) People who identified as being of Aboriginal origin only.

(d) Totals for Aboriginal and Torres Strait Islander people exclude a small number of people who were not present at interview and for whom responses were provided by a proxy.

(e) Based on scores from the modified Kessler Psychological Distress Scale (K5). Denominator for Psychological distress excludes not applicable and no score.

na Not available.

Note: 2018-19 NATSIHS and 2017-18 NHS data have been sourced by the Productivity Commission from TableBuilder.

(a) Cells in this table have been randomly adjusted by the ABS to avoid the release of confidential data. Discrepancies may occur between sums of the component items and totals.

(b) Australia total includes no usual address and migratory-offshore-shipping.

(c) Includes people who identified as being of Aboriginal origin only.

(d) People aged 20–24 years who have completed year 12 or Certificate II or above (includes 'Certificate I/II not further defined (nfd) and III/IV nfd' but excludes persons with a 'Certificate I and Certificate nfd' and people whose level of non-school qualification could not be determined).

(e) Total population of all people aged 20–24 years, excluding persons whose highest year of school completed and/or level of education was not stated.

(f) Includes people who identified as being of both Aboriginal and Torres Strait Islander origin.

np Not published.

Note: Census data have been sourced by the Productivity Commission from TableBuilder.

(a) Data for the Torres Strait region are extracted from the ABS' published "Small Area Estimates" by the Indigenous Regions geography. These modelled estimates use both the survey responses for NATSIHS, together with other information about the population of a geographic area gained from the Population Census and administrative data sources to build a predictive model that estimates a given characteristic for a small area. The term "small area" refers to a geographical area that is smaller than a state or territory, such as Indigenous Regions.

(b) The size of the population denominator can change depending on the demographic to which the question was administered (for example, 15 and over versus total population).

(c) These population estimates are not official estimates and were created solely for analysis of the NATSIHS modelled small area estimates and will not match other population data at the IREG or PHN geography level.

Note: Australia-wide 2018-19 NATSIHS data have been sourced by the Productivity Commission from TableBuilder.

A Population characteristics of Aboriginal and Torres Strait Islander people and their language use

This appendix provides contextual data on the population characteristics of Aboriginal and Torres Strait Islander and non-Indigenous people from the 2016 Census, to aid interpretation of data elsewhere in the Report. Also provided are 2016 Census data on the use of Aboriginal and Torres Strait Islander languages.

Aboriginal and Torres Strait Islander people account for about three per cent of the Australian population

There were an estimated 798 400 Aboriginal and Torres Strait Islander people in Australia at June 2016, accounting for 3.3 per cent of the total Australian population at that time (ABS 2018). The majority of Aboriginal and Torres Strait Islander people lived on the Eastern seaboard of Australia in 2016 (figure A.1).

Figure A.1 **Aboriginal and Torres Strait Islander people, by Indigenous region, June 2016^{a,b}**

^a The estimated number of Aboriginal and Torres Strait Islander Australians in the 37 ABS Indigenous regions as at June 2016. ^b See table A.2 for detailed definitions, footnotes and caveats.

Source: ABS (2019) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2006 to 2031*, Cat. no. 3238.0, Canberra; table A.2.

Nationally as at June 2016, around three in five Aboriginal and Torres Strait Islander people lived in either NSW (33 per cent) or Queensland (28 per cent). The proportions across other jurisdictions ranged from 1 per cent in the ACT to 13 per cent in WA (table A.3).

The majority of Aboriginal and Torres Strait Islander people live in major cities and regional areas — but a much higher proportion live in remote and very remote areas compared with non-Indigenous people

Like all Australians, the majority of Aboriginal and Torres Strait Islander people live in major cities and regional areas (figure A.2). Even so, a much higher proportion of Aboriginal and Torres Strait Islander people lived in remote and very remote areas (19 per cent, compared with 2 per cent of non-Indigenous people), and were spread more evenly across all remoteness areas than non-Indigenous people (figure A.2).

Figure A.2 Proportion of the population, by remoteness area and Indigenous status, June 2016^a

^a See table A.3 for detailed definitions, footnotes and caveats.

Source: ABS (2018) *Estimates of Aboriginal and Torres Strait Islander Australians, June 2016*, Cat. no. 3238.0.55.001; table A.3.

Aboriginal and Torres Strait Islander people as a proportion of the population differed across states and territories. The NT had the highest proportion (30 per cent) while Victoria had the lowest (1 per cent) (figure A.3).

Figure A.3 **Aboriginal and Torres Strait Islander people as a proportion of the population in each State and Territory, June 2016^a**

^a See table A.3 for detailed definitions, footnotes and caveats.

Source: ABS (2019) *Estimates of Aboriginal and Torres Strait Islander Australians*, Cat. no. 3238.0.55.001; table A.3.

The Aboriginal and Torres Strait Islander population is younger than the non-Indigenous population

The Aboriginal and Torres Strait Islander population has a younger age structure than the non-Indigenous population in Australia.¹ As at June 2016:

- 34 per cent of Aboriginal and Torres Strait Islander people were under 15 years old, compared with 18 per cent of non-Indigenous people (figure A.4)
- about 1 per cent of Aboriginal and Torres Strait Islander people were aged 75 years or over, compared with 7 per cent of non-Indigenous people (figure A.4)
- the median age (midpoint) of Aboriginal and Torres Strait Islander people was 23 years, compared with 38 years for non-Indigenous people (table A.1).

¹ Population estimates for Aboriginal and Torres Strait Islander people in this Report are based on 2016 Census of Population and Housing counts, adjusted for net undercount as measured by the ABS Post Enumeration Survey (ABS 2018).

^a See table A.1 for detailed definitions, footnotes and caveats.

Source: ABS (2018) *Estimates of Aboriginal and Torres Strait Islander Australians, June 2016*, Cat. no. 3238.0.55.001; table A.1.

At the time of the 2016 Census, one in ten Aboriginal and Torres Strait Islander people spoke an Aboriginal and Torres Strait Islander language at home

More than 250 Aboriginal and Torres Strait Islander languages, including 800 dialects, existed at the time of European settlement — but today only about 120 languages are still spoken (AIATSIS nd; DITRDC, AIATSIS and ANU 2020, 2020; Marmion, Obata and Troy 2014).

Languages are much more than a communication tool and are integral to maintaining the identity and strength of people and culture. When a language is no longer spoken it disconnects people from their past, and knowledge, traditions and cultures become harder to express and pass on (DITRDC, AIATSIS and ANU 2020). Aboriginal and Torres Strait Islander languages are no exception. The revitalisation and maintenance of Aboriginal and Torres Strait Islander languages is crucial to preserving and strengthening Aboriginal and Torres Strait Islander cultures, which is ultimately linked to the wellbeing of Aboriginal and Torres Strait Islander people (see section 5.5 *Indigenous language revitalisation and maintenance*).

According to the 2016 Census of Population and Housing, 10 per cent of Aboriginal and Torres Strait Islander people spoke an Aboriginal and Torres Strait Islander language at home (figure A.5). This proportion varied across states and territories. The NT had the

highest proportion (66 per cent), while Tasmania had the lowest (less than 1 per cent) (figure A.5).

Figure A.5 Language spoken at home by Aboriginal and Torres Strait Islander people, 2016^a

^a See table A.5 for detailed definitions, footnotes and caveats.

Source: ABS (unpublished) Census of Population and Housing 2016; table A.5.

The proportion of Aboriginal and Torres Strait Islander people who spoke an Aboriginal and Torres Strait Islander language at home also differed across remoteness areas and age groups. Very remote areas had the highest proportion of Indigenous language speakers (63 per cent), followed by remote areas (21 per cent), while less than 2 per cent of Aboriginal and Torres Strait Islander people in major cities or regional areas spoke an Indigenous language at home (figure A.6).

The majority of Aboriginal and Torres Strait Islander people who spoke an Indigenous language at home also spoke English well or very well (85 per cent). However, 11 per cent of Indigenous language speakers said they did not speak English well or at all — ranging from about 3–4 per cent in major cities and inner regional areas, to 13 per cent in very remote areas (figure A.7).

Improving quality of, and access to, data for assessing local needs and planning local solutions is a key future development for data on Aboriginal and Torres Strait Islander people

Like all Australians, the needs of Aboriginal and Torres Strait Islander people are diverse, differing across communities and regions. Access to reliable data is vital for shared decision-making. Reliable data that are easily accessed and understood empower communities to advocate for their needs, and assist governments and others to make more informed decisions and improve efficiency and accountability (PC 2017, p. 61).

Initiatives to provide Aboriginal and Torres Strait Islander people with improved access to, use of and oversight of, databases containing information about themselves and their ancestors contribute to addressing this need (section 5.4 *Case studies in governance*).

However, existing data sets are limited in their effectiveness for smaller regions in several ways. For example, large data sets can:

- under-identify Aboriginal and Torres Strait Islander people and capture only relatively homogenous information
- provide information that is reliable only at higher levels of aggregation and not necessarily relevant for particular communities or regions, even where the data are specific to Aboriginal and Torres Strait Islander people.

Furthermore, large data sets are not always easily accessible in formats that can be readily understood, while data for small areas are often subject to confidentiality requirements which limits the available data².

Shared access to data and information at a regional level is one of the priority reform areas in the National Agreement on Closing the Gap. This includes shared access to location-specific data and information, recognising that disaggregated data and information is most useful to Aboriginal and Torres Strait Islander organisations and communities for local decision-making (Australian Government and Coalition of Peaks 2020).

Attachment tables

Attachment tables are identified in references throughout this appendix by an ‘A’ prefix (for example, ‘table A.2’). These tables can be found on the web page (www.pc.gov.au/oid2020).

| Total | % | 100.0 | 100.0 | 100.0 |

(a) Some states and territories do not have all five remoteness classifications.

(b) For confidentiality purposes, the outer regional and remote areas of Victoria have been combined.

(c) Tasmania does not have major cities areas. For confidentiality purposes, the remote and very remote area have been combined.

(d) For the ACT, major cities and the inner regional areas have been combined. The ACT does not have outer regional, remote or very remote areas.

(e) The NT does not have major cities or inner regional areas.

(a) Survey data are reported in units of '000. No reliance should be placed on small cells and component cells may not sum to the total.

(b) See table A.7 for the relative standard error (RSE) for each estimate/proportion. Estimates/proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates/proportions with an RSE greater than 50 per cent (or where the RSE is reported with an 'np') are considered too unreliable for general use.

(c) Excludes persons aged less than 2 years.

(d) Includes cases where proficiency in English is not known and those persons who do not speak English.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use and have not been published.

(b) Excludes persons aged less than 2 years.

(c) Includes cases where proficiency in English is not known and those persons who do not speak English.
— Nil or rounded to zero. **np** Not published.
