(a) An income quintile is derived by ranking the population from lowest to highest income, and dividing it into five equal groups. The lowest quintile is made up of the 20 per cent of the population with the lowest incomes.

(b) Data excludes 'all incomes not stated' and 'partial incomes'.

(c) Quintile 1 includes households with Negative or Nil Income.

(d) Comprises households where at least one usual resident at home on Census night was of Aboriginal and/or Torres Strait Islander origin.

(e) Total includes Migratory/Offshore/Shipping areas.

(f) Australia total includes Other Territories.

.. Not applicable. – Nil or rounded to zero.

Source: ABS (unpublished) derived from the 2006 Census of Population and Housing.

(a) An income quintile is derived by ranking the population from lowest to highest income, and dividing it into five equal groups. The lowest quintile is made up of the 20 per cent of the population with the lowest incomes.

(b) Data excludes 'all incomes not stated' and 'partial incomes'.

(c) Quintile 1 includes households with Negative or Nil Income.

(d) Comprises households where at least one usual resident at home on Census night was of Aboriginal and/or Torres Strait Islander origin.

(e) Total includes Migratory/Offshore/Shipping areas.

(f) Australia total includes Other Territories.

.. Not applicable. – Nil or rounded to zero.

Source: ABS (unpublished) derived from the 2001 Census of Population and Housing.

TABLE 4A.10.1

**Table 4A.10.1 Children (aged 0–17 years) in substantiations, by Indigenous status, by State and Territory, 2009-10 to 2012-13 (number and rate per 1000 children) (a), (b), (c)**

	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas (d)</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
(a) For 2009-10 onwards, rates of children in substantiations are calculated as the number of children aged 0–17 years (including children whose ages were not stated) divided by the estimated population of children aged 0–17 years at 31 December, multiplied by 1000. For Indigenous children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Prior to 2009-10, rates of children in substantiations were calculated as the number of children aged 0–16 years (see table 4A.10.2).									
(b) A separate unknown Indigenous status category is reported. Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.									
(c) In June 2013, the ABS 'recast' the historical Estimated Resident Population data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.									
(d) Tasmania: For 2010-11, the proportion of substantiations for children of unknown Indigenous status impacts the reliability of these data. As such, any comparisons of the Indigenous status breakdown to previous years should be made with caution. – Nil or rounded to zero.

- (a) Prior to 2009-10, rates of children in notifications, investigations and substantiations were calculated as the number of children aged 0–16 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0–16 years at 31 December, multiplied by 1000. For Indigenous children, the June projections for two years were averaged to obtain a population figure for December of the relevant year.
- (b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category.
- (c) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.
- (d) Victoria: During 2006-07, Victoria introduced a major new data system. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with previous years data.

na Not available. – Nil or rounded to zero.

(a) If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.

TABLE 4A.10.3

**Table 4A.10.3 Children (aged 0–17 years) who were the subject of a substantiation, by type of abuse or neglect, by State and Territory, 2009-10 to 2012-13 (proportion and rate per 1000) (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust (d)</i>
<p>(b) Rates of children in substantiations are calculated as the number of children aged 0-17 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0-17 years at 31 December, multiplied by 1000. For Indigenous children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Prior to 2009-10, rates of children in notifications, investigations and substantiations were calculated as the number of children aged 0–16 years (see table 4A.10.4).</p> <p>(c) In June 2013, the ABS 'recast' the historical Estimated Resident Population data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.</p> <p>(d) Totals for 2012-13 may not equal totals in other tables (which are sourced directly from Australian State and Territory Governments).</p> <p>(e) A separate unknown Indigenous status category is reported. Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category.</p> <p>(f) Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.</p> <p>– Nil or rounded to zero.</p>

- (a) If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.
- (b) Other children are non-Indigenous plus unknown Indigenous status.
- (c) Rates of children in substantiations are calculated as the number of children aged 0-16 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0-16 years at 31 December, multiplied by 1000. For Indigenous children, the June projections for two years were averaged to obtain a population figure for December of the relevant year.
- (d) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.
- (e) Victoria: During 2006-07, Victoria introduced a major new data system. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with previous years data.

TABLE 4A.10.5

**Table 4A.10.5 Children (aged 0–17 years) on care and protection orders, by Indigenous status, by State and Territory, at 30 June 2003 to 2013 (number and rate per 1000 children) (a), (b), (c)**

	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>WA (e)</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
<b>2003-04</b>									
Children aged 0–17 years on care and protection orders at 30 June 2004									
Number of children									
Indigenous	na	574	1 146	583	275	83	53	230	2 944
Non-Indigenous	na	4 677	3 804	1 056	1 180	551	300	115	11 683
Rate per 1000 children aged 0–17 years at 30 June 2004									
Indigenous	na	32.1	15.9	17.0	20.0	8.9	21.3	8.6	11.3
Non-Indigenous	na	4.1	4.3	2.3	3.5	5.1	4.0	3.4	2.6

- (a) Rates of children on care and protection orders were calculated as the number of children aged 0–17 years (including children whose ages were not stated) who were on a care and protection order at 30 June, divided by the estimated population aged 0–17 at 30 June, multiplied by 1000.
- (b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported. Rates are not able to be calculated for children of unknown Indigenous status as corresponding population data are not available.
- (c) In June 2013, the ABS 'recast' the historical Estimated Resident Population data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.
- (c) Victoria: During 2006-07, Victoria introduced a major new data system. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with previous years data.
- (d) WA: Implementation of the Children and Community Services Act 2004 in March 2006 required the legal status of children in care to be reviewed and Protection Orders were sought for a number of children already in care but not under care and protection orders. WA is currently unable to report a child's characteristics based on his or her first substantiation. As a result, a small number of children might be double counted in this table where there has been more than one substantiation and these notifications had differing characteristics such as age or abuse type. Children on care applications are included in the category 'interim and temporary orders'. Specifically, in WA, the application for a care and protection order to be issued for a child is counted as an interim order for national reporting purposes. However, no order is actually issued during this stage. It is thus not valid to compare the number of orders on a percentage basis.

na Not available. – Nil or rounded to zero.

- (a) Data prior to 2004 on children in out-of-home care include the following categories of children even if they do not meet the definition of 'out-of-home care': wards, children under a guardianship order, protected persons (including overseas adoptees) and pre-adoption placements.
- (b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported.
- (c) The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer.
- (d) Rates of children during the year were calculated as the number of children aged 0–17 years (including those whose age was not stated) at 31 December, multiplied by 1000. For Indigenous children, the June projections for two years were averaged to obtain a population figure for December of the relevant year. Rates of children at 30 June, were calculated as the number of children aged 0–17 years (including those whose age was not stated) divided by the estimated population aged 0–17 at 30 June, multiplied by 1000.
- (e) In June 2013, the ABS 'recast' the historical Estimated Resident Population data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS revised Indigenous estimates and projections data for 2001 to 2026. As a result, the rates per 1000 children have been revised.
- (f) NSW: In NSW, payments are made to relative/kin carers as well as foster carers. Relative/kin carers care for many children who are not on an order.

**Table 4A.10.6 Children (aged 0–17 years) in out-of-home care, by Indigenous status, by State and Territory, 2003-04 to 2012-13 (number and rate per 1000 children) (a), (b), (c), (d), (e)**

	NSW (f)	Vic (g)	Qld	WA	SA	Tas (h)	ACT	NT (i)	Aust
(g) Victoria: The foster care category for Victoria includes children on permanent care orders where carers are in receipt of foster care payment and children in individually tailored home-based arrangements. During 2006-07, Victoria introduced a major new data system, which will be rolled out across the State by mid-2008. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with data from previous years.									
(h) Tasmania: The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer. Tasmania is not able to adhere to this definition of out-of-home care. However, the number of carers declining a financial payment is likely to be low. The number of children in out-of-home care as at 30 June 2007 is not comparable to that reported for previous years for Tasmania because of exclusion of a cohort of children who did not meet the definition of out-of-home care.									
(i) NT: Improvement in data quality in 2008-09 resulted in a more accurate count of children in out of home care. The number of children reported to be in out-of-home care in 2007-08 was likely to be undercounted.

- (a) The denominator for calculating the proportion of children excludes Indigenous children living independently and those whose living arrangements were unknown.
- (b) Prior to 2009-10, children of unknown Indigenous status were reported in the non-Indigenous status category. For 2009-10 onwards, a separate unknown Indigenous status category is reported.
- (c) The scope for out-of-home care was expanded in 2007-08 to include children in care where a financial payment was offered but was declined by the carer.
- (d) Residential care includes family group homes.
- (e) Victoria: During 2006-07, Victoria introduced a major new data system, which was progressively rolled out across the State. In parallel, the Children, Youth and Families Act 2005 which commenced in April 2007, introduced new service pathways and processes in Victorian Child Protection and Family Services to support earlier intervention and prevention for vulnerable children and their families. Due to these new service and data reporting arrangements, Victorian child protection data for 2006-07 onwards may not be fully comparable with data for previous years.
- (f) Queensland: There may be some children in the category residential care/independent living who had Indigenous caregivers in facility-based care.
- (g) WA: A small number of children are placed with externally managed foster carers who are also their relative and have been recorded in the foster care category.
- (h) SA: During 2012-13, SA changed databases, which resulted in a data recording issue leading to an undercount of children placed in compliance with the Aboriginal Child Placement Principle. Due to these data issues, SA child protection data for this indicator for 2012-13 is likely to be incorrect and cannot be reliably compared with data for previous years.

TABLE 4A.10.7

Table 4A.10.7 **Indigenous children in out-of-home care by relationship of caregiver, by State and Territory, at 30 June 2004 to 2013 (number and proportion) (a), (b), (c), (d)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (e)</i>	<i>Qld (f)</i>	<i>WA (g)</i>	<i>SA (h)</i>	<i>Tas</i>	<i>ACT</i>	<i>NT (i)</i>	<i>Aust</i>
--	-------------	------------	----------------	----------------	---------------	---------------	------------	------------	---------------	-------------

(i) NT: In the NT, children placed with family members have been included in the 'Indigenous relative/kin' category. Improvement in data quality in 2008-09 resulted in a more accurate count of children in out-of-home care. The number of children in out-of-home care reported in 2007-08 was likely to be undercounted. Due to realignment of placement types to ensure better data integrity, data for the financial year 2012-13 may not be comparable with data provided for previous financial years.

**na** Not available. .. Not applicable. – Nil or rounded to zero.

(a) Estimates with a Relative Standard Error (RSE) of 25 to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) In non-remote areas of the National Aboriginal and Torres Strait Islander Social Survey in order for a person to be a victim of physical or threatened violence, the threat must have been made 'in person'. This concept of 'in person' is not overt in the question used in remote areas of the National Aboriginal and Torres Strait Islander Social Survey.

**RSE** = Relative standard error. **CI** = Confidence interval.

- (a) Estimates with a Relative Standard Error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) In the General Social Survey and non-remote areas of the National Aboriginal and Torres Strait Islander Social Survey in order for a person to be a victim of physical or threatened violence, the threat must have been made 'in person'. This concept of 'in person' is not overt in the question used in remote areas of the National Aboriginal and Torres Strait Islander Social Survey.
- (c) Includes all people aged 18 years and over.
- (d) Includes not stated.
- (e) Non-Indigenous data from the General Social Survey for 2006 are used to compare with Indigenous data for 2008.

**na** Not available.

(a) Counts of Kidnapping/abduction may be inflated slightly because 'deprivation of liberty' (which is out of scope for this collection) is not separately identifiable on NSW Police recording system; therefore counts of this offence type are also included in the kidnapping/abduction offence category.

(b) Calculated using experimental estimates of the Indigenous population based on the 2011 Census of Population and Housing.

(c) Calculated using 2011 Census of Population and Housing, less experimental projections of the Indigenous population.

(d) Rate ratio is the Indigenous rate divided by the non-Indigenous rate.

(d) Excludes driving causing death.

.. Not applicable. – Nil or rounded to zero.

(a) Calculated using experimental estimates of the Indigenous population based on the 2011 Census of Population and Housing.

(b) The victim has identified/been identified as neither Aboriginal nor Torres Strait Islander. Rate calculated using 2011 Census of Population and Housing, less experimental projections of the Indigenous population.

(c) Rate ratio is the Indigenous rate divided by the non-Indigenous rate.

(d) Includes victims for whom sex was not specified.

<b>All ages (e)</b>	<b>284.1</b>	<b>743.2</b>	<b>517.3</b>	<b>10.0</b>	<b>21.8</b>	<b>15.9</b>	<b>28.3</b>	<b>34.2</b>	<b>32.6</b>

(a) Data are from public and private hospitals in all jurisdictions.

(b) Non-fatal refers to records where the mode of separation was not equal to 'died'. Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member. These are the fifth digit details of ICD-10-AM codes for assault X85–Y09, where the relationship of the perpetrator to the victim is spouse/domestic partner, 0; parent, 1; other family member 2. Hospitalisations were based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(c) Non-Indigenous includes hospitalisations where Indigenous status was recorded as non-Indigenous and for WA only where Indigenous status was not stated.

(d) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(e) Rates per 100 000 population, directly age standardised using the 2001 Australian population.

2006-07	206.4	601.6	407.8	11.7	20.5	16.1	17.6	29.4	25.3
2005-06	205.4	562.5	386.5	11.3	21.3	16.3	18.2	26.4	23.7
2004-05	206.9	564.5	390.3	10.0	21.1	15.5	20.7	26.8	25.1

(a) Non-fatal refers to records where the mode of separation was not equal to 'died'. Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member. These are the fifth digit details of ICD-10-AM codes for assault X85–Y09, where the relationship of the perpetrator to the victim is spouse/domestic partner, 0; parent, 1; other family member 2. Hospitalisations were based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Data are for public and private hospitals in all jurisdictions. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality.

(c) Other' includes hospitalisations where Indigenous status was recorded as non-Indigenous or not stated.

(d) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the 'other Australians' hospitalisation rate (which includes Indigenous status not reported).

(e) Rates per 100 000 population, directly age standardised using the 2001 Australian population.

(f) From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. Data are for residents of these jurisdictions, and exclude separations from private hospitals in the NT.

.. Not applicable.

Source: AIHW (unpublished) National Hospital Morbidity Database.

TABLE 4A.11.24

Table 4A.11.24      **Non-fatal hospitalisation rate (per 100 000 population) (age standardised) for family violence related assaults, by Indigenous status, by remoteness, 2012-13 (a), (b), (c)**

	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	<i>Rate ratio (e)</i>
Major cities	197.1	14.4	13.7
Inner and outer regional	245.8	18.4	13.3
Remote and Very Remote	1 510.6	35.9	42.1

- (a) Data are from public and private hospitals in all jurisdictions. Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.
- (b) Non-fatal refers to records where the mode of separation was not equal to 'died'. Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Family violence related assaults include assaults by a spouse/domestic partner, parent or other family member.
- (c) Rates per 100 000 population are calculated using ABS Estimated Resident Population for 2012 by remoteness classification from the 2011 Census (as at 30 June 2012). Rates were directly age standardised to the 2001 Australian population.
- (d) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only those for whom Indigenous status was not stated.
- (e) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

Source: AIHW (unpublished) National Hospital Morbidity Database.

**Non-Indig.** = Non-Indigenous.

- (a) Data are from public and private hospitals in all jurisdictions. Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.
- (b) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.
- (c) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Non-fatal refers to records where the mode of separation was not equal to 'died'. Hospitalisations were based on ICD-10-AM codes for assault X85–Y09.
- (d) Rates per 100 000 population are calculated using calculated using ABS Estimated Resident Population for 2012 by remoteness classification from the 2011 Census (as at 30 June 2011). Rates were directly age standardised to the 2001 Australian population.

Table 4A.11.26      **Non-fatal hospitalisations for assault, by Indigenous status, by remoteness, by relationship of victim to perpetrator, 2012-13 (a), (b)**

	<i>Hospitalisations (no.)</i>		<i>Rate per 100 000 (c)</i>		<i>Rate ratio (e)</i>
	<i>Indig.</i>	<i>Non-Indig. (d)</i>	<i>Indig.</i>	<i>Non-Indig. (d)</i>	

(e) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(f) Other assaults includes assault by a carer, acquaintance or friend, official authorities, other specified person, person unknown to the victim, multiple people unknown to the victim or an unspecified person.

(g) As more than one external cause can be reported for each hospitalisation, the totals are not the sum of the rows of the table.

TABLE 4A.11.27

Table 4A.11.27     **Non-fatal hospitalisations for assault, by Indigenous status, by sex, 2012-13 (a), (b)**

	<i>Hospitalisations (no.)</i>		<i>Rate per 100 000 (c)</i>		<i>Rate ratio (e)</i>
	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	

(a) Data are from public and private hospitals in all jurisdictions.

(b) Non-fatal refers to records where the mode of separation was not equal to 'died'. Hospitalisations were based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(c) Rates per 100 000 population, directly age standardised using the 2001 Australian population.

(d) 'Non-Indigenous' includes hospitalisations where Indigenous status was recorded as non-Indigenous and for WA only also includes not stated.

(e) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.

(f) As more than one external cause can be reported for each hospitalisation, the totals are not the sum of the rows of the table.

Y08–Y09: specified and unspecified means	202	591	85.4	11.4	7.5
Remote and Very remote					
Total assault (X85–Y09) (f)	4 109	615	2 917.1	161.9	18.0
X97–Y00: includes by smoke, fire, sharp/blunt objects	1 740	132	1 254.5	33.8	37.1
Y04: assault by bodily force	1 808	376	1 264.9	99.8	12.7
Y05: sexual assault by bodily force	38	9	26.1	2.4	11.1
Y06: neglect and abandonment	35	2	23.7	0.7	34.6
Y07: other maltreatment	38	8	23.0	2.3	9.9
Y08–Y09: specified and unspecified means	559	81	396.3	21.1	18.7

TABLE 4A.11.28

Table 4A.11.28 **Non-fatal hospitalisations for assault, by Indigenous status, by remoteness, 2012-13 (a), (b)**

	<i>Hospitalisations (no.)</i>		<i>Rate per 100 000 (c)</i>		<i>Rate ratio (e)</i>
	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	
(a)	Data are from public and private hospitals in all jurisdictions. Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.				
(b)	Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Non-fatal refers to records where the hospitalisation was not equal to 'died'.				
(c)	'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.				
(d)	Rates per 100 000 population are calculated using ABS Estimated Resident Population for 2012 by remoteness classification from the 2011 Census (as at 30 June 2011). Rates were directly age standardised to the 2001 Australian population.				
(e)	Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous Australians' hospitalisation rate.				
(f)	As more than one external cause can be reported for each hospitalisation, the totals are not the sum of the rows of the table.

TABLE 4A.11.29

Table 4A.11.29 **Homicide deaths, Indigenous crude rates (per 100 000 population), by sex, NSW, Queensland, WA, SA and the NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g)**

	<i>Males</i>	<i>Females</i>	<i>People</i>
<b>Homicide deaths (number)</b>			
NSW	25	5	30
Qld (h)	23	15	38
WA (i)	28	26	54
SA	8	7	15
NT	30	22	52
<b>NSW, Qld, WA, SA, and the NT</b>	<b>114</b>	<b>75</b>	<b>189</b>
<b>Crude death rate (per 100 000) (j)</b>			
NSW	4.9	1.0	2.9
Qld (h)	5.0	3.2	4.1
WA (i)	13.0	11.9	12.4
SA	8.8	7.6	8.2
NT	17.5	12.9	15.2
<b>NSW, Qld, WA, SA, and the NT</b>	<b>7.9</b>	<b>5.1</b>	<b>6.5</b>
<b>Variability bands (±)</b>			
NSW	4.3	1.9	2.3
Qld (h)	4.6	3.7	2.9
WA (i)	10.8	10.2	7.4
SA	13.6	12.6	9.3
NT	14.0	12.0	9.3
<b>NSW, Qld, WA, SA, and the NT</b>	<b>3.2</b>	<b>2.6</b>	<b>2.1</b>

- (a) Deaths from homicide are defined as causes of death with ICD-10 codes X85–Y09 and Y87.1.
- (b) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in *Causes of Death, Australia, 2010* (cat. 3303.0) and Causes of Death Revisions, 2010 and 2011 in *Causes of Death, Australia, 2012* (cat. 3303.0).
- (c) Data cells with small values have been randomly assigned to protect the confidentiality of individuals. As a result, some totals will not equal the sum of their components. It is important to note that cells with a zero value have not been affected by confidentialisation.
- (d) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (e) Data based on reference year.
- (f) Data on deaths of Aboriginal and Torres Strait Islander people are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.
- (g) Data are reported individually by jurisdiction of residence for NSW, Qld, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis. Total includes data for NSW, Qld, WA, SA and the NT only.

TABLE 4A.11.29

Table 4A.11.29     **Homicide deaths, Indigenous crude rates (per 100 000 population), by sex, NSW, Queensland, WA, SA and the NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g)**

	<i>Males</i>	<i>Females</i>	<i>People</i>
(h)	Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.		
(i)	Aboriginal and Torres Strait Islander data for Western Australia were not published in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0). This adjusted data has been included in this table.		
(j)	Crude rates calculated per 100 000 Estimated Resident Population for the mid-point year. Crude rates cannot be compared across years. Crude rates cannot be compared to age standardised rates. Denominators used in the calculation of rates for the Indigenous population are <i>Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians</i> (ABS Cat. no. 3238.0).

(a) Deaths from homicide are defined as causes of death with ICD-10 codes X85–Y09 and Y87.1.

(b) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in *Causes of Death, Australia, 2010* (Cat. no. 3303.0) and Causes of Death Revisions, 2010 and 2011 in *Causes of Death, Australia, 2012* (Cat. no. 3303.0).

(c) Data based on reference year.

(d) Data are presented in five-year groupings due to the volatility of small numbers each year.

(e) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(f) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.

(g) Denominators used in the calculation of rates for the Indigenous population are *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians* (ABS Cat. no. 3238.0). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

TABLE 4A.11.31

Table 4A.11.31 **Homicide death rates (per 100 000 population) (age standardised) by Indigenous status, by sex, NSW, Queensland, WA, SA, and the NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Males</i>	<i>Females</i>	<i>People</i>	<i>Males</i>	<i>Females</i>	<i>People</i>
(i)	Data on deaths of Aboriginal and Torres Strait Islander people are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.					
(j)	Aboriginal and Torres Strait Islander data for Western Australia were not published in <i>Causes of Death, Australia, 2010</i> (Cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in <i>Causes of Death, Australia, 2010</i> (Cat. no. 3303.0). This adjusted data has been included in this table.					

**np** Not published.

(a) Deaths from homicide are defined as causes of death with ICD-10 codes X85–Y09 and Y87.1.

TABLE 4A.11.33

Table 4A.11.33 **Homicide death rates (per 100 000 population) (crude rates), by Indigenous status, by age, NSW, Queensland, WA, SA and the NT, 2008–2012 (a), (b), (c), (d), (e), (f)**

	Indigenous (g)				Non-Indigenous			
	Under 25	25–34	35–44	45 and over (h)	Under 25	25–34	35–44	45 and over (h)
(b)	All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in <i>Causes of Death, Australia, 2010</i> (Cat. no. 3303.0) and Causes of Death Revisions, 2010 and 2011 in <i>Causes of Death, Australia, 2012</i> (Cat. no. 3303.0).							
(c)	Data based on reference year.							
(d)	Data are presented in five-year groupings due to the volatility of small numbers each year.							
(e)	Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(f)	Data are reported individually by jurisdiction of residence for NSW, Qld, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis. Total includes data for NSW, Qld, WA, SA and the NT only.							
(g)	Data on deaths of Aboriginal and Torres Strait Islander people are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.							
(h)	Includes age not stated.							
(i)	Data cells with small values have been randomly assigned to protect the confidentiality of individuals. As a result, some totals will not equal the sum of their components. It is important to note that cells with a zero value have not been affected by confidentialisation.							
(j)	Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.							
(k)	Aboriginal and Torres Strait Islander data for Western Australia were not published in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0). This adjusted data has been included in this table.							

TABLE 4A.11.33

Table 4A.11.33 **Homicide death rates (per 100 000 population) (crude rates), by Indigenous status, by age, NSW, Queensland, WA, SA and the NT, 2008–2012 (a), (b), (c), (d), (e), (f)**

	<i>Indigenous (g)</i>				<i>Non-Indigenous</i>			
	<i>Under 25</i>	<i>25–34</i>	<i>35–44</i>	<i>45 and over (h)</i>	<i>Under 25</i>	<i>25–34</i>	<i>35–44</i>	<i>45 and over (h)</i>

(l) Crude rates calculated per 100 000 Estimated Resident Population for the mid-point year. Crude rates cannot be compared across years. Crude rates cannot be compared to age standardised rates. Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

**np** Not published.

(a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change.

(b) Victims are either Aboriginal and/or Torres Strait Islander.

(c) Victims not Indigenous or Indigeneity was not identified. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders. Excludes victims whos Indigeneity is unknown.

(d) All victims - includes victims where Indigeneity is unknown.

– Nil or rounded to zero.

(a) Remoteness area of homicide based on ABS postal area to remoteness area concordance 2001 [ABS Cat. No. 9921.0].

(b) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change.

(c) Excludes cases where Indigenous status of victim is unknown or remoteness area of homicide incident is unknown.

(d) Victims and offenders are either Aboriginal and/or Torres Strait Islander. Includes victims of multiple offenders where the primary offender (based on AIC NHMP incident classification) is Aboriginal and/or Torres Strait Islander.

(e) Victims and offenders are not Indigenous. Non-Indigenous includes Caucasian, Asian and Maori/Pacific Islanders. Includes victims of multiple offenders where the primary offender (based on AIC NHMP classification) is neither Aboriginal nor Torres Strait Islander.

TABLE 4A.11.36

		<i>Indigenous victims (d)</i>			<i>Non-Indigenous victims (e)</i>			<i>Total victims</i>	
		<i>rate per</i>			<i>rate per</i>				
<i>Unit</i>	<i>no.</i>	<i>%</i>	<i>100 000 (f)</i>		<i>no.</i>	<i>%</i>	<i>100 000 (f)</i>	<i>no.</i>	<i>%</i>
(f) Population denominators for remoteness areas have been derived by applying the proportions of Indigenous people living in each remoteness area to experimental estimates and projections (low series) of the Indigenous population published by the ABS. Non-Indigenous denominators have been derived by applying proportions of non-Indigenous people in each remoteness area to non-Indigenous population estimates derived by subtracting ABS Indigenous population projections from the ABS total Estimated Resident Population for each year. Therefore, data should be used with caution.									
(g) Australian total includes one incident occurring in an external Australian territory (Norfolk Island).									
– Nil or rounded to zero. <b>na</b> Not available.

(a) Homicide includes murder and manslaughter, but excludes driving causing death. Data reflect information available at the time of reporting and are subject to change. Excludes missing information.

(b) Table reflects Indigenous status and selected comparative statistics of primary victims and offenders (based on AIC NHMP incident classification) for incidents with multiple victims and/or offenders.

(c) Both victims and offenders are either Aboriginal and/or Torres Strait Islander.

(d) Neither victims nor offenders are Indigenous. Includes victims and offenders who are Caucasian, Asian and Maori/Pacific Islanders.

(e) Inter-racial homicides where either the victim or the offender is Indigenous (including homicides involving an Indigenous offender and a non-Indigenous victim, and a non-Indigenous offender and an Indigenous victim).

– Nil or rounded to zero.

TABLE 4A.11.44

Table 4A.11.44 **Rate (per 10 000 population) of clients (aged 10 years and over) escaping family violence, by Indigenous status, by sex, by State and Territory, 2011-12 and 2012-13 (a), (b)**

<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust (c)</i>	<i>Aust Total (number) (d)</i>
<p>(a) Per 10 000 population aged 10 years or over shows how many Indigenous and non-Indigenous people out of every 10 000 Indigenous and non-Indigenous people aged 10 years or over in the population of that sex became SHSC clients. The rate is estimated by comparing the number of Indigenous and non-Indigenous SHSC clients aged 10 years or over with the estimated resident Indigenous and non-Indigenous population aged 10 years or over with the designated sex as at 30 June 2011. Data are adjusted for non-response.</p> <p>(b) Clients escaping family violence include males and females who stated domestic violence as a reason for seeking assistance and/or needed, were provided with, or were referred on for domestic violence counselling or support.</p> <p>(c) The number of clients within a State or Territory relates to clients who ever received assistance from a SHS agency in that State or Territory. Since a client may have support periods in more than one State or Territory, state and territory figures do not sum to the national figure.</p> <p>(d) Sum of components may not add to total due to rounding.</p> <p>(e) Numbers excluded due to errors and omissions in 2012–13: 11 428 males, 20 617 females.</p> <p>(f) Numbers excluded due to errors and omissions in 2011–12: 10 613 males, 19 892 females.</p> <p>.. Not applicable.</p>

(a) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and National data reflect the age scope that applied to these jurisdictions in the relevant years.

(b) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

(a) Crude means the rates have not been age standardised; thus, they do not take into account the different age structures of the Indigenous and non-Indigenous populations.

TABLE 4A.12.3

Table 4A.12.3      **Indigenous crude imprisonment rates per 100 000 adult population, by sex, by State and Territory, 2000 to 2013 (a), (b), (c)**

	NSW (d)	Vic	Qld	WA	SA	Tas	ACT (d)	NT	Aust (d)
(b)	In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS 'recast' the historical estimates for Aboriginal and Torres Strait Islander populations. As a result, the rates per 100,000 adult persons in this table have been recast, and all now use final ERP data based on the 2011 Census of Population and Housing.								
(c)	In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and National data reflect the age scope that applied to these jurisdictions in the relevant years.								
(d)	Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.								
	– Nil or rounded to zero.

(a) Age-standardised to the 2001 Australian population.

TABLE 4A.12.4

Table 4A.12.4      **Age standardised imprisonment rates per 100 000 adult population, by Indigenous status, by State and Territory, 2000 to 2013 (a), (b), (c)**

	NSW (d)	Vic (e)	Qld	WA	SA	Tas (f)	ACT (g)	NT	Aust
--	---------	---------	-----	----	----	---------	---------	----	------

(b) In June 2013, the ABS 'recast' the historical ERP data for the September 1991 to June 2011 period, as a response to a methodological improvement in the Census Post Enumeration Survey. In April 2014, the ABS 'recast' the historical estimates for Aboriginal and Torres Strait Islander populations. As a result, the rates per 100,000 adult persons in this table have been recast, and all now use final ERP data based on the 2011 Census of Population and Housing.

(c) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and National data reflect the age scope that applied to these jurisdictions in the relevant years.

(d) Data for NSW exclude ACT prisoners held in NSW prisons.

(e) Data prior to 2006 include people 17 years of age.

(f) Data in 2000 include people 17 years of age.

(g) Data for ACT include ACT prisoners held in the ACT as well as ACT prisoners held in NSW. From 2006, excludes breaches of periodic detention orders greater than three months.

(h) Apparent increases in 2006 may be due to changes in collecting and recording Indigenous information, or in the willingness of Indigenous people to self-identify.

(a) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and National data reflect the age scope that applied to these jurisdictions in the relevant years.

--	----------------	------------	------------	-----------	-----------	------------	----------------	-----------	-----------------

(b) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

(a) In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. Persons under 18 years are treated as juveniles in most Australian courts and are only remanded or sentenced to custody in adult prisons in exceptional circumstances. Prior to 2006, in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000, in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to be refer to persons aged 17 years and over. Individual State and Territory data and National data reflect the age scope that applied to these jurisdictions in the relevant years.

--	----------------	------------	------------	-----------	-----------	------------	----------------	-----------	-----------------

(b) Prior to 2009, persons sentenced to full-time custody by the ACT were usually held in New South Wales prisons. A new prison facility to house ACT people sentenced to full-time custody, the Alexander Maconochie Centre, began taking prisoners on 30 March 2009. As at 30 June 2009, all ACT prisoners held in New South Wales prisons had been relocated to the new Alexander Maconochie Centre. The NSW figure included the subset of ACT prisoners held in NSW and are not separately counted in the Australian totals.

– Nil or rounded to zero.

## 5 Governance, leadership and culture

---

### Strategic areas for action

Effective governance and leadership, and recognition of culture, play essential parts in the social and economic development of Aboriginal and Torres Strait Islander Australians, and influence virtually all indicators in the framework.

Governance refers to the way the members of a group or community organise themselves to make decisions that affect themselves and others, and includes both Aboriginal and Torres Strait Islander governance and government governance. Leadership is important to the development of a strong governance culture, and there are specific cultural aspects to Aboriginal and Torres Strait Islander leadership.

The term ‘cultures’ used here embraces the diverse Aboriginal and Torres Strait Islander nations and peoples, each with its own distinct cultural norms, law, language and identity. Aboriginal and Torres Strait cultures are not static, nor relegated to history, but are dynamic exchanges, which are understood through engaging in inter-cultural dialogue, either in personal contact or through representations and signs. Culture covers many positive outcomes that are important to Aboriginal and Torres Strait Islander Australians’ conception of wellbeing, which extends beyond merely overcoming disadvantage.

The following indicators are included in the ‘Governance, leadership and culture’ strategic area:

- Valuing Indigenous Australians and their cultures (section 5.1) — one of the principles of the Closing the Gap strategy is emphasising mutual respect between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, and this is also highlighted in the Australian Government’s response to the United Nations Declaration on the Rights of Indigenous Peoples

- 
- Participation in decision making (section 5.2) — participation in decision making is a key element in the UN Declaration on the Rights of Indigenous Peoples, and has been cited as an important factor in self-determination and improving outcomes for Indigenous people. Participation in decision making is important in relation to internal participation (including Aboriginal and Torres Strait Islander governance) and external participation (including government governance)
  - Engagement with services (section 5.3) — ‘Engagement’ is a broad concept that encompasses both accessibility (including barriers to access) and appropriate delivery (including recognition of Aboriginal and Torres Strait Islander cultural perspectives in designing and delivering programs)
  - Case studies in governance (section 5.4) — the case studies emphasise the importance of culture as an essential determinant of good governance
  - Indigenous language revitalisation and maintenance (section 5.5) — for many Aboriginal and Torres Strait Islander Australians, language is an important aspect of culture and wellbeing
  - Indigenous cultural studies (section 5.6) — cultural studies can benefit both Aboriginal and Torres Strait Islander people (culturally appropriate education can contribute to good ‘mainstream’ academic outcomes) and non-Indigenous young people (increasing knowledge can lead to shared views and increased respect)
  - Participation in community activities (section 5.7) — art and ceremony are significant markers of cultural strength, and there is evidence that a range of sport and community activities can foster self-esteem, social interaction and the development of skills and teamwork, leading to good physical and mental health and wellbeing
  - Access to traditional lands and waters (section 5.8) — access to land and waters may allow Aboriginal and Torres Strait Islander Australians to practise and maintain their knowledge of ceremonies, rituals and history. There may also be other social and economic benefits from connection to traditional country, and the ‘Economic participation’ strategic area for action includes the related indicator ‘Indigenous owned or controlled land and business’ (section 9.2).

The Steering Committee acknowledges the diversity of Aboriginal and Torres Strait Islander cultures. While there has been general endorsement of the cultural indicators in this report, they may not reflect the aspirations of all Aboriginal and Torres Strait Islander Australians. In addition, it can be very difficult to define aspects of culture in a way that can be measured for inclusion in a largely quantitative report.

## Attachment tables

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 5A.2.1). These tables can be found on the Review web page ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)), or users can contact the Secretariat directly.

---

## 5.1 Valuing Indigenous Australians and their cultures<sup>1</sup>

### Box 5.1.1 Key messages

- Culture is a key aspect of Aboriginal and Torres Strait Islander wellbeing — not just knowledge and practice of culture by Indigenous Australians, but respect for that culture among the wider community.
- In 2012:
  - four out of five general community respondents regarded Aboriginal and Torres Strait Islander culture (81.4 per cent) and history (85.3 per cent) as important, and half (50.1 per cent) reported feeling personally proud of Aboriginal and Torres Strait Islander culture (tables 5A.1.2 and 5A.1.3). There was no statistically significant change in these proportions between 2008 and 2012
  - while four out of five Aboriginal and Torres Strait Islander Australians (83.8 per cent) rated their knowledge of Aboriginal cultures as ‘high’, fewer than one in three in the general Australian population did so (31.9 per cent). There was no statistically significant change in these proportions between 2008 and 2012 (table 5A.1.1).
- In 2012-13, most Aboriginal and Torres Strait Islander Australians (83.9 per cent) reported not feeling discriminated against (due to their Indigenous status) in the previous 12 months. However, 7.2 per cent felt they had been discriminated against ‘by members of the public’ (table 5A1.8).

### Box 5.1.2 Measures of valuing Indigenous Australians and their cultures

There are five main measures for this indicator.

Four of the measures report data for Aboriginal and Torres Strait Islander Australians and the general population, aged 18 years and over, from Reconciliation Australia’s Australian Reconciliation Barometer with the most recent data for 2012 (national: Indigenous and general community<sup>2</sup>).

- *Knowledge of Aboriginal and Torres Strait Islander cultures* is defined as the proportion of people rating their level of knowledge about Aboriginal and Torres Strait Islander cultures as ‘high’

(continued next page)

---

<sup>1</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, and Reconciliation Australia for reviewing a draft of this section of the report.

<sup>2</sup> Reconciliation Australia advised that whilst the general community sample was selected to be representative of the general community, given the small sample size it is unlikely to have many (if any) Aboriginal and Torres Strait Islander Australians.

---

### Box 5.1.2 (continued)

- *Recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia* is reported using two proxy measures:
  - *Pride in Aboriginal and Torres Strait Islander cultures* is defined as the proportion of people who agree that they are personally proud of Aboriginal and Torres Strait Islander cultures.
  - *Importance of knowledge about Aboriginal and Torres Strait Islander cultures and history* is defined as the proportion of people who agree that it is important that all Australians know about Aboriginal and Torres Strait Islander cultures, and the history of Aboriginal people in Australia.
- *Level of trust* is defined as the proportion of people rating their perceptions of the level of trust between Aboriginal and Torres Strait Islander Australians and the general community as 'high'
- *Level of prejudice* is defined as the proportion of people rating their perceptions of the level of prejudice between Aboriginal and Torres Strait Islander Australians and the general community as 'low'.

One measure reports data for Aboriginal and Torres Strait Islander Australians from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS – NATSIHS component), with the most recent available data for 2012-13 (all jurisdictions: Indigenous; remoteness).

- *Discrimination due to Indigenous status* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 18 years and over who felt discriminated against due to their Indigenous status, in the previous 12 months.

Culture is a key aspect of Aboriginal and Torres Strait Islander wellbeing — not just knowledge and practice of culture by Indigenous Australians, but respect for that culture among the wider community.

### The Australian Reconciliation Barometer

The majority of data for this indicator are drawn from the Australian Reconciliation Barometer surveys, commissioned by Reconciliation Australia (RA). Surveys of both Aboriginal and Torres Strait Islander Australians and the general community were conducted in 2008, 2010 and 2012. (Data from the 2014 survey will be included in future reports.)

The Steering Committee acknowledges Reconciliation Australia's input and advice in developing this indicator and providing data to measure progress.

### Mutual respect

Mutual respect is one of the principles of the Australian Government's Closing the Gap strategy (FaHCSIA 2009). Reconciliation Australia explains that mutual respect:

---

... measures respect based on our level of understanding and pride in the cultures and contributions of Aboriginal and Torres Strait Islander peoples. We believe that as the level of knowledge and understanding increases, more Australians will share in the pride that Aboriginal and Torres Strait Islander people feel for their histories and cultures (RA 2013).

The term ‘cultures’ used here embraces the diverse Aboriginal and Torres Strait Islander nations and peoples, each with its own ‘distinct cultural norms, law, language and identity’ (AHRC 2013a). Aboriginal and Torres Strait cultures are not static, nor relegated to history, but are dynamic exchanges, which are ‘understood through engaging in inter-cultural dialogue, either in personal contact or through representations and signs’ (Langton and Council for Aboriginal Reconciliation 1994).

### Knowledge of Aboriginal and Torres Strait Islander cultures

In 2012, the majority of Aboriginal and Torres Strait Islander Australians (83.8 per cent) rated their knowledge of Aboriginal cultures as ‘high’, compared with fewer than one in three general community respondents (31.9 per cent). There was no statistically significant change in these proportions between 2008 and 2012 (table 5A.1.1).

### Recognition of Aboriginal and Torres Strait Islander contributions to Australia

Aboriginal and Torres Strait Islander Australians contribute in every area of public, social and community life, including the arts, media, academia, politics, sport and business. However, there are no data currently available for the Steering Committee’s preferred measure of ‘recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia’. The Reconciliation Barometer provides data for two proxy measures.

Importance of knowledge about Aboriginal and Torres Strait Islander cultures and history:

- nearly all Aboriginal and Torres Strait Islander respondents considered that it was important for all Australians to know about Aboriginal and Torres Strait Islander cultures (96.1 per cent) and history (98.0 per cent), with no statistically significant change since 2008 (table 5A.1.2)
- four out of five general community respondents regarded Aboriginal and Torres Strait Islander culture (81.4 per cent) and history (85.3 per cent) as important (table 5A.1.2). There was no statistically significant change in these proportions between 2008 and 2012.

Pride in Aboriginal and Torres Strait Islander cultures:

- nearly all Aboriginal and Torres Strait Islander respondents took personal pride in their culture (97.4 per cent), with a statistically significant decrease from (99.1 per cent) since 2008 (table 5A.1.3)

- 
- half of the general community respondents (50.1 per cent) reported feeling personally proud of Aboriginal and Torres Strait Islander culture, with no statistically significant change since 2008 (5A.1.3).

## Progress on a stronger relationship

Stronger relationships between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians build and sustain mutual respect, while mutual respect contributes to stronger relationships — a virtuous circle.

Reconciliation Australia explain that ‘a stronger relationship’, as measured in the Barometer:

... tracks our progress toward a stronger relationship through our perceptions of how we think the relationship is going and whether we think it is important. It also tests for high levels of trust and low levels of prejudice as these are indicators of a strong relationship (RA 2013).

Data from the Barometer are used to explore the levels of prejudice, which reflect (usually negative) *attitudes* toward Aboriginal and Torres Strait Islander Australians. ABS survey data are used to explore the experience of discrimination, which is (usually negative) *behaviour and actions* toward Aboriginal and Torres Strait Islander Australians.

## Trust

The Reconciliation Barometer includes information on perceptions of mutual trust of both Aboriginal and Torres Strait Islander respondents and general community respondents aged 18 years and over. Data for 2012 show relatively low levels of trust:

- in relation to *Aboriginal and Torres Strait Islander Australians trusting other Australians*
  - 14.9 per cent of Aboriginal and Torres Strait Islander respondents considered that Aboriginal and Torres Strait Islander Australians had a high level of trust in other Australians, with no statistically significant change since 2008
  - 11.5 per cent of general community respondents considered that Aboriginal and Torres Strait Islander Australians had a high level of trust in other Australians, with little or no statistically significant change since 2008
- in relation to *other Australians trusting Aboriginal and Torres Strait Islander Australians*
  - 4.9 per cent of Aboriginal and Torres Strait Islander respondents considered that other Australians had a high level of trust in Aboriginal and Torres Strait Islander Australians, with no statistically significant change since 2008

- 13.4 per cent of general community respondents considered that other Australians had a high level of trust in Aboriginal and Torres Strait Islander Australians, with no statistically significant change since 2008 (figure 5.1.1; table 5A.1.4).

**Figure 5.1.1 Perceptions of the level of trust between Aboriginal and Torres Strait Islander people and other Australians, 2012<sup>a,b,c,d</sup>**

<sup>a</sup> The surveys among Indigenous respondents involved recruitment through Indigenous networks across Australia, with an open invitation distributed by email. The sample of Indigenous people, recruited via these networks, may not be truly representative of the overall Indigenous population. The survey sample consisted of 516 Indigenous respondents aged 18 years and over in 2012. <sup>b</sup> The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. This sample consisted of 1012 Australians aged 18 years and over in 2012. <sup>c</sup> Respondents were asked to describe their level of trust on a scale ranging from 'very high, fairly high, fairly low, very low and don't know'. <sup>d</sup> Relative standard errors and 95 per cent confidence intervals for these data should be considered when interpreting these data, and are available in attachment table 5A.1.4.

Source: RA (2013) Australian Reconciliation Barometer; table 5A.1.4.

The 2008 National Aboriginal and Torres Strait Islander Social Survey collected data on the level of trust Aboriginal and Torres Strait Islander Australians aged 18 years and over had for people in general. Nationally, 37.6 per cent of those surveyed disagreed/strongly disagreed that they generally trusted people (ABS 2010). Aboriginal and Torres Strait Islander Australians were more likely to respond that they did not trust people, if they had reported they experienced discrimination (46.9 per cent) compared to those who had not (34.1 per cent) (ABS 2010).

---

## Prejudice

Prejudice takes the form of unfavourable opinion or attitudes toward individuals who belong to a particular group. Reconciliation Australia notes that ‘high levels of prejudice reflect low levels of understanding about one another’ (RA 2013).

---

**Figure 5.1.2 Perceptions of levels of prejudice between Aboriginal and Torres Strait Islander people and other Australians, 2012<sup>a,b,c,d</sup>**

<sup>a</sup> The surveys among Indigenous respondents involved recruitment through Indigenous networks across Australia, with an open invitation distributed by email. The sample of Indigenous people, recruited via these networks, may not be truly representative of the overall Indigenous population. The survey sample consisted of 516 Indigenous respondents in 2012. <sup>b</sup> The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population in terms of age, gender and location. The general community sample consisted of 1012 Australians in 2012. <sup>c</sup> Respondents were asked to describe their level of prejudice on a scale ranging from ‘very high, fairly high, fairly low, very low and don’t know’. <sup>d</sup> Relative standard errors and 95 per cent confidence intervals for these data should be considered when interpreting these data, and are available in attachment table 5A.1.5.

Source: RA (2013) Australian Reconciliation Barometer; table 5A.1.5.

---

The Reconciliation Barometer includes information on perceptions of prejudice of Aboriginal and Torres Strait Islander respondents and general community respondents. Data for 2012 show that most people perceive a high level of prejudice:

- in relation to *the level of prejudice other Australians hold toward Aboriginal and Torres Strait Islander Australians*
  - 4.9 per cent of Aboriginal and Torres Strait Islander respondents perceived that other Australians hold a ‘low’ level of prejudice toward Aboriginal and Torres Strait Islander Australians, with no statistically significant change since 2008

- 21.6 per cent of general community respondents perceived that other Australians hold a ‘low’ level of prejudice toward Aboriginal and Torres Strait Islander Australians, with no statistically significant change since 2008
- in relation to *the level of prejudice Aboriginal and Torres Strait Islander Australians hold towards other Australians*
  - 28.2 per cent of Aboriginal and Torres Strait Islander respondents perceived that Aboriginal and Torres Strait Islander Australians hold a ‘low’ level of prejudice towards other Australians, with no statistically significant change since 2008
  - 18.7 per cent of general community respondents perceived that Aboriginal and Torres Strait Islander Australians hold a ‘low’ level of prejudice towards other Australians, not statistically different since 2008 (figure 5.1.2; table 5A.1.5).

## Discrimination

The Australian Human Rights Commission (AHRC 2013b) states that racial discrimination occurs when a person is treated less favourably than another person in a similar situation, because of their race. The Australian Government has a legal obligation to promote equality and prohibit discrimination on the basis of race, as set out under the *Racial Discrimination Act 1975* (AHRC 2013b).

**Figure 5.1.3 Proportion of Indigenous people aged 18 years and over who felt discriminated against due to their Indigenous status, in the last 12 months, by remoteness, 2012-13<sup>a</sup>**

<sup>a</sup> Proportions are presented with 95 per cent confidence intervals.

Source: ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (2012-13 NATSIHS component); table 5A.1.9.

---

In the 2012-13 AATSIHS, the majority (83.9 per cent) of Aboriginal and Torres Strait Islander Australians aged 18 years and over reported they did not feel discriminated against (due to their Indigenous status) in the last 12 months. However, 7.2 per cent felt discriminated against ‘by members of the public’ (table 5A.1.8).

Aboriginal and Torres Strait Islander Australians aged 18 years and over living in major cities (17.3 per cent) and outer regional areas (19.0 per cent) were more likely to report discrimination than those living in very remote areas (11.3 per cent). There were no significant differences for other areas (figure 5.1.3). Data on feelings of discrimination because of Indigenous status by State and Territory are reported in table 5A.1.8. Data on how Aboriginal and Torres Strait Islander Australians felt after being discriminated against and what they did are reported in tables 5A.1.6-7.

## Things that work

### Box 5.1.3      **Things that work — valuing Indigenous Australians and their cultures**

**Reconciliation Action Plans (RAPs)** are formal reconciliation commitments undertaken by organisations, under Reconciliation Australia’s RAP program. RAPs have been adopted by small and large organisations in business, government and in the community sector to ‘turn their good intentions to real actions’ (RA 2014). The RAP Impact Measurement Report 2012 highlighted the demonstrated benefits of the program. Compared to the general community, people in RAP organisations:

- have more frequent contact with Aboriginal and Torres Strait Islander peoples
- are likely to agree that Aboriginal and Torres Strait Islander peoples hold a special place as the First Australians
- are more likely to be proud of Aboriginal and Torres Strait Islander cultures
- are more likely to trust Aboriginal and Torres Strait Islander peoples
- are less prejudiced
- take more action to support reconciliation (RA 2013b).

(continued next page)

---

### Box 5.1.3 (continued)

#### National Indigenous Television (NITV)

As noted in a Productivity Commission report into broadcasting in 2000, Indigenous radio and television help to sustain language and culture; they provide a vital channel of news and information for Indigenous people; and they have the potential to provide a means for better communication between Indigenous and other Australians (PC 2000). Established in July 2007, NITV started broadcasting free to air across Australia in 2012, with content sourced from the Indigenous production sector. The channel aims to 'inform, entertain and educate its Indigenous and non-Indigenous audiences' (NITV 2014). A positive review commissioned by the then Department of the Environment, Water, Heritage and the Arts (DEWHA 2009) resulted in continued Australian Government funding to the broadcaster. A review of Indigenous broadcasting in 2010 also supported continued funding, but made a number of recommendations to enhance the broadcasters operations (Stevens 2010).

### Future directions in data

The Steering Committee has identified 'recognition of the contributions Aboriginal and Torres Strait Islander Australians make to Australia' as a key measure. However, there is no currently available data source for this measure.

## 5.2 Participation in decision making<sup>3</sup>

### Box 5.2.1 Key messages

- Participation in decision making is a critical component of self-determination for all people.
- In 2008, among Aboriginal and Torres Strait Islander Australians aged 15 years and over:
  - one in four (24.9 per cent) felt they were able to have a say in their community ‘all or most of the time’ on issues important to them. A further 44.7 per cent felt they could have a say some or a little of the time (table 5A.2.1)
  - around one in five (20 per cent) knew someone in government they felt comfortable approaching.
- As at 30 June 2014, Aboriginal and Torres Strait Islander representation in Australian parliaments ranged from:
  - over parity in the ACT Legislative Assembly (5.9 per cent representation in parliament compared with 1.4 per cent representation in the eligible population)
  - near parity in the NT (24.0 per cent representation in parliament compared with 25.2 per cent representation in the eligible population)
  - below parity in NSW, WA, Tasmania and in the Parliament of Australia (House of Representatives and the Senate)
  - no identified Aboriginal and Torres Strait Islander representatives in SA
  - unknown in Victoria and Queensland (table 5.2.1).

### Box 5.2.2 Measures of participation in decision making

There are two main measures for this indicator:

- *Proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could.* There is currently no data source available for this measure.
- *Aboriginal and Torres Strait Islander representation in the Parliament of Australia and in State and Territory parliaments* is defined as the proportion of federal, state and territory parliamentarians who have identified as Aboriginal and/or Torres Strait Islander, compared to the proportion of the Australian population eligible to stand for parliament. The numbers of Aboriginal and Torres Strait Islander members of parliament were supplied by jurisdictions. The most recent available data is for 30 June 2014 (all jurisdictions).

(continued next page)

---

<sup>3</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

---

### Box 5.2.2 (continued)

There are two proxy measures for this indicator:

- *Proportion of Aboriginal and Torres Strait Islander Australians who felt able to have a say within their community* is defined as the proportion of Aboriginal and/or Torres Strait Islander Australians aged 15 years and over who felt they were able to have a say within their community on issues that were important to them all or most of the time.
- *Proportion of Aboriginal and Torres Strait Islander Australians who know someone in government they feel comfortable approaching* is defined as the proportion of Aboriginal and/or Torres Strait Islander Australians aged 15 years and over who personally know someone in government they feel comfortable contacting.

The data source for the two proxy measures is the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2008 (all jurisdictions; age; remoteness).

## Governance, self-determination and participation in decision making

A critical element of governance is self-determination (see section 5.4). Participation in decision making is a key exercise of self-determination. Broadly:

- external participation includes participation in electoral politics, participation in parliamentary processes, and direct participation in the broader governance environment
- internal participation includes Aboriginal and Torres Strait Islander governance, legal systems, institutions and internal decision making structures and processes (UN Expert Mechanism 2011, 2010, cited in AHRC 2012).

While there is general agreement on the importance of Aboriginal and Torres Strait Islander participation in decision making (Gardiner-Garden 2010), there is a lack of data with which to measure this participation. There is currently no data source available for the main measure ‘Proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could’.

## Aboriginal and Torres Strait Islander representation in the Parliament of Australia and in State and Territory parliaments

As noted by Australia’s Social Justice Commissioner, there is ‘no substitute for direct representation’ when it comes to Aboriginal and Torres Strait Islander participation in the decision making processes of government in Australia (Gooda, quoted in Kennett 2012).

Parliamentary representation provides people with ‘a voice in parliament’. Aboriginal and Torres Strait Islander parliamentarians represent what are in effect two constituencies: their electorate, as well as broader Aboriginal and Torres Strait Islander Australia (Deshong 2013; Lloyd 2009).

In both the recent 2013 federal election and the 2012 NT election, there were a record number of Aboriginal and Torres Strait Islander Australians nominated as candidates (Deshong 2013). Although the small numbers involved can fluctuate over short periods, increasing numbers of Aboriginal and Torres Strait Islander candidates are being elected. (Caution should be used in interpreting the representation in parliament due to the small numbers involved.)

**Table 5.2.1 Proportion of Indigenous people in parliament, relative to the proportion of Indigenous people in the population eligible to enter parliament, as at 30 June 2014<sup>a,b,c</sup>**

	NSW	VIC	Qld	WA	SA	Tas	ACT	NT	Aus Gov
Indigenous members of parliament (no.)	1	–	–	2	–	1	1	6	2
Indigenous members as % of all members (%)	0.7	–	–	2.2	–	2.5	5.9	24.0	0.9
Indigenous population as % of population (%) <sup>d</sup>	2.2	0.7	3.2	2.8	1.8	3.7	1.4	25.2	2.3

<sup>a</sup> Current as at 30 June 2014. <sup>b</sup> The numbers of Aboriginal and Torres Strait Islander people elected to Parliament were provided by each jurisdiction. <sup>c</sup> Indigenous members of parliament are counted in the jurisdiction of the parliament (e.g., NSW parliament counted in NSW, Parliament of Australia counted in the Australian Government). <sup>d</sup> Population is aged 18 years and over and eligible to enter parliament.

*Sources:* Australian and State and Territory governments (unpublished) 2014; ABS (2014) Estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, Cat. no. 3238.0.55.001; AEC (2014) Size of the electoral roll and estimated participation rate as at 30 June 2014; table 5A.2.4.

## Aboriginal and Torres Strait Islander representation in the Parliament of Australia

As at 30 June 2014, 0.9 per cent (2 out of 226) federal parliamentarians (House of Representatives and the Senate) self-identified as Aboriginal, while 2.3 per cent of the Australian Aboriginal and Torres Strait Islander population was eligible to nominate to stand for election (table 5.2.1).

## Aboriginal and Torres Strait Islander representation in the State and Territory parliaments

There have been a comparatively high number of Aboriginal and Torres Strait Islander Australians elected to State and Territory parliaments (Lloyd 2009) (although information on the representation of Aboriginal and Torres Strait Islander Australians is not available for all State and Territory parliaments). As at 30 June 2014, Aboriginal and Torres Strait Islander representation in State and Territory parliaments ranged from:

- over parity in the ACT Legislative Assembly (5.9 per cent representation in parliament compared with 1.4 per cent representation in the eligible population)

- 
- near parity in the NT (24.0 per cent representation in parliament compared with 25.2 per cent representation in the eligible population)
  - below parity in NSW, WA and Tasmania
  - no identified Aboriginal and Torres Strait Islander representatives in SA
  - unknown in Victoria and Queensland (table 5.2.1).

### **Felt able to have a say on important issues within the community**

The extent to which people feel that they have a say on important community issues is a proxy for personal autonomy — control over decisions that affect them, and a feeling that their ideas and input are valued by the community.

Nationally in 2008, one-quarter (24.9 per cent) of Aboriginal and Torres Strait Islander Australians aged 15 years and over felt they were able to have their say within the community on issues that were important to them all or most of the time. A further 44.7 per cent felt they could have a say some or a little of the time (table 5A.2.1). (The terms ‘have a say’ and ‘issues that are important to you’ were not defined in the survey, and respondents interpreted these terms based on their personal views (ABS 2010).).

A lower proportion of Aboriginal and Torres Strait Islander Australians living in outer regional areas (18.1 per cent) felt they could have a say all or most of the time, compared with those living in major cities (27.6 per cent), inner regional areas (24.4 per cent) and remote and very remote areas (25.2 per cent and 29.5 per cent respectively) (table 5A.2.2).

Younger Aboriginal and Torres Strait Islander Australians (aged 15–34 years) felt least able to have a say all or most of the time compared to people in the older age groups (35 to 55 years and over) (figure 5.2.1). MacIntyre’s (2001) exploration of the role of elders in decision making in Aboriginal and Torres Strait Islander communities may provide some context for the difference between the younger and older age groups, noting that there is ‘deep respect for the wisdom of elders, who are at the time ... both teachers and guides while they are participating in collective choosing’.

---

Figure 5.2.1 **Proportion of Indigenous people aged 15 years and over that felt they had an opportunity, all or most of the time, to have a say on issues important to them, by age, 2008<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.2.3.

---

Data on participation within the community on important issues are also reported by State and Territory (table 5A.2.1).

### **Knowing someone in government and felt comfortable to approach**

This measure provides a sense of individuals' connection with broader government decision making structures. It is a proxy for people's ability to draw on personal networks to access information and advice.

In 2008, one in five Aboriginal and Torres Strait Islander Australians aged 15 years and over (20 per cent) knew a member of local, state or federal Parliaments, with those aged 25 years and over more than three times as likely as those aged 15–24 years (26 compared to 8 per cent) to know a member of state or federal parliament (ABS 2012).

---

## Things that work

### Box 5.2.3 Things that work — participation in decision making

**Australian Electoral Commission's electoral participation program** is aimed at empowering Aboriginal and Torres Strait Islander Australians in exercising their right to vote, to improve levels of knowledge of democratic and electoral processes and to increase enrolment. The program began in April 2010 and is funded as part of the Australian Government's Closing the Gap initiative (AEC 2012). A 2011 evaluation found that the program's early results were positive, that it 'has a significant role to play in addressing the barriers to participation of Indigenous people in democratic processes' and made a number of recommendations to improve the program's performance (Markiewicz and Patrick 2012).

Sources: AEC (Australian Electoral Commission) 2012, *50th anniversary of the Indigenous right to vote*, [http://www.aec.gov.au/About\\_AEC/publications/fact\\_sheets/50th-anniversary.htm](http://www.aec.gov.au/About_AEC/publications/fact_sheets/50th-anniversary.htm) (accessed 17 June 2014); Markiewicz and Patrick 2012, *Final Report Evaluation IEPP Volume 1 September 2012*, [http://www.aec.gov.au/about\\_aec/Publications/files/iepp-volume-1.pdf](http://www.aec.gov.au/about_aec/Publications/files/iepp-volume-1.pdf) (accessed 19 September 2014).

## Future directions in data

The Steering Committee has identified as a key measure for this indicator the proportion of Aboriginal and Torres Strait Islander Australians who wanted to participate in decision making and felt they could. However, no currently available data source incorporates the aspect of choice in participation — some data are available on whether or not a person participated, but not on whether lack of participation was voluntary or caused by some barrier. The development and collection of data to inform this indicator would assist in measuring Australia's progress in meeting domestic expectations and international human rights obligations.

Australia has over 560 local councils responsible for managing their region and district, yet there is little publicly available information on the number of Aboriginal and Torres Strait Islander Australian Councillors. The Steering Committee would like to include information on levels of Aboriginal and Torres Strait Islander representation in local government in future reports.

## 5.3 Engagement with services<sup>4</sup>

### Box 5.3.1 Key messages

- Engagement with services is critical to improve the outcomes of Aboriginal and Torres Strait Islander Australians. Engagement covers both accessibility of services and the appropriate delivery of services.
- In 2008:
  - Nationally, 29.9 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported that they had problems accessing one or more services in the previous 12 months, with this proportion increasing to 47.7 per cent in very remote areas (figure 5.3.1)
  - the service that most people had difficulty accessing was a dentist (19.5 per cent), followed by a doctor (9.5 per cent) (table 5A.3.2)
  - barriers to access varied by remoteness, with the most common reason in remote areas being 'no services' (23.7 per cent) and the most common reason in non-remote areas being 'waiting time/not available in time' (14.4 per cent) (table 5A.3.3)
  - 3.2 per cent of people reported having difficulty understanding, or being understood by, service providers. For those whose main language was an Indigenous language this increased to 27.7 per cent (table 5A.3.5).
  - Between 2004-05 and 2012-13, the proportion of Aboriginal and Torres Strait Islander Australians discharging themselves against medical advice decreased slightly (from 2.6 per cent to 2.4 per cent), while the rate for non-Indigenous Australians increased slightly (from 0.3 per cent to 0.4 per cent) (table 5A.3.6).

### Box 5.3.2 Measures of engagement with services

There are three main measures for this indicator.

- *Accessing services* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who reported having problems accessing services. The most recent available data are from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) for 2008 (national; all jurisdictions; remoteness). Historical data are not available.
- *Communication with service providers* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who reported having difficulties communicating with service providers. The most recent available data are from the 2008 NATSISS (national: sex; age groups; remoteness).

(continued next page)

---

<sup>4</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

---

**Box 5.3.2 (continued)**

*Discharges against medical advice* is defined as the proportion of hospitalisations where patients left hospital against medical advice or discharged themselves from hospital at their own risk. Data are sourced from the AIHW National Hospital Morbidity Database, with the most recent available data for 2012-13 (all jurisdictions: remoteness; sex). These data do not provide reasons why some people choose to leave hospital against medical advice or discharge themselves at their own risk, or whether there are differences between the reasons of Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians.

Engagement with services is critical to improve the outcomes of Aboriginal and Torres Strait Islander Australians (Flaxman, Muir and Oprea 2009). Poor access to programs and services and ineffective service delivery can compound the disadvantage experienced by Aboriginal and Torres Strait Islander Australians (CGC 2001). Access to primary health care is covered in section 8.1.

Engagement with services is a broad concept that encompasses:

- accessibility (including barriers to access)
- appropriate delivery (including cultural perspectives in designing and delivering programs, and communicating effectively with Aboriginal and Torres Strait Islander clients).

Effective services are a key component of the National Indigenous Reform Agreement. The Council of Australian Governments (COAG) has stipulated that governments will reform service delivery systems to ensure that government investments:

- deliver effective and accessible services that are taken up by Indigenous people in urban and regional locations
- deliver culturally competent services that achieve good outcomes for Indigenous Australians
- maximise linkages between Indigenous-specific and mainstream services
- deliver service models that respond to high levels of mobility amongst Indigenous Australians (COAG 2012).

In January 2009, the Commonwealth and State and Territory governments signed the National Partnership Agreement on Remote Service Delivery, which aimed to improve coordination of remote service delivery (COAG 2009b). In his final report on progress, the Coordinator General for Remote Indigenous Services found that the national partnership had achieved measurable improvements to services and infrastructure in all communities within the scope of the agreement, as well as improvements in relationships and human capabilities for both communities and governments. The report outlined a number of lessons for both governments and communities, which included:

- 
- for government — have locally based and well trained staff, develop cultural competence of government and employ specific local knowledge; and that government engagement with Aboriginal and Torres Strait Islander communities should be transparent, accountable and well administered
  - for communities — governance and leadership must be strong and sustainable; communities should understand how to work with government, invest in planning with stakeholders in community and in government, and develop and deliver local cultural awareness programs to demonstrate how communities work (CGRIS 2014).

More information on Aboriginal and Torres Strait Islander governance and government governance is in section 5.4.

Examples of effective service delivery is highlighted throughout this report in ‘things that work’ case studies.

## Accessing services

Access to services can be affected by the way programs are designed, how they are presented and the cost to users (CGC 2001; Stewart, Lohoar and Higgins 2011). In remote areas, this can be exacerbated by lack of services, lack of commercial competition and difficulties caused by lack of reliable infrastructure — transport and telecommunications — to enable access to services (Altman and Ward 2002; CGC 2001; Hudson 2010; Rennie et al 2013). Failure to register births can make it difficult to obtain other forms of identification such as a driver’s licence, passport, tax file number or other proof of identification later in life, which can create further difficulties with accessing services (Orenstein 2009). Centrelink and Medicare have arrangements that assist people to obtain identification documents for access to government services (Australian Government 2010).

Telecommunications has become increasingly important in accessing services, particularly with the rise of online service provision. Telecommunications in remote Aboriginal and Torres Strait Islander communities are complicated by geographic distance, harsh conditions and cost of infrastructure (ACMA 2008).

In 2009, the Australian, State and Territory governments signed the National Partnership Agreement on Remote Indigenous Public Internet Access, recognising the importance of improved increased access to ‘online resources and services, principally for financial, educational, health, economic and social purposes’ as well as to e-government services (COAG 2009a). The proportion of Aboriginal and Torres Strait Islander households<sup>5</sup> with an internet connection rose from 40 per cent in 2006 to almost two thirds (62.8 per cent) in 2011. This is compared with 77.2 per cent for ‘non-Indigenous households’ in 2011 (ABS 2012).

---

<sup>5</sup> In ABS Census data, an Aboriginal and Torres Strait Islander household is a household where at least one person has identified as being of Aboriginal and/or Torres Strait Islander origin.

**Figure 5.3.1 Proportion of Indigenous people aged 15 years and over who had problems accessing services, by remoteness, 2008<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; (table 5A.3.3).

In 2008, 29.9 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported they had problems accessing one or more services in the previous 12 months, with the proportion significantly higher in very remote areas (47.4 per cent) (figure 5.3.1). Nationally, the types of services most people had problems accessing were dentists (19.5 per cent) and doctors (9.5 per cent), although this differed across remote areas (table 5A.3.3).

In 2008, in total remote areas, the most common barriers people experienced were ‘no services’ (23.7 per cent), ‘not enough services’ (20.5 per cent) and ‘transport/distance’ (18.7 per cent). In total non-remote areas the most common barriers were ‘waiting time/unavailable in time’ (14.4 per cent), ‘cost’ (9.6 per cent) and ‘not enough services’ (8.7 per cent) (figure 5.3.2).

Cultural barriers, including lack of cultural awareness on the part of service providers, racism, social inequality and social exclusion, may also lead to reduced access to services (NMHC 2012; PC 2011; Reilly et al 2008; Scrimgeour and Scrimgeour 2008; Zubrick et al 2010). In the 2008 NATSISS, 2.8 per cent of Aboriginal and Torres Strait Islander Australians reported ‘services not culturally appropriate’ as a barrier for accessing selected services (figure 5.3.2).

National data, and data by State and Territory are reported in table 5A.3.2.

**Figure 5.3.2 Types of barriers to accessing services for Indigenous people aged 15 years and over, by remoteness areas, 2008<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.3.3.

## Communication with service providers

The 2008 NATSISS asked people whose main language was an Aboriginal or Torres Strait Islander language about communication difficulties. Of those that spoke an Indigenous language as their main language (11.5 per cent), over one-quarter (27.7 per cent) reported that they had experienced communication difficulties — similar to 2002 (table 5A.3.5).

Difficulties in communicating with service providers can create barriers to accessing available services (Commonwealth Ombudsman 2011). Effective communication is not limited to language difficulties, but extends to issues including (but not limited to) knowledge of the subject matter, emotional response, body language, and cultural and linguistic nuances. Difficulties can be compounded, as miscommunications may not always be recognised (Cass et al. 2002).

The 2002 NATSISS asked all respondents about communication problems, regardless of their main language:

- 25 per cent of those whose main language was an Indigenous language reported difficulties communicating with service providers (equivalent to 8500 people)
- 8.3 per cent of those whose main language was English reported difficulties communicating with service providers (equivalent to 20 500 people — as those whose

---

main language was English made up 88 per cent of the Indigenous population) (table 5A.3.5).

Data on communication with service providers are also reported by sex and remoteness (table 5A.3.4), and by age (table 5A.3.5).

## **Discharges against medical advice**

According to the Aboriginal and Torres Strait Islander Health Performance Framework (AHMAC 2012), this measure ‘provides indirect evidence of the extent to which hospital services are responsive to Indigenous patients’ needs’.

From 2010-11, Indigenous status in hospital separations data are considered to be of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisations data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Between 2004-05 and 2012-13, the proportion of Aboriginal and Torres Strait Islander Australians who left hospital against medical advice or discharged themselves at their own risk decreased slightly (from 2.6 per cent to 2.4 per cent), while the proportion for non-Indigenous Australians increased slightly (from 0.3 per cent to 0.4 per cent) (table 5A.3.6).

Nationally in 2012-13, the proportion of Aboriginal and Torres Strait Islander Australians who left hospital against medical advice or discharged themselves at their own risk was six times higher than for non-Indigenous Australians (2.4 per cent compared to 0.4 per cent) (table 5A.3.6).

The differences in the proportions between Aboriginal and Torres Strait Islander and non-Indigenous Australians may reflect cost and access to healthcare, particularly for people living in remote and very remote areas. In 2012-13, increasing remoteness of Aboriginal and Torres Strait Islander Australian patients’ usual area of residence was linked with increasing proportions of people leaving hospital against medical advice or discharging themselves at their own risk (1.9 per cent in major cities and regional areas compared to 3.4 per cent in remote and very remote areas) (table 5A.3.7). Non-Indigenous patients living in remote and very remote areas were also more likely to leave hospital against medical advice or discharge themselves at their own risk (table 5A.3.7).

National data for this measure are also available by sex in table 5A.3.6.

---

## Things that work

The following case study provides an example of an initiative to improve service engagement.

### Box 5.3.3 Things that work – engagement with services

Although it has not been formally evaluated, the Steering Committee has identified the Anyinginyi Health Aboriginal Corporation's Eye Program as a promising program worth further examination.

The **Anyinginyi Health Aboriginal Corporation's Eye Program** (NT) commenced in 2006 in the NT (following commencement in NSW in 1999) and coordinates optometrist and eye specialist visits and runs clinics (mobile and permanent) for the people of the Tennant Creek and Barkly region in the NT (covering approximately 337 500 square kilometres and a population of around 8000).

Evidence in increasing the delivery of culturally appropriate eye care services in the region was presented in a case study at the National Rural Health Conference in 2009, which notes that prior to the program, access was limited due to perceived cost, transport, lack of eye health awareness, and lack of eye care practitioners with an understanding of Aboriginal and Torres Strait Islander culture. The program's successes over 2007–2008 achieved through increased collaboration and provision of culturally appropriate services included:

- increase in the services offered from 7 days a year, to 78 days a year
- increase in the number of custom made spectacles for clients from 52 per cent to 82 per cent
- continuity of care, which gained respect from patients and community members (Keys and O'Hara 2009).

Osbourne et al. (2013) notes that the success of the program led to other Aboriginal controlled medical services implementing the program across the NT, with the coordinator of the program (who developed the model) recognised with an Australia Day nomination and certificate in recognition of her work on the program.

## Future directions in data

Data on the number of unregistered births are currently not available. For future editions of the report, data may be available from an Australian Research Council Linkage Project 'Closing the gap on Indigenous birth registration', which aims to quantify the number of births not registered from 2000 to 2009 in Victoria, Queensland, the Northern Territory and Western Australia (Freemantle 2013).

---

The 2008 NATSISS only asked people who spoke an Indigenous language as their main language about problems communicating with service providers. Data on communication problems amongst all Aboriginal and Torres Strait Islander Australians would be beneficial, as communication problems are not limited to those whose main language is an Indigenous language. New data on accessing services and communication with service providers will be available from the 2014 NATSISS, and included in the next report.

## 5.4 Case studies in governance<sup>6</sup>

### Box 5.4.1 Key messages

Research over many years has identified the following six determinants of good Aboriginal and Torres Strait Islander and government governance:

- governing institutions
- leadership
- self-determination
- capacity building
- cultural match
- resources.

The existence of these determinants contributes to the success of organisations, and leads to improved health, wellbeing and prosperity of Aboriginal and Torres Strait Islander communities.

Many successful Aboriginal and Torres Strait Islander organisations contribute to improving the social and economic outcomes for Aboriginal and Torres Strait Islander Australians (ORIC 2013; RA 2006, 2013). Good government governance is particularly important to ‘drive real change on the ground’ (CGRIS 2011).

### Defining governance

What does ‘governance’ mean? A five year (2004–08) Indigenous Community Governance Project (ICGP) defined governance as:

... the evolving processes, relationships, institutions and structures by which a group of people, community or society organise themselves collectively to achieve the things that matter to them. To do this they need to make decisions about:

- their group membership and identity (who is the ‘self’ in their governance)
- who has authority within the group, and over what
- their agreed rules to ensure authority is exercised properly and decision-makers are held accountable
- how decisions are enforced
- how they negotiate their rights and interests with others
- what arrangements will best enable them to achieve their goals (Hunt et al. 2008).

Identifying common principles or determinants that underpin governance, and encouraging the application of these determinants, are the keys to strengthening governance.

---

<sup>6</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, and to Reconciliation Australia for reviewing a draft of this section of the report.

---

## Determinants of good governance

Drawing on the Harvard Project on American Indian Economic Development in the US (2010), the ICGP and broad consultations with Aboriginal and Torres Strait Islander communities and organisations, as well as governments and service providers, the Steering Committee has identified the following six determinants of good governance — relevant to both Aboriginal and Torres Strait Islander communities and organisations and government itself:

- *governing institutions* — the way structures of governance are created, leaders chosen, and the extent of constituents' confidence and support
- *leadership* — the process for which an individual influences group members to attain group or organisational goals
- *self-determination* — for Aboriginal and Torres Strait Islander Australians, having the right and ability to determine their own priorities and design their own instruments of governance, within broad governing institutions
- *capacity building* — having the capabilities (such as knowledge and skills) to get things done
- *cultural match* — respecting processes within different communities to work towards a common ground between the governing structures wanted and the culture of the community
- *resources* — the economic, cultural, social and natural resources, and information technology necessary to underpin successful governance.

The determinants are inter-dependent. No one principle in isolation will lead to good governance — all determinants are necessary for sustained success.

## Aboriginal and Torres Strait Islander governance

This section draws on two case studies of Aboriginal and Torres Strait Islander governance from the 2012 Reconciliation Australia (RA)/BHP Billiton Indigenous Governance Awards (IGAs): the Ngaanyatjarra, Pitjantjatjara and Yankunytjatjara (NPY) Women's Council (box 5.4.2) and the Yiriman Project (box 5.4.3). The winners of the latest round of the IGAs (now jointly managed by Reconciliation Australia and the Australian Indigenous Governance Institute [AIGI]), were announced on 30 October 2014, too late for inclusion in this report. Case studies drawn from the 2014 awards will be featured in future reports, with additional research from the AIGI (formerly RA) Indigenous Governance Toolkit online resource.

---

#### Box 5.4.2 **NPY Women's Council** **Winner Category A: Incorporated organisations**

The NPY Women's Council was started in 1980, and incorporated in 1994.

The 2012 IGA report noted that 'the organisation is a major provider of human services in the Ngaanyatjarra, Pitjantjatjara and Yankunytjatjara lands'. Amongst their accomplishments are the ban of take-away alcohol sales at Curtin Springs roadhouse and the introduction of non-sniffable Opal fuel in Central Australia.

Key features of the organisation include that it:

- is driven by the values and aspirations of members
- is grounded in women's law and culture
- is committed to continuous innovation and improvement
- has courage to take on tough issues (RA 2013).

Sources: NPY Women's Council 2010, *Who we are and how we started: Factsheet 1*, <http://www.npywc.org.au/wp-content/uploads/2012/01/01-Who-We-Are-How-We-Started.pdf> (accessed 3 June 2014); Reconciliation Australia 2013, *Sharing Success: Stories from the 2012 Indigenous Governance Awards*, Reconciliation Australia, Canberra, ACT, [http://reconciliation.org.au/iga/wp-content/uploads/2014/01/IGA\\_2012\\_Analysis\\_Report\\_web.pdf](http://reconciliation.org.au/iga/wp-content/uploads/2014/01/IGA_2012_Analysis_Report_web.pdf) (accessed 3 June 2014).

---

#### Box 5.4.3 **Yiriman Project** **Winner Category B: Non-incorporated projects and initiatives**

The Yiriman Project started in 2000.

The 2012 IGA report noted that: 'The Yiriman project takes young people and elders on trips back to country to immerse them in the stories, songs and knowledge that are their cultural heritage.' This builds young people's confidence and improves their self-worth and has helped to curb the suicides, self-harm and substance abuse in the participating communities.

Project outcomes as summarised by Taylor (2010) are:

- the healing of young people as they walk on country and look after it
- the opportunity for young people to develop and assert culture, language and bush skills
- meaningful employment that values and maintains culture.

The key feature of success is 'the clarity of purpose given to the project by the elders' and 'strong leadership, cultural legitimacy and external administrative support' (RA 2013).

Sources: Reconciliation Australia 2013, *Sharing Success: Stories from the 2012 Indigenous Governance Awards*, Reconciliation Australia, Canberra, ACT, [http://reconciliation.org.au/iga/wp-content/uploads/2014/01/IGA\\_2012\\_Analysis\\_Report\\_web.pdf](http://reconciliation.org.au/iga/wp-content/uploads/2014/01/IGA_2012_Analysis_Report_web.pdf) (accessed 3 June 2014); Taylor, F. 2010, *Partnerships in the Youth Sector - Building Stories in Our Young People: The Yiriman Project*, The Foundation for Young Australians, Melbourne, Victoria, <http://www.fya.org.au/wp-content/uploads/2009/12/What-Works-PYS.pdf> (accessed 3 June 2014).

---

## Governing institutions

Governance institutions are made up of both formal mechanisms (such as policies, rules, regulations, constitutions, legal and judicial systems) and informal ways of doing things (such as taboos, gender norms, religious beliefs, values, kinship and marriage systems) (Hunt and Smith 2006). The Australian Institute of Health and Welfare (AIHW) analysis of the shortlisted 2012 IGA applications showed that 95 per cent of organisations held board meetings, and all organisations had their accounts audited, held annual general meetings and produced annual financial reports (if required). They also had clearly outlined and documented internal dispute resolution processes ... [and] ‘all organisations outlined mechanisms and processes for resolving external complaints’ (RA 2013).

The NPY Women’s Council’s approach to service development is an example of how Aboriginal cultures intertwines with good corporate governance: it is

- Kulikatinnyi (considering something over a long period of time)
- Nyakuakatinnyi (looking for something as one goes along)
- Palyaalkatinnyi (making something as one goes along).

RA (2013) notes that the ‘process ensures that services developed and delivered by the Women’s Council are continually reviewed and improved’.

Good corporate governance that is coupled with Aboriginal and Torres Strait Islander cultural values, relationships and systems of authority produces governing order and good outcomes (Hunt and Smith 2007; Hunt et al. 2008). The IGA shortlisted organisations were flexible in their approaches to dispute resolution and decision making, but were supported with clearly outlined and established processes. Approaches included ‘mediation, traditional law and cultural practices, codes of conduct and informal discussions’ for internal disputes, with external disputes primarily addressed via formal processes’ (RA 2013).

Good governing institutions do not just spontaneously arise. They are the result of often lengthy processes of developing capacity and leadership, and ongoing training and development (see ‘Capacity building’ below). Good governing institutions support ‘board and staff training and development ... [and] compulsory governance training for board members’ (RA 2006).

## Leadership

Aboriginal and Torres Strait Islander leaders are critical to the development of a strong governance culture. While there is a specific cultural aspect to Aboriginal and Torres Strait Islander leadership, leadership often requires people to walk confidently and with influence in two worlds — Aboriginal and Torres Strait Islander and non-Indigenous leadership (AILC 2013).

---

RA (2013) attributes the success of the Yiriman project to the strength of the elders, who form the governance group ‘... the elders have been very clear about why they established the project and what they want to achieve’.

Leadership needs to be nurtured and leaders require training and support to help them fulfil their responsibilities. Sustained leadership requires succession planning, so new people can take over from current leaders over time. The AIHW analysis of shortlisted applicants noted that all organisations had ‘internal development and training programs, whether for staff, board members, or young people in the community’ (RA 2013).

Drawing on the IGA examples and research by the Indigenous Community Governance Project, some lessons for developing leadership and succession planning can be identified:

- training, leadership, personal and professional development, including cultural training builds competent and highly skilled staff (RA 2006, 2013). The NPY Women’s Council offers an orientation of the organisation and the region, which ‘includes detailed cultural advice on cultural differences and Anangu culture
- board election processes adapted to cultural, social, local conditions (RA 2013)
- staggering elections and mentoring new board members
- developing potential board members and board succession planning to ensure board continuity, skill retention and organisational stability (RA 2006, 2013)
- developing the communication skills and self-confidence of young people by providing role models, mentoring and experience to nurture future leaders (RA 2013). The NPY Women’s Council holds an annual career conference called Kungka, which is open to young women in the community. The conference provides education and employment advice, and links young participants with older women ‘who are strong in their culture and successful in their employment and education’ (Indigenous Governance Toolkit 2014).

## Self-determination

A critical element of governance is self-determination. Self-determination is a fundamental human right contained in articles of the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights (AHRC 2013). Self-determination as a human right is also reaffirmed in the *United Nations Declaration on the Rights of Indigenous Peoples*. The Declaration was adopted by the UN General Assembly in 2007, and endorsed by the Australian Government in 2009 (AHRC 2012).

Self-determination has also been given different definitions by different researchers (Calma 2006; Hunt and Smith 2006; Hunt et al. 2008; RA 2006) but, put simply, ‘self-determined people are actors in their own lives instead of being acted upon by others’ (Wehmeyer 2002). An important aspect of self-determination is ‘cultural legitimacy’ — the extent to which there is:

- 
- culturally legitimate participation and control of decision-making (participation in decision making is discussed in section 5.2). Cultural legitimacy was highlighted in the Yiriman Project by IGA judge Gary Banks, who noted the inclusion and ownership of the project within the community' (RA 2013)
  - community participation in community governance institutions (RA 2013). The NPY Women's Council holds 'bush meetings' where directors and staff engage with communities. these are open forums for everyone, not just those who live in that particular community (Indigenous Governance Toolkit 2014).

## Capacity building

There are two important aspects to capacity building. The 'public management' approach emphasises the need to develop a community's ability to meet accountability requirements, and has strong links with the 'governing institutions' and 'leadership' determinants of good governance. The 'community development' approach emphasises empowering communities to take responsibility and control over their own futures, and is closely linked with the 'self-determination' aspect of good governance (Gerritson 2001; Hunt and Smith 2007).

Capacity building for good governance can take many forms. Individuals, groups and organisations can build on their strengths through both formal and informal governance training, for example through governance courses run by the Australian Indigenous Leadership Centre. The 'NPY Women's Council has an approach known locally as the 'malparra way'. Malparra means a person who is together with a friend or companion. In the context of service delivery, this usually means two staff who are working together on a program, one of whom is an Anangu woman or man and other who is a partner staff member, employed for specific professional skills. Malparra way recognises and values the knowledge, skills and resources of the local people and assists the culturally appropriate delivery of services (Indigenous Governance Toolkit 2014).

## Cultural match

Cultural match refers to the match between the governance structures a group wants to develop and the culture of the community that is the development target (CAEPR and RA 2004; Sullivan 2007).

Aboriginal and Torres Strait Islander Australians live with two systems of governance, their own and that of non-Indigenous Australia. The Indigenous Governance toolkit (2014) describes this as 'two-way governance', where Aboriginal and Torres Strait Islander Australians balance and negotiate dual 'culture, laws, rules and forms of accountability' and support bringing 'two ways together'.

For IGA finalists, culture is the foundation of their success: it is 'embedded in every aspect of their organisation-from program delivery and board arrangements, to decision making

---

and community consultation processes’ and means both being true and responsive to their community, and also being accountable ‘externally to stakeholders, funding sources, and government’ (RA 2013).

## Resources

The ‘resources’ determinant focuses on the economic factors necessary to underpin successful governance arrangements. A contributing factor to the success of the Yiriman project is the financial and administrative support provided by the Kimberley Land Council to assist with ‘staff employment, reporting and acquittals’, while the project elders retain their autonomy (RA 2013).

Hunt et al. (2008) notes that, as Aboriginal and Torres Strait Islander community service organisations have increasingly taken on service delivery responsibilities from government, these have come with multiple, complex and costly reporting and accountability requirements. Chaney (2013) argues that these onerous approaches to service contracts often contribute to organisational failure, as resource uncertainty, particularly insecure and ad hoc funding, makes it difficult to recruit and retain staff or to build capacity.

Financial diversity can give Aboriginal and Torres Strait Islander organisations a degree of independence to run programs as Aboriginal and Torres Strait Islander people want them to be run (RA 2006). Flexible funding that facilitates the development of appropriate programs at the community level, and clarity about the roles and responsibilities of both funding agencies and service providers is vital for success (Hunt 2013).

---

**Table 5.4.1 Sources of income of top 20 Aboriginal and Torres Strait Islander corporations, 2007-08 to 2011-12 (per cent)<sup>a,b</sup>**

<i>Financial year</i>	<i>2007-08</i>	<i>2008-09</i>	<i>2009-10</i>	<i>2010-11</i>	<i>2011-12</i>
Government funding	46.9	44.5	45.8	38.2	39.9
Self-generated income	38.2	38.8	39.0	39.6	39.8
Other income sources	14.9	19.7	15.2	22.2	20.3
Philanthropic gifts	<0.1	<0.1	<0.1	<0.1	–

<sup>a</sup> The top 20 corporations make up almost one third (32.9 per cent) of the total income of the top 500 corporations. <sup>b</sup> Percentages are of funding against the total income for each financial year. – Nil or rounded to zero.

Source: ORIC (Office of the Registrar of Indigenous Corporations) 2013, *The top 500 Aboriginal and Torres Strait Islander corporations 2011-12*, Canberra, ACT, [http://www.oric.gov.au/sites/default/files/documents/11\\_2013/Top500\\_2013.pdf](http://www.oric.gov.au/sites/default/files/documents/11_2013/Top500_2013.pdf) (accessed 3 June 2014).

---

Data from Office of the Registrar of Indigenous Corporations (ORIC) shows a cautiously positive story — nearly 40 per cent of the income of the top 20 Aboriginal and Torres Strait Islander organisations was self-generated from 2007-08 to 2011-12, with ORIC

---

noting that ‘the highest earning corporations are slowly but steadily becoming more self-reliant financially’ (table 5.4.1).

## **Government governance**

Government governance refers to governments’ engagement with Aboriginal and Torres Strait Islander Australians. This section examines formal arrangements for ‘high level’ engagement between governments and Aboriginal and Torres Strait Islander communities and organisations, and then applies the six determinants of good governance to government itself.

### **Aboriginal and Torres Strait Islander advisory bodies**

The National Congress of Australia’s First Peoples (National Congress) was established in April 2010. The National Congress is an independent company limited by guarantee and registered under the Corporations Act (National Congress 2014). National Congress advocates and represents its members, but does not engage in service delivery (Calma and Dick 2011). Congress members include Aboriginal and Torres Strait Islander peak bodies, and national and local organisations, as well as Aboriginal and Torres Strait Islander individuals. The National Congress board’s co-chairs and directors are member-elected (National Congress 2014). The National Congress was represented on the working group that advised the Steering Committee on the production of this report.

Some jurisdictions have also established Indigenous advisory bodies to provide advice to governments on Indigenous policy issues (box 5.4.4).

#### **5.4.4 Aboriginal and Torres Strait Islander advisory bodies**

The Australian Government’s Prime Minister’s Indigenous Advisory Council was established in November 2013, and is composed of both Indigenous and non-Indigenous members. Council members were appointed jointly by the Prime Minister, the Minister for Indigenous Affairs, and the Parliamentary Secretary to the Prime Minister. The Council’s brief includes a focus on schooling, employment and justice in Aboriginal and Torres Strait Islander communities (Abbott 2013).

The Australian Government’s Aboriginal and Torres Strait Islander Higher Education Advisory Council provides advice to the Minister for Education. The focus of the Council is on improving outcomes for Aboriginal and Torres Strait Islander students and staff engaged in higher education and research. The majority of members are Aboriginal or Torres Strait Islander, and members include senior Indigenous academics, as well as representatives from business and industry. (Australian Government unpublished.)

(continued next page)

---

#### Box 5.4.4 (continued)

In Western Australia, key advisory bodies include the WA Aboriginal Advisory Committee, the Aboriginal Lands Trust, the Aboriginal Cultural Material Committee and the WA Aboriginal Education and Training Council. These bodies provide relevant advice to the portfolio ministers on matters relating to the interests and wellbeing of Aboriginal people, management of land held in trust, heritage protection and education and training. (WA Government unpublished.)

The South Australian Aboriginal Advisory Council (SAAAC) was established under a policy decision by the Premier in December 2005. The SAAAC is the peak advisory body to the State Government on Aboriginal affairs policy, programs and service delivery. (SA Government unpublished.)

Source: Abbott, T. 2013, *Membership of the Prime Minister's Indigenous Advisory Council*, Media release, 23 November, <https://www.pm.gov.au/media/2013-11-23/membership-prime-ministers-indigenous-advisory-council> (accessed 10 June 2014).

### Determinants of government governance

Good government governance, such as an improved coordination among agencies, removing duplication of services, adapting to change, a stable policy environment and effective processes, and learning from evidence drawn from past evaluations, affect the governance of Aboriginal and Torres Strait Islander organisations and outcomes for Aboriginal and Torres Strait Islander Australians (Henry 2007; Howse cited in Hunt 2013; Phillips-Brown, Reddel and Gleeson 2013).

A key element for good government governance is to ensure that where evaluations are conducted, the lessons from these are made available to Aboriginal and Torres Strait Islander communities and governments (Cobb-Clark 2013; Phillips-Brown, Reddel and Gleeson 2013).

Australian governments have made several collective commitments to improve government governance, including: commissioning this report (COAG 2002); agreeing to the 'Service Delivery Principles for Programs and Services for Indigenous Australians' (COAG 2012), which drew upon the 'National Framework of Principles for Government Service Delivery to Indigenous Australians' (COAG 2004); and establishing a national framework for reporting expenditure on services to Indigenous Australians (IERSC 2009, 2010; SCRGSP forthcoming, 2012).

At the program level, Australian governments have committed to sharing their learning about what works to close the gap on Indigenous disadvantage. The Closing the Gap Clearinghouse provides a collection of evidence-based research on what works to overcome Indigenous disadvantage (AIHW and AIFS nd).

There is information on the use of mainstream services by Indigenous peoples (see the Indigenous Expenditure Report (SCRGSP forthcoming) and the Indigenous Compendium of the Report on Government Services (SCRGSP 2014) but very little information on the

---

barriers to access and use of services faced by Aboriginal and Torres Strait Islander Australians (see section 5.3 on engagement with services).

There are similarities between the determinants of good government governance, the ‘things that work’ success factors in this report (see chapter 3) and the international community development principles that Hunt (2010) identified as important in the way non-government organisations work with Aboriginal and Torres Strait Islander communities. They all reflect the ‘bottom-up’ approach and the self-determination and capacity building determinants of good governance.

The six determinants of good governance have been applied to the Cape York Welfare Reform (box 5.4.5).

#### **Box 5.4.5 Cape York Welfare Reform (CYWR)**

The CYWR is a partnership between four communities (Aurukun, Coen, Hope Vale and Mossman Gorge), the Australian Government, the Queensland Government and the Cape York Group.<sup>7</sup> The 2012 CYWR evaluation report covers a four year period between January 2008 and December 2011 (with some data included for 2012). The program ‘streams’ of social responsibility, education, housing and economic opportunity were assessed by independent evaluators contracted by the Department of Families, Housing, Community Services and Indigenous Affairs (FaHCSIA).

The evaluation examined both short and medium term outcomes, but noted that measuring the overarching objective of changing social norms and behaviours was difficult, and the breadth of the program streams meant that there were issues with causality and attribution.

The report presents a summary of key findings:

Overall there is clear evidence that the wellbeing of residents in the four CYWR communities has improved over the CYWR years. Crime rates are down, infrastructure and services have improved, school attendance has risen or been maintained at high levels, and people appear happier. In no major dimension have outcomes deteriorated in these communities.

Although the governance arrangements were not explicitly evaluated, some relevant observations were made in the report.

- *Governing institutions* — In 2008, a CYWR Project Board was established. The board comprises one representative from each of the partners: the Director General of the Queensland Department of Premier and Cabinet; the (then) Secretary of FaHCSIA; and the Director of the Cape York Institute. Members of the board ‘had sufficient authority to be able to resolve bureaucratic impasses or other implementation barriers’. However, in mid-2012 the board’s role changed from ‘managerial to advisory’.

<sup>7</sup> The Cape York Group is the Cape York Institute, Cape York Partnerships, Cape York Aboriginal Australian Academy and Djarragun College.

---

#### Box 5.4.5 (continued)

- *Leadership* — Cape York leaders and elders, in partnership with government ministers, provided legitimacy and authority. However, ‘evaluation activities revealed some community concerns about the level of integration of the trial governance with existing community governance structures’. Community members noted that for CYWR to be effective, they wanted more communication, consultation and for their representative structures (for example, local councils) to be heeded.
- *Self-determination* — The CYWR included a community engagement process, to involve communities in designing and developing the proposed reforms. In late 2007, the four communities involved each gave their final agreement to participate in the program.
- *Capacity building* — ‘A successful feature has been rebuilding of Indigenous authority to tackle antisocial behaviour through the local Family Responsibilities Commissioners’. CYWR projects addressing money management, parenting support and wellbeing also help build capacity.
- *Cultural match* — For each of the four CYWR communities, the Family Responsibilities Commission (FRC) comprises a legally qualified commissioner and local commissioners. An implementation evaluation of the FRC found that: it contributes to restoring Indigenous authority by supporting local and emerging leaders in local commissioner roles; its jurisdiction is targeted appropriately; and it is engaging community members in a very complex environment (KPMG 2010).
- *Resources* — the Australian government and Queensland government both committed substantial resources to CYWR (Andrews and Scullion 2013).

## Future directions in data

There has been significant progress in examining Aboriginal and Torres Strait Islander governance since the first report in 2003. The introduction of the Indigenous Governance Awards has helped identify and highlight many examples of good practice. The Indigenous Community Governance Project by the Centre for Aboriginal Economic Policy Research and Reconciliation Australia has provided academic rigour to the examination of governance practices. Among governments, evaluations and studies of Indigenous reform initiatives (Dwyer et al. 2009; FaHCSIA 2012; OIPC 2006; Yu, Duncan and Gray 2008) have helped identify aspects of government governance that can assist or impede Aboriginal and Torres Strait Islander governance. That said, there is still more to be done before future reports can include an objective measure of governance.

## 5.5 Indigenous language revitalisation and maintenance<sup>8</sup>

### Box 5.5.1 Key messages

- Language is an important cultural signifier for many Aboriginal and Torres Strait Islander Australians, and plays a significant role in the promotion of resilient communities.
- From 2005 to 2012, the number of spoken Indigenous languages decreased from 145 to 120, while the number of languages spoken by all generations decreased from 18 to 13 (Marmion, Obata and Troy 2014).
- From 2002 to 2008, there was no significant change in the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who could speak an Indigenous language (figure 5.5.3).
- In 2008, for Aboriginal and Torres Strait Islander Australians aged 3 years and over:
  - 10.6 per cent were learning an Indigenous language, with the proportion higher for younger age groups (19.2 per cent for those aged 3–14 years, followed by 5.5–9.1 per cent of those aged 15–54 years, and 1.8 per cent for those aged 55 years and over) (figure 5.5.2)
  - 17.2 per cent spoke an Indigenous language, with this proportion highest in remote plus very remote areas (49.2 per cent) (table 5A.5.3).

### Box 5.5.2 Measures of Indigenous language revitalisation and maintenance

There are two main measures for this indicator.

- *Indigenous language revitalisation* is defined as the proportion of Aboriginal and Torres Strait Islander Australians who are *learning* an Indigenous language (national; by geographic location [location as proxy for individual languages]).
- *Indigenous language maintenance* is defined as the number and proportion of Aboriginal and Torres Strait Islander Australians who are Indigenous language speakers (national; age; geographic location [location as proxy for individual languages]).

The main data source is the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2008. Supplementary data are available from the Australian Institute of Aboriginal and Torres Strait Islander Studies (AIATSIS) National Indigenous Languages Survey (NILS), with the most recent available data collected in 2012.

Aboriginal and Torres Strait Islander languages are closely linked to culture, land and law, and all are connected to wellbeing (Dockery 2011; HoRSCoATSIA 2012). The NILS survey conducted in 2012 found that:

---

<sup>8</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, for reviewing a draft of this section of the report.

- 
- 98 per cent of the 288 respondents agreed that the use of traditional languages improves the wellbeing of Aboriginal and Torres Strait Islander Australians
  - 74 per cent ‘expressed a desire for traditional languages to be strong, widely spoken, used or known in communities and passed on to younger generations’
  - 95 per cent agreed that it was important for their children to learn and use traditional language, and when asked why, 46 per cent said that they wanted the languages to be passed to the next generation (Marmion, Obata and Troy 2014).

Language plays a significant role in the continuation of culture and promotion of resilient communities (AHRC 2010), and is an important cultural signifier for many Aboriginal and Torres Strait Islander Australians, even for those who do not speak an Indigenous language or who are not actively engaged in language programs (Marmion, Obata and Troy 2014). (Section 11.5 has additional information on community functioning).

The United Nations Declaration on the Rights of Indigenous Peoples includes the right to:

‘... revitalise, use develop and transmit to future generations their histories, languages, oral traditions, philosophies, writing systems and literatures, and to designate and retain their own names for communities, places and persons.’ (UN 2008)

The Declaration was adopted by the UN General Assembly in 2007, and endorsed by the Australian Government in 2009 (AHRC 2012).

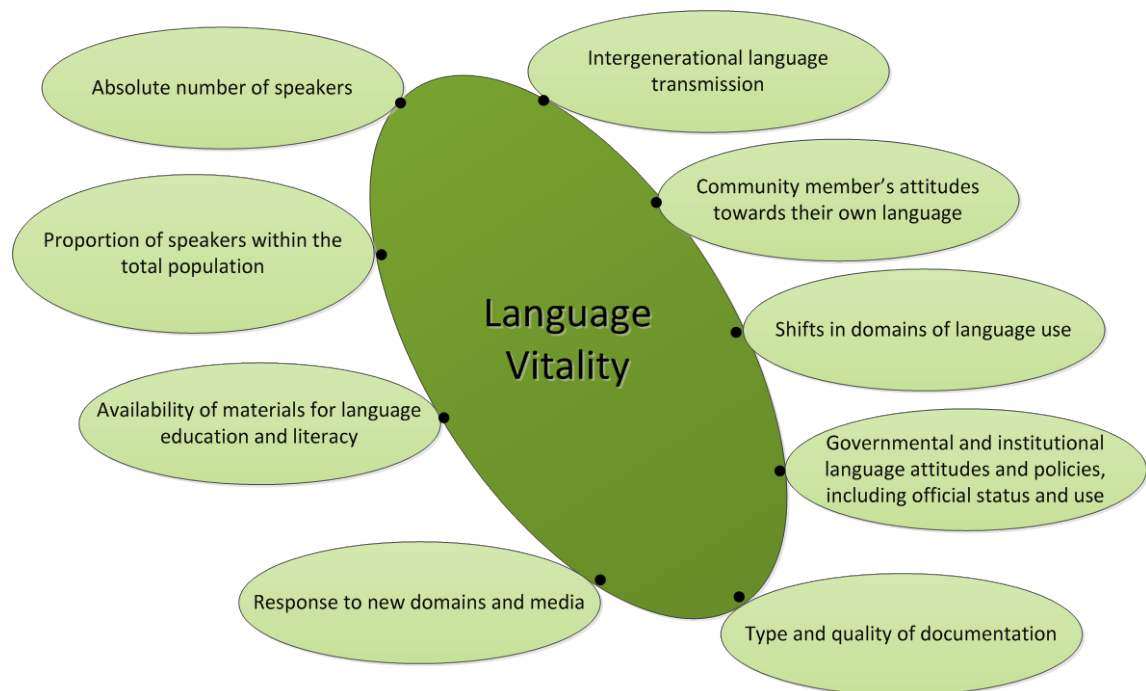

Projects aiming to maintain and revive Aboriginal and Torres Strait Islander languages are being supported by Aboriginal and Torres Strait Islander individuals, language professionals, governments and community organisations in urban, regional and remote locations across Australia (Hobson et al. 2010; HoRSCoATSIA 2012).

Although language revitalisation and maintenance is crucial to preserving and strengthening culture, a lack of proficiency in English can create barriers to education (section 7.1 and 7.3), employment (section 4.6) and access to services (section 8.1 on primary health care). The indicator on engagement with services (section 5.3) includes information on difficulty understanding, or being understood by, service providers.

Schneirer et al. (2011), in their literature review of Aboriginal and Torres Strait Islander cultural heritage, state that evidence is compelling about the endangered state of traditional languages, and highlight the need to *revitalise* languages and to *maintain*, using an assessment of ‘language vitality’. The assessment of language vitality was developed by the United Nations Educational, Scientific and Cultural Organization (UNESCO) Ad Hoc Expert Group on Endangered Languages, and adopted in 2003, and is composed of a number of interrelated factors (figure 5.5.1).

---

Figure 5.5.1 **Nine factors for assessing language vitality<sup>a</sup>**

<sup>a</sup> Diagram reproduced from the *Endangered Languages, 2009 – 2014* website, which summarises the UNESCO document on Language vitality and Endangerment, adopted at the International Expert Meeting on the UNESCO Programme of Safeguarding of Endangered Languages, in Paris on 10-12 March 2003.

Source: United Nations Educational, Scientific and Cultural Organization (2003).

---

The UNESCO document cautions that the factors are not prescriptive, but rather provide a guide and scales to be adapted to local contexts. Due to a lack of robust Australian data for the majority of items in the language vitality assessment, two main measures were distilled and adopted by the Steering Committee for this indicator: the *revitalisation* and *maintenance* of Aboriginal and Torres Strait Islander languages.

---

### Box 5.5.3      **Aboriginal and Torres Strait Islander language data sources**

Two sources of data on Aboriginal and Torres Strait Islander language are used to report against this indicator: the NILS and the NATSISS. Whilst the Census provides some data on speakers of Aboriginal and Torres Strait Islander languages, the question is only asked in relation to the main language spoken at home, and so does not include people whose main language is English but who also speak an Indigenous language (see appendix 3 for more information).

The **NILS2** (2012) had two components:

- the *Language Activity Survey*, which asked organisations about community-based Australian language activities
  - 75 organisations responded (primarily Aboriginal and Torres Strait Islander but also some universities and other non-Indigenous bodies)
- the *Language Attitude Survey*, which asked Aboriginal and Torres Strait Islander Australians about their thoughts about their languages
  - a total of 288 Aboriginal and Torres Strait Islander Australians responded.

Due to different methodologies and survey instruments, unless otherwise noted, data from the NILS2 (collected in 2012) are not directly comparable to the NILS1 (collected in 2005).

The **NATSISS** (2008) collected information from respondents whose main language spoken at home was *not* an Aboriginal or Torres Strait Islander language (as well as those whose main language was an Indigenous language). Respondents whose main language was not an Indigenous language were asked whether they spoke any Aboriginal or Torres Strait Islander languages and, if not, whether they would understand what was being said if someone were to speak an Aboriginal or Torres Strait Islander language to them. All respondents were also asked whether they were currently learning any Aboriginal and Torres Strait Islander languages and, if so, how they were being taught. Updated data from the 2014-15 NATSISS will be included in the next report.

*Sources:* ABS 2010, *National Aboriginal and Torres Strait Islander Social Survey: Users Guide*, Cat. no. 4720.0; ABS 2012, *Census of Population and Housing: Characteristics of Aboriginal and Torres Strait Islander Australians, 2011*, Cat. no. 2076.0; Marmion, D., Obata, K. and Troy, J. 2014, *Community, identity and wellbeing: the report of the Second National Indigenous Languages Survey*, Australian Institute of Aboriginal and Torres Strait Islander Studies.

The NILS2 report estimates that, in 2012, around 120 languages were spoken by Aboriginal and Torres Strait Islander Australians, a reduction from the 145 languages reported in 2005 (and the estimated 250 languages before European settlement) (AIATSIS and FATSIL 2005; Marmion, Obata and Troy 2014).

## **Revitalisation of Aboriginal and Torres Strait Islander languages**

The 2008 NATSISS found that 10.6 per cent of Aboriginal and Torres Strait Islander Australians aged 3 years and over were learning an Indigenous language (table 5A.5.2). This proportion was higher in remote plus very remote areas (14.1 per cent) compared to non-remote areas (9.5 per cent) (table 5A.5.3), and for WA (19.4 per cent) compared to other states and territories (table 5A.5.2).

**Figure 5.5.2 Proportion of Indigenous people learning an Indigenous language, by age group, 2008<sup>a,b</sup>**

<sup>a</sup> People whose main language spoken at home was an Aboriginal or Torres Strait Islander language were not asked whether they were learning an Indigenous language. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.5.1.

The proportion of Aboriginal and Torres Strait Islander Australians learning an Indigenous language was higher for younger age groups, with the largest proportion aged 3–14 years (19.2 per cent) followed by those aged 15–54 years (5.5–9.1 per cent) and the lowest proportion for those aged 55 years and over (1.8 per cent) (figure 5.5.2). (Although it could be assumed that older people already speak an Indigenous language and therefore do not need to learn, there was no significant difference by age in the proportions of Aboriginal and Torres Strait Islander Australians aged 25 years and over who spoke an Indigenous language (table 5A.5.1)).

## Maintenance of Aboriginal and Torres Strait Islander languages

Nationally in 2008, 17.2 per cent of Aboriginal and Torres Strait Islander Australians aged 3 years and over spoke an Indigenous language (with 10.4 per cent speaking it as their main language at home) (table 5A.5.1). People living in remote and very remote areas were more likely to speak an Indigenous language (49.2 per cent), than those living in non-remote areas (6.7 per cent) (table 5A.5.3).

At the state and territory level, the NT had the highest proportion of Indigenous language speakers (59.0 per cent), followed by SA (23.5 per cent), WA (20.5 per cent) and Queensland (16.5 per cent) (table 5A.5.2).

The proportion of Indigenous language speakers is higher in older age groups (between 19 and 23 per cent for people aged 25 years and over) compared to younger age groups (around 13 per cent for people aged 3–24 years) (table 5A.5.1). This difference may reflect that younger people are still learning language (see figure 5.5.2).

**Figure 5.5.3 Proportion of Indigenous people aged 15 years and over speaking an Indigenous language, by age group, 2002 and 2008<sup>a,b,c</sup>**

<sup>a</sup> People whose main language spoken at home was an Aboriginal or Torres Strait Islander language were not asked whether they were learning an Indigenous language. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>c</sup> Data were not collected for persons under 15 years in 2002.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008, table 5A.5.1; ABS (2004) National Aboriginal and Torres Strait Islander Social Survey, Australia, 2002, table 5A.5.6.

Comparable time series data on language speakers are available for Aboriginal and Torres Strait Islander Australians aged 15 years and over. Nationally, from 2002 to 2008, there was no significant change in the proportion of Indigenous language speakers (21.1 per cent and 19.1 per cent respectively). Across age groups, the only significant change was a decrease in the proportion of Aboriginal and Torres Strait Islander 15–24 year olds speaking an Indigenous language (from 18.2 per cent in 2002 to 13.1 per cent in 2008) (figure 5.5.3).

The NILS2 data are heavily qualified, but indicate that in 2012:

- of the 54 languages for which responses were received, 32 were said to have full speakers in one of the age groups

- 
- there was a wide cross-generational decline in usage
  - of the 102 responses, 15 respondents answered that people were fluent in the language for all age groups (Marmion, Obata and Troy 2014).

Comparisons between the 2005 and 2012 NILS data indicate that:

- in 2005 there were around 145 languages still spoken, with around 18 languages considered strong (spoken by all age groups and being passed on to children)
- in 2012 there were around 120 languages still spoken, with around 13 languages considered strong (five fewer than in 2012) (Marmion, Obata and Troy 2014).

## Future directions in data

Data on Aboriginal and Torres Strait Islander language use are limited. Consistent and comparable collection of data on learners and speakers of Aboriginal and Torres Strait Islander languages is important to enable meaningful analysis of change over time.

## 5.6 Indigenous cultural studies<sup>9</sup>

### Box 5.6.1 Key messages

- Culturally appropriate education does not mean that different standards should apply to academic outcomes. Rather, cultural studies can enhance educational achievement for Aboriginal and Torres Strait Islander Australians, as well as educate all students about Indigenous peoples and cultures.
- In 2008, almost two-thirds (65.3 per cent) of Aboriginal and Torres Strait Islander 5–24 year olds reported being taught Indigenous culture as part of their studies (table 5A.6.2). Having been taught Indigenous culture decreased as age increased, with the lowest proportion for Aboriginal and Torres Strait Islander Australians aged 45 years and over (22.6 per cent) (figure 5.6.1). Data are not available to provide a comparator for non-Indigenous people.
- In 2010, Aboriginal and Torres Strait Islander Australians made up a much lower proportion of teachers (primary 1.1 per cent and secondary 0.7 per cent) than students (primary 5.1 per cent and secondary 4.0 per cent) (table 5A.6.1).

### Box 5.6.2 Measures of Indigenous cultural studies

There is no main measure for this indicator.

Information in this section includes qualitative examples of culturally inclusive curricula, and two supplementary measures:

- *Teaching Indigenous cultures* is defined as the proportion of Aboriginal and Torres Strait Islander Australians taught Indigenous culture in school or as part of further studies (national: state and territory; remoteness; age). The most recent available data are from the 2008 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS).
- *Indigenous employment in schools* is defined as the proportion of Aboriginal and Torres Strait Islander school staff. The most recent available data are from the national 2013 Staff in Australia's Schools survey (SiAS) with supplementary administrative data collected by [then] Department of Education, Employment and Workplace Relations up to 2008.

Student outcomes are influenced by many factors, including teacher quality (section 7.2), student attendance (section 7.1), school engagement (section 7.3) and the home environment (chapter 10). In addition, research shows that learning about Indigenous cultures in school and being taught by Indigenous teachers can improve Aboriginal and Torres Strait Islander students' educational achievement (Rahman 2009). Where cultural perspectives are incorporated into the school curriculum and culture, Aboriginal and Torres Strait Islander students' performances have been found to be better than those of Aboriginal and Torres Strait Islander students in other schools (Munns, O'Rourke and Bodkin-Andrews 2013; Watson et al. 2006).

---

<sup>9</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

---

A four year longitudinal study of growth in literacy and numeracy among Aboriginal and Torres Strait Islander students found the following key factors led to improved educational attainment:

- quality teaching (with appropriate professional development in strategies for working with Indigenous students and promoting understanding of cultural issues)
- developing a school culture in which Indigenous students feel included and supported to learn (incorporating the perspectives of Indigenous and other cultures in the curriculum) (Purdie et al. 2011).

Indigenous cultural studies are also important in their own right, educating all Australian students about Aboriginal and Torres Strait Islander peoples and cultures. In 2012, the Reconciliation Australia (RA) Barometer found that 96 per cent of the Aboriginal and Torres Strait Islander sample and 82 per cent of the general community sample believed it was important to learn about Aboriginal and Torres Strait Islander histories and culture (RA 2013).

Numerous studies have also emphasised the importance of Aboriginal studies as part of pre-service teacher training (Craven 2012; DEEWR 2009; Mooney, Halse and Craven 2003). The 2013 Staff in Australia's Schools (SiAS) survey included information on areas in which teachers felt they needed more professional development. Around 26 per cent of primary and secondary teachers with 5 or fewer years of experience, and around 18 per cent with more than 5 years of experience, indicated a need in the area of teaching Aboriginal and Torres Strait Islander children (McKenzie et al. 2014, table 6.4). The survey reported that participation in professional learning activities was amongst the lowest for the category 'teaching Aboriginal and Torres Strait Islander students' for both primary and secondary teachers (McKenzie et al. 2014).

Yunkaporta (2009) found that there is little information on how to teach using Aboriginal perspectives, rather than simply teaching Aboriginal content from a western perspective. A 2009 survey of a national sample of 87 schools with Indigenous students found that, for teachers, everyday face-to-face engagement with the local Indigenous community was a more significant driver of reform of curriculum and teaching than a general knowledge of Indigenous cultures (Luke et al. 2012).

## **Culturally inclusive curricula**

An Australian curriculum, spanning subjects from foundation to year 10, has been developed by the Australian Curriculum, Assessment and Reporting Authority (ACARA) and is being progressively implemented by states and territories. Aboriginal and Torres Strait Islander histories and cultures is a 'cross-curriculum priority' which is embedded in all learning areas. The organising ideas behind this cross-curriculum priority are separated into country/place, culture and people (ACARA 2014). The final review report on the national curriculum was released in October 2014, accompanied by the initial Australian

---

Government response. The review report included recommendations on the teaching of cross curriculum priorities (DoE 2014).

## Teaching Indigenous cultures

Schools exist in different contexts and have varying numbers of Aboriginal and Torres Strait Islander students. Biddle (2010) found that the majority of Aboriginal and Torres Strait Islander children attend schools where they are the minority, and advocated for all students to receive an education that acknowledges and incorporates Aboriginal and Torres Strait Islander history and culture.

The NATSISS 2008 asked Aboriginal and Torres Strait Islander Australians of all age groups whether they had ever been taught culture in school or as part of further studies. Different responses from different age groups can provide some insight into how Aboriginal and Torres Strait Islander culture has been incorporated into curricula over time. Data are not available to provide a comparator for non-Indigenous people.

---

**Figure 5.6.1 Proportion of Indigenous people who were taught Indigenous culture in school or as part of further studies, by age, 2008<sup>a,b,c,d</sup>**

<sup>a</sup> Proportions for Indigenous children aged 2 to 14 years are calculated as a percentage of the number of children who usually attend school. <sup>b</sup> Proportions for persons aged 15 years and over are calculated as a percentage of the number of people who ever attended school or undertook further studies. <sup>c</sup> Responses for Indigenous children aged 2 to 14 and some Indigenous people aged 15 to 17 years were provided by an adult proxy. <sup>d</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.6.2

---

In 2008, 65.3 per cent of Aboriginal and Torres Strait Islander Australians between 5 and 24 years stated that they were taught Indigenous culture at school or as part of further studies (table 5A.6.2). Proportions decreased as age increased, with less than 1 in 4 people (22.6 per cent) aged 45 years and over stating that they were taught Indigenous culture at school or as part of further studies (figure 5.6.1).

**Figure 5.6.2 Proportion of Indigenous people who were taught Indigenous culture in school or as part of further studies, by age, by remote and non-remote areas, 2008 <sup>a,b,c,d</sup>**

<sup>a</sup> Proportions for Indigenous children aged 2 to 14 years are calculated as a percentage of the number of children who usually attend school. <sup>b</sup> Proportions for persons aged 15 years and over are calculated as a percentage of the number of people who ever attended school or undertook further studies. Proportions for persons aged 15 years and over are calculated as a percentage of the number of people who ever attended school or undertook further studies. <sup>c</sup> Responses to 'Whether taught Indigenous culture in schools' for Indigenous children aged 2 to 14 and some Indigenous people aged 15 to 17 years were provided by an adult proxy. <sup>d</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.6.3.

Aboriginal and Torres Strait Islander Australians aged 15 years and over living in all remote areas of Australia were significantly more likely to have been taught Aboriginal and Torres Strait Islander culture at school or as part of further studies (51.8 per cent) compared with people living in non-remote areas (44.0 per cent) (table 5A.6.3). Figure 5.6.2 shows the proportions of Indigenous Australians taught Indigenous culture, by age groups and by remote and non-remote areas.

Data on Aboriginal and Torres Strait Islander Australians taught Indigenous culture in schools are also reported by State and Territory in table 5A.6.2.

---

## Indigenous employment in schools

The employment of Aboriginal and Torres Strait Islander teachers and the presence of Aboriginal and Torres Strait Islander adults in schools act as a positive role model for students, and these staff may be ‘better positioned to understand and respond to the experiences of marginalised students’ (Purdie et al. 2011). These individuals are seen as a ‘bridge’ between the Aboriginal and Torres Strait Islander and non-Indigenous school community (Santoro and Reid 2006).

However, Santoro and Reid (2006) found that Aboriginal and Torres Strait Islander teachers are expected to know and teach all aspects of culture in all Indigenous communities, and are often also responsible for Aboriginal education issues from curriculum to pastoral care. These high expectations, and increased workload, often leads to ‘burn out’ and stress, and they advocate that Aboriginal and Torres Strait Islander teachers, particularly at the early stage of their careers, be provided with professional development and support.

Data from the 2013 SiAS survey found that, nationally, 1.1 per cent of primary school teachers and 0.8 per cent of secondary school teachers identified as Aboriginal and/or Torres Strait Islander, similar to the proportions in 2010 (table 5A.6.1). The proportion of primary school leaders identifying as Aboriginal and/or Torres Strait Islander increased from near zero in 2010 to 1.1 per cent in 2013 (McKenzie et al. 2014). Around 1 per cent of students commencing teacher education programs in 2011 identified as Aboriginal and/or Torres Strait Islander, a slightly higher proportion than the average across other fields of higher education (AITSL 2013). By comparison, in 2013, 5.1 per cent of primary school students and 4.5 per cent of secondary school students were identified as Aboriginal and Torres Strait Islander (table 5A.6.1).

Aboriginal and Islander Education Workers (AIEWs) provide assistance to Aboriginal and Torres Strait Islander students and liaise with educational bodies, government agencies and committees. Available data, for the period 2001 to 2008 indicate that, in contrast to the steady increase in Indigenous teacher numbers, the number of AIEWs has fluctuated over this period (table 5A.6.4). The data collection ceased in 2009.

AIEWs have varying levels of formal qualifications, which may affect their ability to provide educational assistance (as opposed to advice and support in relation to cultural matters). (O’Keefe, Olney and Angus 2013) note that schools that have trouble attracting teachers—particularly in rural and remote areas—often seek to ‘grow good teachers’ by supporting local people to train as non-teaching staff and then to qualify as teachers. In 2008, 50.9 per cent of AIEWs in government schools and 57.6 per cent of AIEWs in Catholic schools had completed or were studying towards formal qualifications, up from 31.3 per cent in government schools and 47.1 per cent in Catholic schools in 2001 (table 5A.6.5).

---

## Things that work

While government-directed initiatives, such as culturally inclusive curricula, can influence the cultural awareness and inclusiveness of education systems, other important factors include: management structures in schools (through the school philosophy and involvement in the community), and the actions of individual teachers (via their teaching methods and attitudes to Indigenous cultures) (Munns, O'Rourke and Bodkin-Andrews 2013; O'Keefe, Olney and Angus 2013). Box 5.6.3 describes one promising program that aims to improve recognition of Aboriginal English.

### Box 5.6.3 Things that work – Indigenous cultural studies

Although the evaluation in 2003 is relatively dated, the Steering Committee has identified **Deadly Ways to Learn** (WA) as a promising practice worth further examination.

The initial Deadly Ways to Learn project, conducted in 14 government, independent and catholic schools in urban and rural areas in WA between 1998 and 2000, aimed to promote parity of esteem between Standard Australian English and Aboriginal English. Teachers and Australian Indigenous Education Officers (AIEOs) worked together to develop two-way, bi dialectal teaching practices that would enhance literacy levels among Aboriginal students in the participating schools. The project resulted in a kit (two books and two videos) to support the implementation of Deadly Ways to Learn practices in Australian schools.

At the start of the project, baseline data were collected on students' development and use of Standard Australian English. Qualitative data were also collected about teaching practices, use of AIEOs, community participation, and general school-community contexts. Cahill and Collard (2003) found that the project led to teaching practices among all participating teachers becoming more inclusive (embracing Aboriginal meanings and Aboriginal English), with more regular discussions among teachers, AIEOs and students about culture and linguistics. They also found that students' writing and reading scores (English as a second language) exceeded agreed targets by 50 per cent.

## Future directions in data

### Indigenous culture in schools

Data on the proportion of Aboriginal and Torres Strait Islander Australians taught culture in schools or as part of further studies are only available every six years from the ABS National Aboriginal and Torres Strait Islander Social Survey. More frequent data are desirable, as are comparable data for the non-Indigenous population.

---

## Indigenous workforce employed in schools

Only limited data are currently available on the Indigenous workforce employed in schools:

- National data on the school workforce are available from the three yearly Staff in Australia's Schools survey, run by Australian Council for Educational Research on behalf of the Department of Education. However, due to the small sample size, data on the Aboriginal and Torres Strait Islander workforce are not available below the national level.
- The initial National Teaching Workforce Dataset produced on behalf of the Australian Education, Early Childhood Development and Youth Affairs Senior Official's Committee, collected data on the Australian teaching workforce including qualifications, registration and employment status (data on professional development was generally not available). However, Indigenous status is unknown for just under half the workforce covered by the dataset.
- The Longitudinal Teacher Education Workforce study tracked a national cohort of teacher education graduates from 2011 to 2013. However, data are not available by Indigenous status, due to the small number of Aboriginal and Torres Strait Islander teachers in the sample.
- Limited annual data on the number of Aboriginal and Torres Strait Islander principals, teachers and education workers (AIEW and equivalents) were reported by individual jurisdictions for 2010, 2011, and 2012 as part of the Ministerial Council for Education, Early Childhood Development and Youth Affairs' Aboriginal and Torres Strait Islander Education Action Plan 2010–14 (SCSEEC 2013). If maintained, and with the addition of nationally comparable data, this collection could provide ongoing information on the Aboriginal and Torres Strait Islander education workforce.<sup>10</sup>

## 5.7 Participation in community activities<sup>11</sup>

### Box 5.7.1 Key messages

- Involvement in community activities can lead to improvement in Aboriginal and Torres Strait Islander Australians' long-term health and physical and mental wellbeing, as well as improved social cohesion in communities.
- In 2008, 62.9 per cent of Aboriginal and Torres Strait Islander Australians attended cultural events, down from 68.1 per cent in 2002 (table 5A.7.6). Whilst attendance decreased across all remoteness areas over this period, it is higher as remoteness increases. In 2008, attendance ranged from 56.4 per cent in major cities to 83.6 per cent in very remote areas (table 5A.7.7).
- International research identified that the participation of Indigenous children and young people in traditional activities can lead to positive emotions, cultural identity and aspirations. In 2008, nearly two-thirds of Aboriginal and Torres Strait Islander 3–24 year olds participated in at least one cultural activity (table 5A.7.10).
- Nationally in 2008, 57.4 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over had participated (including as coach, referee, administrator or player) in sporting and physical recreation activities in the previous year, an increase from 49.3 per cent in 2002 (table 5A.7.6).
- Playing in, or training for, organised sport was higher for non-Indigenous children compared to Aboriginal and Torres Strait Islander children (63.1 per cent compared to 51.0 per cent). This trend was observed across all remoteness areas except major cities, where there was no significant difference (figure 5.7.2). The main factors stopping Aboriginal and Torres Strait Islander children aged 5–14 years from playing organised sport were: don't want to play sport (33.3 per cent); not enough time (15.9 per cent); costs too much (14.9 per cent); and organised sport unavailable (13.1 per cent) (table 5A.7.1).
- Participation rates in community activities varied across jurisdictions and over time but were higher in the ACT for participation in sport and physical recreation activities (71.9 per cent) and in the NT for attendance at cultural events (79.4 per cent) (5A.7.6).

### Box 5.7.2 Measures of participation in community activities

There are two main measures for this indicator.

- *Involvement in arts and cultural events and activities*, defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who participated/attended an Aboriginal and Torres Strait Islander community, social or cultural activity.

(continued next page)

---

<sup>11</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, and to Reconciliation Australia for reviewing a draft of this section of the report.

---

**Box 5.7.2 (continued)**

- *Participation in sport and recreational activities*, defined as proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over who participated in sporting and physical recreation activities.

The most recent data for both measures are from the 2008 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) (all jurisdictions; age; remoteness).

Supplementary measures on Aboriginal and Torres Strait Islander children's and young people's participation in organised sport and selected art and cultural activities are also presented. The most recent available data are from the 2008 NATSISS for Aboriginal and Torres Strait Islander children and the 2009 ABS Children's Participation in Cultural and Leisure Activities Survey (CPiCLAS) for non-Indigenous children (all jurisdictions: age; sex; remoteness). These data are comparable.

Measuring participation in sport, arts or community group activities gives an indication of how connected an individual is to their local community, by mapping formal networks of social relations (Stone 2001).

## **Involvement in arts and cultural events and activities**

There is a positive association between Aboriginal and Torres Strait Islander Australians' involvement in cultural events and activities, as captured in the 2008 NATSISS, and a range of positive socioeconomic indicators, such as higher educational attainment, and higher probability of being employed (Dockery 2011).

In 2008, in remote areas, feeling happy was associated with participating in cultural activities – with 83 per cent of Aboriginal and Torres Strait Islander Australians who were involved in art, craft, dance, music or story-telling reporting they felt happy some or most of the time. Of those who attended cultural activities at least once per week, 81 per cent were happy some or most of the time, compared with 71 per cent among those who rarely or never attended cultural events (ABS 2010b). Dockery (2011) also found that participation in cultural events and activities is associated with better mental health, and to a lesser degree increased happiness.

For Aboriginal and Torres Strait Islander Australians aged 15 years and over, attendance at cultural events in 2008 varied across states and territories, and by remoteness:

- attendance at cultural events in the NT (81.3 per cent) was significantly higher than other states and territories (table 5A.7.6)
- attendance at cultural events increased with remoteness, from 57.0 per cent in non-remote areas to 80.5 per cent in remote areas (table 5A.7.7).

---

Between 2002 and 2008, attendance at cultural events decreased nationally from 68.1 per cent to 62.9 per cent (table 5A.7.6), with significant decreases in attendance for Aboriginal and Torres Strait Islander Australians aged 15 and over (table 5A.7.9).

Data on attendance at cultural events are also reported by age (table 5A.7.9).

### Children and young people's participation in sport and cultural activities

For children and young people, participation in sport and cultural activities provides opportunities to develop physically, socially, emotionally and cognitively (The Smith Family 2013). The Youth Activity Participation Study of Western Australia found that students 'at risk' or from disadvantaged backgrounds benefited most from participation in extracurricular activities, whether it was sport, music, dance or drama (Annear 2010).

International literature shows that there is an association between Indigenous children's participation in traditional activities and positive emotions, cultural identity and aspirations (Smith, Findlay and Crompton 2010). There is also a strong link between engagement in Indigenous culture and young people's wellbeing and resilience (Wexler 2009).

In 2008, over half (50.6 per cent) of Aboriginal and Torres Strait Islander children and young people aged 3–24 years had participated in at least one of the selected cultural activities in the previous 12 months:

- 23.7 per cent had participated in Aboriginal and Torres Strait Islander arts or crafts
- 16.0 per cent had performed Aboriginal and Torres Strait Islander music, dance or theatre
- 10.9 per cent had written or told Aboriginal and Torres Strait Islander stories (table 5A.7.10).

### Participation in sport and recreational activities

Participation in sport and recreational activities has the potential to widely benefit individuals and communities by contributing not only to physical fitness, but also to improved mental wellbeing and social interaction (United Nations Sport for Development and Peace 2014). Sport and recreational activities can lead to (amongst other benefits) improved community cohesion (Cunningham and Beneforti 2005), and increased validation of and connection to culture (Ware and Meredith 2013).

The recent parliamentary report on the contribution of sport to Indigenous wellbeing acknowledged that skills learnt in sport and physical activity include 'life skills' such as: teamwork, problem solving, resilience building, communication and social skills and responsibility. The report concluded that sport could be a positive force in achieving Closing the Gap targets in broad areas such as health, education and employment (HoRSCoATSIA 2013).

Participation in sport and recreation is more than being a player or participant, and includes being a coach, referee and committee member. Volunteering in supporting roles gives non-playing participants an opportunity to develop their skills, self-esteem and purpose, and also improves community cohesion (Cunningham and Beneforti 2002; DinanThompson, Sellwood and Carless 2008).

Whilst there are positive benefits to sport and recreation, Ware and Meredith (2013) note that participation relies on interest, ability and skills, and that some sporting and recreation activities may be too expensive, and may conversely contribute to social exclusion.

**Figure 5.7.1 Participation in sport and recreational activities in the previous 12 months, Indigenous people aged 3 years and over, 2002 and 2008<sup>a,b,c</sup>**

<sup>a</sup> Children aged 3–14 years were not included in the ABS NATSISS 2002. Responses for children aged 3–14 years in 2008 were provided by an adult proxy. <sup>b</sup> in 2002 and 2007 some responses for 15–17 year olds were provided by an adult proxy. <sup>c</sup> Error bars represent 95 per cent confidence intervals.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002, ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; table 5A.7.9.

Nationally, the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over participating in sporting and physical recreation activities increased from 2002 to 2008 (from 49.3 per cent to 57.4 per cent) in both remote and non-remote areas (tables 5A.7.6-7). Participation is significantly higher in the ACT (71.9 per cent in 2008) compared to other jurisdictions (table 5A.7.6).

The proportion of Aboriginal and Torres Strait Islander Australians participating in sporting and recreation activities decreases as age increases. Participation includes as a coach, referee, administrator or player. In 2002, there were significant differences in

---

participation across age groups for those aged 15 years and over. However, between 2002 and 2008 there were significant increases in the proportions of Aboriginal and Torres Strait Islander Australians who participated in sporting and physical recreation activities, except for the group aged 15–24 years, for which rates are similar (figure 5.7.1).

### Children's participation in sport

Studies of all Australian adolescents have demonstrated an association between participation in structured sport and leisure activities and psychological wellbeing (Trainor et al. 2010) and increased school attendance (Blomfield and Barber 2010).

Aboriginal and Torres Strait Islander students surveyed by (Lonsdale et al. 2011) found that participation in sport is also linked to pride in their Aboriginal and Torres Strait Islander identities. A 2009 study of urban Aboriginal and Torres Strait Islander young people highlighted that many sporting and recreation activities were spoken of as points of connection with family, community and culture (Nelson 2009). Participating in organised sporting and recreational activity also reduces unsupervised leisure time, and may divert young people from inappropriate or antisocial behaviour (Ware and Meredith 2013).

In 2008, around half of Aboriginal and Torres Strait Islander children aged 5–14 years (51.0 per cent) spent time playing or training for organised sports outside school hours, with nearly three quarters (72.7 per cent) physically active for at least one hour every day in the previous week (table 5A.7.1).

Nationally in 2008, participation in organised sport was higher for non-Indigenous children compared to Aboriginal and Torres Strait Islander children (63.1 per cent compared to 51.0 per cent). This trend was observed across all remoteness areas except major cities, where there was no significant difference (figure 5.7.2).

**Figure 5.7.2 Children's (aged 5–14 years) participation in organised sport in the last 12 months, 2008<sup>a,b</sup>**

<sup>a</sup> Includes participation in sports organised through a school or a club, outside school hours. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008, ABS (unpublished) Children's Participation in Cultural and Leisure Activities 2009; table 5A.7.2.

In 2008, the main factors stopping Aboriginal and Torres Strait Islander children aged 5–14 years from playing organised sport were: don't want to play sport (33.3 per cent); not enough time (15.9 per cent); costs too much (14.9 per cent); and organised sport unavailable (13.1 per cent) (table 5A.7.1). There are no comparable data for non-Indigenous children. Data on children participating in physical activities and organised sport are also reported by State and Territory (5A.7.1), and by sex (5A.7.3).

Access to sporting facilities (including parks and reserves) may affect participation in sport and recreation (ABS 2012). Among Aboriginal and Torres Strait Islander households in 2008, over 90 per cent had access to outdoor playing fields and play areas (ABS 2010a). There was reduced access to swimming pools (63.5 per cent) and indoor sporting facilities (58.9 per cent) in remote areas (ABS 2010a).

## Things that work

Whilst the research generally supports the idea that participation is valuable, the impact of participation in community activities is hard to quantify, as the benefits are generally 'long-term and diffuse' (Ware and Meredith 2013).

---

The following case studies describe activities within organisations and communities that demonstrate the benefits of participation in sports, arts and community activities (box 5.7.3).

**Box 5.7.3      Things that work — Aboriginal and Torres Strait Islander participation in sports, arts and community activities**

The **Coonamble sports mentoring program** is targeted at both Aboriginal and Torres Strait Islander and non-Indigenous males in Coonamble in north-west NSW. The program, which commenced in 2006, aims to teach life skills to 12–18 year old males through sports-based mentoring by adults at local sporting clubs.

Although the program is small scale, and has not yet been independently evaluated, a review by the [then] Communities and Families Clearinghouse Australia in 2009 found that, in the first year of the project, the 15 participants showed ‘increased social, emotional and relationship development’ and ‘skills and motivation to achieve their goals’, with 13 participants reporting improvement in their relationship skills and 10 participants reporting improvements in life skills. Reports from school coordinators in the following year stated that 14 participants either remained in school or gained employment in the following year, ‘a figure previously unheard of in this area’ (CaFCA and AIFS 2009).

Source: CaFCA and AIFS (Communities and Families Clearinghouse Australia and Australian Institute of Family Studies) 2009, *Sports Mentoring Project - Coonamble*, Promising Practice Profiles archive - Child Family Community Australia, [http://www.aifs.gov.au/cafca/ppp/profiles/la\\_sports\\_mentoring\\_program.html](http://www.aifs.gov.au/cafca/ppp/profiles/la_sports_mentoring_program.html) (accessed 7 July 2014).

## **Future directions in data**

New data on participation in sport and physical activity (levels of exercise undertaken for fitness, recreation and sport) will be available from the National Aboriginal and Torres Strait Islander Nutrition and Physical Activity Survey component of the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (due for release in September 2014 — too late for inclusion in this report). These new data will not be comparable to the 2008 NATSISS data currently presented in this section. Comparable times series is important for measuring change over time. Where possible comparability across ABS surveys is recommended.

Data on involvement in arts, cultural events and activities are only available every six years from the ABS National Aboriginal and Torres Strait Islander Social Survey. More frequent data is desirable. Inclusion of comparable questions in the ABS National Aboriginal and Torres Strait Islander Health Survey would increase the frequency to three-yearly.

## 5.8 Access to traditional lands and waters<sup>12</sup>

### Box 5.8.1 Key messages

- Access to traditional lands and waters gives an indication of Aboriginal and Torres Strait Islander Australians' connection to country and, for some, is associated with improved health outcomes.
- In 2012-13:
  - 62.4 per cent of Aboriginal and Torres Strait Islander adults identified with a clan, tribal or language group, with the proportion increasing as remoteness increased (from 55.3 per cent in major cities to 84.2 per cent in very remote areas (table 5A.8.1))
  - 72.3 per cent of Aboriginal and Torres Strait Islander adults recognised traditional homelands and under 1 per cent identified as not being allowed to visit homelands (table 5A.8.1)
  - 87.6 per cent of those in remote areas recognised homelands (and 45.4 per cent lived on homelands), while 67.8 per cent of those in non-remote areas recognised homelands (and 18.8 per cent lived on homelands) (table 5A.8.1). There was also a significant increase in recognition in non-remote areas between 2004-05 to 2012-13 (from 60.1 per cent to 67.8 per cent) (table 5A.8.1) following a decrease from 1994 to 2002. There was no significant change in remote areas from 2002 to 2012-13 (table 5A.8.3)
  - for those in non-remote areas, recognition of homelands increased with age (from 59.8 per cent of 18–24 year olds to 72.2 per cent of those aged 55 years and over) (table 5A.8.2).

### Box 5.8.2 Measures of access to traditional lands and waters

There is one main measure for this indicator. *Recognition and access to homelands and traditional country* is defined as the proportion of Aboriginal and Torres Strait Islander Australians aged 18 years and over who recognise areas as their homelands or traditional country.

A supplementary measure on the proportion of Aboriginal and Torres Strait Islander Australians aged 18 years and over who identified with a clan, tribal or language group is also reported.

The most recent data for both measures are from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) 2012-13 (national: age; remoteness). Historical data for 2008 and 2002 are directly comparable, but historical data for 1994 (limited) and 2004-05 are only comparable for non-remote areas, as data were not collected in remote areas for these two surveys.

There are currently no data specifically on access to traditional waters.

---

<sup>12</sup> The Steering Committee notes its appreciation to Ms Robynne Quiggin, Australian Indigenous Governance Institute, who reviewed a draft of this section of the report.

---

Aboriginal and Torres Strait Islander Australians report that they derive physical, spiritual, emotional and cultural benefits from their connection to country (Burgess and Morrison 2007; Dockery 2011). ‘Country’ refers to a specific clan, tribal group or nation of Aboriginal and Torres Strait Islander Australians and incorporates all the knowledge, stories and resources within a particular area, including land, air and water (Fredericks 2013). Notion of country is central to self-identity for Aboriginal and Torres Strait Islander Australians (Kingsley et al. 2013).

Bishop et al. (2012) states that, as country is intrinsically linked to self-identity, the wellness of the people reflects the wellness of the country, while maintenance of country is important for maintenance of health (section 8.7 discusses the interaction with mental health).

The data in this section focus on recognition and access to country. The data do not show whether Aboriginal and Torres Strait Islander Australians have control or ownership, rights to resources found on their homelands or access to particular sites that may be of cultural significance. Information on ownership and control of land is discussed in section 9.2.

The reported data are based on Aboriginal and Torres Strait Islander Australians’ own understanding of what constitutes their homelands or traditional country. Some Aboriginal and Torres Strait Islander Australians may live on or visit Indigenous owned or controlled land but they may not consider it to be their own homelands or traditional country. Movement from traditional country may have been either voluntary or involuntary, with many people who were removed from their families (the Stolen Generations) not being able to find their families or to identify their traditional country (NMHC 2012).

## **Recognition and access to homelands and traditional country**

Access to traditional lands is conceptualised as a determinant of health (AHMAC 2012). Weir, Stacey and Youngetob (2011) summarised the literature on some of the positive associations with Aboriginal and Torres Strait Islander Australians living and accessing their traditional country, which included: positive health behaviours (increased exercise and physical activity, more nutritious diet, reduction in substance abuse) and a lesser burden on the health care system (savings in preventing disease, reduced hospital costs) as well as the overall economic benefits of a healthier population.

Morphy’s (2008) work with Aboriginal Australians from North-East Arnhem Land suggests that traditional homelands communities, where individuals are interconnected through multiple bonds, exhibit ‘an orderly system of leadership and succession’ according to established systems of governance. The stability and longevity of these governance systems were perceived by the Aboriginal Australians in the study as protective factors against ‘social breakdown and loss of culture and the loss of many of the younger generations to drugs and alcohol’.

However, living on homelands/traditional country, particularly in remote or very remote regions of Australia, sometimes equates to reduced or restricted access to services such as health, housing and education, with people from these communities temporarily relocating to larger centres to access these services (AHRC 2010; Kerins 2010).

In 2012-13, 72.3 per cent of Aboriginal and Torres Strait Islander Australians aged 18 years and over recognised homelands/traditional country, with recognition higher in remote areas (87.6 per cent) than non-remote areas (67.8 per cent) (table 5A.8.1). There was also a significant increase in recognition in non-remote areas between 2004-05 to 2012-13 (from 60.1 per cent to 67.8 per cent) (table 5A.8.1) following a decrease between 1994 and 2004-05 (table 5A.8.3).

**Figure 5.8.1 Proportion of Indigenous people aged 18 years and over who recognise and live on homelands/traditional country, by remoteness areas, 2012-13<sup>a,b,c</sup>**

<sup>a</sup> Includes respondents that did not know if they were allowed to visit homelands or not. <sup>b</sup> Includes people who refused to answer, or who provided 'don't know' or 'not stated' responses. <sup>c</sup> Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 5A.8.1.

Source: ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (2012-13 NATSIHS component); table 5A.8.1.

ABS survey data show that recognition of homelands/traditional country is not restricted to those Aboriginal and Torres Strait Islander Australians who live there (figure 5.8.1). As noted in the Aboriginal and Torres Strait Islander Health Performance Framework (AHMAC 2012), a return to country in the traditional sense is no longer an option for some Aboriginal Australians, particularly in South Eastern Australia. However, Fredericks (2013) argues that Aboriginal and Torres Strait Islander Australians still maintain strong connections to their country even if they live on lands that belong to other Aboriginal

---

Australians, or if they recognise lands where large urban centres have grown in post-settlement Australia.

In 2012-13, 87.6 per cent of Aboriginal and Torres Strait Islander Australians aged 18 years and over in remote areas recognised homelands (and 45.4 per cent lived on homelands), while 67.8 per cent of those in non-remote areas recognised homelands (and 18.8 per cent lived on homelands) (figure 5.8.1). Less than 1 per cent of Aboriginal and Torres Strait Islander Australians aged 18 years and over identified as not being allowed to visit homelands (table 5A.8.1).

Data for non-remote areas in 2012-13 showed recognition of homelands increasing with age (from 59.8 per cent for 18–24 year olds to 72.2 per cent for those aged 55 years and over in 2012-13) (table 5A.8.2).

### Traditional waters

For many Aboriginal and Torres Strait Islander Australians, water is an essential part of identity, culture and country (Birkhead et al 2011; O'Bryan 2012). The Expert Panel on Constitutional Recognition of Indigenous Australians recommended that there should be an acknowledgment of the continuing relationship of Aboriginal and Torres Strait Islander Australians with both their traditional lands and waters (FAHCSIA 2012).

The National Water Initiative (NWI), agreed by COAG in 2004, is currently the primary vehicle in Australia for recognising the relationship of Aboriginal and Torres Strait Islander Australians with water (O'Bryan 2012). Assessment of progress of the NWI is undertaken by the National Water Commission (NWC), which published a review of Aboriginal and Torres Strait Islander Australians' involvement in water planning, in May 2014. The review found that:

... while approaches are variable across Australia, most governments have made significant advances in recognising the need to address Indigenous water issues ... However, challenges remain and little progress has been observed in the allocation or licensing of water for Indigenous social, economic, spiritual or cultural purposes (NWC 2014).<sup>13</sup>

### Identification with a clan, tribal or language group

Identification with a clan, tribal or language group is one aspect of connection to country (Fredericks 2013).

In 2012-13, 62.4 per cent of Aboriginal and Torres Strait Islander Australians aged 18 years and over identified with a clan, tribal or language group, with the proportion increasing as remoteness increased (from 55.3 per cent in major cities to 84.2 per cent in very remote areas) (table 5A.8.1).

---

<sup>13</sup> The NWC will cease at the end of 2014, with the triennial water reform assessment due to COAG in late 2014.

---

## Future directions in data

Data on Aboriginal and Torres Strait Islander Australians recognising and living on their homelands or traditional country was available for remote areas for the first time in the 2012-13 AATSIHS. Ongoing collection of these data in remote areas in future ABS Indigenous health surveys is desirable, to provide three yearly (rather than the previous six yearly) reporting.

Given the importance of connection to country to the health of Aboriginal and Torres Strait Islander Australians, the collection of information on the reasons why a person does not identify with clan, tribal or language group or recognise homeland could assist in developing culturally appropriate responses.

The collection of additional information around recognition of traditional waters would complement the qualitative information formerly published in the National Water Commission assessments.

2008	1.1	2.8	<b>2.9</b>	3.1	2.1	<b>3.0</b>	1.1

(a) Participants were asked to describe their level of their perception of knowledge on a scale ranging from 'very high, fairly high, fairly low, very low or no knowledge'. Participants from both groups completed the survey questionnaires online.

(b) The surveys among Indigenous respondents involved recruitment through Indigenous networks across Australia, with an open invitation distributed by email. The sample of Indigenous people, recruited via these networks, may not be truly representative of the overall Indigenous population. The survey sample consisted of 516 Indigenous respondents in 2012, 704 in 2010 and 617 in 2008.

The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population population in terms of age, gender and location. The general community sample consisted of 1012 Australians in 2012, 1220 in 2010 and 1007 in 2008. Reconciliation Australia advised that whilst the general community sample was selected to be representative of the general community, given the small sample size is unlikely to have many (if any) Indigenous Australians.

TABLE 5A.1.4

Table 5A.1.4      **Perceptions of the level of trust between Indigenous people and other Australians, by Indigenous status, 2008 to 2012 (per cent) (a)**

	<i>Very high (%)</i>	<i>Fairly high (%)</i>	<b><i>Total high (%)</i></b>	<i>Fairly low (%)</i>	<i>Very low (%)</i>	<b><i>Total low (%)</i></b>	<i>Don't know (%)</i>
2008	1.8	11.3	<b>13.1</b>	51.0	30.1	<b>81.1</b>	5.7
	Relative standard error						
2012	20.7	8.9	<b>8.0</b>	3.0	5.4	<b>1.7</b>	10.5
2010	19.2	8.2	<b>7.4</b>	2.8	4.4	<b>1.4</b>	11.3
2008	23.0	8.8	<b>8.1</b>	3.1	4.8	<b>1.5</b>	12.8
	95 per cent confidence intervals						
2012	0.9	1.9	<b>2.1</b>	3.1	2.7	<b>2.5</b>	1.7
2010	0.8	1.7	<b>1.9</b>	2.8	2.6	<b>2.2</b>	1.3
2008	0.8	2.0	<b>2.1</b>	3.1	2.8	<b>2.4</b>	1.4

- (a) Respondents were asked to describe their level of trust on a scale ranging from 'very high, fairly high, fairly low, very low or don't know'. Participants from both groups completed the survey questionnaires online.
- (b) The surveys among Indigenous respondents involved recruitment through Indigenous networks across Australia, with an open invitation distributed by email. The sample of Indigenous people, recruited via these networks, may not be truly representative of the overall Indigenous population. The survey sample consisted of 516 Indigenous respondents in 2012, 704 in 2010 and 617 in 2008.
- (c) The general community surveys were based on a sample of Australians that were selected to be representative of the Australian population population in terms of age, gender and location. The general community sample consisted of 1012 Australians in 2012, 1220 in 2010 and 1007 in 2008. Reconciliation Australia advised that whilst the general community sample was selected to be representative of the general community, given the small sample size is unlikely to have many (if any) Indigenous Australians.

(a) The number of Indigenous people elected to Parliament were provided by each jurisdiction. Indigenous members of parliament were counted in the jurisdiction of the parliament. Current as at 30 June 2014.

(b) Includes members of both chambers for the Parliament of Australia and the states of NSW, Victoria, WA, SA and Tasmania. The remaining jurisdictions are unicameral.

(c) ABS 2014 projected Indigenous population as at 30 June 2014 (series B).

(d) Australian Electoral Commission (AEC) estimates of 'eligible Australians' as at 30 June 2014 (used as a proxy by the Steering Committee for the Review of Government Service Provision for Australian citizens eligible to nominate as candidates to stand for federal and state elections).

(e) The 'eligible Australians' category is based on estimates the AEC receives from the ABS of Australian citizens who are resident in Australia. As these estimates have a lag of several quarters, AEC extrapolates them to the reference date. The AEC then make adjustments in order to incorporate those groups which are captured by the ABS, but not eligible, or not captured, but are eligible. This includes additions for: eligible British subjects, those who have acquired citizenship since the last census, and overseas electors. The AEC then remove from that list people who have been removed from the roll on the basis of being 'unable to understand the nature and significance of voting'. These people, while Australian citizens, are not eligible to vote.

– Nil or rounded to zero.

(a)	Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.									
(b)	Sum of components may be more than total as people may have reported having problems accessing more than more service and/or having more than one barrier to accessing services.									
(c)	Includes people who reported having problems accessing 'other' services not further defined.									
(d)	Includes people who reported having experienced 'other' barriers not further defined.									
	– Nil or rounded to zero.

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) In 2002, all people aged 15 years and over were asked if they had experienced difficulties when communicating with service providers. In 2008, only those aged 15 years and over who reported that they spoke an Indigenous language as their main language at home were asked about difficulties when communicating with service providers. The response categories for the set of communicating with service providers questions were also slightly different between the two surveys, however, they are still comparable once the 2002 data are limited to only those who spoke an Indigenous language as their main language at home.
- (c) Difference between rate for people in total non-remote and total remote is statistically significant.

TABLE 5A.3.4

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) In 2002, all people aged 15 years and over were asked if they had experienced difficulties when communicating with service providers. In 2008, only those aged 15 years and over who reported that they spoke an Indigenous language as their main language at home were asked about difficulties when communicating with service providers. The response categories for the set of communicating with service providers questions were also slightly different between the two surveys, however, they are still comparable once the 2002 data are limited to only those who spoke an Indigenous language as their main language at home.

(c) Includes not stated responses.

.. Not applicable. np Not published.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Excludes separations with a principal diagnosis of 'Mental and behavioural disorders' (ICD-10AM codes 'F00-F99').

(b) Percentage of hospitalisations for which patients left hospital at own risk or were discharged against medical advice in the period.

(c) Data are reported for public and private hospitals in all jurisdictions.

(d) Data are reported for public and private hospitals in NSW, Victoria, Qld, WA and SA and public hospitals in the NT, for residents of these jurisdictions.

(e) 'Other' includes hospitalisations of non-Indigenous people and those for whom Indigenous status was not stated.

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) Proportions and relative standard errors for 'Culture taught in school' are calculated as a percentage of the children who usually attend school in each of the respective age groups.
- (c) Proportions and relative standard errors for 'Children aged 2 to 14 years that usually attend school' are calculated as a percentage of the total population of children aged 2 to 14 years. Total who usually attend school includes 'not known'.
- (d) Proportions and relative standard errors for 'Children aged 2 to 14 years that don't usually attend school' are calculated as a percentage of the total population of children aged 2 to 14 years.
- (e) Proportions and relative standard errors for 'Taught Indigenous culture at school or as part of further studies' are calculated as a percentage of the 'Total that attended school or undertook further studies'.

– Nil or rounded to zero. **np** Not published.

AIEWs = Aboriginal and Islander Education Workers.

- (a) The number of Indigenous students in Catholic schools is based on the number in all Catholic schools, not just IESIP funded Catholic systems. Staff numbers are those in IESIP funded Catholic systems.
- (b) For some states these figures are based on actual numbers and for some others it is based on full time equivalent (FTE).
- (c) Figures are not to be considered as nationally reflective because not all states reported on employment in any one year.
- (d) Catholic schools' enrolment data includes some other non government schools including many indigenous run schools that have greatly influenced the results.
- (e) Figure for 2001 includes 140 teacher aides in Queensland who were not classified as AIEWs because they were not placed in identified positions.
- (f) Includes school and non school based AIEWs.
- (g) Changes in the way staffing in the category 'specialist support staff' was reported by two state departments in 2003 means that it is not possible to provide a consistent picture of change over the period 2002-03.
- (h) Total for government schools in 2001 is less than the sum of numbers for Indigenous teachers and AIEWs because the total Indigenous staff numbers in government schools does not include 140 teacher aides in Queensland not classified as AIEWs.
- (i) Reporting of these data to DEEWR in Indigenous Education Performance Reports ceased on 31 December 2008.

Source: DEEWR *National Report to Parliament on Indigenous Education and Training 2008*; DEST (unpublished) IESIP performance reports 2003–2004; DEEWR (unpublished) IEP performance reports 2005–2008.

AIEWs = Aboriginal and Islander Education Workers.

TABLE 5A.6.5

**Table 5A.6.5      Aboriginal and Islander Education Workers in government and Catholic schools who have completed or are undertaking professional development leading to formal qualifications, 2001 to 2008 (d)**

---

- (a) From 2005 onwards, education providers reported on the number of AIEWs who have achieved, or are studying for, other qualifications.
- (b) The increase in AIEWS undertaking diploma courses in 2005 was because of a decision by the SA Department of Education and Children's Services to make it compulsory for AIEWs to have a diploma qualification.
- (c) Does not include data on partially completed qualifications for 2005 and 2006 from the Queensland Department of Education and the Arts and the South Australian Department of Education and Children's Services.
- (d) Reporting these data to DEEWR in Indigenous Education Performance reports ceased on 31 December 2008.
  - Nil or rounded to zero. **na** Not available.

- (a) Estimates with a RSE of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) The physical activity recommendations by the Department of Health and Ageing for children aged 5 to 12 years are that children need at least 60 minutes a day (and up to several hours) of moderate to vigorous physical activity every day.
- (c) Outside of school hours.
- (d) Question asked of children who had played **less** than 4 types of organised sport (124 335).
- (e) Includes lack of appropriate training or equipment.
- (f) Sum of components may exceed total as people may have provided more than one response.
- (g) Question asked of children who had played organised sport in the last 12 months (64 866).
- (h) Difference between Indigenous and non-Indigenous rate is statistically significant for Australia, and for all jurisdictions, except Tasmania.
- (i) Difference between Indigenous and non-Indigenous rate is statistically significant for NSW, Victoria and Australia.
- (j) Difference between Indigenous and non-Indigenous rate is only statistically significant for SA.
- (k) Difference between Indigenous and non-Indigenous rate is statistically significant for Victoria, Queensland, the NT and Australia.
- (l) Difference between Indigenous and non-Indigenous rate is statistically significant for NSW, Victoria, Queensland, WA, SA, and Australia.
- (m) Difference between Indigenous and non-Indigenous rate is statistically significant for NSW, Victoria, the ACT and Australia.

**na** Not available. – Nil or rounded to zero. **np** Not published.

<b>Total Indigenous people aged 15 years and over (incl. not stated responses)</b>		—	—	—	—	—	—	—	—	—

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.

(b) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by a proxy.

(c) Sum of components may exceed total as people may have participated in more than one of the selected activities.

(d) In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.

(e) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.

(f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.

(g) In 2002, NAIDOC week activities were not listed as a separate event.

(h) 'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.

— Nil or rounded to zero.

TABLE 5A.7.7

Table 5A.7.7      **Indigenous people aged 15 years and over: participation in selected social activities, participation in selected sporting and physical recreation activities, and attendance at Indigenous cultural events, by remoteness, 2002 and 2008 (a), (b)**

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Total non-remote</i>	<i>Remote</i>	<i>Very remote</i>	<i>Total remote</i>	<i>Australia</i>
<b>Total Indigenous people aged 15 years and over (incl. not stated responses)</b>	<b>±</b>	<b>–</b>	<b>–</b>	<b>–</b>	<b>–</b>	<b>–</b>	<b>–</b>	<b>–</b>	<b>–</b>

- (a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by a proxy.
- (c) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (d) In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.
- (e) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.
- (f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.
- (g) In 2002, NAIDOC week activities were not listed as a separate event.
- (h) 'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.
- (i) Difference between rate for total non-remote areas in 2002 and 2008 is statistically significant.
- (j) Difference between rate for total remote areas in 2002 and 2008 is statistically significant.
- (k) Difference between rate for Australia in 2002 and 2008 is statistically significant.
- Nil or rounded to zero.

<b>Total Indigenous people aged 15 years and over (incl. not stated responses)</b>	±	–	–	–	–	–	–	–	–	–

- (a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) In both 2002 and 2008 some responses for people aged 15 to 17 years were provided by an adult proxy.
- (c) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.
- (d) Includes participating in 'recreational or cultural group activities', 'attended native title meeting', 'community or special interest group activities', 'church or religious activities' or 'attended funerals/sorry business, ceremonies or Indigenous festivals'.
- (e) Includes participating in social activities such as 'went to a café, restaurant or bar', 'visited a library, museum or art gallery', 'attended movies, theatre or concert', 'visited park, botanic gardens, zoo, theme park', 'watched Indigenous TV' or 'listened to Indigenous radio'. 'Has been involved in social activities' in last twelve months is slightly different between the 2002 and 2008 surveys. The 2002 question included the option 'fishing or hunting in a group', this wasn't asked about in 2008. In 2008 'watched Indigenous TV', and 'listened to Indigenous radio' was asked about, these were not asked about in 2002.
- (f) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (g) 'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.
- Nil or rounded to zero.

TABLE 5A.7.9

Table 5A.7.9      **Indigenous people aged 3 years and over: participation in selected social activities, participation in selected sporting and physical recreation activities, and attendance at Indigenous cultural events, by age groups, 2002 and 2008 (a), (b)**

	<i>Unit</i>	<i>3–14 years</i>	<i>15–24 years</i>	<i>25–34 years</i>	<i>35–44 years</i>	<i>45–54 years</i>	<i>55+ years</i>	<i>Total 15+ years</i>	<i>Total 3+ years</i>
--	-------------	-----------------------	------------------------	------------------------	------------------------	------------------------	------------------	----------------------------	---------------------------

- (a) Estimates with a relative standard error of 25 per cent to 50 per cent should be interpreted with caution.
- (b) In both 2002 and 2008, responses for some people aged 15 to 17 years were provided by an adult proxy.
- (c) Sum of components may exceed total as people may have participated in more than one of the selected activities.
- (d) In 2002, information was collected in both non-remote and remote areas about the following social activities: recreational or cultural group activities; community or special interest group activities; church or religious activities; went out to a café, restaurant or bar; involvement in sport or physical activities; and attendance at a sporting event as a spectator. In non-remote areas only, these data were also collected: visited library, museum or art gallery; attended movies, theatre or concert; and visited park, botanic gardens, zoo or other theme park. In remote areas only, data were collected about: attendance at ATSIC or native title meetings; funerals, ceremonies or festivals; and fishing or hunting in a group.
- (e) Includes participating in sporting activities in the capacity of a 'coach, instructor or teacher', 'referee, umpire or official', 'committee member or administrator', 'took part in sporting activities', 'sports spectator' or 'other sporting activity'.
- (f) In 2002, people were asked about attendance at funerals, but not 'sorry business'.
- (g) In 2002, NAIDOC week activities were not listed as a separate event.
- (h) 'Attendance at cultural events' includes attendance at 'Funeral/sorry business', 'Ceremony', 'NAIDOC week activities', 'Sports carnival', 'Art/craft/music or dance festival/carnival' or 'Aboriginal/Torres Strait Islander Organisation'.

## 6 Early child development

---

### Strategic areas for action

In 2009, COAG agreed to the *National Partnership Agreement on Indigenous Early Childhood Development*, with the aim of improving the health and development outcomes of Aboriginal and Torres Strait Islander children across Australia (COAG 2009).<sup>1</sup> Providing children with a good start can have a long lasting effect on the rest of their lives, opening up opportunities for the future. However, problems at this early stage can create barriers that prevent children achieving their full potential.

The indicators in the early child development strategic area focus on the drivers of long term advantage or disadvantage:

- antenatal care (section 6.1) — the health of women during pregnancy, childbirth and the period following birth is important for the wellbeing of both women and children
- health behaviours during pregnancy (section 6.2) — the health behaviours of women during pregnancy, including the consumption of tobacco and other drugs impacts on the wellbeing of both mother and children
- teenage birth rate (section 6.3) — teenage births are associated with lower incomes and poorer educational attainment and employment prospects for young parents
- birthweight (section 6.4) — the birthweight of a baby is a key indicator of health status. Low birthweight babies require longer periods of hospitalisation after birth and are more likely to have poor health, or even die in infancy and childhood. Low birthweight is also correlated with poorer health outcomes later in life
- early childhood hospitalisations (section 6.5) — the hospitalisation rate provides a broad indicator of the scale of serious health issues experienced by children

---

<sup>1</sup> This National Partnership Agreement ended on 30 June 2014.

- 
- injury and preventable disease (section 6.6) — most childhood diseases and injuries can be successfully prevented or treated without hospitalisation
  - ear health (section 6.7) — Aboriginal and Torres Strait Islander children tend to have high rates of recurring ear infections that, if not treated early, can become chronic and lead to hearing impairment, which in turn can affect children’s capacity to learn and socialise
  - basic skills for life and learning (section 6.8) — the early social and cognitive development of children provides the foundations upon which later relationships and formal learning depend.

Several COAG targets and headline indicators reflect the importance of early child development:

- young child mortality (section 4.2)
- early childhood education (section 4.3)
- substantiated child abuse and neglect (section 4.10).

Other headline indicators are important influences on early childhood outcomes:

- household and individual income (section 4.9)
- family and community violence (section 4.11).

Outcomes in the early child development area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- healthy lives (access to primary health, obesity and nutrition) (chapter 8)
- economic participation (income support) (chapter 9)
- home environment (overcrowding, access to functioning water, sewerage and electricity services) (chapter 10)
- safe and supportive communities (alcohol/drug misuse and harm) (chapter 11).

## Attachment tables

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 6A.1.1). These tables can be found on the Review web page ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)), or users can contact the Secretariat directly.

## 6.1 Antenatal care<sup>2</sup>

### Box 6.1.1 Key messages

- Antenatal care provides expectant mothers with information and early screening that can identify and help manage issues that may affect birth outcomes. Fifty per cent of Aboriginal and Torres Strait Islander women who gave birth in 2011 attended at least one antenatal visit in the first trimester (table 6A.1.1) and 84.6 per cent attended five or more antenatal visits (table 6A.1.29).
- In 2011, after adjusting for population age structures, Aboriginal and Torres Strait Islander mothers attended their first antenatal visit later in pregnancy than non-Indigenous mothers and attended less frequently (attended five or more visits at 0.9 times the rate for non-Indigenous mothers) (tables 6A.1.7 and 6A.1.12).
- Trends varied across the jurisdictions for which time series data are available but:
  - the proportion of Aboriginal and Torres Strait Islander mothers in very remote areas attending in the first trimester increased from 39.3 per cent in 2007 to 47.5 per cent in 2010 (NSW, SA and the NT combined) (table 6A.1.6)
  - the gap in mothers attending five or more visits narrowed in all remoteness areas from 2007 to 2011 (Queensland, SA and the NT combined) (tables 6A.1.22–26).

### Box 6.1.2 Measures of antenatal care

There are two main measures for this indicator (aligned with the associated NIRA indicator).

- *Antenatal visits in the first trimester* is defined as the proportion of women who gave birth who attended at least one antenatal visit in the first trimester.
- *Five or more antenatal visits* is defined as the proportion of women who gave birth who attended five or more antenatal visits.

The most recent available data for both main measures are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- nationally standardised data items on *gestation at first antenatal visit* are only available from July 2010 (caution should be used in making jurisdictional comparisons prior to this date), and nationally standardised data items on *number of antenatal visits* are not yet available.
- data by remoteness for 2011 are not directly comparable to data for previous years.

A supplementary measure on health and nutrition during pregnancy is also reported.

Although many Aboriginal and Torres Strait Islander women experience healthy pregnancies, some experience complications of pregnancy and childbirth, resulting in poorer birth outcomes than those experienced by non-Indigenous women.

---

<sup>2</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

---

Antenatal care provides expectant mothers with information and early screening that can identify and help manage issues that may affect birth outcomes. Inadequate or late access to quality antenatal care has been associated with poor pregnancy outcomes, such as prematurity, low birth weight and increased delivery intervention (DOHA 2013). Low birthweight infants are prone to ill health and at greater risk of dying during the first year of life (section 6.4, Birthweight).

Antenatal care may be especially important for Aboriginal and Torres Strait Islander women, as they are at higher risk of giving birth to low birthweight babies and have greater exposure to other risk factors such as anaemia, poor nutritional status, hypertension, diabetes, genital and urinary tract infections and smoking (AHMAC 2012). Antenatal care is an indicator in the National Indigenous Reform Agreement (NIRA) (COAG 2012), and improved access to antenatal care was a focus of the National Partnership Agreement on Indigenous Early Childhood Development (Australian Government 2009)<sup>3</sup>.

The optimal number of antenatal care visits is the subject of some debate (Gausia et al. 2013; Hunt and Lumley 2002). National evidence-based antenatal care guidelines have been developed by the Department of Health and Ageing in collaboration with State and Territory governments, and approved by the NHMRC (DOHA 2013). These guidelines include a recommended first visit within the first 10 weeks of gestation, with the subsequent schedule of antenatal visits to be based on the individual woman's needs (for uncomplicated pregnancies — 10 visits for the first pregnancy and 7 visits for subsequent pregnancies). However, the indicator in this report is defined against a lower standard of five or more visits to align with the NIRA.

## **Antenatal visits in the first trimester**

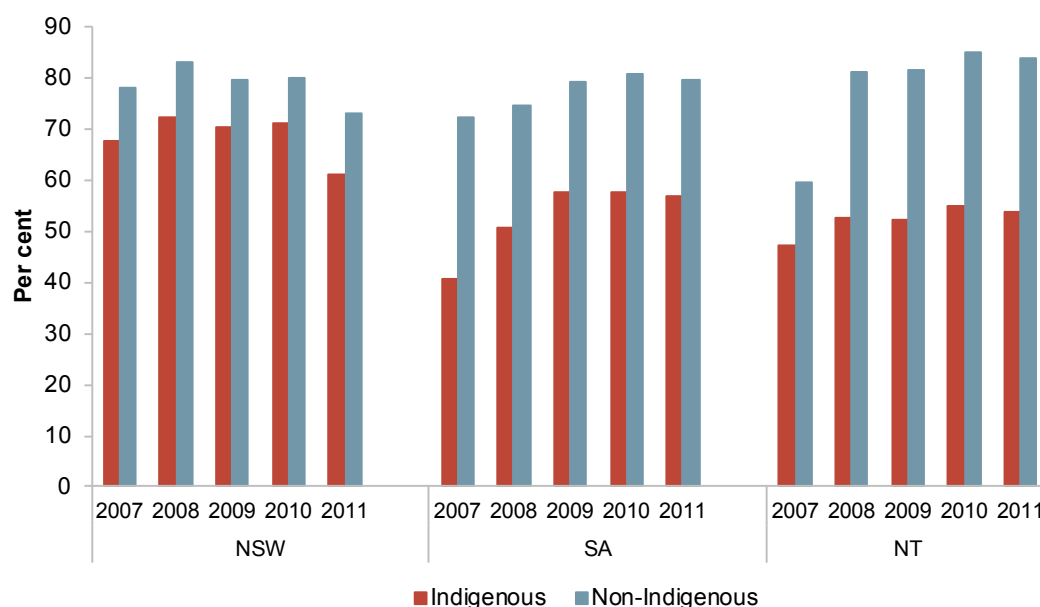

Nationally in 2011, 50.0 per cent of Aboriginal and Torres Strait Islander women who gave birth attended at least one antenatal visit in the first trimester (table 6A.1.1). After adjusting for differences in population age structures, the rate for Aboriginal and Torres Strait Islander women was 0.8 times the rate for non-Indigenous women (table 6A.1.7).

Data were not available for all jurisdictions in all years, but there are comparable data available for three jurisdictions (NSW, SA and the NT) from 2007 to 2011. The gap between Aboriginal and Torres Strait Islander women and non-Indigenous women narrowed 9.1 percentage points in SA between 2007 and 2011 (figure 6.1.1).

---

<sup>3</sup> The National Partnership Agreement on Indigenous Early Childhood Development expired on 30 June 2014. However, the antenatal and reproductive healthcare provisions have been funded for an additional 12 months under a multilateral Project Agreement for Indigenous teenage sexual and reproductive health and young parent support.

Figure 6.1.1 **Mothers who attended at least one antenatal visit in the first trimester, NSW, SA and the NT, 2007 to 2011<sup>a,b</sup>**

<sup>a</sup> Data are by place of usual residence of the mother. <sup>b</sup> Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

Source: AIHW (National Perinatal Data Collection), cited in SCRGSP (2013); tables 6A.1.7–11.

The proportion of Aboriginal and Torres Strait Islander women attending at least one antenatal visit in the first trimester by remoteness area varied across jurisdictions. However, over time there has been a consistent improvement in very remote areas — combined data for NSW, SA and the NT showed an increase from 39.3 per cent in 2007 to 47.5 per cent in 2010 (the latest comparable year) (table 6A.1.6). Age standardised data are provided for comparisons with non-Indigenous women (tables 6A.17–21).

## Five or more antenatal visits

In 2011, 84.6 per cent of Aboriginal and Torres Strait Islander mothers attended five or more antenatal visits (NSW, Queensland, SA, Tasmania, ACT and the NT combined) (table 6A.1.29). After adjusting for differences in population age structures, the rate for Aboriginal and Torres Strait Islander women was 0.9 times the rate for non-Indigenous women (table 6A.1.12).

Data were not available for all jurisdictions in all years, but there are comparable data available for three jurisdictions (Queensland, SA and the NT) from 2007 to 2011. When taking into account differences in population age structures, the gap between Aboriginal and Torres Strait Islander women and non-Indigenous women narrowed in Queensland (from 15.2 to 10.3 percentage points) and SA (from 23.0 to 14.7 percentage points) from

---

2007 to 2011. In the NT, the gap widened from 2007 to 2009 before narrowing again to 2011, resulting in less than a percentage point change from 2007 to 2011 (tables 6A.1.12–16). For these three jurisdictions combined, the gap narrowed in all remoteness areas (tables 6A.1.22–26).

## **Health and nutrition during pregnancy**

Antenatal care provides an opportunity to identify maternal health issues. Nutrition and diet are important for the health of the mother and baby during pregnancy. Pregnant women and women considering pregnancy are advised to have a balanced diet and in particular to maintain adequate folate levels to decrease the risk of neural tube defects such as spina bifida.<sup>4</sup> A number of studies have reported poor nutrition for Aboriginal and Torres Strait Islander women of childbearing age and during pregnancy (McDermott et al. 2009; Wen et al. 2010).

Aboriginal and Torres Strait Islander women are at higher risk of having Type 2 diabetes and gestational diabetes than non-Indigenous mothers, and these conditions pose a heightened risk of pre-term birth, delivery with no labour, caesarean section, hypertension and longer stay in hospital. In 2005–2007, nearly 7 per cent of Aboriginal and Torres Strait Islander mothers had diabetes during pregnancy: 1.5 per cent had pre-existing diabetes and 5.1 per cent had gestational diabetes mellitus (GDM), compared with 0.6 per cent of non-Indigenous mothers who had pre-existing diabetes and 4.7 per cent had GDM (AIHW 2010).

The most recent available national data on health and nutrition of mothers of Aboriginal and Torres Strait Islander children is from the 2008 ABS National Aboriginal and Torres Strait Islander Social Survey and was reported in the 2011 OID report. Relevant data by State and Territory and remoteness are reproduced in tables 6A.1.27–28 of this report.

## **Things that work**

Culturally safe service provision, involvement of Aboriginal and Torres Strait Islander elders and the community in developing services, and incorporation of traditional midwifery knowledge and skills have been found to encourage Aboriginal and Torres Strait Islander women to access maternity health services, and to lead to better maternal outcomes (Kildea and Van Wagner 2013; Kildea et al. 2012; Murphy and Best 2012; Reibel and Walker 2010; Simmonds et al. 2010; Wilson 2009). In a 2013 South Australian study, women with Aboriginal babies who attended Aboriginal Family Birthing Program

---

<sup>4</sup> Neural tube defects are where an opening in the spinal cord or brain occurs during early fetal development. Spina bifida is one form of neural tube defect that affects spine development.

---

services were almost five times as likely as women attending mainstream public care to say that their antenatal care was ‘very good’ (Glover et al. 2013)<sup>5</sup>.

Programs after birth also play an important part in health outcomes for mothers and their children (Bar-Zeev et al. 2012). Sivak, Arney and Lewig (2008) found that a family home visiting program for Aboriginal and Torres Strait Islander babies after birth had positive outcomes for the health and wellbeing of both mothers and babies.

Box 6.1.3 includes case studies of some things that are working to improve antenatal care for Aboriginal and Torres Strait Islander women.

### Box 6.1.3 ‘Things that work’ – Antenatal care

The **Winnunga Nimmityjah Aboriginal Health Service** (ACT) is an Aboriginal community controlled primary health care service which provides culturally safe and holistic health services to the Aboriginal and Torres Strait Islander people of the ACT and surrounding areas. An independent evaluation in 2011 found that the **Aboriginal Midwifery Access Program** provided by the service was a benchmark program for the delivery of culturally appropriate midwifery services to parents and new-borns. It encouraged women to access treatment at an early stage in pregnancy, and provided comprehensive antenatal and postnatal services, including: home visits; assistance with appointments for antenatal investigations and specialist care; transport; birth support; postnatal follow-up; and immunisations (Wong et al. 2011).

Although not formally evaluated, the Steering Committee has identified the **Bumps, Babies and Beyond** (BBB) program (Victoria) as a promising practice worth further examination. The BBB program has been offered since February 2012 through the Mallee District Aboriginal Services (MDAS; formerly Mildura Aboriginal Corporation). BBB is based on the Queen Elizabeth Centre’s (QEC) successful ‘Tummies to Toddlers’ pilot program, and the partnership between QEC and MDAS won a NAPCAN Play Your Part Award in 2012. BBB’s success has been recognised at a local and State level, and resulted in an invitation to present at the World Association for Infant Mental Health International conference in June 2014 (MDAS 2014).

BBB supports parents, particularly mothers, to develop positive interactions with their babies, improve their connectedness to support networks, reduce depression and anxiety, and assist the development of secure parent/child attachments. BBB combines home visits and group sessions, engaging pregnant women and their partners from about 26 weeks and continuing until their babies are around 18 months of age. Specific goals of the program include: antenatal appointments; post natal check-ups; maternal and child health key ages and stages; child immunisation; SIDS safe sleeping guidelines; QUIT and home safety (NAPCAN 2013).

---

<sup>5</sup> The questionnaire was undertaken by women living in Adelaide (44 per cent) and regional areas including Ceduna, Port Lincoln, Whyalla, Port August, Murray Bridge and Mt Gambier (56 per cent).

---

## Future directions in data

The data for both primary measures are from the National Perinatal Data Collection (NPDC) managed by the AIHW. It includes data items specified in the Perinatal National Minimum Dataset (NMDS) plus additional items collected by the states and territories.

The usefulness of NPDC data has historically been affected by some gaps in reporting, lack of national consistency and low response rates. Under schedule F of the National Indigenous Reform Agreement, the AIHW is improving the quality of NPDC data. Recent improvements include the collection of data on gestational age at first antenatal visit (included in this report). Data on the number of antenatal visits is anticipated to be available for reporting from 2016.

Data on the nutrition and health of Aboriginal and Torres Strait Islander mothers and young children are only available every six years (from the ABS NATSISS). More regular data and comparative data for non-Indigenous mothers and children are required.

## 6.2 Health behaviours during pregnancy<sup>6</sup>

### Box 6.2.1 Key messages

- Tobacco smoking, excessive alcohol drinking and illicit substance use during pregnancy can lead to miscarriage, stillbirth, foetal growth restriction, congenital anomalies, premature birth and low birthweight.
- Nationally (excluding Victoria), the proportion of Aboriginal and Torres Strait Islander mothers who smoked during pregnancy declined by 4.2 percentage points from 2005 to 2011 (tables 6A.2.1—6A.2.7).
- Nationally in 2011, half of Aboriginal and Torres Strait Islander mothers (50.0 per cent) smoked during pregnancy (table 6A.2.1), with the proportion slightly lower in major cities (45.7 per cent) compared with other areas (51.2–52.6 per cent) (table 6A.2.8).
- After adjusting for differences in population age structures, the rate of smoking during pregnancy for Aboriginal and Torres Strait Islander mothers in 2011 was four times the rate for non-Indigenous mothers (table 6A.2.9). This ratio was highest in major cities (4.1 times as high) and lower in regional and remote areas (3.1–3.4 times as high) (table 6A.2.16).

### Box 6.2.2 Measuring of health behaviours during pregnancy

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Tobacco smoking during pregnancy* is defined as the number of women who smoked during pregnancy as a proportion of the total number of women who have given birth.

The most recent available data are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- nationally standardised data items on tobacco smoking are available from July 2010. Caution should be used in making jurisdictional comparisons prior to this date
- nationally comparable time series data, excluding Victoria, are available from 2005 to 2011
- data disaggregated by remoteness for 2011 are not comparable to data for previous years.

Data are also provided for three supplementary measures:

- The proportion of mothers, with Aboriginal and Torres Strait Islander children aged 0–3 years, who:
  - used tobacco during pregnancy
  - consumed alcohol during pregnancy
  - used illicit drugs during pregnancy.

(continued next page)

---

<sup>6</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

---

**Box 6.2.2 (continued)**

The most recent available data for these measures are from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2008 (data available every six years) (all jurisdictions; remoteness).

Data on tobacco use during pregnancy from the NPDC and the NATSISS are not directly comparable.

Smoking in pregnancy can lead to miscarriage, stillbirth or premature birth and low birthweight (Gilligan et al. 2007; Samper et al. 2012; Walters 2009; Wills and Coory 2008). When a pregnant woman smokes, fetal levels of nicotine have been found to be 15 per cent higher than maternal levels, and fetal nicotine exposure can damage the brain, leading to health, behavioural and cognitive problems that emerge later in life (Behl et al. 2013; Hutchinson et al. 2010; Pickett et al. 2008; Stone KC et al. 2010; Stroud et al. 2009). A recent study suggests that maternal smoking during pregnancy is also an important risk factor for Attention Deficit Hyperactivity Disorder (ADHD) (Telethon Institute for Child Health Research 2013).

Negative health effects of maternal tobacco smoking may continue after birth via nicotine in breast milk and via passive (or second-hand) smoking (Johnston et al. 2011; Julvez et al. 2007). Passive smoking has been linked with higher rates of respiratory illness, sudden infant death syndrome (SIDS), vascular dysfunction, asthma and effects on hearing in children (Durante 2012; Ferrence 2010; Jones et al. 2011).

### **Tobacco consumption during pregnancy**

Nationally in 2011, the proportion of Aboriginal and Torres Strait Islander females smoking during pregnancy was 50.0 per cent (table 6A.2.1). The proportion was lower in major cities (45.7 per cent) compared with other areas (51.2–52.6 per cent), though the pattern varied across jurisdictions (table 6A.2.8).

After adjusting for differences in population age structures, the rate of smoking during pregnancy for Aboriginal and Torres Strait Islander women was four times the rate for non-Indigenous women (table 6A.2.9). This ratio was highest in major cities (4.1 times as high) and lower in regional and remote areas (3.1–3.4 times as high) (table 6A.2.16).

Figure 6.2.1 **Rates of tobacco smoking during pregnancy for Indigenous females, 2005 to 2011**<sup>a,b,c</sup>

<sup>a</sup> Excludes births where the mother's Indigenous status was not stated. <sup>b</sup> Data are not available for Victoria. Total excludes women who gave birth in Victoria. Due to small numbers, the total also excludes women who were Victorian residents who gave birth elsewhere in Australia. <sup>c</sup> Excludes mothers for whom smoking status was not stated.

Source: AIHW (unpublished) National Perinatal Data Collection; tables 6A.2.1—6A.2.7.

Nationally comparable time series data (excluding Victoria) are available from 2005.

Nationally (excluding Victoria), the proportion of Aboriginal and Torres Strait Islander females smoking during pregnancy decreased from 54.8 per cent in 2005 to 50.6 per cent in 2011 — a decrease of 4.2 percentage points (figure 6.2.1).

Survey data on smoking by mothers of Aboriginal and Torres Strait Islander children aged 0–3 years in 2008 show similar results to the 2011 NPDC data, although the survey data should be used with caution due to high relative standard errors for some results (tables 6A.2.23–24).

## Alcohol consumption during pregnancy

Heavy alcohol consumption during pregnancy may cause physical and neurocognitive disorders termed ‘fetal alcohol spectrum disorders’ (FASD) (Fitzpatrick et al. 2012; O’Leary et al. 2007). FASD are characterised by various combinations of growth restriction of the fetus, facial anomalies and impaired brain structure and function, including memory, cognition, gross and fine motor control, intellectual disability, language and behaviour problems (Fitzpatrick et al. 2012; O’Leary et al. 2007).

---

Measured prevalence of FASD varies depending on the method of identification and the true prevalence of FASD in Australia unknown (Burns et al. 2013; Elliott 2013; Fitzpatrick et al. 2012; House of Representatives 2012). The House of Representatives' Inquiry into FASD estimates the prevalence in Australia to be between 0.06 and 0.68 per 1000 live births, and for Aboriginal and Torres Strait Islander Australians between 2.76 and 4.7 per 1000 births (House of Representatives 2012).

In 2010, the National Drug Strategy Household Survey found that, of all women surveyed who had been pregnant in the previous twelve months, 47.3 per cent consumed alcohol while pregnant before knowledge of their pregnancy, and 19.5 per cent consumed alcohol while pregnant after knowledge of their pregnancy (Callinan and Room 2012). In 2008, around one in five mothers of Aboriginal and Torres Strait Islander children aged 0–3 years (19.6 per cent) reported that they consumed alcohol during pregnancy, with no significant differences in reported consumption across states and territories (table 6A.2.23) or remoteness areas (table 6A.2.24).

### **Illicit drug use during pregnancy**

Illicit drug use during pregnancy has detrimental effects on the fetus and the mother's health. Effects on the mother and baby differ according to the drugs used, and can range from fetal drug dependency (neonatal abstinence syndrome), intra-uterine growth retardation, prematurity, mortality, problems with normal brain development, low birthweight, and problems with behaviour such as sleeping patterns, mood, attention and cognitive deficits later in life (Derauf et al. 2009; Kennare, Heard and Chan 2005; Ludlow, Evans and Hulse 2004; Oei and Lui 2007).

In 2010, 4.2 per cent of all women aged 14 years and over used illicit drugs while pregnant and or breastfeeding (AIHW 2011). In 2008, 5.0 per cent of mothers aged 15 years and over of Aboriginal and Torres Strait Islander children aged 0–3 years reported using illicit drugs or substances during pregnancy, with no significant differences in reported consumption across states and territories (table 6A.2.23) or remoteness areas (table 6A.2.24). These data are not available disaggregated by the Indigenous status of mothers.

Glover et al. (2013) reported that 36 per cent of 130 women participating in their 2011 study of the antenatal experiences of Aboriginal women and families in SA used 'yarndi' (cannabis) during pregnancy.

### **Things that work**

Research on programs that support Aboriginal and Torres Strait Islander pregnant women and parents of young children to stop smoking is increasing, but researchers note the need for more evidence of strategies that work (Eades et al. 2012; Gould et al. 2013; Hefler and Thomas 2013; Marley et al. 2012; Wood et al. 2008). Passey, Sanson-Fisher and Stirling

---

(2013) found that current pregnant Aboriginal and Torres Strait Islander women smokers were less positive about the effectiveness of strategies to quit smoking than service providers, and that family support was considered the most helpful strategy. Passey et al. (2012) found that knowledge of antenatal smoking risks was an insufficient strategy to stop smoking for Aboriginal and Torres Strait Islander women, whose social environment and daily stressors may be exacerbated by pregnancy. Glover et al. (2013) found that over half the women participating in a study of the antenatal experiences of Aboriginal women and families reported having to deal with three or more social health issues (e.g., housing problems, drug and alcohol issue, family violence, death of a family member) when they were pregnant. Box 6.2.3 includes case studies of some things that are working to stop smoking and reduce risk taking behaviours during pregnancy.

### Box 6.2.3 'Things that work'

#### NSW Aboriginal Maternal and Infant Health Service (AMIHS)

The AMIHS was established to improve the health of Aboriginal women during pregnancy and decrease perinatal morbidity and mortality for Aboriginal babies. The strategy included targeted antenatal/postnatal programs for Aboriginal women and infants; and a statewide training and support program for midwives and Aboriginal Health Workers (AHWs). The service is delivered through a continuity-of-care model, where midwives and AHWs collaborate to provide a high quality maternity service that is culturally sensitive, women centred, based on primary health-care principles and provided in partnership with Aboriginal people.

A 2012 evaluation found that, consistent with earlier evaluations, the program was successfully meeting its goal to improve the health outcomes of Aboriginal mothers and babies by providing culturally appropriate maternity care. Specifically, there had been an increase in women receiving antenatal care before 20 weeks gestation, and a reduction in pre-term births. The evaluation noted that the strengths of the program included the partnerships between the AHWs and midwives, working together in a primary health-care model to provide continuity of care. The program has expanded to include secondary programs including mental health, drug and alcohol, and Quit for Life Smoking cessation in pregnancy programs, and Aboriginal health educators (Murphy & Best 2012).

Although not formally evaluated, the Steering Committee has identified the **Stop smoking in its tracks** project, a collaborative project undertaken by the University of Sydney and the AMIHS, as a promising practice worth further examination. This small scale program included incentives to stop smoking (vouchers for use at local stores) plus client assessment and intensive counselling, free nicotine replacement therapy, educational resources, social support groups, interventions for other drug use and support from household members. The completion rate for the trial was 86 per cent (19 women), with 84 per cent of the participants making a quit attempt and 42 per cent not smoking at 36 weeks. Participants appreciated the frequent and ongoing support, found the rewards very motivating, and considered that the constant reinforcement from the AMIHS team was important (Hefler and Thomas 2013).

---

## Future directions in data

The data for the primary measure are from the National Perinatal Data Collection (NPDC) managed by the AIHW. It includes data items specified in the Perinatal National Minimum Dataset (NMDS) plus additional data items collected by the states and territories.

The usefulness of NPDC data has historically been affected by some gaps in reporting, lack of national consistency and low response rates. Under schedule F of the National Indigenous Reform Agreement, the AIHW is improving the quality of NPDC data. Recent improvements include the collection of data on smoking during pregnancy (included in this report).

Limited information is available about the prevalence of Fetal Alcohol Spectrum Disorders (FASD) in Australia, due to factors including a low level of awareness by clinicians, complexity of diagnosis and the absence of nationally agreed and consistent diagnostic criteria and definitions. In 2013, the Department of Health contracted the AIHW to undertake a scoping project to identify ways of collecting and reporting information about children with FASD. The project has found that, with some development work, jurisdictional congenital anomalies registers could include notifications for FASD. The AIHW is aiming to release the report of this project by the end of 2014 (AIHW forthcoming).

The AIHW is also continuing to pursue the collection of data on alcohol use during pregnancy. Its National Maternity Data Development project (NMDDP) is developing nationally consistent perinatal data. Through the project, a list of high priority data items for national standardisation and addition to the Perinatal National Minimum Data Set (NMDS) has been developed, including data on Alcohol consumption in pregnancy. In June 2012, the AIHW sought agreement from states and territories to pilot the data item alcohol use in pregnancy for potential implementation. As at the time of preparing this report full agreement had not been received from the states and territories to commence the pilot.

## 6.3 Teenage birth rate<sup>7</sup>

### Box 6.3.1 Key messages

- Giving birth as a teenager can pose additional risks for both the mother and the baby.
- The Aboriginal and Torres Strait Islander teenage birth rate increased from 64.6 births per 1000 women aged 15–19 years in 2004 to 77.0 births per 1000 women aged 15–19 years in 2009, before decreasing to 68.1 births per 1000 women aged 15–19 years in 2012. The non-Indigenous teenage birth rate followed a similar trend increasing from 13.4 births per 1000 women aged 15–19 years in 2004 to 15.0 births per 1000 women aged 15–19 years in 2008, before decreasing to 12.8 births per 1000 women aged 15–19 years in 2012 (table 6A.3.1).
- Over time, there has been a change in the age profile of Aboriginal and Torres Strait Islander mothers, with a decrease in the proportion of mothers aged under 18 years from 9.5 per cent in 1998 to 7.3 per cent in 2012 (table 6A.3.2).
- In 2012, 30.9 per cent of fathers of children of Aboriginal and Torres Strait Islander teenage mothers were aged less than 20 years, similar to the proportion of fathers of children of non-Indigenous teenage mothers (28.0 per cent) (table 6A.3.7).

### Box 6.3.2 Measures of teenage birth rate

The main measure for this indicator is *Teenage birth rate*, defined as the number of live births per 1000 female population aged 15–19 years.

Data are also provided for three supplementary measures:

- Median age of parents
- Births to teenage mothers, by age of mother
- Births to teenage mothers, by age of father.

The most recent available data for all measures are from the ABS Birth Registrations Collection (all jurisdictions; age; remoteness). Births are reported according to the date of registration (which may occur in a different year to the birth itself).

Another potential source of data on teenage births is the AIHW's National Perinatal Data Collection (NPDC), which records births reported by State and Territory health authorities to the National Perinatal Data Unit (a collaborating unit of the AIHW). However, data from the ABS Birth Registrations Collection are not directly comparable to data from the NPDC due to differences in methods, timing and reporting. Also, the NPDC has a shorter time series than the ABS birth data, with nationally comparable NPDC data on Indigenous status of the mother only available from 2005, and data on Indigenous status of the baby was only available for selected jurisdictions from 2012.

---

<sup>7</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

---

Giving birth as a teenager can pose a greater risk of adverse pregnancy outcomes (Shrim et al. 2011). The age of the mother is associated with the risk of foetal complications and perinatal health, with adverse outcomes more likely amongst mothers in their teenage years and mothers over the age of around 35 years (Laws and Sullivan 2004).

Many studies have measured the association between teenage pregnancy and the likelihood that the mother or child will experience socioeconomic disadvantage both at the time of birth and later in the mother's or child's life. Children of teenage mothers have worse outcomes in terms of education, earnings and health (Francesconi 2008). Jeon, Kalb and Vu (2011) examined welfare participation among Australian teenage mothers and found a strong association between welfare participation and being a teenage mother. In Australia, teenage mothers are overrepresented among recipients of the main income support payment for single mothers (Morehead and Soriano 2005), and are overrepresented among disability support payment recipients (Jeon, Kalb and Vu 2011). Teenage mothers are less likely than older mothers to have completed year 12, be employed or to have a post-school qualification (Kalb, Le and Leung 2012). A WA study found that not only are Aboriginal and Torres Strait Islander teenagers more likely to experience teenage pregnancy than non-Indigenous teenagers, but are also more likely to experience a repeat pregnancy within two years (Lewis et al. 2010).

For some young women, motherhood can have transformative potential (Brand 2013; Keys 2007; Smith, Skinner and Fenwick 2012). Larkins et al (2011) found that teenage women in their Townsville study of 186 young Indigenous women took motherhood very seriously and spoke about how becoming a mother gave meaning to their lives. Those who had supportive families that provided emotional and practical support found the transition to motherhood easier than those who did not (Larkins et al. 2011). Unfortunately, Larkins et al (2011) found the young mothers in their study were highly mobile and generally had poor relationships with their mothers, distrust of men and a family history of early parenting. Some of these women also had experienced sexual or physical abuse or domestic violence in their families.

The Aboriginal and Torres Strait Islander population has a younger age structure than the non-Indigenous population. The median age of the Aboriginal and Torres Strait Islander population at 30 June 2011 was 21.8 years, compared to 37.6 years for the non-Indigenous population (ABS 2013b). This difference in age structure contributes to the relatively high fertility of Aboriginal and Torres Strait Islander women. In 2012, the median age of Aboriginal and Torres Strait Islander mothers was 25.2 years and the fertility rate was 2.71 babies per woman, compared to a median age of 30.9 years for non-Indigenous mothers and a fertility rate of 1.93 babies per non-Indigenous woman (table 6A.3.4; ABS 2013a). The median age of Aboriginal and Torres Strait Islander mothers decreases as remoteness increases, but for non-Indigenous mothers the median age is lowest in regional areas (table 6A.3.5). These data are also reported by State and Territory (table 6A.3.4).

---

## Teenage birth rate

Aboriginal and Torres Strait Islander teenagers have a much higher birth rate and poorer outcomes compared to their non-Indigenous counterparts. Similar results have been found for other indigenous peoples internationally. Luong (2008) noted that, for Canadian Aboriginals, teenage pregnancy is much more common than for other Canadians. Teenage pregnancy is also much more common for Māori than other New Zealanders (Lawton et al. 2013).

The Aboriginal and Torres Strait Islander teenage birth rate has declined from 77.0 births per 1000 women aged 15–19 years in 2009, to 68.1 births per 1000 women aged 15–19 years in 2012. The non-Indigenous teenage birth rate has also declined, from 15.0 births per 1000 women aged 15–19 years in 2008 to 12.8 births per 1000 women aged 15–19 years in 2012 (table 6A.3.1).

---

Figure 6.3.1 **Teenage birth rate for Indigenous females, by age, 2004 to 2012<sup>a</sup>**

<sup>a</sup> These data exclude 1911 registered births where the Indigenous status was not stated for mothers aged 15–19 years over the period 2004 to 2012.

Sources: ABS (unpublished) Births, Australia, 2012; ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; Table 6A.3.1.

---

For Aboriginal and Torres Strait Islander females, the year at which the decrease in rates occurred differed by age. For those aged 17 years or younger, the decrease occurred from 2008, and for those aged 18 and 19 years, the decrease occurred from 2009 (figure 6.3.1).

These data are also reported by State and Territory (table 6A.3.1).

---

## Teenage birth by age of mother

Younger teenage mothers have higher risks than older teenage mothers, because their bodies have not had time to fully develop (Roth et al. 1998).

The age profile of Aboriginal and Torres Strait Islander teenage mothers has changed over time. From 1998 to 2012, the proportion of babies born to Aboriginal and Torres Strait Islander mothers aged 17 years or younger declined from 9.5 per cent in 1998 to 7.3 per cent in 2012, while the proportions of babies born to Aboriginal and Torres Strait Islander mothers aged 18 and 19 years remained relatively stable around 5 and 6 per cent respectively. The proportions of babies born to non-Indigenous teenage mothers for most age groups decreased from 1998 to 2012 (table 6A.3.2). These data are also reported by State and Territory in table 6A.3.2. The number of births to teenage mothers, by age of mother between 1998 and 2012 is provided in table 6A.3.6.

The proportion of babies born to Aboriginal and Torres Strait Islander teenage mothers increases with remoteness (from 17.6 per cent in major cities to 19.5 per cent in remote areas and 22.4 per cent in very remote areas in 2012). The proportion of babies born to non-Indigenous teenage mothers is highest in regional areas (9.8 per cent), followed by remote areas (6.9 per cent) and major cities (2.3 per cent). This pattern is consistent over time (table 6A.3.3) and consistent with the pattern for median age of Aboriginal and Torres Strait Islander and non-Indigenous mothers (table 6A.3.5).

## Teenage birth by age of father

International research indicates that children of young and teenage fathers also have an increased risk of adverse birth outcomes such as preterm birth, low birthweight, small for gestational age births, low Apgar Score<sup>8</sup> and infant mortality (Chen et al. 2008; Doamekpor, Amutah and Ramos 2013), congenital malformations such as gastroschisis and trisomy 13 (Archer et al. 2007), schizophrenia (Wohl and Gorwood 2007), and some studies have found associations for neural tube defects (Kazaura, Lie and Skjærven 2004; McIntosh, Olshan and Baird 1995).

Information about the age of fathers of babies born to teenage females can assist in developing age appropriate programs to reduce teenage birth rates. Lohan et al. (2010) suggest that greater understanding of teenage fathers' perspectives could re-frame the idea that adolescent pregnancy is solely a women's issue. Larkins et al. (2011) found that young Aboriginal and Torres Strait Islander men who had not yet become parents had idealised perceptions about teenage pregnancy and parenthood.

Nationally in 2012, 30.9 per cent of fathers of children of Aboriginal and Torres Strait Islander teenage mothers were aged less than 20 years, similar to the proportion of fathers

---

<sup>8</sup> The Apgar score is a numerical score that indicates a baby's condition shortly after birth. Apgar scores are based on an assessment of the baby's heart rate, breathing, colour, muscle tone and reflex irritability.

---

of children of non-Indigenous teenage mothers (28.0 per cent) (table 6A.3.7). However, the age of the father is unknown in a large proportion of records (27.4 per cent where the mother is Aboriginal and Torres Strait Islander and 14.7 per cent where the mother is non-Indigenous), which makes interpretation of these data difficult (table 6A.3.7). These data are also reported by State and Territory (table 6A.3.7) and remoteness (table 6A.3.8).

## Things that work

Programs have been developed to assist teenage and young mothers to care for their children. Box 6.3.3 provides an example of programs designed to assist young Aboriginal and Torres Strait Islander mothers.

### Box 6.3.3 Things that work — Teenage birth rate

The **Ngala Nanga Mai pARenT Group** Program is a small scale program operating in La Perouse, Sydney. It aims to: improve the health of young Aboriginal parents and their children; facilitate parents' return to educational opportunities; and improve social connectedness (ARCHI 2014). The program won several awards in 2010, and in 2013 was awarded the NSW/ACT State Creative Partnerships Arts and Health Award and was one of six finalists for a National Award (ICH 2014). The program provides:

- a twice-weekly, three hour art program for young parents
- support and education programs for the parents by an Aboriginal Early Education Officer
- health checks for the babies by an Early Childhood Nurse
- provision of an accessible co-located paediatric clinic and health promotion talks by a Paediatric doctor
- linkages to midwives who provide continuity of care from the antenatal to the postnatal period.

Tutoring support services are also provided by TAFE OTEN Aboriginal Education Training Unit's Indigenous Tutorial Assistance Scheme, to enhance access to educational and employment opportunities.

A 2011 evaluation found that, between 2009 and 2012, 94 participants (parents of 133 children) attended the group at least once, with 31 participants identified as regular attendees. The program had facilitated access to health care, and program participants reported improved mental health, wellbeing and social connectedness. Twenty-five participants enrolled in higher education, and at least five participants gained full time employment with support from the program (ICH 2014).

The Closing the Gap Clearinghouse has found that effective parenting support programs for Aboriginal and Torres Strait Islander families generally include the following:

- use of cultural consultants in conjunction with professional parent education facilitators and home visitors

(continued next page)

---

### Box 6.3.3 (continued)

- long-term rather than short-term programs
- a focus on the needs of both parents/carers and the child
- a supportive approach that focuses on family strengths
- use of structured early intervention program content while also responding flexibly to families (AIHW 2012).

Sources: ICH (Institute for Creative Health) 2014; ARCHI (Australian Resource Centre for Healthcare Innovations) 2014; AIHW 2012, *Parenting in the early years: effectiveness of parenting support programs for Indigenous families*, Resource sheet no. 16 produced for the Closing the Gap Clearinghouse.

## Future directions in data

There are limited data on teenage mothers' and fathers' access to sexual or reproductive health services, apart from contraception use (for women aged 18–49 years from ABS Aboriginal and Torres Strait Islander health surveys) and the number of antenatal check-ups (from the AIHW National Perinatal Data Collection and included in section 6.1 of this report).

*Births, Australia* (ABS 2013a) is published annually by the ABS and provides data on Aboriginal and Torres Strait Islander births (where the father, mother or both identify as Aboriginal and/or Torres Strait Islander), births to Aboriginal and Torres Strait Islander women and non-Indigenous births (where neither the father nor mother identify as Aboriginal and/or Torres Strait Islander). While this collection includes the age of the father, for a high proportion of births by teenage mothers the age of the father is unknown. Identification of the father is currently not compulsory on birth registrations.

A complete estimation of teenage *pregnancy* rates would combine abortion figures with numbers of births and perinatal deaths. However, it is not currently possible to gain a precise figure for the number of abortions performed, either in the first or second trimester for Aboriginal and Torres Strait Islander teenage women.

## 6.4 Birthweight<sup>9</sup>

### Box 6.4.1 Key messages

- Birthweight is a key indicator of the health status of babies and a predictor of their health outcomes later in life.
- For available jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT), the proportion of low birthweight babies born to Aboriginal and Torres Islander mothers decreased from 11.7 per cent in 2000 to 11.1 per cent in 2011 (figure 6.4.1).
- Nationally in 2011 for all jurisdictions, 11.2 per cent of babies born to Aboriginal and Torres Strait Islander mothers had low birthweight, compared to 4.6 per cent of babies born to non-Indigenous mothers (table 6A.4.2).
- The proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers increased with remoteness, whilst the proportion of low birthweight babies born to non-Indigenous mothers decreased slightly as remoteness increased (excluding major cities) (tables 6A.4.6–11).

### Box 6.4.2 Measures of birthweight

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Incidence of low birthweight among live-born babies* is defined as the number of low birthweight (less than 2500 grams) live-born singleton infants as a proportion of the total number of live-born singleton infants with known birthweight.

The most recent available data for this measure are from the AIHW National Perinatal Data Collection (NPDC) (all jurisdictions; remoteness). Key points to note are:

- since 2011, data are available by the Indigenous status of the baby. Historical data are only available by the Indigenous status of the mother
- data disaggregated by remoteness for 2011 are not directly comparable to data for previous years.

Children with a low birthweight require longer periods of hospitalisation after birth and are more likely to have poor health, or even die in infancy (AIHW 2011). Data on birthweight for Aboriginal and Torres Strait Islander and non-Indigenous fetal deaths shows similar proportions of low birthweight babies (table 6A.4.15). Low birthweight can also affect brain development and increase the likelihood of developing chronic diseases in adulthood, including hypertension, kidney disease and diabetes mellitus (Barker 2012; DeKieviet et al. 2012; Khalidi et al. 2012; Luyckx et al. 2013; Singh 2011).

Low birthweight can be a result of pre-term birth (although the infant may be within the expected weight range for its gestational age) or being born at the normal time (after

---

<sup>9</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

37 weeks) but of low birthweight (indicating fetal growth retardation) (ABS and AIHW 2008). In 2008-2009, 65 per cent of Aboriginal and Torres Strait Islander pre-term births were of low birthweight and 5 per cent of full term births were of low birthweight, compared with 56 per cent pre-term births and 2 per cent full term births for non-Indigenous mothers (AIHW 2013).

For Aboriginal and Torres Strait Islander babies, the evidence is mixed on whether fetal growth retardation or pre-term birth is the main cause of low birthweight (Mackerras 1998; Rousham and Gracey 2002; Sayers and Powers 1997). Predictors of fetal growth retardation and pre-term birth are listed in table 6.4.1. Of these predictors, information on tobacco and alcohol consumption during pregnancy (section 6.2) and teenage birth rates (section 6.3) are available in this report. A multivariate analysis for the period 2006–2008 showed that, for Aboriginal and Torres Strait Islander mothers, 26 per cent of low birthweight births can be attributed to smoking during pregnancy (after taking into account pre-term birth and other factors — the rate is 33 per cent unadjusted), compared with 9 per cent for other mothers (AHMAC 2012). If the smoking rate during pregnancy among Aboriginal and Torres Strait Islander mothers were the same as for other mothers, after accounting for other factors, the proportion of babies with low birthweight among the Aboriginal and Torres Strait Islander population could be reduced by 19 per cent (AIHW 2013). Increasing the number of antenatal visits (section 6.1) has also been identified as having a positive impact on the birthweight of babies (Khalidi et al. 2012; Taylor et al. 2013). Antenatal visits enable education and monitoring of risk factors.

**Table 6.4.1 Predictors of fetal growth retardation and pre-term birth**

<i>Fetal growth retardation</i>	<i>Pre-term birth</i>
Maternal age	Maternal anaemia
Maternal pre-pregnancy weight	Infections
Prior low birthweight infant	Maternal cigarette smoking
Gestational weight gain (maternal nutrition)	Maternal diabetes
Maternal cigarette smoking	Pregnancy induced hypertension
Alcohol consumption	

*Sources:* Mackerras, D (2001) 'Birthweight changes in the pilot phase of the Strong Women Strong Babies Strong Culture Program in the Northern Territory', *Australian and New Zealand Journal of Public Health*, vol. 25, no. 1, pp34–40; Algert et al 1993 cited in Bambrick, H. J. 2003, "Dying fast and young": Contemporary Aboriginal Health, Chapter 3' in *Child Growth and Type 2 Diabetes Mellitus in a Queensland Aboriginal Community*, April 2003, thesis submitted for the degree of Doctor of Philosophy, Australian National University, [https://digitalcollections.anu.edu.au/bitstream/1885/46071/30/04\\_chapter3.pdf](https://digitalcollections.anu.edu.au/bitstream/1885/46071/30/04_chapter3.pdf) (accessed 10 February 2014).

Recent results from the Gudaga study (a birth cohort study of Aboriginal infants in an urban area of NSW) found that when all risk and protective factors were accounted for, there was no statistically significant difference in birthweight between Aboriginal and non-Aboriginal infants (Comino et al. 2012). This reinforces that Indigeneity itself is not a factor for low birthweight, but rather the prevalence of individual risk and protective factors.

---

## Low birthweight

For available jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT), the proportion of low birthweight babies born to Aboriginal and Torres Strait Islander mothers decreased from 11.7 per cent in 2000 to 11.1 per cent in 2011 (figure 6.4.1). Over the same period, the proportion for non-Indigenous mothers remained relatively constant around 4.5 per cent (table 6A.4.1). Significance testing on the time series from 2000 to 2011 shows the decrease over this period for Aboriginal and Torres Strait Islander mothers was statistically significant (AIHW 2014).

---

Figure 6.4.1 **Proportion of liveborn singleton babies of low birthweight born in NSW, Victoria, Queensland, WA, SA and the NT, to Indigenous mothers, 2000 to 2011<sup>a,b,c</sup>**

<sup>a</sup> Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic and WA; and multiple births. <sup>b</sup> Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence. Babies born to mothers residing in Tasmania and the ACT are excluded. <sup>c</sup> Data on Indigenous births relate to babies born to Indigenous mothers only, and excludes babies born to non-Indigenous mothers and Indigenous fathers. Therefore, the information is not based on the total count of Indigenous babies.

Source: AIHW 2014, *Birthweight of babies born to Indigenous mothers*, Cat. no. IHW 138, Canberra; table 6A.4.1.

---

Nationally in 2011 for all jurisdictions, 11.2 per cent of babies born to Aboriginal and Torres Strait Islander mothers had low birthweight, compared to 4.6 per cent of babies born to non-Indigenous mothers (table 6A.4.2).

The proportion of babies born with low birthweight born to Aboriginal and Torres Strait Islander mothers increases with remoteness — in 2011, this ranged from 9.9 per cent in

---

major cities to 13.5 per cent in very remote areas. Proportions decreased for non-indigenous mothers decreased as remoteness increased (excluding major cities) (tables 6A.4.6–4.11).

Aggregating three years of data enables subsetting of low birthweight into very low and extremely low birthweights. The ratio of proportions for Aboriginal and Torres Strait Islander mothers compared to non-Indigenous mothers for low birthweight is similar for very low and extremely low birthweights (around 2:1) (table 6A.4.14).

From 2011, data were available by Indigenous status of the infant (that is, where the mother and/or the father are Aboriginal or Torres Strait Islander), and for all jurisdictions except WA and SA (table 6A.4.12). However, caution should be used in interpreting these data as there are a large number of births for whom the Indigenous status of the infant could not be determined.

Additional data on selected birth outcomes for women are reported in tables 6A.4.16–17. Associations between birthweight and maternal health for Aboriginal and Torres Strait Islander children are reported in table 6A.4.18.

## Things that work

### Box 6.4.3 Things that work — Birthweight

The national **Healthy for Life (HfL) program**, funded by the Office for Aboriginal and Torres Strait Islander Health, commenced in 2005–06 and includes a formal objective of improving child and maternal health care services.

The HfL program is available to established primary health-care providers in Aboriginal Community Controlled Health Services (ACCHS), State and Territory health services and Divisions of General Practice. ACCHS comprise about 65 per cent of the services participating in the program. The HfL program has a strong focus on continuous quality improvement and collects and reports data for a range of qualitative and quantitative indicators. These provide information on clinical outcomes in three health priority areas: maternal health, child health and chronic disease. Essential indicators are provided for each ACCHS, allowing them to benchmark themselves and assess areas where they have done well since the inception of the HfL program in 2007, as well as areas that could be improved.

An independent evaluation found over the year to June 2008 there was a decrease in the proportion of low birthweight babies, but also an increase in the proportion of high birthweight babies (Urbis 2009). More recent data from the HfL Report Card found that the number of Aboriginal and Torres Strait Islander babies with normal birthweight increased from 583 (81.5 per cent) in 2007–08 to 850 (84.2 per cent) in 2010–11 (AIHW 2013).

*Sources:* AIHW (2013) *Healthy for Life – Aboriginal Community Controlled Health Services Report card*; Urbis (2009) *Evaluation of the Healthy for Life Program*, Final report 30 June 2009. Prepared for the Department of Health and Ageing.

---

## Future directions in data

Although the National Perinatal Data Collection includes data from 2011 on the Indigenous status of the infant, for around 6 per cent of cases the Indigenous status is unknown, due to unknown Indigenous status of the father. Identification of the father is not compulsory on birth registrations.

## 6.5 Early childhood hospitalisations<sup>10</sup>

### Box 6.5.1 Key messages

- For children aged 0–4 years:
  - nationally in 2012-13, 29 658 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised, compared with 23 318 per 100 000 non-Indigenous children (table 6A.5.1)
  - nationally in 2012-13, hospitalisation rates for Aboriginal and Torres Strait Islander children and other children were similar in major cities (24 389 and 23 713 per 100 000 population, respectively), but rates in regional areas were 1.2 times as high for Aboriginal and Torres Strait Islander children (27 185 and 23 238 per 100 000 population, respectively) and in remote areas were twice as high (45 447 and 23 562 per 100 000 population, respectively) (table 6A.5.10)
  - from 2004-05 to 2012-13, for NSW, Victoria, Queensland, WA, SA and the NT combined, hospitalisation rates for Aboriginal and Torres Strait Islander children increased from 23 725 to 30 406 per 100 000 population. Rates for other children fluctuated over the period with no clear trend, leading to a widening of the gap (figure 6.5.1).

### Box 6.5.2 Measures of early childhood hospitalisations

The main measure for this indicator is the *hospitalisation rate*, which is defined as the hospital separation rate per 100 000 of Aboriginal and Torres Strait Islander children aged 0–4 years, by principal diagnoses. Data is sourced from the National Hospital Morbidity Database (NHMD) (all jurisdictions; remoteness), with the most recent data available for 2012-13.

This section and the next section (section 6.6 Injury and preventable diseases) should be read together. Section 6.6 provides data on a subset of hospitalisations that are potentially preventable. The Council of Australian Governments (COAG) National Indigenous Reform Agreement includes hospitalisation rates by principal diagnosis as a progress indicator for its target of ‘halving the gap in mortality rates for Indigenous children under five within a decade’ (COAG 2012). Related data on young child mortality are included in section 4.2.

Early childhood hospitalisation rates are an indicator of the health of young children. However, hospitalisations represent the most serious cases and are not a measure of the actual prevalence of injury and disease. Many children suffering disease and injury do not require hospital treatment — most do not require formal medical treatment or are treated by doctors, nurses and other primary health care providers outside of hospital. A high rate of hospitalisation may also indicate differential access and use of primary health care, as

---

<sup>10</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

---

many hospital admissions could be prevented if more effective non-hospital care were available and used (AIHW 2014; AHMAC 2011).

Monitoring the leading causes of hospitalisations can uncover emerging health risks, as well as highlight where there may be a need for more effective primary health care. The types of major diseases children present with, the number of multiple diagnoses and the duration and frequency of children's hospitalisations are all important measures of the health of Aboriginal and Torres Strait Islander children.

The stage of a child's development affects the types and seriousness of injuries requiring hospitalisation; for example, as children's mobility increases, the hazards they are exposed to change. Steenkamp and Cripps identified that the risk of hospitalisation for falls increases with age but, for other conditions such as poisoning, children under five years have the highest risk of hospitalisation (AIHW 2014).

A Telethon Institute of Child Health study in Western Australia found that the most common reason for hospitalisation before the age of two was infection (mainly respiratory and gastrointestinal), accounting for 34 per cent of all admissions. Aboriginal children had significantly higher admission and comorbidity rates, stayed longer and were more likely than non-Indigenous children to die in hospital. Hospitalisation rates for Aboriginal children for infections were more than four times as high as those for non-Indigenous children — although, over time, admission rates had declined for Aboriginal children and increased for non-Indigenous children (Carville et al. 2007). Another Western Australian study indicates that hospitalisation rates for Aboriginal and Torres Strait Islander children under five for burn injury were three times as high as those for non-Indigenous children for 1983 to 2008 (Duke et al. 2011).

O'Grady et al (2010) found that Aboriginal and Torres Strait Islander infants (aged less than 12 months) in the Central Australian region were hospitalised for pneumonia at among the highest rates reported in the world, with 78.4 episodes per 1000 child-years. A Western Australia study found that Aboriginal children aged up to two years were admitted for pneumonia at 14 times the rate for non-Indigenous children between 1990 and 2000 (Carville et al. 2007).

## **Hospitalisation rate**

From 2010-11, Indigenous status in hospital separations data are considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander Indigenous identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Nationally in 2012-13, 29 658 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised, with the rate increasing as remoteness increased (tables 6A.5.1 and

6A.5.10). The rate for non-Indigenous children was 23 318 per 100 000 population (table 6A.5.1).

In 2012-13, diseases of the respiratory system were the most common cause of hospitalisation of Aboriginal and Torres Strait Islander children aged 0–4 years, with 7782 per 100 000 Aboriginal and Torres Strait Islander children hospitalised nationally, 1.7 times the rate for non-Indigenous children. Aboriginal and Torres Strait Islander children aged 0–4 years were twice as likely as other children to be hospitalised due to infectious and parasitic diseases (table 6A.5.1).

**Figure 6.5.1 Hospitalisation rates for children aged 0–4 years, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2012-13<sup>a,b,c,d</sup>**

<sup>a</sup> Data includes six jurisdictions for which the quality of Indigenous identification in hospitalisation data is considered acceptable (NSW, Victoria, Queensland, WA, SA and the NT only). <sup>b</sup> Data are based on principal diagnosis as classified by the ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification. <sup>c</sup> Data are based on State of usual residence. <sup>d</sup> 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

Source: AIHW (unpublished) National Hospital Morbidity Database; tables 6A.5.1–9.

From 2004-05 to 2012-13, hospitalisation rates for NSW, Victoria, Queensland, WA, SA and the NT combined for Aboriginal and Torres Strait Islander children increased from 23 726 to 30 406 per 100 000 population. Rates for other children fluctuated over the period with no clear trend, leading to an widening of the gap (figure 6.5.1). For Aboriginal and Torres Strait Islander children, hospitalisation rates increased for five of the six top diagnoses, while hospitalisations for 'certain infectious and parasitic diseases' decreased

---

from 3086 per 100 000 population in 2004-05 to 2612 per 100 000 population in 2012-13, (twice the rate for other children) (tables 6A.5.1 and 6A.5.9).

In 2012-13, hospitalisation rates were similar for Aboriginal and Torres Strait Islander children and non-Indigenous children in major cities (24 390 and 23 713 per 100 000 population, respectively), but rates in regional areas were 1.2 times as high for Aboriginal and Torres Strait Islander children (27 185 and 23 238 per 100 000 population, respectively) and in remote areas were twice as high (45 448 and 23 562 per 100 000 population, respectively) (table 6A.5.10).

## 6.6 Injury and preventable disease<sup>11</sup>

### Box 6.6.1 Key messages

- For children aged 0–4 years:
  - nationally in 2012–13, 16 083 per 100 000 Aboriginal and Torres Strait Islander children were hospitalised for potentially preventable diseases and injuries, while the rate for non-Indigenous children was 9672 per 100 000 population. Diseases of the respiratory system accounted for almost half of all hospitalisations for both Aboriginal and Torres Strait Islander and non-Indigenous children (table 6A.6.1).
  - from 2004–05 to 2012–13, potentially preventable hospitalisation rates (for NSW, Victoria, Queensland, WA, SA and the NT combined) increased for Aboriginal and Torres Strait Islander children (from 14 652 to 16 561 per 100 000 population) and decreased for other children (from 10 835 to 9879 per 100 000 population) (tables 6A.6.1–9).
  - in 2008–2012, for NSW, Queensland, WA, SA and the NT combined, the death rate from injury and preventable diseases for Aboriginal and Torres Strait Islander children was 36.3 deaths per 100 000 population, a decrease from 41.7 per 100 000 population in 2003–2007 (figure 6.6.1). The rate for non-Indigenous children also decreased over this period (from 15.8 to 11.3 deaths per 100 000 population) (tables 6A.6.11–12).

### Box 6.6.2 Measures of injury and preventable disease

There are two main measures for this indicator:

- *Potentially preventable hospitalisations* is defined as the number of hospital separations for injury and potentially preventable disease for children aged 0–4 years as a rate per 100 000 children aged 0–4 years. The main data source is the AIHW National Hospital Morbidity Database (NHMD), with the most recent available data for 2012–13 (all jurisdictions: remoteness).
- *Potentially avoidable deaths* is defined as the number of deaths from potentially preventable and treatable injury and disease for children aged 0–4 years as a rate per 100 000 children aged 0–4 years. The main data source is the ABS Causes of Death collection with the most recent available data for 2012 (NSW, Queensland, WA, SA and the NT).

In Australia, many childhood diseases are generally prevented or successfully treated without hospitalisation. The main focus of this indicator is on the most serious cases of disease and injury, which result in a hospital admission. Some infections that may appear minor can have serious longer term health effects. Recurring skin and throat infections (caused by group A streptococcal bacteria) in some Aboriginal communities are associated with the highest worldwide rates of acute rheumatic fever, which can lead to rheumatic heart disease (Currie and Carapetis 2000 in Zubrick et al. 2004). The major pathogen of

---

<sup>11</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

---

skin infection, group A streptococcus, is also associated with chronic renal failure — a prevalent and highly burdensome condition among Aboriginal adults (Zubrick et al. 2004).

A wide range of social, cultural, physical and economic factors influence the health of children. Communities and governments can assist in preventing disease and promote the health of children through improved access to quality medical care, disease registers to improve follow up care, free vaccination programs, the provision of adequate housing, education on the benefits of good nutrition and sanitation, and policies and promotion to reduce the risk of injury. Breastfeeding can reduce the risk of hospitalisation for a range of acute childhood illnesses, including gastrointestinal diseases and infections, and prevent the development of infections and chronic diseases such as diabetes and obesity in later life (FaHCSIA 2013; Queensland Health 2014).

Access to effective and appropriate health care services (including dental and immunisation services) can influence the health of children in the short and long term. More information on immunisation rates in children and the prevalence of vaccine preventable diseases as well as access to primary health care in general, is included in section 8.1. Section 6.7 includes information on ear infections in children and section 8.6 covers tooth decay in children (and adults). See section 10.2 for more information on diseases associated with poor environmental health.

## **Potentially preventable hospitalisations**

Hospitalisation rates are not a measure of the prevalence of a condition in the community, but they do provide an indication of the extent to which serious illnesses are being treated in hospitals. Potentially preventable hospitalisations include conditions that potentially could have been prevented by the provision of appropriate non-hospital health services, and injuries that potentially could have been prevented (usually outside the health system in broader society).

These data should be interpreted with care — research suggests that parents of Aboriginal and Torres Strait Islander infants use health services differently to parents of non-Indigenous infants. Ou et. al (2010), using the Longitudinal Study of Australian Children, found that the health status of Aboriginal and Torres Strait Islander infants in the study was poorer than that of non-Indigenous infants, and that parents of Aboriginal and Torres Strait Islander infants accessed certain health services less frequently than non-Indigenous parents. The parents of Aboriginal and Torres Strait Islander infants were less likely to have used maternal and child health centres, help lines, maternal and child health nurse visits, general practitioners and paediatricians. However, Aboriginal and Torres Strait Islander infants were more likely than other Australian children to have received treatment at hospital outpatient clinics or to have been hospitalised (Ou et al. 2010). In Wave 3 of Footprints in Time, it was reported that the most common reasons for visits to hospital were asthma and chest infections, intestinal problems and ear problems (FaHCSIA 2012).

---

Nationally in 2012-13, the rate of hospitalisation of Aboriginal and Torres Strait Islander children aged 0–4 years for potentially preventable diseases was 16 083 per 100 000 population (table 6A.6.1), with the rate increasing as remoteness increased (table 6A.6.10). The rate for non-Indigenous children was 9672 per 100 000 population. Diseases of the respiratory system is the most common hospitalisation for both Aboriginal and Torres Strait Islander children and non-Indigenous children (around half of all hospitalisations for both) with the rate for Aboriginal and Torres Strait Islander children almost double that of non-Indigenous children (table 6A.6.1).

From 2010-11, Indigenous status in hospital separations data are considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander Indigenous identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13. From 2004-05 to 2012-13 in NSW, Victoria, Queensland, SA, WA and the NT combined, potentially preventable hospitalisation rates increased for Aboriginal and Torres Strait Islander children (from 14 652 to 16 561 per 100 000 population) and decreased for other children (from 10 835 to 9879 per 100 000 population). The Aboriginal and Torres Strait Islander child hospitalisation rate increased from 1.4 to 1.7 times the rate of other child hospitalisations (tables 6A.6.1–9).

### **Potentially preventable deaths of Aboriginal and Torres Strait Islander children**

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

For 2008–2012, around one in five deaths (21.8 per cent) of Aboriginal and Torres Strait Islander children aged 0–4 years was attributable to external causes and preventable diseases, a rate of 36.3 per 100 000 population (table 6A.6.11).

**Figure 6.6.1 Mortality rates from external causes and preventable diseases, Indigenous children aged 0–4 years, NSW, Queensland, WA, SA and the NT, 2003–2007 and 2008–2012<sup>a</sup>**

<sup>a</sup> Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.

Source: ABS (unpublished) Causes of Death, Australia, 2012; tables 6A.6.11–12.

There has been an overall decrease in the death rate from external causes and preventable diseases for Aboriginal and Torres Strait Islander children aged 0–4 years, from 41.7 per 100 000 population in 2003–2007 to 36.3 per 100 000 population in 2008–2012 (figure 6.6.1). Over the same period the rate also decreased for non-Indigenous children, from 15.8 deaths per 100 000 population to 11.3 deaths per 100 000 population (tables 6A.6.11–12).

## 6.7 Ear Health<sup>12</sup>

### Box 6.7.1 Key messages

- The proportion of Aboriginal and Torres Strait Islander children aged 0–14 years with a hearing condition decreased from 11.2 per cent in 2001 (2.4 times the rate for non-Indigenous children) to 7.1 per cent in 2012-13 (2.0 times the rate for non-Indigenous children in 2011-12) (figure 6.7.1). In remote areas, the proportion decreased from 17.5 per cent in 2001 to 9.1 per cent in 2012-13 (figure 6.7.2).
- Nationally in 2012-13, the hospitalisation rate for diseases of the middle ear and mastoid for Aboriginal and Torres Strait Islander children was 9.2 per 1000 children aged 0–3 years and 7.1 per 1000 children aged 4–14 years (table 6A.7.4). For children aged 0–14 years, the rate in remote areas (15.6 per 1000 population) was almost three times as high as the rate in major cities or regional areas (5.9 and 5.7 per 1000 population respectively) (table 6A.7.13).
- Available data indicate that from 2004-05 to 2012-13 the hospitalisation rate for Aboriginal and Torres Strait Islander children for ear and hearing problems:
  - increased from 6.7 to 9.5 per 1000 population for 0–3 year olds (while the rate for other children declined slightly from 13.2 to 12.3 per 1000 population)
  - increased from 5.1 to 7.3 per 1000 population for 4–14 year olds (while the rate for other children declined slightly from 5.2 to 4.5 per 1000 population) (figure 6.7.3).

### Box 6.7.2 Measures of ear health

There are two main measures for this indicator:

- *Prevalence of hearing conditions in children* is defined as the proportion of children aged 0–14 years with a reported hearing condition. Data are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS – NATSIHS component)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data for 2012-13 (national: by age; remoteness). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS – NHS component), with the most recent data for 2011-12. Indicators using both AATSIHS (2012-13) and AHS (2011-12) are referenced as 2011–13.<sup>13</sup>
- *Hospitalisation rates for ear and hearing problems in children* is defined as the proportion of hospital separations for children aged 0–14 years where the principal diagnosis was diseases of the ear and mastoid. Data are sourced from the National Hospital Morbidity Database (NHMD) with the most recent data available for 2012-13 (all jurisdictions; by age; remoteness).

Conditions affecting ear health are classified by the part of the ear (external, middle or inner) in which the condition occurs. The ear condition with the most significant impact on

---

<sup>12</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

<sup>13</sup> The survey questions for children under 15 years old were completed by an adult in the child's household.

---

hearing for Aboriginal and Torres Strait Islander Australians is otitis media (inflammation and/or infection of the middle ear), which is caused by bacterial or viral infections, and is often the result of a cold. There are different levels of severity of otitis media (see Burns and Thomson 2013 for definitions) and complications, particularly if left untreated, can result in hearing loss. Some forms of otitis media are treatable either through antibiotics or surgery (Leach et al. 2008; O’Leary and Triolo 2009), but public health strategies focus on prevention, awareness and early identification for best results (Burrow and Thomson 2006; Burns and Thomson 2013).

Factors that have been identified as increasing the risk of ear health issues include: social disadvantage; limited access to primary health care and treatment (see section 8.1); nutritional problems (see section 8.5); crowded housing conditions (see section 10.1); inadequate access to water, functioning sewerage and waste removal systems (see section 10.3); passive smoking (see section 8.4); use of dummies beyond age of 11 months; and use of day care for children. Breastfeeding is associated with a reduced risk of otitis media (Burns and Thomson 2013).

Hearing loss adversely affects child development and has far reaching implications for social relationships and life opportunities. Severe cases of otitis media can lead to ongoing medical complications that negatively affect a child’s early acquisition of verbal language, intellectual development and social skills and educational attainment, and later in life their employment outcomes (CIRCA 2010).

## **Prevalence of hearing conditions in children**

Aboriginal and Torres Strait Islander Australians, particularly in remote areas, experience some of the highest levels of ear disease and hearing loss in the world, with rates up to ten times those for non-Indigenous Australians (Senate Inquiry 2010). Some Aboriginal and Torres Strait Islander communities have a prevalence of chronic suppurative otitis media (CSOM — a middle ear infection involving a perforated ear drum that can also be accompanied by hearing impairment) up to 10 times higher than the four per cent rate that the World Health Organization (WHO) identifies as ‘a massive public health problem’ requiring ‘urgent attention’ (WHO 2004).

For Aboriginal and Torres Strait Islander children, hearing loss is widespread and much more common than in the broader Australian population (Morris et al. 2006; Kong and Coates 2009; Burns and Thomson 2013). Among non-Indigenous children, otitis media (middle ear infection) typically resolves with age and is rarely seen in children over the age of eight (Burrow and Thomson 2003). Generally, the incidence of otitis media peaks in two age groups: between 6 and 24 months (when many infants are weaned and exposed to environmental conditions); and at 4-5 years (when children start kindergarten) (Kong and Coates 2009; Burns and Thomson 2013). Studies have consistently found that, in Aboriginal and Torres Strait Islander children, otitis media typically starts at a younger age, is much more common and is more likely to result in hearing loss than in

non-Indigenous children (Boswell and Nienhuys 1996; Couzos, Metcalf and Murray 1999; Morris et al. 2005; Rothstein, Heazlewood and Fraser 2007). Aboriginal and Torres Strait Islander children under three years of age are at the highest risk of ear disease — this is the most critical development period for speech and language development, underpinning communication, learning, and social and emotional development (Aithal, Yonovitz and Aithal 2008; Brouwer et al. 2005; Couzos, Metcalf and Murray 2007; Nienhuys 1992; Williams and Jacobs 2009).

**Figure 6.7.1 Prevalence of hearing conditions in children aged 0–14 years, by age, 2001 to 2011–13<sup>a,b</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS (NATSIHS component). Data for non-Indigenous Australians are from the 2011–13 AHS (NHS component for the period 2011–12).

Sources: ABS (unpublished) National Health Survey 2001; ABS (unpublished) National Health Survey 2004–05; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004–05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) National Health Survey 2007–08; ABS (unpublished) AATSIHS 2012–13 (2012–13 NATSIHS component); ABS (unpublished) AHS 2011–13 (2011–12 NHS component); table 6A.7.1.

In 2012–13, 7.1 per cent of Aboriginal and Torres Strait Islander children aged 0–14 years had a hearing condition (2.0 times the rate for non-Indigenous children in 2011–12), a decrease from 11.2 per cent in 2001 (and from 2.4 times the rate for non-Indigenous children). This decrease was statistically significant for children aged 4–14 years. (A declining trend is also evident for children aged 0–3 years, but the sample was too small for the difference to be statistically significant) (figure 6.7.1).

Data specifically for otitis media are available in table 6A.7.2. Prevalence rates for this condition have decreased for Aboriginal and Torres Strait Islander children aged 0–14 years from 4.4 per cent in 2004-05 to 2.8 per cent in 2012-13, and for non-Indigenous children from 2.4 per cent in 2001 to 1.2 per cent in 2011-12.

**Figure 6.7.2 Prevalence of hearing conditions in Indigenous children aged 0–14 years, by remoteness, 2001 to 2012-13<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) NHS 2001; NATSIHS 2004-05; NATSISS 2008; AATSIHS 2012-13 (2012-13 NATSIHS component); table 6A.7.3.

In remote areas, the proportion of Aboriginal and Torres Strait Islander children aged 0–14 years with a hearing condition decreased from 17.7 per cent in 2001 to 9.1 per cent in 2012-13. There was no statistically significant difference in the equivalent rates for non-remote areas over this period (8.5 per cent in 2001 compared to 6.6 per cent in 2012-13) (figure 6.7.2).

## Hospitalisations for ear and hearing problems in children

Hospitalisations data only include those who have accessed medical services, and have been diagnosed and admitted to hospital for the specified conditions. Cases that result in a visit to a general practitioner or to an emergency department, but do not lead to hospitalisation, are excluded. There may also be a large share of 0–3 year olds whose parents may not be aware that their children have an ear or hearing problem or where access to hospitals may be limited.

---

The following analysis focusses on diseases of the middle ear and mastoid (including otitis media), which are the most common reasons for hospitalisation related to ear and hearing problems. The attachment tables include additional information on hospitalisations for diseases of the external and inner ear, and other disorders of the ear.

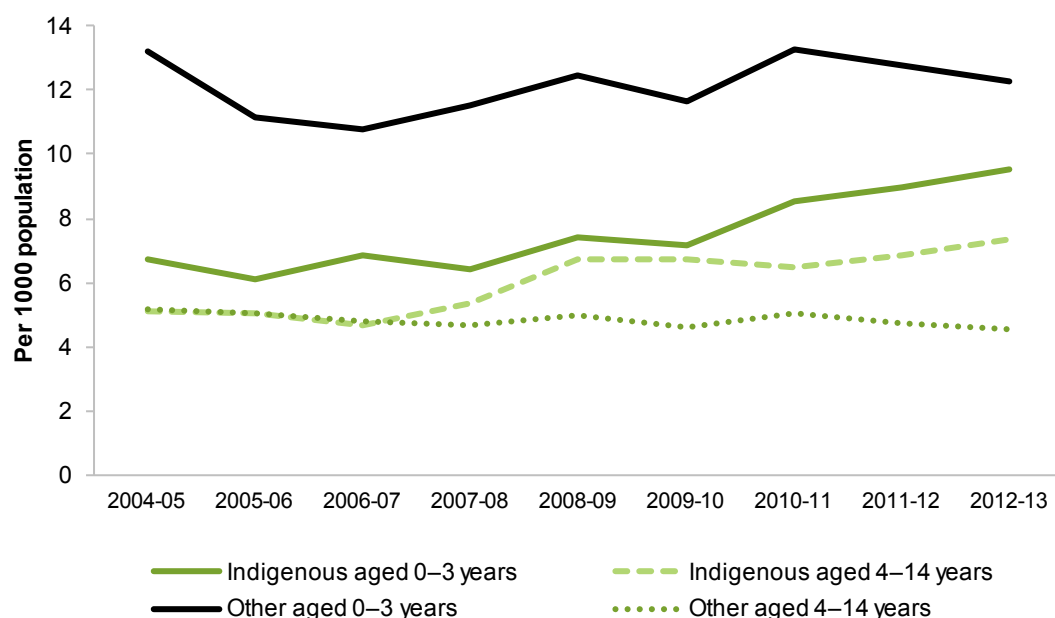

From 2010-11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Nationally in 2012-13, the hospitalisation rate for middle ear and mastoid conditions for Aboriginal and Torres Strait Islander children aged 0–3 years (9.2 per 1000 population) was slightly lower than for non-Indigenous 0–3 year old children (12.0 per 1000 population). However, rates for Aboriginal and Torres Strait children aged 4–14 years (7.1 per 1000 population) were higher than for non-Indigenous 4–14 year old children (4.4 per 1000 population) (table 6A.7.4).

The hospitalisation rate for diseases of the middle ear and mastoid for children aged 0–14 years varied by remoteness.

- In major cities, hospitalisation rates for Aboriginal and Torres Strait Islander children (5.9 per 1000 population) were lower than rates for non-Indigenous children (6.7 per 1000 population).
- In remote plus very remote areas, hospitalisation rates for Aboriginal and Torres Strait Islander children (15.6 per 1000 population) were twice as high as rates for non-Indigenous children (7.3 per 1000 population) (table 6A.7.13).

Figure 6.7.3 **Rates of hospitalisation for diseases of the middle ear and mastoid, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2012-13<sup>a</sup>**

<sup>a</sup> Other includes separations where Indigenous status was reported as non-Indigenous or not stated.

Source: AIHW (unpublished) National Hospital Morbidity Database; tables 6A.7.4-12.

Between 2004-05 and 2012-13, the hospitalisation rate for diseases of the middle ear and mastoid increased for Aboriginal and Torres Strait Islander aged 0-3 years (from 6.7 to 9.5 per 1000 population) and 4-14 years (from 5.1 to 7.1 per 1000 population), while the rate for other children aged 4-14 years declined slightly from 5.2 to 4.5 per 1000 population (there was no clear trend for other children aged 0-3 years) (figure 6.7.3).

## Things that work

Outlined below is an example of an initiative that has worked to improve ear health for Aboriginal and Torres Strait Islander children (box 6.7.3).

---

### Box 6.7.3      **Things that work – Ear health**

The national **Care for Kids' Ears** initiative, launched on 1 July 2011, was designed and produced by the Australian Government to increase awareness of ear disease and hearing loss in Aboriginal and Torres Strait Islander communities, particularly for families and carers of children aged 0–5 years. The overarching goal of the campaign was to increase awareness of ear disease and highlight the importance of seeking and following treatment to prevent hearing loss. A specific website was developed to include information and resources for parents and carers; early childhood groups; teachers; and health professionals. The website includes a talking book in 22 Indigenous languages (DoH 2014).

An independent evaluation conducted from July 2011 to June 2013 by the Cultural and Indigenous Research Centre Australia (CIRCA) found that the campaign had a positive impact on awareness of ear disease among Aboriginal and Torres Strait Islander communities, including increased knowledge of symptoms and prevention, and increased help-seeking behaviours. A follow-up survey of 200 mothers/female carers was conducted around 18 months after the campaign launch in urban and rural locations nationally. The survey found that those exposed to the campaign were more likely than those who weren't to identify at least one prevention action unprompted (74.1 per cent compared to 51.3 per cent) and were also more likely to say they had taken their child to have their ears checked in the last 12 months when they did not have any signs or symptoms (70.4 per cent compared to 43.7 per cent of those not exposed) (CIRCA 2013).

Sources: DoH 2014, *Care for Kids' Ears*, <http://www.careforkidsears.health.gov.au/> (accessed 19 September 2014); CIRCA 2013, *Australian Government Department of Health and Ageing, Evaluation of the National Indigenous Ear Health Campaign – Final Report*.

## **Future directions in data**

Only limited data are available on the burden of hearing loss in Aboriginal and Torres Strait Islander children, with current survey data limited due to the difficulty in obtaining reliable estimates for small populations. More comprehensive and reliable data are required to enable the assessment of the type and severity of ear infections in Aboriginal and Torres Strait Islander children and the resulting hearing loss.

## 6.8 Basic skills for life and learning<sup>14</sup>

### Box 6.8.1 Key messages

- The basic skills for life and learning indicator focusses on the development and learning of children in their early years (up to 8 years of age).
- In 2012, the proportions of Aboriginal and Torres Strait Islander children classified as developmentally 'on track' were between 57–65 per cent across all Australian Early Development Index (AEDI) domains. The proportions increased across all domains between 2009 and 2012, with the largest increase in the domain of language and cognitive skills (from 48.1 per cent to 58.0 per cent) (tables 6A.8.1 and 6A.8.2).
- These proportions are below those of non-Indigenous children (between 75-84 per cent) (table 6A.8.1) but the gap has narrowed across all domains since 2009 (by between 1 and 6 percentage points).
- The proportion of Aboriginal and Torres Strait Islander children receiving a fourth year Aboriginal and Torres Strait Islander Health Assessment has more than tripled, from 17.7 per cent in 2007-08 to 60.8 per cent in 2012-13 (table 6A.8.7). Assessment rates increased with remoteness (from 40 per cent in major cities to 81.9 per cent in remote/very remote areas) (table 6A.6.8).

### Box 6.8.2 Measures of basic skills for life and learning

There are four main measures for this indicator. Data are available for all jurisdictions.

- *Children on track on Australian Early Development Index (AEDI) domains* is defined as the proportion of children entering their first year of school who are on track (top 75 per cent) in the five AEDI domains: physical health and wellbeing; social competence; emotional maturity; language and cognitive skills (school-based); and communication skills and general knowledge. The most recent available data are for 2012.
- *Language background* is defined as the proportion of Aboriginal and Torres Strait Islander children entering their first year of school with a language background other than English. The most recent available data are for 2012 from the AEDI.
- *Health checks* is defined as the proportion of children aged 4 years receiving a fourth year developmental health check. The most recent available data are for 2012-13 from the Australian Government Department of Health.
- *Informal learning activities* is defined as the proportion of children aged 3–8 years who undertook informal learning activities with their main carer in the last week. The most recent available data are for 2008 from the ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS) for Aboriginal and Torres Strait Islander children and the ABS Childhood Education and Care Survey (CEaCS) for non-Indigenous children.

---

<sup>14</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Macquarie University, who reviewed a draft of this section of the report.

This indicator focuses on the development and learning of children in their early years (up to 8 years of age). Young children who are well nurtured do better in school and develop the skills needed to be productive and responsible adults (Zubrick et al. 2006).

## Children on track on Australian Early Development Index<sup>15</sup> (AEDI) domains

The AEDI is a population measure of children's development as they enter full time school. The AEDI assists communities to understand the development of local children compared to other children nationally. In 2012, the AEDI checklist was completed for 289 973 children in their first year of formal full-time school (96.5 per cent of all children enrolled to begin school in 2012), including 15 490 Aboriginal and Torres Strait Islander children (5.3 per cent of all children surveyed) (Australian Government 2013).

The five developmental domains of the AEDI and their associated sub-domains are presented in table 6.8.1.

**Table 6.8.1 AEDI domains of children's development**

<i>Physical health and wellbeing</i>	<i>Social competence</i>	<i>Emotional maturity</i>	<i>Language and cognitive skills (school-based)</i>	<i>Communication skills and general knowledge</i>
Physical readiness for the day	Overall social competence	Pro-social and helping behaviour	Basic literacy	Communication skills and general knowledge
Physical independence	Responsibility and respect	Anxious and fearful behaviour	Interest in literacy, numeracy and memory	
Gross and fine motor skills	Approaches to learning	Aggressive behaviour	Advanced literacy	
	Readiness to explore new things	Hyperactivity and inattention	Basic numeracy	

Source: Australian Government 2013, *A Snapshot of Early Childhood Development in Australia 2012 — AEDI National Report*, Canberra.

In 2012:

- Between 57–65 per cent of Aboriginal and Torres Strait Islander children were 'on track' in all of the five AEDI domains, compared to 75–84 per cent of non-Indigenous children (table 6A.8.1)
- Aboriginal and Torres Strait Islander children were more likely to be classified as 'on track', and to have a smaller gap to non-Indigenous children, in the domains of 'physical health and wellbeing', 'social competence' and 'emotional maturity'

<sup>15</sup> From 1 July 2014 the Australian Early Development Index became known as the Australian Early Development Census (AEDC).

- Aboriginal and Torres Strait Islander children were less likely to be classified as ‘on track’, and to have a larger gap to non-Indigenous children, in the domains of ‘language and cognitive skills’ and ‘communication skills and general knowledge’ (table 6A.8.1)
- the proportion of Aboriginal and Torres Strait Islander children classified as ‘on track’ in all domains decreased as remoteness increased (figure 6.8.1 for the domain of language and cognitive skills and table 6A.8.3 for other domains).

**Figure 6.8.1 Australian Early Development Index, proportion of five year old children classified ‘on track’ in the language and cognitive skills domain, 2012<sup>a</sup>**

<sup>a</sup> 'On track' children score in the highest 26–100th percentile of the AEDI.

Source: Australian Early Development Index 2012 (unpublished), Social Research Centre; table 6A.8.3.

From 2009 to 2012, the proportion of Aboriginal and Torres Strait Islander children classified as ‘on track’ increased across all domains, with the gap between Aboriginal and Torres Strait Islander and non-Indigenous children narrowing between 1 and 6 percentage points (tables 6A.8.1 and 6A.8.2). The largest percentage point increase for Aboriginal and Torres Strait Islander children was for ‘language and cognitive skills’ (from 48.1 per cent to 58.0 per cent) (tables 6A.8.1 and 6A.8.2). However, this domain still has the largest gap between Aboriginal and Torres Strait Islander and non-Indigenous children (table 6A.8.1).

Data are also reported by State and Territory (tables 6A.8.1-2) and by remoteness (tables 6A.8.3-4).

---

## Language background

Language development is one of the dimensions that determines a child's readiness for school (Dockett et al. 2008). A child whose first language is not English may be disadvantaged in an English learning environment (Dockett, Perry and Kearney 2010; Fogarty and Schwab 2012; Zubrick et al. 2006).

Language is also important for life. Research indicates that a person's primary language — the first language learnt, or the mother tongue — is used to gain knowledge of the world and is inextricably linked with how people become social beings and form their earliest memories. Language forms a significant component of a person's cultural identity (Kral and Morphy 2006; LoBianco and Slaughter 2009).

The AEDI collects data on language background other than English, encompassing children who speak languages other than, or in addition to, English at home, or are reported by teachers to have English as a second language. In 2012, 19.8 per cent of Aboriginal and Torres Strait Islander children entering their first year of school had a language background other than English (Australian Government 2013). The proportion of Aboriginal and Torres Strait Islander children whose first language was not English ranged from 5 per cent in major cities to 59.3 per cent in remote and very remote areas (table 6A.8.6). Data are also available for selected jurisdictions (NSW, Vic, Qld, WA, NT) and for 'rest of Australia' (table 6A.8.5).

## Health checks

This section provides data on the proportion of Aboriginal and Torres Strait Islander and non-Indigenous children receiving a fourth year developmental health check. The aim of the checks is to improve the health and wellbeing of Australian children by promoting early detection of lifestyle risk factors and delayed development.

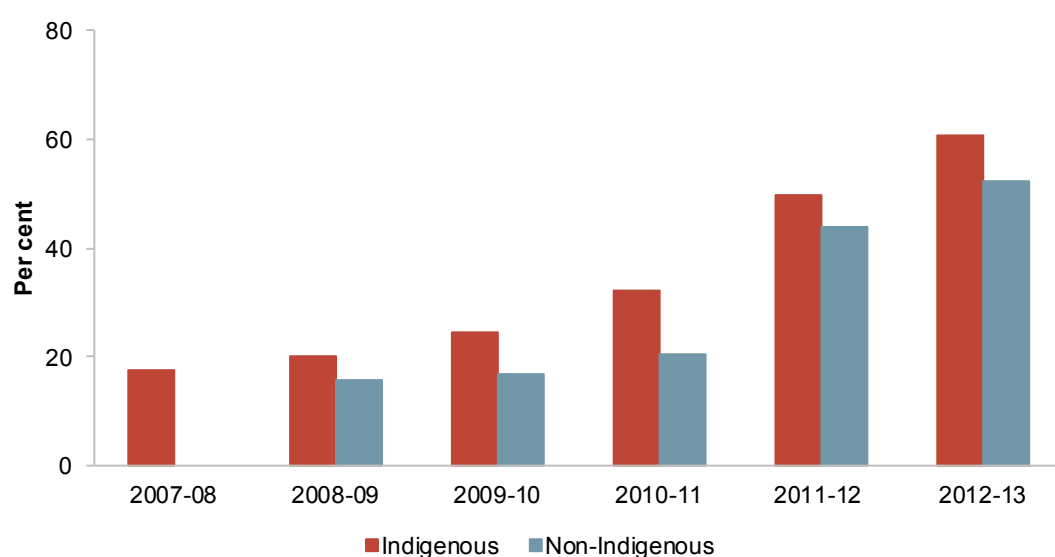

Two types of Medicare Benefits Schedule checks are reported in this section:

- The Aboriginal and Torres Strait Islander Health Assessment, which is available to 0–14 year old Aboriginal and Torres Strait Islander children (prior to 1 May 2010 this was called the Aboriginal and Torres Strait Islander Child Health Check). (Data for the Aboriginal and Torres Strait Islander Health Assessments are restricted to children aged 3–5 years, to align with the age scope for the Health Assessments, below.)
- The Health Assessment, which is available to all children (Aboriginal and Torres Strait Islander children and non-Indigenous children) aged three, four or five years (prior to 1 May 2010 this was called the Healthy Kids Check).

This section does not report on developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres.

In 2012-13, almost two-thirds of Aboriginal and Torres Strait Islander 3–5 year olds (60.8 per cent) received a fourth year developmental health assessment, compared to just over one half of non-Indigenous 3–5 year olds (52.1 per cent) (table 6.8.7). Assessment rates increased with remoteness for Aboriginal and Torres Strait Islander children (from 40 per cent in major cities to 81.9 per cent in remote/very remote areas) and decreased with remoteness for non-Indigenous children (from 51.5 per cent in major cities to 33.9 per cent in remote/very remote areas) (table 6A.6.8).

**Figure 6.8.2 Proportion of children receiving a fourth year developmental health check, 2007-08 to 2012-13<sup>a,b,c,d,e</sup>**

<sup>a</sup> Financial year based on date of processing. <sup>b</sup> Aboriginal and Torres Strait Islander Health Assessments data include claims for MBS Item 708 (Aboriginal and Torres Strait Islander Child Health Check pre 1 May 2010) and Item 715 (Aboriginal and Torres Strait Islander Peoples Health Assessment post 1 May 2010) for children aged 3–5 years. <sup>c</sup> Data for Health Assessments include claims for MBS Items 709 and 711 (Healthy Kids Check pre 1 May 2010) and Items 701, 703, 705, 707 and 10 986 (Health Assessment post 1 May 2010) for all children (Indigenous status not specified) aged 3–5 years. <sup>d</sup> Rates for the Aboriginal and Torres Strait Islander Health Assessment use Aboriginal and Torres Strait Islander projections of the population aged four years. Rates for the Health Assessment use an estimate of the four year old non-Indigenous population. <sup>e</sup> The Health Assessment commenced in 2008 therefore data are not available for 2007-08.

*Sources:* DoH (unpublished) Medicare Benefits Schedule (MBS) data collection; ABS (2014) Estimates and Projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026, Cat. no. 3238.0; ABS (2012, 2013) Australian Demographic Statistics, June 2012, December 2012 and June 2013, Cat. no. 3101.0; table 6A.6.7.

The proportion of four year olds receiving developmental health checks has increased over time for both Aboriginal and Torres Strait Islander and non-Indigenous children. The proportion of Aboriginal and Torres Strait Islander children receiving fourth year developmental health checks increased from 17.7 per cent in 2007-08 to 60.8 per cent in

---

2012-13. The rate for non-Indigenous children increased from 15.8 per cent in 2008-09 to 52.2 per cent in 2012-13 (figure 6.8.2).

These data are also reported by State and Territory in table 6A.8.7.

## **Informal learning activities**

Informal learning, particularly from a carer, is important to Aboriginal and Torres Strait Islander children because it builds resilience and cultural knowledge, both of which are recognised in a strengths based approach to school readiness (Armstrong et al. 2012; Bath and Biddle 2011).

In non-remote areas in 2008, almost all Australian children aged 3–8 years did some form of informal learning activity with their main carer in the previous week, with the proportion of Aboriginal and Torres Strait Islander children (97.9 per cent) not significantly different to the Australian total (99.1 per cent) (table 6A.8.10).

However, the type of activities differed. Watching television, a video or a DVD was the most common informal learning activity a carer undertook with an Aboriginal and Torres Strait Islander child (91.7 per cent). Being read stories, or listening to the child read, was the most common activity a carer undertook with a non-Indigenous child (95.7 per cent) (table 6A.8.10).

Data for all remoteness areas are only available for Aboriginal and Torres Strait Islander children. The proportions of children undertaking informal learning activities with their main carer was consistently higher for those living in major cities than for those living in remote and very remote areas. The results for those who:

- were assisted with their homework — major cities, 53.0 per cent; remote and very remote areas, 22.0 per cent
- spent time with their carer on the computer — major cities, 37.7 per cent; remote and very remote areas, 12.3 per cent
- were read a book — major cities, 72.9 per cent; remote and very remote areas 51.1 per cent (table 6A.8.10).

These data are also reported by State and Territory in table 6A.8.9.

---

## Things that work

### Box 6.8.3 Things that work — Basic skills for life and learning

#### Home Interaction Program for Parents and Youngsters (HIPPY)

After its initial introduction by the Brotherhood of St Laurence, the Australian Government rolled out the HIPPY program nationally from 2008. HIPPY is not specific to Indigenous Australians but is run in five areas with high Aboriginal and Torres Strait Islander populations. It has two Indigenous-specific pilot locations, where it was adapted to better meet Aboriginal and Torres Strait Islander families' needs (AIHW 2013).

Under the program, home tutors work with parents for two years, to support children from disadvantaged backgrounds to transition to school. It is described as 'a combined home and centre-based early childhood enrichment program that supports parents in their role as their child's first teacher' (Liddell et al. 2011).

A 2011 evaluation found that the HIPPY program provided significant benefits for parents. Positive outcomes for parents included: increased confidence to teach their child and talk to the child's teacher; improved parenting skills; better relationships between parents and children; social connectedness with other parents; increased knowledge about the school's requirements; improved awareness of the child's skills and abilities; and pride in the child's learning achievement. Benefits for the children included improved familiarity and confidence with school work. The evaluation noted that HIPPY was more successful where the local Indigenous leaders and community were closely involved and where there were strong relationships between the agency delivering HIPPY and other child and family services (Liddell et al. 2011; AIHW 2013). The Closing the Gap Clearinghouse identified that preschool programs with the following characteristics can assist children to transition to school and contribute to positive educational outcomes:

- extensive involvement and consultation with local Indigenous communities and a culturally appropriate approach
- connections with services and organisations in the local community
- flexibility to adapt to the needs of the local community (especially where mainstream education programs are being provided)

well-trained staff, using a mix of home and childcare-centre-based activities, with an explicit focus on child development (AIHW 2013).

Sources: Liddell et al (2011) *An evaluation of the national rollout of the Home Interaction Program for Parents and Youngsters (HIPPY)* produced for DEEWR; AIHW (2013) *What works? A review of actions addressing the social and economic determinants of Indigenous Health*, Issues Paper no. 7 produced for the Closing the Gap Clearinghouse.

## Future directions in data

Data on fourth year developmental health checks are sourced from the Medicare Benefits Schedule data collection. The relevant health checks include a Health Assessment (available to all children aged 3, 4 and 5 years) and the Aboriginal and Torres Strait Islander Health Assessment (available to all Aboriginal and Torres Strait Islander children

---

aged 0–14 years). Data are not currently able to be disaggregated by Indigenous status for the Health Assessment, due to data quality issues. This disaggregation is important to provide a more accurate assessment of the number of Aboriginal and Torres Strait Islander children receiving fourth year developmental health checks.

Babies and young children may also receive regular developmental health checks from maternal and child health nurses employed by State, Territory or local governments. Data for health checks provided by maternal and child health nurses are currently not available.

TABLE 6A.1.1

Table 6A.1.1 **Indigenous women who gave birth who attended at least one antenatal visit in the first trimester (crude rates), by State and Territory, 2011 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (c)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Total (d)</i>	<i>3-state total (e)</i>
Number who attended at least one antenatal visit in the first trimester	no.	1 864	318	1 648	462	343	183	37	674	5 529	2 881
Number of women who gave birth (f)	no.	3 008	821	3 572	1 333	630	265	75	1 351	11 055	4 989
Proportion who attended at least one antenatal visit in the first trimester	%	62.0	38.7	46.1	34.7	54.4	69.1	49.3	49.9	50.0	57.7

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Data are by place of usual residence of the mother.

(c) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

(d) Total includes data for Tas for the first time and is not comparable with totals from previous years.

(e) Total includes NSW, SA, and the NT only.

(f) Excludes women whose gestation at first antenatal visit was not stated.

TABLE 6A.1.2

Table 6A.1.2 **Indigenous women who gave birth who attended at least one antenatal visit in the first trimester, NSW, Vic, Qld, WA, SA, ACT, NT, 2010 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (c)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>ACT</i>	<i>NT</i>	<i>Total (d), (e)</i>
Number who attended at least one antenatal visit in the first trimester	no.	2 250	376	1 267	307	342	36	686	5 264
Number of women who gave birth (f)	no.	3 139	779	3 321	1 032	603	63	1 313	10 250
Proportion who attended at least one antenatal visit in the first trimester	%	71.7	48.3	38.2	29.7	56.7	57.1	52.2	51.4

- (a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published. Data are by place of usual residence of the mother. Women who gave birth in NSW, Victoria, Qld, WA, SA, the ACT or the NT but reside in another jurisdiction are not reported due to small numbers.
- (c) Due to data system reforms the Victorian Perinatal Data Collection for 2009 and 2010 are provisional pending further quality assurance work.
- (d) Total includes data for Vic, WA, and the ACT for the first time and is not comparable with totals from previous years.
- (e) Total includes NSW, Vic, Qld, WA, SA, ACT and the NT only. These data are not generalisable to Australia.
- (f) Excludes women whose gestation at first antenatal visit was not stated.

TABLE 6A.1.4

Table 6A.1.4      **Indigenous women who gave birth who attended at least one antenatal visit in the first trimester, NSW, SA and NT, 2008 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>SA</i>	<i>NT</i>	<i>Total (c)</i>
Number who attended at least one antenatal visit in the first trimester	no.	2 023	259	653	2 935
Number of women who gave birth (d)	no.	2 862	544	1 330	4 736
Proportion who attended at least one antenatal visit in the first trimester	%	70.7	47.6	49.1	62.0

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit is not part of the Perinatal NMDs. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria, Queensland, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in NSW, SA or the NT but reside in another jurisdiction are not reported due to small numbers.

(c) Total includes NSW, SA and the NT only. These data are not generalisable to Australia.

(d) Excludes women whose gestation at first antenatal visit was not stated.

Source: AIHW National Perinatal Data Collection, cited in SCRGSP (2013) NIRA performance information 2012-13, PC, Canberra.

TABLE 6A.1.5

**Table 6A.1.5 Indigenous women who gave birth who attended at least one antenatal visit in the first trimester, NSW, SA and NT, 2007 (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>SA</i>	<i>NT</i>	<i>Total (c)</i>
Number who attended at least one antenatal visit in the first trimester	no.	1 828	171	561	2 560
Number of women who gave birth (d)	no.	2 748	407	1 340	4 495
Proportion who attended at least one antenatal visit in the first trimester	%	66.5	42.0	41.9	57.0
Rate ratio (e)	no.	0.9	0.6	0.8	0.8
Rate difference (f)	no.	- 10.5	- 31.8	- 12.4	- 17.5

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relate to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Gestation at first antenatal visit is not part of the Perinatal NMDs. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria, Queensland, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in NSW, SA or the NT but reside in another jurisdiction are not reported due to small numbers.

(c) Total includes NSW, SA and the NT only. These data are not generalisable to Australia.

(d) Excludes women whose gestation at first antenatal visit was not stated.

(e) Rate ratio is the directly age standardised Indigenous proportion divided by the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2007 as the standard population.

(f) Rate difference is the directly age standardised Indigenous proportion less the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2007 as the standard population.

TABLE 6A.1.8

Table 6A.1.8 **Age standardised rate of women who gave birth and attended at least one antenatal visit in the first trimester, NSW, Vic, Qld, WA, SA, ACT, NT, by Indigenous status, 2010 (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>ACT (e)</i>	<i>NT</i>	<i>Total (f), (g)</i>
<b>At least one antenatal visit reported in first trimester (rate)</b>									
Indigenous	%	71.3	51.5	38.9	29.5	57.6	np	55.1	52.2
Non-Indigenous	%	79.9	62.1	63.7	56.4	80.8	44.9	84.9	69.3
<b>Variability bands for rate</b>									
Indigenous	±	3.8	5.9	2.7	4.3	8.1	np	5.4	1.8
Non-Indigenous	±	0.6	0.6	0.7	1.0	1.3	1.9	3.7	0.3
Rate ratio (h)	no.	0.9	0.8	0.6	0.5	0.7	np	0.6	0.8
Rate difference (i)	no.	-8.6	-10.6	-24.8	-26.9	-23.3	np	-29.8	-17.1

- (a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Gestation at first antenatal visit was added to the Perinatal NMDS in July 2010. For births before July 2010 data collection is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are available in Tasmania but due to partial implementation during 2010 of antenatal information and small numbers it hasn't been published. Data are by place of usual residence of the mother. Women who gave birth in NSW, Victoria, Qld, WA, SA, the ACT or the NT but reside in another jurisdiction are not reported due to small numbers.
- (c) Data are directly age-standardised using the Australian female population who gave birth in 2010.
- (d) Due to data system reforms the Victorian Perinatal Data Collection for 2009 and 2010 are provisional pending further quality assurance work.
- (e) Age standardised rates have not been produced for the ACT, as denominators for some age groups are less than 30.
- (f) Total includes data for Vic, WA, and the ACT for the first time and is not comparable with totals from previous years.
- (g) Total includes NSW, Vic, Qld, WA, SA, the ACT and the NT only. These data are not generalisable to Australia.
- (h) Rate ratio is the directly age standardised Indigenous proportion divided by the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2010 as the standard population.
- (i) Rate difference is the directly age standardised Indigenous proportion less the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2010 as the standard population.

TABLE 6A.1.8

Table 6A.1.8 **Age standardised rate of women who gave birth and attended at least one antenatal visit in the first trimester, NSW, Vic, Qld, WA, SA, ACT, NT, by Indigenous status, 2010 (a), (b), (c)**

<i>Unit</i>	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>ACT (e)</i>	<i>NT</i>	<i>Total (f), (g)</i>
-------------	------------	----------------	------------	-----------	-----------	----------------	-----------	-----------------------

**np** Not published.

TABLE 6A.1.9

Table 6A.1.9      **Age standardised rate of women who gave birth and attended at least one antenatal visit in the first trimester, NSW, Qld, SA, NT, by Indigenous status, 2009 (a), (b), (c), (d)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (e)</i>	<i>SA</i>	<i>NT</i>	<i>Total (f), (g)</i>
<b>At least one antenatal visit reported in first trimester (rate)</b>						
Indigenous	%	70.3	37.1	57.7	52.2	56.6
Non-Indigenous	%	79.8	60.1	79.2	81.6	75.5
<b>Variability bands for rate</b>						
Indigenous	±	4.0	3.7	9.0	5.0	2.4
Non-Indigenous	±	0.6	0.9	1.3	3.7	0.5
Rate ratio (h)	no.	0.9	0.6	0.7	0.6	0.7
Rate difference (i)	no.	-9.4	-23.0	-21.4	-29.4	-18.9

- (a) Crude and age-standardised proportions for the years 2007, 2008 and 2009 will differ slightly to those reported in previous years as data have been recalculated to exclude from the denominator 'unknown' and 'not stated' values for number of antenatal visits (to be consistent with the indicator specifications for this indicator).
- (b) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (c) Gestation at first antenatal visit is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in NSW, Qld, SA or the NT but reside in another jurisdiction are not reported due to small numbers.
- (d) Data are directly age-standardised using the Australian female population who gave birth in 2009.
- (e) For Queensland, antenatal visit in the first trimester data were collected from 1 July 2009.
- (f) Total includes NSW, Qld, SA and the NT only. These data are not generalisable to Australia.
- (g) Total includes data for Queensland for the first time and is not comparable with totals from previous years.
- (h) Rate ratio is the directly age standardised Indigenous proportion divided by the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2009 as the standard population.
- (i) Rate difference is the directly age standardised Indigenous proportion less the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2009 as the standard population.

Very remote	±	np	..	7.1	7.4	np	np	..	np	4.5	9.3

(a) Women who gave birth in the period, whether resulting in a live or still birth, if the birthweight is at least 400 grams or the gestational age is 20 weeks or more, except in WA, where included if gestational age is 20 weeks or more or if gestation unknown birthweight is at least 400 grams. Excludes births where mother's Indigenous status was not stated. Excludes women whose gestation at first antenatal visit was not stated. First trimester is up to and including 13 completed weeks. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Data are by place of usual residence of the mother.

(c) Data are directly age-standardised using the Australian female population who gave birth in 2011.

(d) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

(e) Total includes data for Tas for the first time and is not comparable with totals from previous years.

(f) Total includes NSW, SA, and the NT only.

.. Not applicable. **np** Not published.

- (a) Indigenous women who gave birth at 32 week or more gestation to a live birth or stillbirth. Excludes births where mother's Indigenous status was not stated. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.
- (b) Number of antenatal visits is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for NSW, Victoria, WA and Tasmania. Data are available in the ACT but are not of sufficient quality to publish. Data are by place of usual residence of the mother. Women who gave birth in Queensland, SA or the NT but reside in another jurisdiction are not reported due to small numbers.
- (c) Data are directly age-standardised using the Australian female population who gave birth in 2009.
- (d) Age standardised rate calculated after excluding records with missing or null values.
- (e) Total includes Queensland, SA and the NT only. These data are not generalisable to Australia.

**np** Not published. .. Not applicable.

Responding population	±	–	–	–	–	–	–	–	–	–

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population.
- (c) Child born late (42 weeks or more). Child born on time (37-41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33-36 weeks).
- (d) Data for 'Child's mother sought advice or information about pregnancy or child birth' was only collected from birth mothers (excludes other child proxies). For this indicator only, proportions are based on the population of birth mothers (42 800).
- (e) Other includes 'At a birthing centre', 'At a general medical clinic or facility', 'At home' and 'Other'.  
– Nil or rounded to zero. **np** Not published.

Responding population	±	—	—	—	—	—	—	—	—

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

(b) Information on some aspects of maternal health could not be obtained from all respondents. Proportions are therefore based on the responding population.

(c) Child born late (42 weeks or more). Child born on time (37–41 weeks). Child born early includes 'Child born very early' (32 weeks or less) and 'Child born early' (33–36 weeks).

(a) Indigenous women who gave birth at 32 week or more gestation to a live birth or stillbirth. Excludes births where mother's Indigenous status was not stated. Antenatal visits relates to care provided by skilled birth attendants for reasons related to pregnancy.

(b) Number of antenatal visits is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data are not available for Victoria and WA. Data are by place of usual residence of the mother. Women who gave birth in NSW, Qld, SA, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers.

(c) Percentages calculated after excluding records with missing or null values.

(d) Total includes NSW, Qld, SA, Tas, the ACT and the NT only. These data are not generalisable to Australia.

Source AIHW National Perinatal Data Collection, cited in SCRGSP (2013) NIRA performance information 2012-13, PC, Canberra.

(a) Excludes births where the mother's Indigenous status was not stated.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) The Perinatal NMDS includes two standardised data items on smoking during pregnancy for births from July 2010: smoking during first twenty weeks of pregnancy and smoking after twenty weeks of pregnancy. Standardised data were implemented by NSW, Vic, Qld, WA, SA, the ACT and the NT and partially implemented by Tas. Data from non-standard smoking items made available as part of the National Perinatal Data Collection (NPDC) have been used, therefore, caution should be used when interpreting these numbers.

(d) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

(e) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(f) For women who gave birth in the NT, smoking status was recorded at the first antenatal visit.

(g) Excludes mothers for whom smoking status was not stated.

– Nil or rounded to zero.

(a) Excludes births where the mother's Indigenous status was not stated.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Smoking status during pregnancy was not part of the Perinatal NMDS for the 2009 collection period. The question used is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers.

(d) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(e) For women who gave birth in SA and the NT, smoking status was recorded at the first antenatal visit.

(f) The proportion of Indigenous women smoked during pregnancy in NT is underestimated and will be increased when smoking status is assigned for the 'not stated' group. Caution should be used when interpreting these rates. In 2009, when 'not stated' smoking status is excluded from analysis, the proportion of Indigenous mothers who smoked during pregnancy in NT is 54 per cent.

(g) Excludes mothers for whom smoking status was not stated.

— Nil or rounded to zero.

(a) Excludes women whose Indigenous status was not stated, non-residents and those with a not stated State/Territory of usual residence.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Smoking status during pregnancy was not part of the Perinatal NMDS for the 2009 collection period. The question used is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers.

(d) Data are directly age-standardised using the Australian female population who gave birth in 2009.

(e) Excludes mothers for whom smoking status was not stated.

(f) Due to data system reforms the Victorian Perinatal Data Collection for 2009 and 2010 are provisional pending further quality assurance work.

(g) For women who gave birth in SA, 'Smoked' includes women who quit before the first antenatal visit.

(h) For women who gave birth in SA and the NT, smoking status was recorded at the first antenatal visit.

(i) In accordance with Data Principle 2 (page 1), age standardised rates have not been produced for Tasmania and the ACT, as denominators for some age groups are less than 30.

(j) Rate ratio is the directly age standardised Indigenous proportion divided by the directly age standardised non-Indigenous proportion using the Australian female population who gave birth in 2009 as the standard population.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval (CI) is also reported for each estimate.

(b) Differences between jurisdictional rates and national rates are not statistically significant.

(c) Information on some aspects of maternal health could not be obtained from all respondents. Proportions for use of alcohol, tobacco and illicit substances during pregnancy have therefore been calculated on the responding population.

**np** Not published.

(a) The denominator for this measure is the number of women aged between 15 and 19 years of age.

TABLE 6A.3.1

Table 6A.3.1      **Number and birth rate for women aged 15 to 19 years, by State and Territory by age of mother, average birth rate and rate ratios, 2004–2012 (a), (b), (c)**

	2004	2005	2006	2007	2008	2009	2010	2011	2012	Average birth rate
--	------	------	------	------	------	------	------	------	------	--------------------

(b) Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005 to 2010. For more information: see Births, Australia, 2012 (Cat. no. 3301.0).

(c) These data exclude 1911 registered births where the Indigenous status was not stated for mothers aged between 15 and 19 years over the period 2004-2012.

(d) Includes Other Territories.

– Nil or rounded to zero. **np** Not published. **na** Not available. .. Not applicable.

(a) Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005 to 2010.

(b) RAs are based on the Australian Statistical Geography Standard (ASGS), 2011 (cat. no. 1270.0.55.001) Statistical Area Level 2 boundaries.

(c) Indigenous births to teenage mothers comprise births where either parent identifies as being of Aboriginal and Torres Strait Islander origin.

– Nil or rounded to zero.

- (a) Teenage mothers comprise women aged less than 20 who have given birth.
- (b) Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005 to 2010.
- (c) Remoteness areas are based on the Australian Statistical Geography Standard (ASGS), 2011 (cat. no. 1270.0.55.001) Statistical Area Level 2 boundaries.
- (d) Births which could not be assigned to an Statistical Area Level 2 cannot be allocated to a Remoteness Area and have been excluded from this table. Therefore Remoteness Area totals will differ from state level totals.
- (e) Father can be Indigenous or non-Indigenous.  
– Nil or rounded to zero.

<b>Total ASR (c)</b>	<b>50.5</b>	<b>47.4</b>	<b>14.8</b>	<b>84.7</b>	<b>3.4</b>

(a) Rate ratio: proportion for Indigenous divided by proportion for non-Indigenous.

(b) Total includes non-resident mothers.

(c) Age standardised rate (ASR) based on directly age standardised proportions using the population of women aged 15–44 years who gave birth in all states as the standard.

TABLE 6A.4.1

Table 6A.4.1      **Low birth weight among liveborn singleton babies born in NSW, Victoria, Queensland, WA, SA and the NT, by Indigenous status of mother, 2000 to 2011 (a), (b), (c)**

	<i>Unit</i>	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011
Proportion of babies with low birth weight (<2500g)													
Indigenous	%	11.7	11.5	11.8	11.9	12.1	12.1	11.4	11.3	11.1	10.8	10.7	11.1
Non-Indigenous	%	4.5	4.5	4.6	4.5	4.6	4.5	4.6	4.4	4.4	4.4	4.5	4.5
Rate ratio	no.	2.6	2.6	2.6	2.6	2.6	2.7	2.5	2.6	2.5	2.4	2.4	2.5
Rate difference (d)	no.	7.2	7.0	7.3	7.4	7.5	7.5	6.8	6.9	6.7	6.4	6.3	6.6

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic and WA; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence. Babies born to mothers residing in Tasmania and the ACT are excluded.

(c) Data on Indigenous births relate to babies born to Indigenous mothers only, and excludes babies born to non-Indigenous mothers and Indigenous fathers. Therefore, the information is not based on the total count of Indigenous babies.

(d) Rate difference is the proportion of Indigenous babies with low birth weight less the proportion of non-Indigenous babies with low birth weight.

Rate ratio (g)	no.	2.4	2.5	2.1	3.1	2.7	1.5	2.3	2.9	2.5
Rate difference (h)	no.	6.2	6.9	5.0	9.4	8.1	2.6	5.4	8.7	6.8

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for Victoria have not been confirmed by the Victorian Perinatal Data Collection due to the nature of this collection. This is because the data are collected by place of birth but are published by place of residence. Therefore totals include women who gave birth in other states and territories but resided in Victoria.

(d) Birthweight data on babies born to Indigenous mothers residing in the ACT should be viewed with caution as they are based on small numbers of births.

(e) Data on Indigenous births relate to babies born to Indigenous mothers only, and excludes babies born to non-Indigenous mothers and Indigenous fathers. Therefore, the information is not based on the total count of Indigenous babies.

(f) Includes births to mothers whose Indigenous status was not stated.

(g) Rate ratio is the proportion of Indigenous babies with low birth weight divided by the proportion of non-Indigenous with low birth weight.

(h) Rate difference is the proportion of Indigenous babies with low birth weight less the proportion of non-Indigenous with low birth weight.

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic and WA; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Birthweight data on babies born to Indigenous mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.

(e) Data on Indigenous births relate to babies born to Indigenous mothers only, and excludes babies born to non-Indigenous mothers and Indigenous fathers. Therefore, the information is not based on the total count of Indigenous babies.

(f) Includes births to mothers whose Indigenous status was not stated.

.. Not applicable. **np** Not published.

TABLE 6A.4.12

Table 6A.4.12      **Incidence of low birth weight among live born singleton babies, by State and Territory, by Indigenous status of the infant, 2011 (a), (b), (c)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic (d)</i>	<i>Qld</i>	<i>Tas (e)</i>	<i>ACT (e)</i>	<i>NT</i>	<i>Aust</i>
--	-------------	------------	----------------	------------	----------------	----------------	-----------	-------------

- (e) Birthweight data on babies born residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.
- (f) Data on Indigenous status of the baby is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data on Indigenous status of the baby was available for NSW, Vic, Qld, Tas, the ACT and the NT only. Women who gave birth in NSW, Vic, Qld, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers. Table excludes women who gave birth in WA and SA where Indigenous status of the baby was not available.
- (g) Includes births whose Indigenous status was not stated.
- (h) Rate ratio is the proportion of Indigenous babies with low birth weight divided by the proportion of non-Indigenous babies with low birth weight.
- (i) Rate difference is the proportion of Indigenous babies with low birth weight less the proportion of non-Indigenous babies with low birth weight.

(a) Data relate to live births. Data exclude stillbirths; births both less than 20 weeks gestation and less than 400 grams birthweight; births less than 20 weeks gestation (where gestation is known) in Vic; and multiple births.

(b) Data are by place of usual residence of the mother. Table excludes non-residents, external territories and not stated State/Territory of residence.

(c) Totals for each State and Territory cannot be reconciled by individual jurisdictions as data are collected by place of birth but are published by place of residence.

(d) Due to data system reforms the Victorian Perinatal Data Collection for 2011 are provisional pending further quality assurance work.

(e) Birthweight data on babies born to Indigenous mothers residing in the ACT and Tasmania should be viewed with caution as they are based on small numbers of births.

(f) Data on Indigenous status of the baby is not part of the Perinatal NMDS. The current question is not consistent across jurisdictions, therefore, caution should be used when interpreting these numbers. Data on Indigenous status of the baby was available for available for NSW, Vic, Qld, Tas, the ACT and the NT only. Women who gave birth in NSW, Vic, Qld, Tas, the ACT and the NT but reside in another jurisdiction are not reported due to small numbers. Table excludes women who gave birth in WA and SA where Indigenous status of the baby was not available.

<b>Total aged 0–3 years</b>	<b>6.0</b>	..	..	..	<b>41.7</b>	..	..	..

- (a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate.
- (b) Differences between rates for children with low birthweight (less than 2500 grams) and normal birthweight (2500 grams or more) are not statistically significant.
- (c) Information on some aspects of maternal health could not be obtained from all respondents. Proportions for use of alcohol, tobacco and illicit substances during pregnancy have therefore been calculated on the responding population.

.. Not applicable. **np** Not published. – Nil or rounded to zero.

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

TABLE 6A.5.1

Table 6A.5.1      **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by State and Territory, 2012-13 (a), (b), (c)**

	<i>Hospitalisations (no.)</i>			<i>Age specific rate (d)</i>			<i>Rate ratio (g)</i>
	<i>Indigenous</i>	<i>Non-Indigenous (e)</i>	<i>Other (f)</i>	<i>Indigenous</i>	<i>Non-Indigenous (e)</i>	<i>Other (f)</i>	

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude separations from private hospitals in the NT, Tasmania and the ACT.

(c) Australia data include public and private hospitals in all jurisdictions.

(d) Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.

(e) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.

(f) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(g) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(h) Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.

(i) Data for the 6-jurisdiction subtotal exclude separations from private hospitals in the NT.

- (a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.
- (b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude private hospitals in the NT, Tasmania and the ACT.
- (c) Australia data include public and private hospitals in all jurisdictions.
- (d) Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.
- (e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.
- (f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.
- (g) Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.
- (h) Data for the 6-jurisdiction subtotal exclude separations from private hospitals in the NT.

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions exclude private hospitals in the NT, Tasmania and the ACT.

(c) Australia data include public and private hospitals in all jurisdictions.

(d) Rate is reported as number per 100 000 population of children aged 0–4 years. Denominator is a rolling average of 3 financial years populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(g) Other includes diseases of the skin and subcutaneous tissue; diseases of the digestive system; congenital malformations, deformations and chromosomal abnormalities; diseases of the ear and mastoid process; diseases of the genitourinary system; diseases of the nervous system; neoplasms; diseases of the eye and adnexa; diseases of the blood and blood forming organs and certain disorders involving the immune system; endocrine, metabolic and nutritional disorders, mental and behavioural disorders; diseases of the circulatory system; pregnancy, childbirth and the puerperium; and diseases of the musculoskeletal system and connective tissue.

(h) SA data for 'Certain conditions originating in the perinatal period' and 'Contact with health services' for 2010-11 are not published as data issues relating to separations for these diagnosis are being investigated.

(i) Data for the 6-jurisdiction subtotal exclude separations from private hospitals in the NT.

**np** Not published.

<b>Total hospitalisations</b>	<b>7 213</b>	<b>5 769</b>	<b>45 447.7</b>	<b>23 562.3</b>	<b>1.9</b>

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(c) Includes public and private hospitals in all jurisdictions.

(d) Rate per 100 000 population of children aged 0–4 years. 2012 projected population data used for denominator.

Table 6A.5.10      **Number and rate of hospitalisations for children aged 0–4 years, by principal diagnosis chapter, by remoteness, 2012-13 (a), (b), (c)**

	<i>Hospitalisations (no.)</i>		<i>Age specific rate (d)</i>		<i>Rate ratio (e)</i>
	<i>Indigenous</i>	<i>Non-Indigenous</i>	<i>Indigenous</i>	<i>Non-Indigenous</i>	

(e) Rate ratio is the Indigenous rate divided by the non-Indigenous rate.

Source: AIHW (unpublished) National Hospital Morbidity Database.

Other (X60–X84; Y10–Y39; Y85–Y98) (g)	23	107	109	27.6	7.5	7.7	3.6
<b>Total potentially preventable hospitalisations</b>	<b>13 407</b>	<b>137 268</b>	<b>139 338</b>	<b>16 083.2</b>	<b>9 671.8</b>	<b>9 817.7</b>	<b>1.6</b>

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions and the six jurisdiction total exclude separations from private hospitals in the NT, ACT and Tasmania.

(c) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(d) Non-Indigenous includes hospitalisations identified as not Indigenous except for WA which also includes hospitalisations for children for whom Indigenous status was not stated.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

TABLE 6A.6.1

Table 6A.6.1      **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by Indigenous Status and State and Territory, 2012-13 (a), (b)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>			<i>Age specific rate (c)</i>			<i>Rate ratio (f)</i>
	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	<i>Other (e)</i>	<i>Indigenous</i>	<i>Non-Indigenous (d)</i>	<i>Other (e)</i>	

(f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

(h) Data are for public and private hospitals in all jurisdictions.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

TABLE 6A.6.2

Table 6A.6.2      **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by Indigenous Status and State and Territory, 2011-12 (a), (b)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (c)</i>		<i>Rate ratio (e)</i>
	<i>Indigenous</i>	<i>Other (d)</i>	<i>Indigenous</i>	<i>Other (d)</i>	
Other (X60–X84; Y10–Y39; Y85–Y98) (f)	18	132	21.7	9.5	2.3
<b>Total potentially preventable hospitalisations</b>	<b>13 286</b>	<b>141 046</b>	<b>15 992.2</b>	<b>10 113.2</b>	<b>1.6</b>

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised. Data for individual jurisdictions and the six jurisdiction total exclude separations from private hospitals in the NT, ACT and Tasmania.

(c) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(d) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(e) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(f) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

(g) Data are for public and private hospitals in all jurisdictions.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

<b>Total potentially preventable hospitalisations</b>	<b>34</b>	<b>1 137</b>	<b>5 171.1</b>	<b>5 011.1</b>	<b>1.0</b>

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude separations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

- (a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.
- (b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude separations from private hospitals in the NT, ACT and Tasmania.
- (c) Data for Tasmania and the ACT should be interpreted with caution.
- (d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.
- (e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.
- (f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.
- (g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

(a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.

(b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude separations from private hospitals in the NT, ACT and Tasmania.

(c) Data for Tasmania and the ACT should be interpreted with caution.

(d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.

(e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.

(f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.

(g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

Source: AIHW (unpublished) National Hospital Morbidity Database.

- (a) Data are for principal diagnosis as based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases) 10th Revision, Australian Modification.
- (b) Data are reported by State or Territory of usual residence of the patient hospitalised and exclude separations from private hospitals in the NT, ACT and Tasmania.
- (c) Data for Tasmania and the ACT should be interpreted with caution.
- (d) Rate per 100 000 population of children aged 0–4 years. Denominators are a rolling average of 3 financial year populations.
- (e) 'Other children' includes hospitalisations of non-Indigenous children and those for whom Indigenous status was not stated.
- (f) Rate ratio is the Indigenous rate divided by the 'other' rate for time series comparisons.
- (g) All the external cause records of each person were examined. Where a person had multiple records of a type of cause, this was counted only once.

**np** Not published. – Nil or rounded to zero. **na** Not applicable.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).

(b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(c) Includes public and private hospitals in all jurisdictions.

(d) Rate per 100 000 population of children aged 0–4 years. Use the 2012 projected population by remoteness area as denominator for the remoteness categories, as Australian data by remoteness for 2013 are not yet available. For "Total Australia", the 2012-13 population is used as denominator.

(e) Rate ratio is the Indigenous rate divided by the non-Indigenous rate.

Table 6A.6.10      **Number and rate of hospitalisations for injury and potentially preventable diseases for children aged 0–4 years, by remoteness, 2012-13 (a), (b), (c)**

ICD-10-AM code and description	<i>Hospitalisations (no.)</i>		<i>Age specific rate (d)</i>		<i>Rate ratio (e)</i>

Variability bands: Indigenous children (o)	±	18.5	20.8	51.1	52.3	55.9	13.8	2.7	4.4	5.9	7.2	25.5	2.1
2010 population aged 0–4 years	no.	26 191	24 673	10 761	4 470	7 698	73 793	448 050	279 523	142 754	92 807	11 073	974 207

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008–2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29–33 and Technical Notes, Causes of Death Revisions, 2006 in Causes of Death, Australia, 2010 (cat. 3303.0) and Causes of Death Revisions, 2010 and 2011 in Causes of Death, Australia, 2012 (cat. 3303.0).

(b) Data are presented in five-year groupings due to the volatility of small numbers each year.

(c) Data based on reference year. See data quality statements for a more detailed explanation.

(d) Some totals and figures may not compute due to the effects of rounding.

(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(f) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.

(g) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.

TABLE 6A.6.11

Table 6A.6.11 **Deaths from external causes and preventable diseases for children aged 0–4 years, by Indigenous status, NSW, Queensland, WA, SA, NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g)**

	Indigenous							Non-Indigenous (h)					
	Unit	NSW	Qld (i)	WA (j)	SA	NT	Total (k)	NSW	Qld (i)	WA (j)	SA	NT	Total (k)
(j)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.												
(k)	Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.												
(l)	See tables 5A.5.1–6 for ICD-10 codes included in 'External Causes and Preventable Diseases'.												
(m)	Crude rates calculated per 100 000 Estimated Resident Population for children aged less than 5 years for the average of the period 2003-2008.												
(n)	Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.												
(o)	Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jursidictions or between jurisdictions and totals.

2005 population aged 0–4 years	no.	24 634	23 060	10 317	4 040	8 136	70 187	403 590	234 877	116 399	84 521	9 508	848 895

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006-2007 (final). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in Causes of Death, Australia, 2010 (cat. 3303.0) and Causes of Death Revisions, 2010 and 2011 in Causes of Death, Australia, 2012 (cat. 3303.0).

(b) Data are presented in five-year groupings due to the volatility of small numbers each year.

(c) Data based on reference year. See data quality statements for a more detailed explanation.

(d) Some totals and figures may not compute due to the effects of rounding.

(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.

(f) Data on deaths of Aboriginal and Torres Strait Islander Australians are affected by differing levels of coverage of deaths identified as Indigenous across states and territories. Care should be exercised in analysing these data, particularly in making comparisons across states and territories and between the Indigenous and non-Indigenous data.

(g) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

TABLE 6A.6.12

Table 6A.6.12 **Deaths from external causes and preventable diseases for children aged 0–4 years, by Indigenous status, NSW, Queensland, WA, SA, NT, 2003–2007 (a), (b), (c), (d), (e), (f), (g)**

(a) Proportions with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Proportions with a RSE greater than 50 per cent are considered too unreliable for general use. A 95 per cent confidence interval is also reported against each estimate.

(b) Includes partial hearing loss and deafness in one ear.

(c) Includes Otitis Media, Tinnitus, Meniere's disease/Vertiginous syndrome and type of hearing problem not known. Data for 2008 also includes Otitis externa.

(d) Components may not add to total as people may have reported more than one type of ear/hearing problem.

(e) The rate ratio is calculated by dividing the rate for Indigenous children by the corresponding rate for non-Indigenous children.

.. Not applicable.

TABLE 6A.7.3

Table 6A.7.3 **Children aged 0–14 years with a long-term hearing problem: type of ear/hearing problem, by Indigenous status, by remoteness, 2001, 2004-05, 2008 and 2011-13 (per cent of population) (a)**

	Indigenous									Non-Indigenous			Rate ratio (d)
	Non-remote (b)			Remote (c)			Australia			Australia			
	Proportion (%)	RSE (%)	95 per cent CIs (±)	Proportion (%)	RSE (%)	95 per cent CIs (±)	Proportion (%)	RSE (%)	95 per cent CIs (±)	Proportion (%)	RSE (%)	95 per cent CIs (±)	
Total with a hearing condition (f)	8.5	17.1	2.8	17.7	14.4	5.0	11.2	10.3	2.3	4.7	5.6	0.5	2.4

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. A 95 per cent confidence interval is also reported against each estimate.

(b) Non-remote comprises major cities and inner and outer regional areas. See glossary for definitions of remoteness areas.

(c) Remote comprises remote and very remote areas. See glossary for definitions of remoteness areas.

(d) The rate ratio is calculated by dividing the rate for Indigenous children by the corresponding rate for non-Indigenous children.

(e) Includes Tinnitus, Meniere's disease/Vertiginous syndrome and type of hearing problem not known.

(f) Components may add to more than total as people may have reported more than one type of ear/hearing problem.

(g) Includes Tinnitus and Meniere's disease/Vertiginous syndrome.

'Suppurative and unspecified otitis media' is a subcategory of 'Diseases of middle ear and mastoid' and so categories should not be summed.

(c) Includes separations where Indigenous status was reported as non-Indigenous or not stated.

(d) Separations per 1000 population of children aged 0–3 years and 4–14 years. Denominators are 3-year rolling averages based on population backcast estimates and projections from the 2011 Census.

– Nil or rounded to zero

Source: AIHW (unpublished) National Hospital Morbidity Database.

TABLE 6A.7.13

Table 6A.7.13 **Hospital separations for children aged 0–14 years, where the principal diagnosis was diseases of the ear and mastoid process, by remoteness, 2012-13 (a), (b), (c)**

Principal diagnosis	Number		rate per 1000 (e)	
	Indigenous	Non-Indigenous (d)	Indigenous	Non-Indigenous (d)
<b>Major cities</b>				
Diseases of external ear (H60–H62)	17	640	0.2	0.2
Diseases of middle ear and mastoid (H65–H75)	484	19 253	5.9	6.7
<i>suppurative and unspecified otitis media (H66)</i>	140	5 118	1.7	1.8
Diseases of inner ear (H80–H83)	1	59	–	–
Other disorders of ear (H90–H95)	37	1 226	0.4	0.4
<b>Inner and Outer Regional</b>				
Diseases of external ear (H60–H62)	28	250	0.3	0.2
Diseases of middle ear and mastoid (H65–H75)	641	6 979	5.7	6.3
<i>suppurative and unspecified otitis media (H66)</i>	184	1 951	1.6	1.8
Diseases of inner ear (H80–H83)	1	18	–	–
Other disorders of ear (H90–H95)	40	362	0.4	0.3
<b>Remote and Very Remote</b>				
Diseases of external ear (H60–H62)	37	23	0.8	0.3
Diseases of middle ear and mastoid (H65–H75)	737	493	15.6	7.3
<i>suppurative and unspecified otitis media (H66)</i>	320	182	6.8	2.7
Diseases of inner ear (H80–H83)	4	1	0.1	–
Other disorders of ear (H90–H95)	26	27	0.6	0.4

(a) Data are from public and private hospitals in all jurisdictions.

(b) Principal diagnosis categories are based on ICD-10-AM classification (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). 'Suppurative and unspecified otitis media' is a subcategory of 'Diseases of middle ear and mastoid' and so categories should not be summed.

(c) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.

(d) 'Non-Indigenous' includes hospitalisations of non-Indigenous people and for WA only also those for whom Indigenous status was not stated.

(e) Rates per 1000 population aged 0-14 years are calculated using ABS Estimated Resident Population 2012 by remoteness classification from the 2011 Census (as at 30 June 2011).

– Nil or rounded to zero.

(a) Rest of Australia - Due to some small cell values in SA and particularly in the ACT and Tasmania, these jurisdictions have been combined to allow values for each of the language categories, jurisdictional category totals and the Australian total to be reported.

(b) In order of frequency, the ten most commonly spoken Indigenous languages, other than Aboriginal English, were: Creole/Kriol, Djambarrpuynu, Pitjantjatjara, Murrinh Patha, Arrernte, Warlpiri, Yumplatok (Torres Strait Creole), Alyawarr, Tiwi and Anindilyakwa.

(c) The ten most commonly spoken non-Indigenous languages, other than English, were: Oceanian Pidgins and Creoles, Samoan, Tongan, Spanish, Maori (New Zealand), Arabic, Greek, Tagalog, Maori (Cook Island) and Papua New Guinea Languages.

(d) There were two children in the 2009 collection who speak Kriol/Creole who have an unknown remoteness category, and are not included in this table.

TABLE 6A.8.7

Table 6A.8.7 **Proportion of children receiving a fourth year developmental health check, by type of health check, by state and territory, 2007-08 to 2012-13 (a), (b), (c), (d), (e)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas (f)</i>	<i>ACT (f)</i>	<i>NT</i>	<i>Aust (g)</i>
Health Assessment (k)	no.	..	..	..	..	..	..	..	..	..
Target population	no.	..	..	..	..	..	..	..	..	..
Proportion of target population assessed	%	..	..	..	..	..	..	..	..	..

(a) Financial year data is based on date of processing

(b) Location is based on patients' residential postcode for the last service during the period.

(c) Includes counts of all children aged 3-5 years receiving Aboriginal and Torres Strait Islander Child Health Assessment (formerly Child Health Check) and all children aged 3-5 years receiving the Health Assessment (formerly Healthy Kids Check).

(d) Children who received both a Health Assessment and an Aboriginal and Torres Strait Islander people's Health Assessment during the reference period were counted only against the Aboriginal and Torres Strait Islander Health Assessment.

(e) The patient count will be factored if the patient's postcode belongs to multiple states.

(f) Data for Aboriginal and Torres Strait Islander Child Health Assessment are not published for Tasmania or the ACT for 2007-08 to 2010-11 due to small numbers, but are included in the total for Australia.

(g) Australian total includes where location was unknown.

(h) Includes claims for Medicare Benefits Schedule (MBS) Item 708 (Aboriginal and Torres Strait Islander Child Health Check, available to 30 April 2010) and Item 715 (Aboriginal and Torres Strait Islander People's Health Assessment, available from 1 May 2010) for children aged 3-5 years in the reference period. Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Indigenous Australians. Data for Indigenous Australians are therefore likely to understate the proportion who access health assessments.

(i) Includes claims for MBS items 709 and 711 (Healthy Kids Check, available to 30 April 2010) and items 701, 703, 705, 707 and 10986 (Health Assessment, available from 1 May 2010) for children aged 3-5 years in the reference period. Data do not include developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres. This is known to be a particular issue for several jurisdictions. For example, in Victoria, the Victorian Maternal and Child Health Service provided a 3.5 year old Key Ages and Stages consultation to 47 638 children in the 2011-12 financial year. Data include Indigenous children who received a Healthy Kids Check and did not also receive a health check under MBS items 708 or 715.

(j) Aboriginal and Torres Strait Islander rates are calculated using as denominator the population of children aged 4 years, derived from Indigenous Experimental Estimates and Projections (Indigenous Population) Series B. Non-Indigenous rates are calculated using as denominator the population of children aged 4 years, derived from ABS final ERP data (2011 Census base) and using the average of the two years as at June eg. 2010 and 2011. For 30 June 2012 and 30 June 2013 first release preliminary estimates have been used.

(k) The Health Assessment (Healthy Kids Check) commenced in 2008 therefore there is no data available for 2007-08.

**np** Not published. ... Not applicable.

(c) Includes counts of all children aged 3-5 years receiving Aboriginal and Torres Strait Islander Health Assessment (formerly Child Health Check) and all children aged 3-5 years receiving the Health Assessment (formerly Healthy Kids Check).

(d) Children who received both a Health Assessment and an Aboriginal and Torres Strait Islander people's Health Assessment during the reference period were counted only against the Aboriginal and Torres Strait Islander Health Assessment.

(e) The patient count will be factored if the patient's postcode belongs to multiple states.

(f) Remoteness areas have been collapsed due to the availability of Indigenous population data for remoteness areas.

(g) Includes claims for Medicare Benefits Schedule (MBS) Item 715 (Aboriginal and Torres Strait Islander People's Health Assessment) for children aged 3-5 years for the 2012-13 reference period. Data exclude health assessments provided outside DHS Medicare under service models used to increase access for people in remote areas and for Indigenous Australians. Data for Indigenous Australians are therefore likely to understate the proportion who access health assessments.

(h) Aboriginal and Torres Strait Islander rates are calculated using as denominator the population of children aged 4 years, derived from Indigenous Experimental Estimates and Projections (Indigenous Population) Series B. Non-Indigenous rates are calculated using as denominator the population of children aged 4 years, derived from ABS final ERP data (2011 Census base) and using the average of the two years. For 30 June 2012 and 30 June 2013 first release preliminary estimates have been used.

(i) Includes claims for MBS items 701, 703, 705, 707 and 10986 (Health Assessment) for children aged 3-5 years. Data do not include developmental health check activity conducted outside Medicare, such as State and Territory early childhood health assessments in preschools and community health centres. This is known to be a particular issue for several jurisdictions. Data include Indigenous children who received a Health Assessment and did not also receive a health check under MBS items 708 or 715.

## 7 Education and training

---

### Strategic areas for action

Education is a life-long activity, beginning with learning and development in the home through to the more formal settings of school education, vocational education and training (VET) and higher education. Education and training aims to develop the capacities and talents of students, so they have the necessary knowledge, understanding, skills and values for a productive and rewarding life. Actions in this strategic area can help strengthen communities and regions both economically and socially, and there are strong links between higher levels of education and improved health outcomes.

The indicators in this strategic area for action focus on the key factors that contribute to positive education and training outcomes, as well as measures of the outcomes themselves:

- school attendance (section 7.1) — there is a direct relationship between days attending school and academic performance
- teacher quality (section 7.2) — the quality of teaching is a key determinant of student outcomes. However, defining and measuring teacher quality is difficult. This section discusses research into the determinants of teacher quality and identifies data that could be used for future reporting
- school engagement (section 7.3) — school attendance alone is unlikely to be enough to improve students' educational outcomes. Although defining and measuring student engagement with schooling is complex, research suggests that relevant dimensions include positive self-identity, belonging, participation, and attendance
- transition from school to work (section 7.4) — the transition from school to work is a critical period. Young people who are actively engaged in education and training, or employed, are at a lower risk of long term disadvantage.

---

Several COAG targets and headline indicators reflect the importance of education and training:

- early childhood education (section 4.3)
- reading, writing and numeracy (section 4.4)
- year 12 attainment (section 4.5)
- post-secondary education — participation and attainment (section 4.7).

Other COAG targets and headline indicators can be directly influenced by education and training outcomes:

- employment (section 4.6)
- household and individual income (section 4.9).

Outcomes in the education and training area can be affected by outcomes in several other strategic areas, or can influence outcomes in other areas:

- governance, leadership and culture (governance capacity and skills) (chapter 5)
- early child development (basic skills for life and learning, ear health) (chapter 6)
- healthy lives (access to primary health care and fewer potentially preventable hospitalisations will affect education outcomes, while education outcomes can influence tobacco consumption and harm, and obesity and nutrition) (chapter 8)
- economic participation (employment and occupation, and home ownership) (chapter 9).

## Attachment tables

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 7A.1.1). These tables can be found on the Review web page ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)), or users can contact the Secretariat directly.

---

## 7.1 Year 1 to 10 attendance<sup>1</sup>

### Box 7.1.1 Key messages

- In May 2014, COAG agreed to a target to close the gap in school attendance between Aboriginal and Torres Strait Islander children and non-Indigenous children within 5 years (COAG 2014). However, nationally comparable data were not available for this report.
- Years 5 and 10 have been selected to represent the middle (primary) and later (secondary) years of schooling.
  - Within individual school sectors within a State or Territory in 2013, Aboriginal and Torres Strait Islander students generally had lower attendance than non-Indigenous students, and this difference was larger in year 10 compared to year 5 (tables 7A.1.1–21).
  - From 2007 to 2013, attendance rates for Aboriginal and Torres Strait Islander students in year 5 were fairly stable in government schools, but decreased for year 10 (tables 7A.1.1–21). Attendance rates in Catholic and independent schools fluctuated over time with no clear trend.

### Box 7.1.2 Measure of Year 1 to 10 attendance

There is one main measure for this indicator (aligned with the associated NIRA indicator).

- *Student attendance* is defined as the number of actual full time equivalent student days attended over the collection period as a percentage of the total number of possible student days, for children enrolled full time in years 1 to 10. Data are sourced from the Australian Curriculum, Assessment and Reporting Authority (ACARA) National Schools Attendance Collection, with the most recent available data for 2013 (State and Territory; school sector).

Data are of acceptable accuracy within individual school sectors within a State or Territory, but are currently not comparable across school sectors or states and territories, due to differences in collection and reporting processes.

COAG has identified student attendance as one of the progress measures for the Closing the Gap target of halving the gap in year 12 or equivalent attainment by 2020. In addition, as part of the 2014 Closing the Gap report release (Australian Government 2014), the Prime Minister proposed a new target to close the gap in school attendance within five years. This is to be accomplished by all schools achieving a minimum 90 per cent attendance rate, regardless of their proportion of Aboriginal and Torres Strait Islander students. COAG agreed the new target in May 2014 (COAG 2014). However, detailed measures are yet to be determined.

National and international research identify that regular school attendance is important to achieving core skills, such as literacy and numeracy (Balfanz and Byrnes 2012; Purdie and

---

<sup>1</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

---

Buckley 2010; UNICEF Innocenti Research Centre 2004). The Western Australian Aboriginal Child Health Survey 2000–2002 showed a direct relationship between the number of days absent from school and academic performance (Zubrick et al. 2006). A 2006 study found that school attendance was influenced by three main factors — parental insistence that children go to school, teacher quality and bullying and teasing (DEWR 2006; see also Taylor 2004) (teacher quality is discussed in section 7.2). Indigenous students are less likely to have parental support, such as help with homework, compared with non-indigenous children (UNICEF Innocenti Research Centre 2004). Research highlights that attendance at school is necessary but it alone is not sufficient to achieve improved educational outcomes (Hancock et al. 2013; Mellor and Corrigan 2004), and other factors such as how engaged a student is at school is also important. Student engagement with schooling is discussed in more detail in section 7.3.

## **Student attendance**

In Australia in 2013, school attendance was compulsory for children from the age of 6 years (5 years in WA<sup>2</sup> and Tasmania), although children may start school at an age younger than the compulsory age. Most children commence full time schooling in the grade preceding Year 1 (pre year 1).

As part of the Compact with Young Australians, COAG implemented a National Youth Participation Requirement, which commenced on 1 January 2010 (COAG 2009). Young people are required to:

- participate in schooling (or an approved equivalent) until they complete year 10
- following year 10, participate full time (at least 25 hours per week) in education, training or employment, or a combination of these activities, until 17 years of age.

Data on student attendance rates across all school sectors for the period 2007–2013 are available in tables 7A.1.1–21. Years 5 and 10 have been selected to represent the middle (primary) and later (secondary) years of schooling. Although attendance rates cannot be directly compared across jurisdictions or school sectors (government, independent or Catholic), some broad generalisations can be drawn from the data. Across each State and Territory and school sector in 2013:

- Aboriginal and Torres Strait Islander students generally had lower attendance rates than non-Indigenous students, and this difference was larger in year 10 than in year 5
- attendance rates for both Aboriginal and Torres Strait Islander students and non-Indigenous students generally declined from year 5 to year 10
- in government schools, from 2007 to 2013, there was little change in attendance rates for Aboriginal and Torres Strait Islander students in year 5 but the rates decreased for year 10 students (6 percentage points or less for each jurisdiction except the NT, which

---

<sup>2</sup> The compulsory starting age for WA changed from 6 to 5 years of age starting from 2013.

---

fell 13 percentage points). Attendance rates in Catholic and independent schools fluctuated over time with no clear trend.

Northern Territory attendance rates by geolocation are available for the first two terms of 2013. These data are not directly comparable to other data in this report. In Term 1, attendance rates for Aboriginal and Torres Strait Islander students were highest in provincial locations (85 per cent), and lower in remote and very remote locations (75 per cent and 58 per cent respectively). The attendance rates for non-Indigenous students were stable across remoteness locations (provincial 92 per cent, remote 90 per cent, and very remote 91 per cent). Term 2 data showed a similar pattern. (NT Department of Education 2014)

Data are reported by jurisdiction, by school sector, and for each year of schooling in tables 7A.1.1–21.

## Things that work

A literature review for the Closing the Gap Clearinghouse found very few high quality evaluations of programs that were aimed at increasing attendance (Purdie and Buckley 2010). However, the review found that a common feature of successful school attendance programs was collaboration between public agencies and the community in program design and decision-making (often by engaging parents or community based organisations).

## Future directions in data

Data comparability issues across jurisdictions and school sectors limit the usefulness of the existing data. ACARA, in consultation with jurisdictions, has developed National Standards for Student Attendance Data Reporting (National Standards) which were endorsed by the Standing Council on School Education and Early Childhood (SCSEEC) in December 2012. The National Standards specify reporting by Indigenous status by geographic location (geographic location not available in current data). It is anticipated that data for all jurisdictions except NSW will be available for reporting according to the new standards from 2015. Data from NSW are expected to be available from 2016. Further work will be needed to determine whether amendments to the National Standards are required to address reporting requirements for the new COAG target.

## 7.2 Teacher quality<sup>3</sup>

### Box 7.2.1 Key message

- Teacher quality is considered the most important ‘in-school’ influence on student educational outcomes. However, no measures or data are currently available for reporting against this indicator.

While a lack of systematic evaluation makes it difficult to identify the most effective combination of measures to address educational disadvantage, it is clear that improving teacher quality overall is an important precondition (PC 2012). Teachers are the single most important ‘in school’ influence on student achievement (Hattie 2009). Teacher quality can influence student educational outcomes both directly and indirectly, by fostering a positive, inclusive and safe learning environment (Boon 2011). However, student educational outcomes (including reading, writing and literacy, covered in section 4.4, and year 12 attainment, covered in section 4.5) are also affected by a range of other factors such as family life, student motivation and ability (Biddle and Cameron 2012), and school resourcing (Sullivan, Perry and McConney 2013).

Schools with higher proportions of disadvantaged students often report persistent difficulties in attracting and retaining teachers, leaders and support staff who have the skills, knowledge and capabilities to appropriately meet the learning needs of these students (PC 2012). Schools in disadvantaged areas often have a high proportion of teachers who are recent graduates, as well as a high staff turnover, which can impede student learning. The low quantity and quality of housing in disadvantaged areas, as well as the unpredictability of the social environment can contribute to the difficulties in attracting and retaining teachers. Such problems are particularly severe in remote Indigenous schools (Brasche and Harrington 2012).

Quality teachers work closely with their peers and other school workers, recognise the diverse ways that students learn, challenge them by setting high expectations, provide them with continuous feedback and bring to the classroom a deep knowledge of the subject matter (box 7.2.2).

---

<sup>3</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

---

### Box 7.2.2 What makes for quality teaching

Fully understanding what constitutes quality teaching remains an ongoing policy challenge. This is partly due to the diverse ways that individual students learn. Mapping the professional dimensions (content and pedagogy) and personal capability dimensions of teaching is also complex. Even so, there are some recurring themes in the available evidence.

In a synthesis of the research evidence, Professor Geoff Masters concluded that highly effective teachers are those who:

- create an environment where all students are expected to learn successfully
- have a deep understanding of the subjects they teach
- direct their teaching to student needs and readiness
- provide continuous feedback to students about their learning
- reflect on their own practice and strive for continuous improvement.

The particular characteristics of quality teachers of Indigenous students can include cultural awareness, awareness of individual student needs and setting ambitious learning goals.

Source: PC 2012, *Schools Workforce - Productivity Commission Research Report*, <http://www.pc.gov.au/projects/study/education-workforce/schools/report> (accessed 18 February 2014).

Improving teacher quality is part of COAG's strategy to close the gap in educational outcomes between Aboriginal and Torres Strait Islander and non-Indigenous students (MCEECDYA 2010) and is a priority under the *National Education Agreement* (Council of Australian Governments 2012). The *National Partnership Agreement on Improving Teacher Quality* (which ended 31 December 2013) targeted a series of reforms aimed at improving teacher and school leader quality for all students, and in particular, for students in disadvantaged Indigenous, rural/remote and hard to staff schools (Council of Australian Governments 2009).

A significant outcome of the National Partnership was the *National Professional Standards for Teachers* (now known as the *Australian Professional Standards for Teachers*), which provide a nationally consistent basis to recognise teacher quality levels. The standards outline what teachers should know and be able to do and are grouped in to three domains of teaching: professional knowledge, professional practice, and professional engagement. These are then separated into descriptors at four professional career stages: Graduate, Proficient, Highly Accomplished and Lead which reflect the continuum of a teacher's developing professional expertise. The standards require that all teachers demonstrate professional expertise when teaching Aboriginal and Torres Strait Islander students (AITSL 2011).

Data on teacher accreditation are not currently available. However, subject to data availability in the future, measures of initial accreditation and then progression through career stages may be considered for future reports.

The initial National Teacher Workforce Dataset (NTWD) collected data from mid-2012 to mid-2013, and may provide baseline data on qualification, registration and employment

---

status of teachers. The initial NTWD includes some basic data on teachers' Indigenous status, and found that Aboriginal and Torres Strait Islander teachers were less likely than non-Indigenous teachers to have postgraduate qualifications, and that the conversion from graduate to teaching or applying for teaching is lower for Aboriginal and Torres Strait Islander teachers than for non-Indigenous teachers (although the reasons for this are not currently known). However, for teachers with an education qualification (Bachelor, Graduate Diploma or Diploma in Education), the proportion going on to complete further qualifications is similar for Aboriginal and Torres Strait Islander teachers and non-Indigenous teachers (4 to 5 per cent) (Ernst and Young 2014).

## **Aboriginal and Torres Strait Islander school teachers**

Increasing the number of Aboriginal and Torres Strait Islander teachers could help foster student engagement and improve educational outcomes for Aboriginal and Torres Strait Islander students.

In 2013, Aboriginal and Torres Strait Islander Australians made up a much lower proportion of teachers (primary 1.1 per cent and secondary 0.8 per cent) than students (primary 5.1 per cent and secondary 4.5 per cent) (ABS 2013; MATSITI 2014; McKenzie et al. 2014; table 5A.6.1 in this report) Whilst these proportions were similar in 2010 (McKenzie et al. 2011), a notable area of growth since 2010 was among primary school leaders, where the proportion who identified as being of Aboriginal and/or Torres Strait Islander origin increased from near zero to 1.1 per cent in 2013 (McKenzie et al. 2014). Section 5.6 on Indigenous cultural studies contains further information on the Aboriginal and Torres Strait Islander education workforce.

## **Future directions in data**

Under the (now ceased) National Partnership Agreement on Teacher Quality, two new data collections related to the teacher workforce were established.

- The National Teaching Workforce Dataset collected data on the Australian teaching workforce including qualifications, registration and employment status (data on professional development was generally not available). However, Indigenous status is unknown for over half the workforce covered by the dataset, largely driven by the extremely low proportion of teachers in Victoria declaring their Indigenous status (0.1 per cent).
- The first national results from the Longitudinal Teacher Education Workforce Study are anticipated to be available in late 2014. The study tracked a national cohort of teacher education graduates from 2011 to 2013 and collected data on the impact of pre-service and in-service education and experiences on teacher quality. However, data are not available by Indigenous status, due to the small number of Aboriginal and Torres Strait Islander teachers in the sample (17 teachers — 1 per cent of the sample).

## 7.3 School engagement<sup>4</sup>

### Box 7.3.1 Key messages

- Student engagement with school and learning is key to achieving improved educational outcomes.
- There is no nationally agreed definition of school engagement. Further work is required to develop nationally agreed measures and data sources.

While school attendance is important (see section 7.1), there is growing interest nationally and internationally, in looking beyond students' physical presence at school to examine their relationships with school and learning (Fredericks and McCloskey (eds) 2012; Phan 2014; Social Inclusion Board 2007). Aboriginal and Torres Strait Islander students' engagement with schooling is a key outcome in the 2010–2014 Aboriginal and Torres Strait Islander Education Action Plan (MCEECDYA 2010) (and is also a key outcome for the general population as specified in the National Education Agreement).

Although evidence suggests a link between school engagement and improved educational attainment, the strength of this link remains unclear and varies by school (Lonsdale et al. 2011; OECD 2003). In addition, the concept of school engagement has proven to be difficult to define and measure (Axelson and Flick 2011; Fredericks and McCloskey (eds) 2012). In general, school engagement has been described using three main constructs:

- behavioural/participatory — such as following the rules and being present at school (attendance)
- emotional/affective — such as values and emotional responses toward school, subjects and learning (such as interest or anxiety)
- cognitive/academic — such as motivation and effort (Fredericks, Blumenfeld and Paris 2004; Lonsdale et al. 2011).

Research has shown that school engagement can be shaped by contextual factors such as:

- students' experiences, needs and characteristics, including self-identity and connectedness
- the school and classroom context, including teacher quality (see section 7.2), teacher support, school funding, attitudes of peers and culturally inclusive structures and practices in schools (see section 5.6)
- the wider environment, including socio-economic circumstances, and parental and community involvement (Fredericks, Blumenfeld and Paris 2004; Helme and Lamb 2011; Munns, O'Rourke and Bodkin-Andrews 2013; Social Inclusion Board 2007).

---

<sup>4</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

---

Schools have been found to have higher levels of student engagement when there was a strong disciplinary climate, good student-teacher relations and high expectations for student success (OECD 2003).

## **School engagement and Aboriginal and Torres Strait Islander students**

Relatively few studies have considered how the concept of school engagement relates to Aboriginal and Torres Strait Islander students. As part of its evaluation of the Sporting Chance Program, the Australian Council for Educational Research (ACER) completed a literature review of Aboriginal and Torres Strait Islander school engagement (Lonsdale et al. 2011). Four key components were identified:

- positive self-identity — including feelings about one's self and culture
- belonging — including both broad cultural connectedness, and group connectedness (with peers), and is closely linked to self-identity
- participation — including following rules and active involvement in learning tasks
- attendance — including being present at school. However, merely being present did not mean that a student was engaged in school, and conversely, absenteeism did not mean that a student was not engaged (for example, cultural reasons for absences could mean a student is engaged in learning that is important to their self-identity and belonging).

De Bortoli and Thomson (2010) examined the influence of contextual factors on the results of Aboriginal and Torres Strait Islander students and non-Indigenous students in the 2000 and 2006 Programme for International Student Assessment (PISA) tests.<sup>5</sup> For both Aboriginal and Torres Strait Islander and non-Indigenous students, performance in maths and science was strongly associated with self-efficacy, and positively correlated with self-concept. On average, Aboriginal and Torres Strait Islander students reported significantly lower levels of confidence in their abilities.

## **Things that work**

Whilst there is a lack of research and program evaluation on Aboriginal and Torres Strait Islander school engagement (Purdie and Buckley 2010), the ACER literature review (Lonsdale et al. 2011) identified several programs that use incentives and rewards to increase student attention and retention. Box 7.3.2 presents one program identified as increasing Aboriginal and Torres Strait Islander students' school engagement, and one promising program worth further consideration.

---

<sup>5</sup> PISA is a triennial international survey which aims to evaluate education systems worldwide by testing the skills and knowledge of 15-year-old students. In Australia, PISA is a key part of the National Assessment Program (NAP) and complements other NAP assessments, such as the National Assessment Program — Literacy and Numeracy (NAPLAN).

---

### Box 7.3.2 Things that work – school engagement

The **Sporting Chance Program** is an Australian Government initiative that commenced operating in 2007. The Program aims to improve educational outcomes for Aboriginal and Torres Strait Islander students through sport and recreation. In 2012, a total of 21 providers delivered 64 projects for up to 11 000 primary and secondary students across NSW, Victoria, WA and the NT. The Program has two elements:

- School-based Sports Academies for secondary school students, which provide sports-focused learning and development opportunities to students before, during and after school
- Education Engagement Strategies (EES) for primary and secondary school students, which include school visits by high profile athletes at least twice per year. Visiting athletes stay in the community for 1–5 days and participate in mentoring and role-modelling activities.

In December 2010, ACER was commissioned to evaluate the program. The evaluation method used a mix of surveys, interviews and small group discussions with Academy project providers, principals, staff, parents, students and community members and analysis of administrative data on enrolment, attendance and literacy and numeracy outcomes. Of the 143 schools contacted as part of the evaluation, 87 (61 per cent) participated.

The evaluation found that school staff in both the Academies and ESS projects consider that the Program is having a moderate (positive) impact on school engagement (although the degree and nature of improvement varied between schools). The sustainability of this engagement was more evident in the Academies than in the EES projects. The evaluation did not include comparison results for schools and students not in the Program.

Although it has not been formally evaluated, the Steering Committee has identified the **Students Hairdressing Integrating Education (SHINE) program** (Geraldton, WA) as a promising program worth further examination.

The SHINE program, established in 2010, targets year 9 Aboriginal female students who have a history of low attendance and are significantly at risk of not completing school. The program provides a workplace simulation in a college classroom refurbished into a hair salon. The program is coordinated by a classroom teacher who is also a qualified hairdresser, beauty therapist and counsellor. Students attend the program in addition to completing normal school requirements.

As at the end of 2013, over 140 girls had participated in the program. The program has improved attendance and behaviours at school, as well as the uptake of traineeships among program participants (PHAA 2013).

The program has won the following awards:

- 2011 Milton Thorne Award for WA Outstanding School Initiative for Aboriginal Education
- 2012 National Australia Bank Schools First Awards — WA State Impact Award
- 2013 PHAA WA award — Aboriginal health award.

(continued next page)

---

### Box 7.3.2 (continued)

Sources: Lonsdale et al. 2011, *Evaluation of the Sporting Chance Program for Department of Education, Employment and Workplace Relations*, October, Australian Council for Educational Research, Camberwell, Victoria; WA Government (unpublished); PHAA (Population Health Association of Australia) 2013, *in touch in WA*, PHAA WA Branch Newsletter: December 2013.

## Future directions in data

Further work is required to determine the definitions, appropriateness and method of collating and reporting data on Aboriginal and Torres Strait Islander students' engagement with school. The ACER evaluation proposed measures against the four dimensions it identified as important to Aboriginal and Torres Strait Islander students' school engagement (table 7A.3.1). The suitability of these measures for national reporting should be assessed and, if found suitable, appropriate data sources identified.

Further work is also required to investigate the factors affecting the link between school engagement and learning outcomes.

## 7.4 Transition from school to work<sup>6</sup>

### Box 7.4.1 Key messages

- Young people who do not successfully make the transition from education to work are at risk of long-term disadvantage.
- Between 2002 and 2011–13, there was an increase in the proportion of Aboriginal and Torres Strait Islander 17–24 year olds who were participating in post-school education or training or were employed (from 32.4 per cent in 2002 to 40.3 per cent in 2011–13). The non-Indigenous rate remained around 75 per cent, leading to a narrowing of the gap (from 42.8 percentage points in 2002 to 35.2 percentage points in 2011–13) (figure 7.4.2).
- In 2011, the proportion of Aboriginal and Torres Strait Islander Australians fully engaged in work, study or training decreased as the location became more remote (50.5 per cent in major cities, 17.9 per cent in very remote areas) (figure 7.4.3).
- Among people aged 18–64 years, labour force participation and employment-to-population ratios for Aboriginal and Torres Strait Islander Australians were lower than those for non-Indigenous Australians for all levels of non-school qualification except 'Bachelor Degree or higher', where the rates were similar (table 7.4.1).

### Box 7.4.2 Measures of transition from school to work

There are two main measures for this indicator:

- *Successful transition from school* is defined as the proportion of young people aged 17–24 years who are participating in post-school education or training or are employed.
- *Labour force status and employment-to-population ratio of people aged 18 to 64 years who have achieved a qualification of Certificate level III or above* is defined as the proportion of people aged 18–64 years with a qualification of Certificate level III or above who are (a) in the labour force and (b) employed.

Data for both measures are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2012–13 (engagement by remoteness; employment status by sex; remoteness; jurisdiction). Comparable data for the non-Indigenous population are available from the ABS National Health Survey, with the most recent available data for 2011–12. Indicators using both AATSIHS (2012–13) and AHS (2011–12) data are referenced as 2011–13.

Supplementary data are also reported from the ABS Census of Population and Housing (Census), with the most recent available data for 2011 (remoteness; all jurisdictions). Survey and Census data are not directly comparable.

Young people who do not successfully make the transition from education to work are at risk of long-term disadvantage. Levels of education are key contributors to labour market

---

<sup>6</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

---

success. School leavers without a formal school qualification may have few opportunities for work, and as time passes, their chances of gaining employment or re-entering full time education are likely to decline further (AIHW 2013; Marks 2008; McMillan and Marks 2003).

The transition from study to work is generally smoother for university and TAFE graduates, who also tend to earn significantly more than those who enter the workforce directly from school (Lamb and McKenzie 2001; Lamb 2001). Data on employment and training outcomes for VET graduates are obtained from the National Centre for Vocational Education Research's Student Outcomes Survey, and are reported in the Report on Government Services on an annual basis (SCRGSP 2014). For university bachelor degree graduates, including Aboriginal and Torres Strait Islander graduates, work participation and salary outcomes have been shown to continue to improve for at least five years after graduation (Coates and Edwards 2009).

Section 4.5 contains more information on secondary school attainment for Aboriginal and Torres Strait Islander students. Unemployment and labour force participation for Aboriginal and Torres Strait Islander Australians aged 15–64 years are discussed in section 4.6. More information on employment undertaken by Aboriginal and Torres Strait Islander Australians — including employment by full time and part time status, sector, industry and skill level — is in section 9.1.

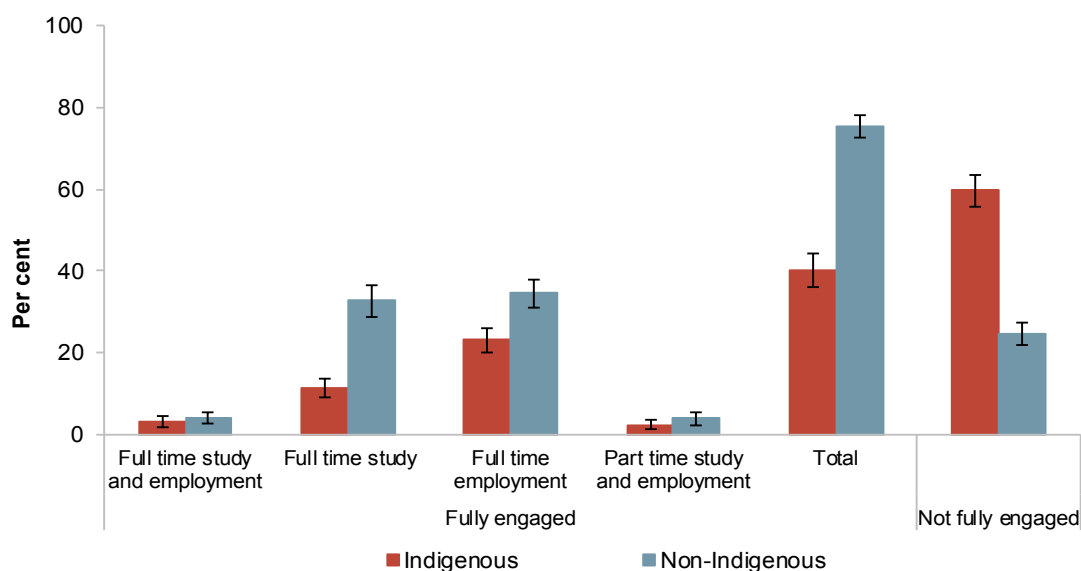

Additional factors that may affect Aboriginal and Torres Strait Islander school-leavers in the transition to employment include 'entrenched disadvantage', social exclusion factors such as labour market discrimination, and the relatively higher cost of education to those of lower socioeconomic status (Hunter 2010). Section 5.1 includes information on levels of trust, perceptions of prejudice and experience of discrimination.

Some people are not working or studying because of carer responsibilities. In 2012, the birth rate of Aboriginal and Torres Strait Islander females aged 19 years was around five times as high as that for non-Indigenous females (68 babies per 1000 females, and 13 babies per 1000 females, respectively) (table 6A.3.1). Teenage birth rates are examined in more detail in section 6.3.

## **Young people who have successfully transitioned from school**

Young people who are participating in study benefit from the additional returns to further education. Those participating in employment benefit from employment experience, the development of work skills and familiarity with new technologies.

Figure 7.4.1 **Proportion of 17–24 year olds who are fully engaged in post-school education and/or training or employment, 2011–13<sup>a,b,c</sup>**

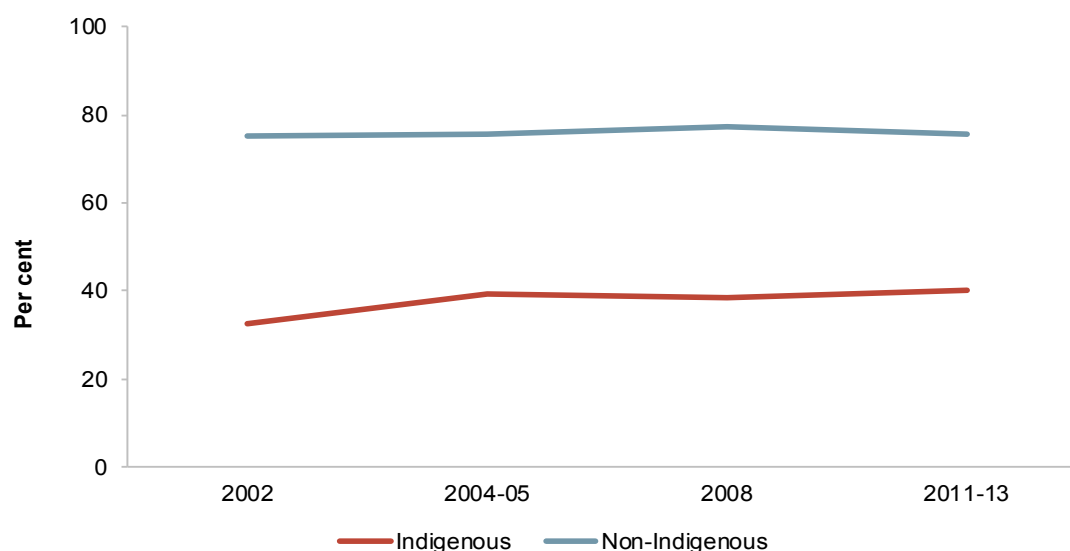

**a** Data exclude people enrolled in secondary school. **b** Error bars represent 95 per cent confidence intervals around each estimate. **c** The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

Sources: ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey, 2012–13 (Core component); ABS (unpublished) Australian Health Survey 2011–13 (2011–12 Core component); table 7A.4.1.

Nationally in 2011–13, 40.3 per cent of Aboriginal and Torres Strait Islander Australians aged 17–24 years were participating in post-school education or training or were employed, compared with 75.5 per cent of non-Indigenous 17–24 year olds. Larger proportions of non-Indigenous young people than Aboriginal and Torres Strait Islander young people were engaged in ‘full time study’ (32.7 per cent compared with 11.6 per cent) and ‘full time employment’ (34.7 per cent compared with 23.1 per cent), while the rates were similar between the ‘full time study and full time employment’, and ‘part time study and part time employment’ categories (figure 7.4.1). These data are also reported by remoteness in table 7A.4.1.

**Figure 7.4.2 Proportion of 17–24 year olds who are fully engaged in post-school education and/or training or employment, 2002, 2004-05, 2008 and 2011–13<sup>a,b,c</sup>**

<sup>a</sup> Data exclude people enrolled in secondary school. <sup>b</sup> Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 7A.4.2. <sup>c</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011-12).

*Sources:* ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey, 2002; ABS (unpublished) General Social Survey 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004-05; ABS (unpublished) National Health Survey, 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) National Health Survey 2007-08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (Core component); ABS (unpublished) Australian Health Survey 2011-13 (2011-12 Core component); table 7A.4.2.

Between 2002 and 2011–13, there was an increase in the proportion of Aboriginal and Torres Strait Islander Australians aged 17–24 years who were fully engaged and participating in post-school education or training or were employed (from 32.4 per cent in 2002 to 40.3 per cent in 2011–13). The rate for non-Indigenous Australians remained constant over this period (75.2 per cent in 2002 and 75.5 per cent in 2011–13), leading to a narrowing of the gap (from 42.8 percentage points in 2002 to 35.2 percentage points in 2011–13) (figure 7.4.2). These data are also reported by remoteness in table 7A.4.2.

Although not directly comparable, data from the Census show similar trends to the survey data. Census data show that the proportion of Aboriginal and Torres Strait Islander 17–24 year olds who were fully engaged in post-school education, training or employment increased from 33.8 per cent in 2001 to 39.4 per cent in 2011. Over the same period, the rate for non-Indigenous Australians increased from 71.8 per cent in 2001 to 73.9 per cent, leading to a narrowing of the gap from 38.0 percentage points to 34.5 percentage points (table 7A.4.6).

Figure 7.4.3 shows Census data by remoteness (survey data for very remote areas are not available for non-Indigenous Australians for 2008 and 2011–13).

**Figure 7.4.3 Proportion of 17–24 year olds who are fully engaged in post-school education and/or training or employment, by remoteness, 2011<sup>a</sup>**

<sup>a</sup> See table 7A.4.6 for more information on caveats to this data.

Source: ABS (unpublished) 2011 Census of Population and Housing; table 7A.4.6.

Nationally, in 2011, the proportion of Aboriginal and Torres Strait Islander Australians aged 17–24 years fully engaged in work, study or training decreased as the location became more remote (50.5 per cent in major cities, 17.9 per cent in very remote areas). This trend differed for non-Indigenous Australians, where the proportion was higher in major cities (76.2 per cent) compared to outer regional areas (66.6 per cent) but was highest in very remote areas (78.4 per cent) (figure 7.4.3).

Census data disaggregated by State and Territory, and remoteness area for people aged 17–24 years who were not employed or studying for 2001, 2006 and 2011 are included in tables 7A.4.6–7.

## Outcomes from education — labour force participation and employment status by educational attainment

This measure examines the labour force status of people with different levels of educational qualifications. Certificate level III is usually considered the minimum qualification necessary to substantially improve a person's employment outcomes (see

section 4.7 for more information on post-secondary education, participation and attainment).

**Table 7.4.1 Level of highest non-school qualification and employment status, 2002 and 2011–13<sup>a,b,c,d</sup>**

	2002		2011–13	
	Indigenous	Non-Indigenous	Indigenous	Non-Indigenous
<i>Labour force participation as a proportion of the population aged 18–64 years (%)</i>				
Certificate III and higher	83.9	87.2	78.1	86.8
Certificate III to advanced diploma	81.9	85.6	76.7	85.8
Bachelor degree or higher	90.8	89.2	86.0	87.9
Other	59.5	72.5	54.3	73.8
<b>Total</b>	<b>64.5</b>	<b>79.1</b>	<b>62.7</b>	<b>81.6</b>
<i>Employed people as a proportion of the population aged 18–64 years (%)</i>				
Certificate III and higher	74.3	84.4	69.7	84.6
Certificate III to advanced diploma	72.6	82.4	67.4	83.2
Bachelor degree or higher	80.4	86.9	81.8	86.3
Other	46.1	66.7	40.5	69.4
<b>Total</b>	<b>51.4</b>	<b>74.5</b>	<b>50.7</b>	<b>78.6</b>

<sup>a</sup> Excludes people enrolled in secondary school. <sup>b</sup> Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 7A.4.3. <sup>c</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12). <sup>d</sup> See table 7A.4.3 for detailed footnotes.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002; ABS (unpublished) General Social Survey 2002; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012–13 (2012–13 Core component); ABS (unpublished) Australian Health Survey 2011–13 (2011–12 Core component); table 7A.4.3.

Nationally, for people aged 18–64 years:

- in 2011–13, among Aboriginal and Torres Strait Islander Australians, those with a Bachelor Degree or higher had the highest labour force participation rate (86.0 per cent) and employment-to-population ratio (81.8 per cent), similar to that for non-Indigenous Australians with the same level of qualifications. For all other categories, rates for Aboriginal and Torres Strait Islander Australians were lower than for non-Indigenous Australians
- the labour force participation rate for Aboriginal and Torres Strait Islander Australians decreased for all qualification categories between 2002 and 2011–13, except for those with a Bachelor Degree or higher, whose labour force participation was stable over time. Employment-to-population ratios for Aboriginal and Torres Strait Islander Australians were stable over time for those with Certificate III and higher, but fell for those with Certificate II or lower (‘other’)

- 
- the non-Indigenous labour force participation rate and employment-to-population ratios were higher than their Aboriginal and Torres Strait Islander counterparts in all categories except for those with a Bachelor Degree or higher, where the rates were similar (table 7.4.1).

Tables 7A4.3–5 provide data on the level of highest non-school qualification and labour force status by sex, remoteness, and jurisdiction.

## Future directions in data

The ABS program of ongoing Indigenous-specific household surveys will continue to provide a range of education and labour force data on a three-yearly cycle. Data on this topic are also available from the Census.

(a) Indigenous refers to those who identify an origin of Aboriginal but not Torres Strait Islander, Torres Strait Islander but not Aboriginal, or both Aboriginal and Torres Strait Islander.

(b) Non-Indigenous refers to those who identify themselves as non-Indigenous or where Indigenous status is unknown/not stated.

(c) Student attendance rates are collected and provided as the whole number (rounded to zero decimal place).

(d) Different definitions and methodologies are used by jurisdictions and sectors to collect attendance, therefore data cannot currently be aggregated or averaged at the national level, or compared between jurisdictions.

(a) Indigenous refers to those who identify an origin of Aboriginal but not Torres Strait Islander, Torres Strait Islander but not Aboriginal, or both Aboriginal and Torres Strait Islander.

(b) Non-Indigenous refers to those who identify themselves as non-Indigenous or where Indigenous status is unknown/not stated.

(c) Student attendance rates are collected and provided as the whole number (rounded to zero decimal place).

(d) Different definitions and methodologies are used by jurisdictions and sectors to collect attendance, therefore data cannot currently be aggregated or averaged at the national level, or compared between jurisdictions.

(a) Attendance rates are the number of actual full time equivalent 'student days' attended as a percentage of the total number of possible student days attended over the period. Student attendance data are reported for full time students in years 1–10, but are not collected uniformly across jurisdictions and schooling sectors. See source for detailed explanatory notes on data.

RSE = Relative Standard Error. CI = Confidence Interval.

(a) Estimates with a RSE of 25 per cent to 50 per cent should be used with caution.

(b) Excludes people enrolled in secondary school.

(c) The number of employed people expressed as a percentage of the total population in the same group.

(d) The number of employed and unemployed people expressed as a percentage of the total population in the same group.

(e) Includes Certificate III/IV, Certificate III/IV not further defined and Advanced Diploma/Diploma.

(f) Includes Bachelor Degree, Graduate Diploma/Graduate Certificate and Postgraduate Certificate.

(g) Includes Certificate I and II, Cert I and II not further defined, Certificate not further defined and those who do not have a non-school qualification.

(h) Includes persons whose level of non-school qualification was inadequately described or not stated or level not determined.

**np** Not published. – Nil or rounded to zero.

## 8 Healthy lives

---

### Strategic areas for action

Health outcomes directly affect the quality of people's lives, including their ability to socialise with family and friends, to participate in the community and to work and earn an income. Physical health outcomes are related to a number of factors, including a healthy living environment, access to and use of health services, and lifestyle choices. Health risk behaviours, such as smoking and poor diet, are strongly associated with many aspects of socioeconomic disadvantage. Mental health issues are related to a complex range of medical issues, historical factors, the stressors associated with entrenched disadvantage and drug and substance misuse.

In May 2014, the Australian Government announced that an implementation plan for the *National Aboriginal and Torres Strait Islander Health Plan* will be developed by the end of 2014, which will outline the Commonwealth's blueprint for coordinated effort to improve health outcomes (Nash 2014).

The following indicators are included in the 'Healthy lives' strategic area:

- access to primary health care (section 8.1) — the first point of contact with the health system enables prevention, early intervention, case management and ongoing care. It can also help address health risk behaviours
- potentially preventable hospitalisations (section 8.2) — many hospital admissions could be prevented if more effective non-hospital care were available, either at an earlier stage in disease progression or as an alternative to hospital care. Hospitalisations for injury and poisoning may also be preventable, although not necessarily through better primary health care
- potentially avoidable deaths (section 8.3) — some deaths could be prevented if effective public health, medical and other interventions were available

- 
- tobacco consumption and harm (section 8.4) — tobacco consumption is a significant contributor to premature death and ill health. In addition tobacco consumption can divert scarce family resources
  - obesity and nutrition (section 8.5) — obesity and poor nutrition are significant contributors to poor health outcomes
  - oral health (section 8.5) — healthy teeth are important for overall health. Historically, Aboriginal and Torres Strait Islander Australians had less tooth decay, due to a traditional diet. Current levels of oral health reflect changed diet, dental hygiene and access to dental services
  - mental health (section 8.7) — mental health plays an important role in social and emotional wellbeing. Mental health is considered to include not only mental illness but the overall mental wellbeing of an individual, with the latter influenced by a range of factors including domestic violence, substance misuse, imprisonment and family breakdown
  - suicide and self-harm (section 8.8) — suicide and self-harm cause great grief. Studies suggest that Aboriginal and Torres Strait Islander suicide is influenced by a complex set of factors relating to history of dispossession, removal from family, discrimination, resilience, social capital and socio-economic status.

Several COAG targets and headline indicators reflect the importance of healthy lives:

- life expectancy (section 4.1)
- young child mortality (section 4.2)
- disability and chronic disease (section 4.8).

Other headline indicators can be directly influenced by health outcomes:

- employment (section 4.6)
- household and individual income (section 4.9).

Outcomes in the healthy lives area can be affected by outcomes in all other strategic areas, and can influence outcomes in other areas.

## Attachment tables

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 8A.1.1). These tables can be found on the Review web page ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)), or users can contact the Secretariat directly.

## 8.1 Access to primary health care<sup>1</sup>

### Box 8.1.1 Key messages

- In 2012-13, 39.3 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported their health status as excellent or very good. This was a decrease from 43.7 per cent in 2008 (table 8A.1.1).
- In 2012-13, a smaller proportion of Aboriginal and Torres Strait Islander adults reported not seeing a GP/specialist in the previous 12 months (13.6 per cent) compared with 2001 (19.4 per cent). The decrease was largest in remote areas (from 30.2 per cent to 15.6 per cent) (tables 8A.1.15-16). For those that did not consult a GP/specialist when they had a health-related problem, around half (49.6 per cent) cited 'personal reasons' (table 8A.1.17).
- In 2012-13, almost 2 in 5 Aboriginal and Torres Strait Islander Australians aged 2 years and over either had not consulted in a dentist in the previous two years (26.6 per cent) or had never consulted a dentist (13.9 per cent). In remote areas, 21.0 per cent reported never having consulted a dentist (table 8A.1.18). For those that did not consult a dentist when they had an oral health-related problem, the most commonly reported reason nationally was 'cost' (45.6 per cent). In remote areas, the most common reason was 'logistical' (55.5 per cent) (table 8A.1.20).
- While Aboriginal and Torres Strait Islander Australians make up around 3 per cent of the Australian population, they make up only 1.3 per cent of the health workforce (table 8A.1.45).

### Box 8.1.2 Measures of access to primary health care

Access to healthcare is a complex concept, involving sufficient supply of services, and the ability to utilise available services (which may be influenced by affordability, physical accessibility and acceptability of the services). There is no single measure of access that encompasses all these aspects. Five proxy measures are reported.

- *Self-assessed health status* is defined as the proportion of the population aged 15 years and over reporting their health status as very good or excellent (all jurisdictions; age; sex; remoteness; selected characteristics).
- *Aboriginal and Torres Strait Islander Australians use of primary health care services* is defined as the proportion of the population aged 18 years and over (for GP/specialist) and 2 years and over (dentist) not visiting a GP/specialist/dentist when they had a health problem (national; remoteness).

(continued next page)

---

<sup>1</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

### Box 8.1.2 (continued)

The most recent data for self-assessed health status and use of primary health care services are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2012-13. Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011-12. AATSIHS and AHS data are presented together as covering the overall time period 2011–13.

- *Immunisation rates* is defined as vaccination coverage rates for selected diseases for children (reported at 1, 2 and 5 years of age) and adult immunisation rates for those aged 50 years and over. Data for children are derived from the Australian Childhood Immunisation Register (ACIR), with the most recent data for 2013 (all jurisdictions; age).  
Data for Aboriginal and Torres Strait Islander adults are available from the 2012-13 AATSIHS (national; age). Data are not available for non-Indigenous adults.
- *Expenditure on health care services* is defined as total recurrent health expenditure and per person expenditure on primary and secondary/tertiary health care. Expenditure refers to funding from multiple government and non-government sources, including private health insurance. Data are sourced from the AIHW Expenditure on Health for Aboriginal and Torres Strait Islander peoples 2010-11 publication (national).
- *Aboriginal and Torres Strait Islander health workforce* is defined as the proportion of Aboriginal and Torres Strait Islander people aged 15 years and over employed in a health related occupation. Data for this report are sourced from the ABS Census of Population and Housing (the Census), with the most recent data for 2011 (national).

Access to primary health care services influences health status by detecting and treating illness, managing chronic conditions and providing prevention programs. Primary health care can affect outcomes in a range of headline indicators and strategic areas for action, including life expectancy (section 4.1), child mortality (section 4.2) and disability and chronic disease (section 4.8). Poor health can also affect people's educational attainment (section 4.5) and ability to work (section 4.6). Section 5.3 (engagement with services) examines Aboriginal and Torres Strait Islander Australian's access to a range of services and some of the access barriers they may face.

Health services can be divided into primary services (which include public and community health services, Aboriginal and Torres Strait Islander Community Controlled Primary Health Care Services, general practitioner consultations, hospital emergency attendances, general practitioner ordered investigations and prescriptions, and over the counter medicines) and secondary/tertiary services (which involve a referral within the health system or a hospital admission). Primary health care services can reduce the need for secondary/tertiary services (section 8.2 reports on hospitalisations that may be potentially preventable with appropriate primary care.)

Due to their poorer health, Aboriginal and Torres Strait Islander Australians could be expected to utilise health services at a much higher rate than non-Indigenous Australians, but available data suggest that Aboriginal and Torres Strait Islander utilisation is only

---

marginally higher (AHMAC 2012; Deeble 2009). Lack of services, lack of affordability and lack of social/cultural acceptability of services are all potential barriers to Aboriginal and Torres Strait Islander Australians accessing primary health care (Ware 2013). Institutional and cultural barriers may also lead to adverse health outcomes (Paradies, Harris and Anderson 2008). Section 5.1 includes data on Aboriginal and Torres Strait Islander perceptions of discrimination based on their Indigenous status.

## **Self-assessed health status**

In 2012-13, 39.3 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported their health status as excellent or very good, a decrease from 43.7 per cent in 2008 and 43 per cent in 2004-05 (table 8A.1.1). The decrease was similar for males and females (table 8A.1.3) and for people in remote and non-remote areas (table 8A.1.9).

In 2011-13, after adjusting for differences in population age structures, a lower proportion of Aboriginal and Torres Strait Islander Australians reported their health as excellent or very good, compared with non-Indigenous Australians — a gap of around 22 percentage points (similar to the gap in 2008 and 2004-05). The proportion of people reporting their health status as excellent or very good decreased with age for both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (table 8A.1.1).

In 2011-13, age-adjusted reported health status for both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians varied according to a range of socioeconomic characteristics. The proportion of people aged 15 years and over rating their health status as excellent or very good was higher for those:

- with a highest year of schooling of year 12, compared with year 9 (16.1 percentage points higher for Aboriginal and Torres Strait Islander Australians and 24.9 percentage points higher for non-Indigenous Australians)
- in the highest income quintile compared with the lowest income quintile (14.0 percentage points higher for Aboriginal and Torres Strait Islander Australians and 22.8 percentage points higher for non-Indigenous Australians) (table 8A.1.10).

Data on health status of Aboriginal and Torres Strait Islander Australians aged 15 years and over are also reported by State and Territory (tables 8A.1.5 and 8A.1.11) and by selected population characteristics (table 8A.1.10).

Data on health status of Aboriginal and Torres Strait Islander children aged 0-14 years as reported by the survey respondent are available for 2008 (tables 8A.1.2 and 8A.1.8). No new data were available for this report.

---

## Aboriginal and Torres Strait Islander Australian's use of primary health care services

The following section compares the use of different primary health care services by Aboriginal and Torres Strait Islander Australians in non-remote and remote areas. Data are not available for non-Indigenous Australians for the current period.

Survey data reported below asked people how long it had been since they had last consulted a GP/specialist or dentist, regardless of whether they had a health-related problem. Reasons for not consulting were only asked of people who identified that they had a health problem but had not consulted a GP/specialist or dentist in the previous 12 months.

### GP/specialist

In 2012-13, around one in seven (13.6 per cent) of Aboriginal and Torres Strait Islander Australians aged 18 years and over had not consulted a GP/specialist in the previous 12 months — a decrease from 20.6 per cent in 2004-05 and 19.4 per cent in 2001 (table 8A.1.15). The decrease was greatest in remote areas, with the proportion almost halving from 30.2 per cent in 2001 to 15.6 per cent in 2012-13 (table 8A.1.15).

Aboriginal and Torres Strait Islander Australians reported a variety of reasons for not visiting a GP when they had a health problem. In 2012-13, 'personal reasons'<sup>2</sup> were most commonly reported (49.6 per cent), followed by 'logistical reasons' (33.9 per cent) and 'decided not to seek care' (33.7 per cent) (table 8A.1.17). 'Personal reasons' were also the most commonly reported reason in 2004-05 (39.5 per cent) but the proportion was significantly higher in 2012-13 (table 8A.1.17).

AIHW research indicates that Aboriginal and Torres Strait Islander Australians' access to GPs relative to need decreases with remoteness, as a result of both decreased physical access to GPs and increased predicted need for primary health care. The decrease in access relative to need by remoteness was less pronounced for non-Indigenous Australians (AIHW 2014a).

### Dentist

In 2012-13, just over a quarter (26.6 per cent) of Aboriginal and Torres Strait Islander Australians aged 2 years and over reported not having visited a dentist in the previous two years, and a further 13.9 per cent reported never having visited a dentist. The proportion who had never visited a dentist was higher for those in remote areas (21.0 per cent) than for those in non-remote areas (11.9 per cent) (tables 8A.1.18-19).

---

<sup>2</sup> Personal reasons include: too busy (work, personal or family responsibilities), discrimination, service not culturally appropriate, language problems, dislikes service or health professional, afraid, embarrassed, or felt service would be inadequate.

---

In 2012-13, the most commonly reported reason for not going to a dentist in the previous 12 months when they had an oral health-related problem was 'cost' (45.6 per cent), followed by 'personal reasons' (43.3 per cent) and 'logistical reasons' (32.9 per cent). In remote areas, 'logistical reasons' (55.5 per cent) were most commonly reported, while 'cost' (49.2 per cent) was the most commonly reported reason in non-remote areas (table 8A.1.20). Nationally, the proportion of people reporting 'cost' as a reason increased from 30.0 per cent in 2004-05 to 45.6 per cent in 2012-13 (table 8A.1.20).

Data on reasons for not going to 'other health professionals' by remoteness are available in table 8A.1.20 (for 2004-05 and 2012-13). Data on health services usually used by Aboriginal and Torres Strait Islander children aged 0-14 years are available in tables 8A.1.22-24 (for 2008 only — no new data available).

## Immunisation rates

Immunisation is effective in preventing sickness and death from vaccine preventable diseases. The Australian Childhood Immunisation Register (ACIR) assesses children for immunisation coverage at 12-15 months, 24-27 months and 60-63 months, by Indigenous status, for all jurisdictions. Nationally in 2013, the overall vaccination coverage rate for one year old Aboriginal and Torres Strait Islander children (86.1 per cent) was slightly lower than for other children of the same age (90.3 per cent). For children aged two years and five years, overall vaccination coverage rates were within one percentage point for Aboriginal and Torres Strait Islander children and other children (table 8A.1.25).

Time series data for childhood immunisation rates are available for NSW, Victoria, WA, SA and the NT. (Data from the ACT, Queensland and Tasmania were not available prior to 2008 due to data quality issues with reporting of Indigenous identification.) For available jurisdictions, the largest increase in vaccination coverage rates occurred for 5 year olds, with the proportion increasing for Aboriginal and Torres Strait Islander children from 75.9 per cent in 2008 to 92.3 per cent in 2013, and for other children from 78.8 per cent in 2008 to 91.7 per cent in 2013 (table 8A.1.25). Childhood immunisation data reported by State and Territory are available in tables 8A.1.30-41.

Vaccination against influenza and pneumonia is recommended for Aboriginal and Torres Strait Islander Australians aged 50 years and over and non-Indigenous Australians aged 65 years and over. No new data are available on vaccination rates for non-Indigenous adults, but in 2012-13, for Aboriginal and Torres Strait Islander Australians aged 50 years and over:

- 56.8 per cent reported being vaccinated against influenza in the previous 12 months
- 28.5 per cent reported being vaccinated against pneumococcus in the last five years (a decrease from 34 per cent in 2004-05) (tables 8A.1.42; AIHW 2013a).

Data on immunisation rates for Aboriginal and Torres Strait Islander Australians aged 50 years and over are also available by age in table 8A.1.42.

---

## Expenditure on health care services

Expenditure per person on health services provides an indication of the relative use of health care services by Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians. Comparisons of expenditure require consideration of relative need. For example, chronic diseases are expensive to treat, and Aboriginal and Torres Strait Islander Australians have higher rates of chronic disease than non-Indigenous Australians (AIHW 2014b). Section 4.8 includes information on rates of chronic disease.

The Australian Government (44.8 per cent) and the State and Territory governments (46.6 per cent) combined funded 91.4 per cent of the total health expenditure for Aboriginal and Torres Strait Islander Australians in 2010-11. For non-Indigenous Australians, the Australian Government (44.5 per cent) and the State and Territory governments (23.7 per cent) funded 68.1 per cent of the total health expenditure (AIHW 2013b).

Per person expenditure on Aboriginal and Torres Strait Islander Australians is significantly higher in remote areas than in non-remote areas, while per person expenditure for non-Indigenous Australians in remote areas is only slightly higher than expenditure in non-remote areas. This suggests that patient-level factors are a major determinant of health expenditure in remote areas (rather than the cost of delivering services) (AIHW 2013b).

*AIHW Expenditures on Health for Aboriginal and Torres Strait Islander Peoples 2010-11* disaggregates expenditure by primary and secondary/tertiary<sup>3</sup> health expenditure (AIHW 2013b).<sup>4</sup> Caution should be used in interpreting these estimates, due to issues around incomplete recording of Indigenous status and limitations of financial recording systems (AIHW 2013b).

For 2010-11, total expenditure on health care from government and non-government sources (including insurance) for Aboriginal and Torres Strait Islander Australians:

- was \$7995 per person, compared with \$5437 per non-Indigenous Australian (table 8A.1.43). This expenditure was highest on hospitals for both Aboriginal and Torres Strait Islander Australians (\$3826 per person) and non-Indigenous Australians (\$2169 per person), followed by community health services for Aboriginal and Torres Strait Islander Australians (\$1967 per person) and medical services for non-Indigenous Australians (\$1011 per person) (table 8A.1.43).
- for primary health services was \$3602 per person, compared with \$2447 per non-Indigenous Australian (table 8A.1.44). Across primary health services, expenditure

---

<sup>3</sup> Primary health service include public and community health services and those flowing from a patient-initiated contact (general practitioner consultations, hospital emergency attendances, general practitioner ordered investigations and prescriptions, over the counter medicines). Secondary/tertiary services involved a referral within the health system or a hospital admission.

<sup>4</sup> Data are also available on healthcare expenditure in the Indigenous Expenditure Report (SCRGSP 2012) and care should be taken when comparing estimates from this report due to different definitions and methodology, source of expenditure data and time period.

---

per person was highest on community health services (\$1967) for Aboriginal and Torres Strait Islander Australians, followed by medical services (\$406). For non-Indigenous Australians, primary health expenditure per person was highest for medications (\$751) followed by medical services (\$626) (table 8A.1.44). Comparative information on secondary/tertiary health services is in table 8A.1.44.

## **The Aboriginal and Torres Strait Islander health workforce**

Due to cultural differences, language barriers and racism experienced when accessing some mainstream health services, some Aboriginal and Torres Strait Islander Australians feel more comfortable seeing Aboriginal and Torres Strait Islander health professionals and accessing Aboriginal Community Controlled Health services. However, although Aboriginal and Torres Strait Islander Australians make up around 3 per cent of the Australian population (ABS 2013), Census data show that Aboriginal and Torres Strait Islander Australians represent only 1.3 per cent of people working in health-related occupations. For some occupations this proportion is even lower (for example, registered nurses — 0.8 per cent, general medical practitioners — 0.3 per cent, and dental practitioners — 0.2 per cent) (table 8A.1.45). As many Aboriginal and Torres Strait Islander Australians needing health care will be treated by non-Indigenous health professionals, it is important that non-Indigenous health professionals treating Aboriginal and Torres Strait Islander Australians are trained to be culturally competent.

Increasing the number of Aboriginal and Torres Strait Islander health workers, requires similar improvements in educational outcomes to those needed for improvement in Aboriginal and Torres Strait Islander employment more generally. Sections 4.5, 4.6, 4.7, chapter 7 and section 9.1 provide more information on education and employment outcomes and case studies of successful programs.

## **Future directions in data**

Research has been undertaken to develop a geospatial index on access to GP services relative to need. The index incorporates information on GP service locations (as a measure of primary care service availability), spatial accessibility (defined as time to drive to a GP service), and differential health needs for primary care services. The index was first published in July 2014, and may be further refined as more data become available. The ABS 2016 Census may introduce long-term health conditions as a new topic, which could improve the ability to assess differential health needs (AIHW 2014a). The ABS has advised that a final decision on topics for the 2016 Census is expected in the first half of 2015.

## 8.2 Potentially preventable hospitalisations<sup>5</sup>

### Box 8.2.1 Key messages

- For Aboriginal and Torres Strait Islander Australians, hospitalisation rates for potentially preventable *chronic* conditions are more than twice the rate for potential preventable *acute* conditions, while for non-Indigenous Australians the hospitalisation rates for these two types are similar (tables 8A.2.1 and 8A.2.6).
- In 2012-13, hospitalisations for chronic conditions made up 6.7 per cent of all hospitalisations for Aboriginal and Torres Strait Islander Australians (1.6 times the equivalent proportion for non-Indigenous Australians) (table 8A.2.1).
- Coding changes mean time series are not available for acute and chronic conditions. In 2012-13, after adjusting for differences in population age structures:
  - the hospitalisation rate for chronic conditions for Aboriginal and Torres Strait Islander Australians was more than four times the rate for non-Indigenous Australians. For both Aboriginal and Torres Strait Islander and non-Indigenous Australians, the largest proportion of these hospitalisations were for diabetes complications, followed by chronic obstructive pulmonary diseases (table 8A.2.1)
  - the hospitalisation rate for potentially preventable acute conditions for Aboriginal and Torres Strait Islander Australians was more than twice the rate for non-Indigenous Australians. For Aboriginal and Torres Strait Islander Australians, the majority of these hospitalisations were due to kidney failure from bacterial infection (pyelonephritis), followed by convulsions and epilepsy (table 8A.2.6)
  - the hospitalisation rate for Aboriginal and Torres Strait Islander Australians for influenza and pneumonia was 3.4 times the rate for non-Indigenous Australians, and the hospitalisation rate for other vaccine preventable conditions was 5.7 times the rate for non-Indigenous Australians (table 8A.2.9)
  - hospitalisation rates for all categories of potentially preventable conditions increased as remoteness increased for both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (tables 8A.2.3, 8A.2.8 and 8A.2.11).

### Box 8.2.2 Measures of potentially preventable hospitalisations

Potentially preventable hospitalisations are those admissions that may have been prevented through appropriate preventive health interventions and early disease management, usually delivered in primary care and community-based care settings.

(continued next page)

---

<sup>5</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

### Box 8.2.2 (continued)

There are three main measures for this indicator, relating to the rate of hospitalisation per 100 000 population for:

- potentially preventable chronic conditions — diseases that typically persist for at least six months (including complications of diabetes)
- potentially preventable acute conditions — diseases that cause serious short term illness that could possibly be prevented, or their severity minimised
- vaccine preventable conditions — including influenza and pneumonia.

Data for all measures are sourced from the AIHW National Hospital Morbidity Database, with the most recent data available for 2012-13 (national by remoteness). Data for potentially preventable chronic conditions and potentially preventable acute conditions are not directly comparable over time due to changes in coding for related conditions.

Additional data are reported on the rate of hospitalisation for injury, poisoning and other external causes, and sexually transmitted conditions, that could potentially have been prevented (national by remoteness; sex).

The extent of potentially preventable hospitalisations is an indirect measure of whether people are receiving adequate primary health care. In many cases, hospital admissions can be prevented if more effective non-hospital care is available, either at an earlier stage in disease progression or as an alternative to hospital care (AHMAC 2011; Katterl et al. 2012; Russell 2013). Communication and collaboration between patients and healthcare providers make it easier for people to understand and use information and services to take care of their health (AHMAC 2012). However, higher rates of potentially preventable hospitalisations may also be due to higher prevalence of the underlying diseases, particularly chronic diseases (AHMAC 2012; AIHW 2014).

Consistent research shows that Aboriginal and Torres Strait Islander Australians have a higher rate of potentially preventable hospitalisations than non-Indigenous Australians (Katterl et al. 2012). Even after controlling for age, sex and remoteness, the rate of potentially preventable hospitalisation for Aboriginal and Torres Strait Islander Australians is 1.5 times as high as the rate for non-Indigenous Australians. Indigenous status appears to have a larger affect than remoteness on whether a hospitalisation was for a potentially preventable disease (AIHW 2014).

From 2010-11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Data for potentially preventable hospitalisations for chronic and acute conditions are not comparable over time, due to changes in changes in coding for related conditions. Analysis

---

in text is restricted to the current year only for these conditions. Historic data for 2004-05 to 2012-13 are available in the tables 8A.2.2 and 8A.2.7

## **Potentially preventable chronic conditions**

In 2012-13, hospitalisations for potentially preventable chronic<sup>6</sup> conditions comprised 6.7 per cent of all hospitalisations for Aboriginal and Torres Strait Islander Australians, 1.6 times the rate for non-Indigenous Australians (4.3 per cent) (8A.2.1).

After adjusting for differences in population age structures, the hospitalisation rate for chronic conditions for Aboriginal and Torres Strait Islander Australians was more than four times the rate for non-Indigenous Australians (6712.6 per 100 000 population and 1549.3 per 100 000 population respectively) (table 8A.2.1). For both Aboriginal and Torres Strait Islander and non-Indigenous Australians, the hospitalisation rate for potentially preventable chronic conditions increased as remoteness increased (table 8A.2.3).

For both Aboriginal and Torres Strait Islander and non-Indigenous Australians, diabetes complications accounted for the largest proportion of hospitalisations for preventable chronic conditions (4476.2 per 100 000 population and 730.8 per 100 000 population respectively), followed by chronic obstructive pulmonary diseases (1119.3 per 100 000 population and 252.3 per 100 000 population respectively) (table 8A.2.1).

Data on Type 2 diabetes as a principal diagnosis are also available in tables 8A.2.4– 5.

## **Potentially preventable acute conditions**

In 2012-13, after adjusting for differences in population age structures, the hospitalisation rate for potentially preventable acute conditions<sup>7</sup> for Aboriginal and Torres Strait Islander Australians was more than twice the rate for non-Indigenous Australians (2930.5 per 100 000 population and 1349.1 per 100 000 population respectively) (table 8A.2.6). For both Aboriginal and Torres Strait Islander and non-Indigenous Australians, the hospitalisation rate for potentially preventable acute conditions increased as remoteness increased (table 8A.2.8).

For Aboriginal and Torres Strait Islander Australians, kidney failure from bacterial infection (pyelonephritis) accounted for the largest rate of hospitalisations for preventable acute conditions, followed by convulsions and epilepsy (table 8A.2.6).

---

<sup>6</sup> Diseases that would typically persist for at least six months.

<sup>7</sup> Relate to serious short-term illness and could possibly be prevented or severely minimised, through access to effective primary health care services.

---

## Vaccine preventable conditions

In 2012-13, after adjusting for differences in population age structures, the hospitalisation rate for Aboriginal and Torres Strait Islander Australians for influenza and pneumonia was 3.4 times the rate for non-Indigenous Australians (258.8 per 100 000 population and 76.1 per 100 000 population respectively), and for other vaccine preventable conditions was 5.7 times the rate for non-Indigenous Australians (93.5 per 100 000 population and 16.3 per 100 000 population respectively) (table 8A.2.9).

Hospitalisations for influenza and pneumonia increased as remoteness increased for both Aboriginal and Torres Strait Islander and non-Indigenous Australians. Hospitalisations for other vaccine preventable conditions increased as remoteness increased for Aboriginal and Torres Strait Islander Australian, but the rate was lowest in remote and very remote areas for non-Indigenous Australians (table 8A.2.11).

Over the period 2004-05 to 2012-13, for NSW, Victoria, Queensland, WA, SA and the NT combined, hospitalisation rates for Aboriginal and Torres Strait Islander Australians increased for influenza and pneumonia and other vaccine preventable conditions. The rate increased for other Australians for influenza and pneumonia but remained relatively stable for other vaccine preventable conditions, with the gap widening for both (table 8A.2.10).

## Other hospitalisations

Available data for hospitalisations for infections with a predominantly sexual mode of transmission show that, in 2012-13, hospitalisation rates for Aboriginal and Torres Strait Islander Australians for these infections (21.0–60.4 per 100 000 population) were considerably higher than the rate for non-Indigenous Australians (up to 14.2 per 100 000 population) (table 8A.2.13).

Data are also available for hospitalisations for infections with a predominantly sexual mode of transmission by remoteness in table 8A.2.13.

Hospitalisations where the principal diagnosis was injury and poisoning and other consequences of external causes, may be prevented by both appropriate primary health care and educational awareness programs. In 2012-13, hospitalisation rates for Aboriginal and Torres Strait Islander Australians for these causes was 1.8 times the rate for other Australians (tables 8A.2.16).

Data are also available for hospitalisations where the principal diagnosis was injury and poisoning and other external causes, by sex and remoteness in tables 8A.2.14–15.

## 8.3 Potentially avoidable deaths<sup>8</sup>

### Box 8.3.1 Key messages

- For people aged under 75 years:
  - between 1998 and 2012, after adjusting for differences in population age structures, mortality rates from avoidable causes for Aboriginal and Torres Strait Islander Australians declined at a greater rate than for non-Indigenous Australians. The gap has narrowed from 368.2 deaths to 297.9 deaths per 100 000 population. However, in 2012, the avoidable death rate for Aboriginal and Torres Strait Islander Australians remained over 3 times the rate for non-Indigenous Australians (table 8A.3.9).
  - for the period 2008–2012, three quarters of Aboriginal and Torres Strait Islander deaths were potentially avoidable (7079 out of 9438 deaths), compared to two-thirds of non-Indigenous deaths (112 076 out of 169 111 deaths) (tables 8A.3.1 and 8A.3.10).
  - for the period 2008–2012, after adjusting for differences in population age structures, the most common causes of avoidable mortality for Aboriginal and Torres Strait Islander Australians were ischaemic heart disease (heart attacks) (18.5 per cent), cancer (18.0 per cent) (particularly lung cancer (6.5 per cent)), diabetes (10.4 per cent) and suicide (8.9 per cent) (table 8A.3.7).

### Box 8.3.2 Measures of potentially avoidable deaths

There is one main measure for this indicator.

- *Potentially avoidable deaths* is defined as the number and rate of deaths from potentially preventable and treatable conditions<sup>9</sup> for people aged less than 75 years (NSW, Queensland, WA, SA and the NT; age and sex).

Data for this measure are sourced from the ABS Causes of Death collection, with the most recent available data for 2012. People aged 75 years and over are excluded due to difficulty in assigning a cause of death that can be clearly defined as avoidable or unavoidable (Page et al. 2006).

Reducing potentially avoidable deaths is a key contributor to improving life expectancy (section 4.1). Potentially avoidable deaths can be reduced through lifestyle improvements (such as reduced alcohol (section 11.1), drug (section 11.2) and tobacco consumption (section 8.4)), high quality, effective and accessible primary prevention, early intervention and medical treatment, and is closely related to measures of access to primary health care (section 8.1) and potentially preventable hospitalisations (section 8.2).

---

<sup>8</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

<sup>9</sup> A list of causes for potentially avoidable deaths is available in table 8A.3.11.

---

Research into mortality trends over the last three decades in Australia shows that health care has made a significant contribution to the reduction in mortality, but that those with a higher socioeconomic status have obtained a greater benefit (Korda et al. 2007). This may be because factors outside the health system also contribute to potentially avoidable deaths, including socioeconomic factors (lower level of education, employment and income — see chapters 7, and 9); lifestyle factors (illicit substance use, obesity and lack of nutrition — see sections 8.4, 8.8, 11.1 and 11.2); environmental factors (lack of clean water and sanitation — see section 10.3) and exposure to abuse, neglect and violence (sections 4.10, 4.11 and 11.3).

For Aboriginal and Torres Strait Islander Australians, chronic diseases and injury account for the greatest proportions of avoidable deaths, but are amenable to prevention as well as treatment. A 2009 study in the NT found the observed decline in avoidable deaths in the NT had been greatest for conditions amenable to medical treatment and care, including neonatal and paediatric care, antibiotics, immunisation, drug therapies, improved intensive care and surgical procedures. (Li et. al 2009 cited in AHMAC 2012).

## Potentially avoidable deaths

Mortality rates for potentially avoidable causes are defined as the number of deaths per 100 000 population. The following caveats apply:

- five year aggregate data are used for current period analysis due to the volatility of the small number of deaths. Single year data are presented for time series analysis only.
- data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

## Current period

For the period 2008–2012, after adjusting for differences in population age structures, the potentially avoidable mortality rate for Aboriginal and Torres Strait Islander Australians aged 0–74 years was three times the rate for non-Indigenous Australians. For both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, the majority of potentially avoidable deaths were attributable to potentially *preventable* conditions (63.2 and 61.3 per cent of avoidable deaths, respectively) with the remainder potentially *treatable* conditions (36.8 and 38.7 per cent of avoidable deaths, respectively) (table 8A.3.3).

From 15 years of age, potential avoidable mortality increased with age for both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (for those aged 15–24 years, 84.5 and 28.9 deaths per 100 000 population respectively, whilst for those aged 65–74 years, 2103.2 and 837.3 deaths per 100 000 population respectively). Aboriginal and Torres Strait Islander males had higher rates of avoidable mortality than

females across all age categories (except for the 1–4 year age group), with the rates for males aged 15–24 and 25–34 years more than twice the rates for females of the same ages (table 8A.3.5).

Potentially avoidable mortality data reported by selected states and territories are available in tables 8A.3.1 and 8A.3.3.

### Over time

Potentially avoidable death rates for Aboriginal and Torres Strait Islander Australians are declining. From 1998 to 2012, after adjusting for differences in population age structures, Aboriginal and Torres Strait Islander mortality rates from avoidable causes for people aged 0–74 years declined by 27.4 per cent, with a larger decline for males (29.4 per cent) than for females (24.5 per cent) (table 8A.3.9).

**Figure 8.3.1 Avoidable mortality rates, people aged 0–74 years, NSW, Queensland, WA, SA and the NT, 1998 to 2012<sup>a,b</sup>**

<sup>a</sup> Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and number of deaths to support analysis. They do not represent an Australian total. <sup>b</sup> Data are age standardised.

Sources: ABS (unpublished) Causes of Death, Australia, Cat. no. 3303.0; ABS (unpublished) Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, Cat. no. 3238.0; table 8A.3.9.

From 1998 to 2012, after adjusting for differences in population age structures, the gap in potentially avoidable mortality rates between Aboriginal and Torres Strait Islander

---

Australians and non-Indigenous Australians narrowed from 368.2 to 297.9 deaths per 100 000 population (figure 8.3.1).

The percentage decrease in non-Indigenous avoidable mortality rates (37.6 per cent) was larger than the percentage decrease in Aboriginal and Torres Strait Islander rates (27.4 per cent). However, as the avoidable mortality rates for non-Indigenous Australians are lower, the gap in the rates narrowed (table 8A.3.9).

For 2008–2012, after adjusting for differences in population age structures, the most common causes of avoidable mortality for Aboriginal and Torres Strait Islander Australians aged 0–74 years were ischaemic heart disease (heart attacks) (18.5 per cent), cancer (18.0 per cent) (particularly lung cancer (6.5 per cent)), diabetes (10.4 per cent) and suicide (8.9 per cent) (table 8A.3.7).

The greatest opportunities to further reduce avoidable mortality rates for Aboriginal and Torres Strait Islander Australians appear to be in relation to deaths avoidable through risk factor reduction and general health promotion (52.7 per cent of avoidable deaths for the period 2008–2012), followed by early detection and treatment (24.2 per cent) and once the disease is fully established therapy and rehabilitation (23.1 per cent)<sup>10</sup> (table 8A.3.10).

## 8.4 Tobacco consumption and harm<sup>11</sup>

### Box 8.4.1 Key messages

- Between 2001 and 2012-13, the crude daily smoking rate for Aboriginal and Torres Strait Islander adults declined from 50.7 to 44.4 per cent (table 8A.4.1).
- A similar decline in non-Indigenous smoking rates meant that the gap in (age adjusted) daily smoking rates remained relatively constant at around 26 percentage points between 2001 and 2011-13 (table 8A.4.6).
- In 2012-13, the age adjusted rate of hospitalisations related to tobacco use for Aboriginal and Torres Strait Islander Australians was 3.8 times the rate for non-Indigenous Australians (table 8A.4.11).

### Box 8.4.2 Measures of tobacco consumption and harm

There is one main measure for this indicator (aligned with the associated NIRA indicator), rates of current daily smokers, measured by the proportion of people aged 18 years and over who are current daily smokers (all jurisdictions; remoteness; age; sex).

Smoking rate data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2012-13 (core component). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011-12 (core component). Indicators using both AATSIHS (2012-13) and AHS (2011-12) are referenced as 2011-13.

Data are also provided for the supplementary measure, tobacco related hospitalisations (all jurisdictions; remoteness; sex).

Tobacco consumption is a subsidiary performance measure for COAG's target of 'closing the life expectancy gap (between Indigenous and non-Indigenous Australians) within a generation' (COAG 2012).

Among Aboriginal and Torres Strait Islander Australians, tobacco use is the leading risk factor contributing to disease and death (Vos et al. 2007). Studies have found that smoking tobacco increases the risk of numerous cancers, heart and vascular diseases, and depression (AHMAC 2012; Cunningham et al. 2008; Pasco et al. 2008).

Compared to non-Indigenous people, Aboriginal and Torres Strait Islander Australians who smoke generally commence at an earlier age, smoke for longer, and make fewer quitting attempts than non-Indigenous Australians (CEITC 2010, 2014).

---

<sup>11</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

Tobacco use is often associated with other lifestyle related health risk factors, such as excessive alcohol consumption and poor diet. Long term risky/high risk drinkers (both males and females) were more likely to be current smokers than those who drank at a low risk level (ABS 2006). Section 11.1 examines alcohol consumption and harm. According to the World Health Organization, tobacco and poverty are inextricably linked worldwide (WHO 2004). Non-smokers tend to have higher incomes and less disadvantage in a range of other areas (Thomas et al. 2008).

In addition to long term health risks, low income groups (such as some Aboriginal and Torres Strait Islander families and communities) are affected by the financial strain associated with tobacco use. Expenditure on tobacco can divert scarce family resources away from meeting other needs, such as housing, nutrition and health care (Briggs, Lindorff and Ivers 2003).

## **Tobacco consumption**

Current daily smokers are people who smoked one or more cigarettes (or pipes or cigars) per day at the time of survey interview.

The COAG performance measure and the data presented in this section focus on the proportion of people aged 18 years and over who are current daily smokers. However, as noted, Aboriginal and Torres Strait Islander Australians tend to start smoking at an earlier age than non-Indigenous people — for 2011–13, around one in six (15.7 per cent in 2012-13) of Aboriginal and Torres Strait Islander 15 to 17 year olds were current daily smokers, compared with around one in twenty five (3.9 per cent in 2011-12) of non-Indigenous 15 to 17 year olds (table 8A.4.10).

Nationally in 2012-13, the crude daily smoking rate among Aboriginal and Torres Strait Islander adults was 44.4 per cent, a decline from 50.7 per cent in 2001 (table 8A.4.1).

In 2012-13, the crude daily smoking rate for Aboriginal and Torres Strait Islander Australians varied across states and territories, from 29.7 per cent in the ACT to 53.3 per cent in the NT (table 8A.4.1). Smoking rates were higher in very remote areas (54.6 per cent) and remote areas (48.9 per cent) than in major cities (40.2 per cent) (table 8A.4.2). In non-remote areas in 2012-13, smoking was most prevalent among those aged 25–54 years (between 45.5 and 49.0 per cent), with smoking rates much lower for older people (27.7 per cent for those aged 55 years and over). A similar pattern was observed for non-Indigenous Australians, although the daily smoking rates were consistently lower across all age groups (table 8A.4.10).

After adjusting for different population age structures, the current daily smoking rate for Aboriginal and Torres Strait Islander Australians in 2012-13 was 2.6 times the rate for non-Indigenous Australians in 2011-12 (table 8A.4.6). The gap in smoking rates was widest in major cities (table 8A.4.7).

---

Short-term trend data for age adjusted smoking rates are presented in figure 8.4.1.

---

Figure 8.4.1 **Current daily smokers aged 18 years and over, 2001 to 2011–13<sup>a,b,c</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> Rates are age standardised. <sup>c</sup> Current period data for Aboriginal and Torres Strait Islander Australians are from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

*Sources:* ABS (unpublished) National Health Survey 2001; ABS (unpublished) National Health Survey and National Aboriginal Torres Strait Islander Health Survey 2004–05; ABS (unpublished) National Aboriginal Torres Strait Islander Social Survey 2008; ABS (unpublished) National Health Survey 2007–08; ABS (unpublished) AATSIHS 2012–13 (core component); ABS (unpublished) AHS 2011–13 (2011–12 core component); table 8A.4.6.

---

Between 2001 and 2011–13, after adjusting for differences in population age structures, the daily smoking rate declined for both Aboriginal and Torres Strait Islander adults and non-Indigenous adults, leaving the gap relatively unchanged around 26 percentage points (table 8A.4.6).

Data for smoking rates reported by State and Territory are available in tables 8A.4.6–8, and for remoteness by sex in table 8A.4.9.

## **Tobacco related hospitalisations and deaths**

Tobacco smoking is the single largest cause of preventable death and disease in Australia (AIHW 2011). There is a strong causal relationship between tobacco consumption and multiple chronic diseases, including coronary heart disease, stroke, chronic respiratory tract diseases and cancer. Smoking in pregnancy can lead to miscarriage, stillbirth or

---

premature birth (Graham et al. 2007). Smoking prevalence among pregnant Aboriginal and Torres Strait Islander women is high relative to the Australian population (Gilligan et al. 2009). Section 6.2 includes information on women reporting smoking during pregnancy.

There are no comparable data on smoking related deaths for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians for inclusion in this report. Data on hospitalisations related to tobacco use are sourced from the AIHW National Hospital Morbidity Database. These data only cover tobacco related illnesses resulting in admission to a hospital, and only relate to conditions directly attributable to tobacco — they do not include most conditions where tobacco may be a contributing factor but the link is not direct and immediate (AIHW 2010).

From 2010-11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

In 2012-13, the age adjusted rate of hospitalisation related to tobacco use for Aboriginal and Torres Strait Islander Australians was 3.8 times the rate for non-Indigenous Australians (table 8A.4.11). The gap between Aboriginal and Torres Strait Islander Australians and other Australians increased slightly from 2004-05 to 2012-13 (table 8A.4.12).

In 2012-13, the age adjusted hospitalisation rate for tobacco use was 1.3 times higher for Aboriginal and Torres Strait Islander males than females (table 8A.4.11). The age adjusted rate of hospitalisations for tobacco use for both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians increased as remoteness decreased (table 8A.4.13).

Data for hospitalisation rates by State and Territory by sex are available in table 8A.4.12.

---

## 8.5 Obesity and nutrition<sup>12</sup>

### Box 8.5.1 Key messages

- In 2012-13, 78.4 per cent of Aboriginal and Torres Strait Islander children aged 2–14 years were meeting the guidelines for adequate daily fruit intake, similar to the rate for non-Indigenous children (80.0 per cent). The proportions meeting the guidelines for adequate daily vegetable intake were much lower — 15.7 per cent for Aboriginal and Torres Strait Islander children and 13.3 per cent for non-Indigenous children (table 8A.5.13).
- In 2012-13, 69.2 per cent of Aboriginal and Torres Strait Islander adults were categorised as clinically obese (39.8 per cent) or overweight (29.4 per cent). Only 27.7 per cent were considered to be of normal weight (table 8A.5.8). After adjusting for different population age structures, the proportion of Aboriginal and Torres Strait Islander adults categorised as overweight or obese was 1.2 times the proportion for non-Indigenous adults (table 8A.5.2).

### Box 8.5.2 Measures of obesity and nutrition

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Overweight and obese* is defined as the number of people aged 18 years and over with a BMI in the range 25.0–29.9 (overweight) or 30 or higher (obese) as a proportion of the total population. Additional data are also reported for people with a BMI of 18.5–24.9 (normal weight) and with a BMI of less than 18.5 (underweight) (all jurisdictions; remoteness; sex; age).

Data are also provided for a supplementary measure defined as the proportion of children meeting the recommended average daily fruit and vegetable consumption guidelines (national; remoteness; age).

Data for both measures are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2012-13. Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011-12. AATSIHS and AHS data are presented together as covering the overall time period of 2011–13.

BMI data for 2012-13 are not directly comparable with earlier data for 2004-05.

The prevalence of overweight and obesity is a subsidiary performance measure for COAG's target of 'closing the life expectancy gap (between Indigenous and non-Indigenous Australians) within a generation' (COAG 2012).

For Aboriginal and Torres Strait Islander Australians, high body mass and physical inactivity are two significant risk factors for poor health outcomes (Thorpe and Browne 2009).

---

<sup>12</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

Excess weight increases the risk of an individual developing, among other things, cardiovascular disease, Type 2 diabetes, some musculoskeletal conditions and some cancers. The risk of developing these conditions increases with this level of excess weight (AIHW 2013). Research suggests that the excess burden of overweight and obesity for Aboriginal and Torres Strait Islander Australians reduces the average life expectancy by between one and three years, accounting for 9 to 17 per cent of the total gap in life expectancy between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (Zhao et al. 2013).

Lifestyle factors resulting in overconsumption of energy in the diet and a decrease in physical activity are major contributors to obesity (NHMRC 2013).

Good nutrition contributes to quality of life and helps to maintain a healthy body weight, protect against infections, and reduce the risk of chronic disease and premature deaths. Studies have found that people on low incomes tend to purchase foods that provide the most calories for the least cost, such as soft drinks (Brimblecombe and O’Dea 2009; Brownell and Frieden 2009; Harrison et al. 2007; WHO 2008). Low income, in combination with the high cost of fresh food, contributes to obesity, poor nutrition and the displacement of healthy food choices in remote Aboriginal communities. (Section 4.9 provides more information on incomes.)

Regular physical activity and intake of a nutritious diet commensurate with energy requirements can have a protective effect against obesity related diseases (Australian Medical Association and AMA 2005; NHMRC 2013). Section 5.7 provides more information on participation in organised sport, arts or community group activities. Good nutrition is important during pregnancy (see section 6.1, Antenatal care) because pathways to chronic diseases can begin in utero (O’Dea 2008; WHO 2005). Low birthweight (see section 6.4) is associated with a higher risk of central obesity, type 2 diabetes, kidney failure, high blood pressure, and heart disease in later life. Good nutrition is also important for infant and childhood growth and development and for establishing healthy habits for life (ARACY 2008; Eades et al. 2010; Tomkins 2001; WHO 2008).

Inadequate housing in remote areas compounds the issue of providing a well-balanced daily diet (House of Representatives 2009; Lee et al. 2009). In one community, less than six per cent of houses had essential kitchen hardware for the storage and preparation of food (Lee et al. 2009). Section 10.3 provides more information on housing infrastructure.

Research shows that it becomes more difficult to get on track towards a healthy weight as age increases, emphasising the importance of early prevention, to avoid the development of overweight and obesity (FaHCSIA 2013). Education has an important role in establishing health behaviours and the readiness of individuals to effect behavioural change (NHMRC 2013).

---

## Obesity

Obesity is most commonly measured using the body mass index (BMI). BMI is calculated as weight (kg) divided by the square of height (m). BMI values are grouped according to World Health Organization and National Health and Medical Research Council guidelines. Adults with a BMI of 25 to less than 30 are categorised as overweight and those with a BMI of 30 or higher are categorised as obese (NHMRC 2013; WHO 2000).

Nationally in 2012-13, 69.2 per cent of Aboriginal and Torres Strait Islander adults were considered to be obese (39.8 per cent) or overweight (29.4 per cent). Only 27.7 per cent were considered to be of normal weight. Rates of overweight were higher for males (32.3 per cent) than females (26.6 per cent) but rates of obesity were higher for females (43.3 per cent) than for males (36.2 per cent). Whilst rates of overweight remained relatively stable as age increased, rates of obesity increased with age (from 28.4 per cent for those aged 18–24 years to 48.8 per cent of those aged 55 years and over). The trend was similar for males and females (table 8A.5.8).

After adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander adults who were overweight or obese in 2012-13 was 1.2 times the proportion for non-Indigenous adults in 2011-12 (table 8A.5.2).

Data for rates of overweight and obesity by State and Territory and by remoteness area are available in tables 8A.5.2, 8A.5.4 and 8A.5.6. Data for all BMI categories by State and Territory are available in table 8A.5.6.

Children have lower rates of overweight and obesity than adults. In 2012-13, 30.4 per cent of Aboriginal and Torres Strait Islander children aged 2–14 years were categorised as overweight (19.9 per cent) and obese (10.5 per cent) (ABS 2014)

The BMI data for Aboriginal and Torres Strait Islander Australians collected in 2012-13 were calculated from *measured* height and weight, while data collected in 2004-05 were calculated from *reported* height and weight, which means that the two sets of data are not directly comparable.

## Child nutrition

The NHMRC Australian dietary guidelines recommend eating a wide variety of nutritious food (vegetables, legumes, fruits, cereals, lean meat, fish, poultry, milks, yoghurts and cheeses (reduced fat varieties where possible)) and drinking plenty of water. The guidelines recommend limiting consumption of saturated fat, salt, alcohol and sugars.

Data reported for 2011–13 are based on the 2013 NHMRC daily food consumption guidelines (NHMRC 2013). For children and adolescents, the guidelines depend on age and sex, varying from 3.5 to 5.5 serves of vegetables and legumes/beans, and 1 to 2 serves of fruit.

---

In 2011–13, 78.4 per cent of Aboriginal and Torres Strait Islander children aged 2–14 years across all areas (remote and non-remote) met the guidelines for adequate daily fruit consumption, similar to the rate for non-Indigenous children (80.0 per cent). The proportions meeting the guidelines for adequate daily vegetable intake were much lower — 15.7 per cent for Aboriginal and Torres Strait Islander children and 13.3 per cent for non-Indigenous children (table 8A.5.13).

Time series comparisons are difficult— the guidelines for adequate fruit and vegetable consumption changed between 2008 and 2011–13, and the 2008 survey did not collect information on non-Indigenous children in remote areas. Comparisons over time are limited to the number of serves of fruit and vegetables for children in non-remote areas, for which there were no significant changes between 2008 and 2011–13 for Aboriginal and Torres Strait Islander children and non-Indigenous children (except for a decrease in the proportion of Aboriginal and Torres Strait Islander children ‘who do not usually eat fruit’) (tables 8A.5.14 and 8A.5.15).

## Future directions in data

There are few comparable time series data from which to draw conclusions about the prevalence and burden of obesity among Aboriginal and Torres Strait Islander children, and only limited data are available on their dietary behaviours.

## 8.6 Oral health<sup>13</sup>

### Box 8.6.1 Key measures

- In 2012-13, younger Aboriginal and Torres Strait Islander children aged 0–4 years and 5–9 years had higher rates of hospitalisation for dental health conditions than non-Indigenous children in the same age groups (8.4 and 4.9 per 1000 population and 12.2 and 9.8 per 1000 population, respectively), but older Aboriginal and Torres Strait Islander children aged 10–14 years had lower rates (3.0 and 5.9 per 1000 population respectively) (8A.6.12).
- In 2008, 31.6 per cent of Aboriginal and Torres Strait Islander children aged 0–14 years were reported as having teeth or gum problems and 34.8 per cent of all Aboriginal and Torres Strait Islander children had not visited a dentist in the previous 12 months. ‘Waiting time’ (32.0 per cent) and ‘cost’ (20.7 per cent) were the most common reasons for not visiting a dentist (tables 8A.6.4–6).
- In NSW (2007) and SA, Tasmania and the NT (2008), 29 to 43 per cent of Aboriginal and Torres Strait Islander children aged 5–10 years had no decayed, missing or filled deciduous (baby) teeth compared with 48 to 60 per cent of non-Indigenous children (table 8A.6.1).

### Box 8.6.2 Measures of oral health

There are two main measures for this indicator:

- *Child dental health* is defined as the proportion of children with no decayed, missing or filled teeth (dmft/DMFT) for children aged 5–10 years (infant teeth) and 6–15 years (permanent teeth)<sup>14</sup>. Data are sourced from the AIHW Child Dental Health Survey, with the most recent data for Aboriginal and Torres Strait Islander children for 2007 for NSW and 2008 for SA, Tasmania and the NT (age; remoteness).
- *Adult dental health* is defined as the number of decayed, missing and filled teeth (DMFT) for people aged 15 years and over. Data are sourced from the National Survey of Adult Oral Health, 2004–2006 (national).

Supplementary data for the main measures are reported from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data for 2012-13 for people aged 15 years and over and for 2008 for children aged 0–14 years. Non-Indigenous comparator data are not available as these data were not collected in the Australian Health Survey (AHS).

A supplementary measure is reported on the hospitalisation rate for dental health conditions per 1000 population (national: remoteness; age).

---

<sup>13</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

<sup>14</sup> DMFT/dmft: uppercase letters denote permanent (adult) teeth and lowercase letters denote deciduous (infant) teeth. DMFT/dmft experience is quantified as the sum of decayed, missing and filled teeth. The index is cumulative: once a tooth has decay, it is permanently recorded as such, and therefore changes in risk factors or active disease levels do not change this for the individual.

---

Oral health is an important part of overall health and wellbeing (AHMAC 2012; Williams et al. 2011). Two of the most frequently occurring oral diseases are tooth decay (also known as dental decay or dental caries) and periodontal disease (Jamieson, Sayers and Roberts-Thomas 2010). Both are preventable and, with early treatment, curable (Williams et al. 2011).

- Tooth decay unless treated early, may result in pain, infection and destruction of soft tissue in the mouth. This may contribute to the development or exacerbation of other diseases. In addition, eating difficulty or pain may lead to modification of eating habits and subsequent nutritional problems. Dental health may affect speech and language development, and exacerbate other chronic diseases (Jamieson, Sayers and Roberts-Thomas 2010; NACOH 2004; Zander et al. 2013).
- Periodontal diseases of the tissues surrounding teeth are associated with bacterial infection of the periodontal tissues, and are specifically attributed to poor oral hygiene as opposed to diet. Periodontal diseases range in severity from gingivitis (a mild reversible form) to periodontitis (a severe destruction of the tissues) (Williams et al. 2011).

Older Aboriginal and Torres Strait Islander children generally have more dental decay than non-Indigenous children, and the decay is less likely to have been treated. Untreated tooth decay is also significantly more prevalent among Aboriginal and Torres Strait Islander adults than among non-Indigenous adults (AHMAC 2012). Historically, the traditional diets of Aboriginal and Torres Strait Islander Australians were associated with low levels of tooth decay. A marked rise in the consumption of food and drinks containing high levels of sugar and other refined carbohydrates over recent decades — particularly in remote communities and among children — has occurred at the same time as an increase in levels of tooth decay among Aboriginal and Torres Strait Islander Australians (Jamieson, Armfield and Robert-Thomson 2007; NACOH 2004).

Factors in oral health include diet, dental hygiene and environmental factors, such as water fluoride levels. Access to dental services is also a factor in prevention, as well as treatment (AHMAC 2009).

Preventative oral health behaviours such as tooth brushing and flossing are developed mainly through education and modelling by adults in the home environment and/or education outside the home (Jamieson, Armfield and Robert-Thomson 2007). Among Aboriginal and Torres Strait Islander children, levels of preventative oral health behaviours are relatively low. A survey of children in remote Indigenous communities between 2000 and 2003 found that under 20 per cent of Aboriginal and Torres Strait Islander children brushed their teeth at home or school (Jamieson, Armfield and Robert-Thomson 2007).

Regular dental check-ups are important in the prevention and early treatment of dental decay. In 2012-13, 13.9 per cent of Aboriginal and Torres Strait Islander people aged 2 years and over reported never having visited a dentist (table 8A.1.37-38), with cost the most commonly reported reason for not visiting a dentist in the last 12 months, followed by

---

logistical reasons in remote areas and personal reasons in non-remote areas (table 8A.1.39).

Additional data on dental consultations and oral health actions from the 2012-13 Aboriginal and Torres Strait Islander Health Survey are reported in section 8.1 (Access to primary health care).

## Child dental health

---

Figure 8.6.1 **Proportion of children aged 6–15 years with no decayed missing or filled permanent teeth, by age, NSW (2007), SA, Tasmania and the NT, 2008**

Source: AIHW (2013) *Aboriginal and Torres Strait Islander Health Performance Framework 2012: Detailed analysis*; table 8A.6.2.

---

The most recent available data are relatively old. In NSW (2007), SA, Tasmania and the NT (2008):

- the proportions of Aboriginal and Torres Strait Islander children aged 5–10 years with no decayed, missing or filled deciduous (baby) teeth (dmft) ranged from 28.7 to 42.5 per cent, lower than the proportions for non-Indigenous children, which ranged from 47.8 to 59.6 per cent (table 8A.6.1).
- the proportions of children aged 6–15 years with no decayed, missing or filled permanent (adult) teeth (DMFT) decreased as age increased, with a larger decrease for Aboriginal and Torres Strait Islander children:

- 
- for children aged 6 years, over 90 per cent of Aboriginal and Torres Strait Islander children (93.9 per cent) and non-Indigenous children (95.0 per cent) had no DMFT
  - for children aged 15 years, 11.2 per cent of Aboriginal and Torres Strait Islander children and 38.4 per cent of non-Indigenous children had no DMFT (figure 8.6.1).
  - for children aged 6–15 years, Aboriginal and Torres Strait Islander children across all age groups and remoteness areas generally had higher rates of DMFT than non-Indigenous children (table 8A.6.3).

Supplementary data from the 2008 NATSISS found that almost one third of Aboriginal and Torres Strait Islander children aged 0–14 years (31.6 per cent) were reported to have teeth or gum problems, with 34.8 per cent of those with reported problems not visiting a dentist within the previous 12 months (tables 8A.6.4 and 8A.6.5). The most common reasons reported for not visiting a dentist were ‘waiting time’ (32.0 per cent) and ‘cost’ (20.7 per cent) (table 8A.6.6).

## **Adult dental health**

In 2004–2006, Aboriginal and Torres Strait Islander Australians aged 15 years and over had an average of 14.8 decayed, missing or filled teeth (mean DMFT), compared with 12.8 teeth for non-Indigenous Australians. The mean number of decayed and missing teeth was higher for Aboriginal and Torres Strait Islander Australians across all age groups from 15 to 74 years, while the mean number of filled teeth was higher for non-Indigenous Australians in the age groups from 35 to 74 years (table 8A.6.7).

In 2012-13, 4.7 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported complete natural tooth loss. The rate for complete tooth loss was highest for those aged over 55 years (23.6 per cent) and higher in non-remote areas (5.1 per cent) than in remote areas (3.3 per cent) (tables 8A.6.8 and 8A.6.9).

Data on complete natural tooth loss for Aboriginal and Torres Strait Islander Australians aged 15 years and over are available by State and Territory and by sex in table 8A.6.9.

## **Potentially preventable hospitalisation for dental conditions**

From 2010-11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

In 2012-13, after adjusting for differences in population age structures, Aboriginal and Torres Strait Islander Australians were hospitalised for dental conditions at 1.3 times the

---

rate for non-Indigenous Australians (table 8A.6.10). The age adjusted hospitalisation rate for Aboriginal and Torres Strait Islander Australians in remote areas was over twice the rate for those in non-remote areas (table 8A.6.11).

From 2004-05 to 2012-13, for NSW, Victoria, Queensland, WA, SA and the NT combined, the age adjusted hospitalisation rate for dental health conditions for Aboriginal and Torres Strait Islander Australians increased by 56.5 per cent, while rates for other Australians remained relatively stable (table 8A.6.10).

In 2012-13, younger Aboriginal and Torres Strait Islander children aged 0–4 years and 5–9 years had higher rates of hospitalisation for dental health conditions than non-Indigenous children in the same age groups (8.4 and 4.9 per 1000 population and 12.2 and 9.8 per 1000 population respectively), but older Aboriginal and Torres Strait Islander children aged 10–14 years had lower rates than non-Indigenous children (3.0 and 5.9 per 1000 population respectively) (table 8A.6.12).

Data by type of hospital dental procedure for children aged 0–14 years are available in table 8A.6.14 and for dental hospitalisation rates by remoteness by age in table 8A.6.15.

## 8.7 Mental health<sup>15</sup>

### Box 8.7.1 Key messages

- In 2012-13, almost one-third of Aboriginal and Torres Strait Islander adults (30.1 per cent) reported experiencing high/very high levels of psychological distress, an increase from 27.2 per cent in 2004-05 (table 8A.7.2).
- After adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander adults experiencing high/very high psychological distress in 2012-13 was 2.7 times the proportion for non-Indigenous Australians in 2011-12 (table 8A.7.1).
- In 2012-13, the age-adjusted rate of hospitalisation for mental and behavioural disorders for Aboriginal and Torres Strait Islander Australians was twice the rate for non-Indigenous Australians (table 8A.7.28).

### Box 8.7.2 Measures of mental health

There is one main measure for this indicator:

- *Psychological distress*<sup>16</sup> is defined as the proportion of people aged 18 years and over experiencing high/very high levels of psychological distress. Data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2012-13 (all jurisdictions; national data by remoteness, age and stressors). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011-12. AATSIHS and AHS data are presented together as covering the overall time period 2011-13.

There are three supplementary measures for this indicator:

- *Treatment rates* is defined as the rate of patients treated for mental health by emergency departments (national), community and residential mental health care (all jurisdictions), and general practitioners (national).
- *Hospitalisation rates* is defined as the rate of hospital separations for mental and behavioural disorders per 100 000 population (all jurisdictions: sex, remoteness).
- *Deaths from potentially avoidable mental and behavioural disorders* is defined as the rate of deaths from mental and behavioural disorders per 100 000 population (NSW, Queensland, WA, SA and the NT: age, sex).

Mental health is essential to the overall health and wellbeing of individuals, and is closely related to the COAG targets for improved health outcomes. Mental health can also affect

---

<sup>15</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

<sup>16</sup> Based on Kessler Psychological Distress Scale-10 (K10) modified to five questions (K5) which measure an individual's level of psychological distress in the past four weeks.

---

outcomes in other areas, such as economic participation (chapter 9), and safe and supportive communities (chapter 11).

Mental health relates to the ability to negotiate the daily challenges and social interactions of life, without experiencing undue emotional or behavioural incapacity (DoHA 2010). Mental health includes both mental illness and overall mental wellbeing. Although mental wellbeing problems are distinct from mental illness, the two interact and influence each other.

- Mental *illness* describes a range of behavioural and psychological conditions that can affect an individual's mental health functioning and quality of life. The most common mental illnesses are anxiety, affective (mood), and substance use disorders. Mental illness also includes low prevalence conditions such as schizophrenia, bipolar disorder and other psychoses, and severe personality disorder (DoHA 2010). While of lower prevalence, these conditions can severely affect people's ability to function in their daily lives (Morgan et al. 2011).
- Mental *wellbeing* can be affected by a broad range of factors, including domestic violence (see section 4.11), substance misuse (see section 11.2), physical health problems, incarceration (see section 4.12), family breakdown and social disadvantage (AHMAC 2004; Dudgeon, Milroy and Walker 2014).

Many of the unique risk factors faced by Aboriginal and Torres Strait Islander Australians have persisted across generations, most particularly the ongoing effects of colonisation (Dudgeon, Milroy and Walker 2014). Socio-historical-political factors influence the mental health of Aboriginal and Torres Strait Islander people, through the impact of family separation, the taking away of land, social inequity, racism, and the loss of culture and identity (Vicary and Westerman 2004). (See the historical narrative on Australia's first peoples in chapter 1.)

Racism can be a key source of stress and socioeconomic disadvantage faced by Aboriginal people and families, with negative effects on social and emotional wellbeing (Dudgeon, Milroy and Walker 2014). Research in the NT found a significant association between interpersonal racism and depression among Aboriginal and Torres Strait Islander Australians (AHMAC 2012). (See section 5.1 on valuing Indigenous Australians and their cultures.)

On the positive side, a WA study showed that higher socioeconomic status was associated with a reduced risk of mental health problems in Aboriginal children (Dudgeon, Milroy and Walker 2014).

## Psychological distress

In 2012-13, almost one third of Aboriginal and Torres Strait Islander Australians aged 18 years and over (30.1 per cent) reported experiencing high/very high levels of psychological distress — an increase from 27.2 per cent in 2004-05 (table 8A.7.2). In

2012-13 this rate was significantly lower for those aged 55 years and over (24.5 per cent) than for those aged 18–24 years (30.2 per cent) and 45–54 years (30.5 per cent) (table 8A.7.3).

After adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander adults experiencing high/very high levels of psychological distress in 2012-13 was around 2.7 times the rate for non-Indigenous adults in 2011-12. For Aboriginal and Torres Strait Islander adults, the proportion decreased as remoteness increased. There was no significant difference by remoteness for non-Indigenous adults (table 8A.7.1).

**Figure 8.7.1 Proportion of people aged 18 years and over with high/very high levels of psychological distress, 2004-05, 2008 and 2011-13<sup>a,b,c</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> Data are age standardised. <sup>c</sup> Data for Aboriginal and Torres Strait Islander Australians are from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011-13 AHS (for the period 2011-12).

*Sources:* ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey (NATSIHS) 2004-05; ABS (unpublished) National Health Survey (NHS) 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey (NATSISS) 2008; ABS (unpublished) National Health Survey (NHS) 2007-08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) 2012-13 National Aboriginal and Torres Strait Islander Health Survey (NATSIHS component); ABS (unpublished) Australian Health Survey (AHS); 2011-13 (NHS 2011-12 component); table 8A.7.1.

Between 2004-05 and 2011-13, after adjusting for differences in population age structures, the gap between the proportion of Aboriginal and Torres Strait Islander adults and non-Indigenous adults experiencing high/very high psychological distress widened (from 13.6 percentage points to 18.6 percentage points) (figure 8.7.1).

---

In 2012-13, the most commonly reported stressors for Aboriginal and Torres Strait Islander adults experiencing high/very high levels of psychological distress were ‘feeling unsafe’ (62.4 per cent), ‘getting back together with spouse’ (50.4 per cent), ‘abuse or violent crime’ (48.7 per cent) and ‘pressure to fulfil cultural responsibilities’ (48.0 per cent) (table 8A.7.5). Data on the level of psychological distress reported by State and Territory are available in table 8A.7.2.

The attachment tables include supplementary data about selected attributes of positive wellbeing (calm and peaceful, happy, full of life, lots of energy) by State and Territory, sex and remoteness (tables 8A.7.8–13) and selected attributes of psychological distress (nervous, without hope, restless or jumpy, that everything was an effort and sadness) by sex, age and remoteness (tables 8A.7.14–22).

Prisoners exhibit higher rates of emotional and mental wellbeing problems than the general population. Available data suggest that, in 2012, non-Indigenous prison entrants had higher rates of high/very high levels of psychological distress (38 per cent) than Aboriginal and Torres Strait Islander prison entrants (20 per cent) (AIHW 2013). This may reflect the relative ‘normalisation’ of imprisonment in some Indigenous communities (see section 4.12 on Imprisonment and juvenile detention.)

## Treatment rates

Treatment rate data are reported for a selection of mental health services by ‘occasions of service’. A patient may be counted more than once if they received multiple occasions of service.

- *General practitioner encounters* — 16.7 out of every 100 GP encounters were mental health related for Aboriginal and Torres Strait Islander Australians in 2011-12, compared with 12.2 per 100 GP encounters for non-Indigenous Australians (table 8A.7.23)
- *Community based mental health service contacts*:<sup>17</sup> — there were 871 service contacts per 1000 Aboriginal and Torres Strait Islander Australians in 2010-11, compared with 277 service contacts per 1000 non-Indigenous Australians (table 8A.7.25)
- *Residential mental health care* — there were 2.6 episodes of community-based residential care per 10 000 Aboriginal and Torres Strait Islander Australians in 2010-11, compared with 1.8 per 10 000 non-Indigenous Australians (table 8A.7.25).

Data on community based and residential mental health service contacts by State and Territory are available in table 8A.7.25.

---

<sup>17</sup> Community based mental health service contacts refers to specialised public mental health services dedicated to the assessment, treatment, rehabilitation and care of non-admitted clients.

---

## Hospitalisation rates

From 2010-11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Nationally in 2012-13, the rate of hospital separations for mental and behavioural disorders for Aboriginal and Torres Strait Islander Australians was 2371.3 per 100 000 population. The most common principal diagnoses were substance use disorders (862.7 per 100 000 population) and mood and neurotic disorders (720.2 per 100 000 population). For NSW, Victoria, Queensland, WA, SA and the NT combined, the hospitalisation rate increased from 1941.5 per 100 000 population in 2004-05 to 2660.0 per 100 000 population in 2012-13 (table 8A.7.27).

In 2012-13, after adjusting for differences in population age structures, the rate of hospitalisation for mental and behavioural disorders for Aboriginal and Torres Strait Islander Australians was twice the rate for non-Indigenous Australians (table 8A.7.28). For both Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, the hospitalisation rate was higher for major cities compared to other remoteness areas (table 8A.7.30).

For NSW, Victoria, Queensland, WA, SA and the NT combined, between 2004-05 and 2012-13, after adjusting for differences in population age structures, the gap in the rate of hospitalisations for mental and behavioural disorders for Aboriginal and Torres Strait Islander Australians widened from 1.5 to 1.9 times the rate for other Australians (tables 8A.7.29 and 38).

Data on hospitalisations for mental and behavioural disorders are available by State and Territory in tables 8A.7.29 and 8A.7.31–38.

## Mental and behavioural disorders as cause of death

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Indigenous identification and numbers of deaths to support analysis.

Over the period 2008–2012, there were 10.5 deaths per 100 000 population for Aboriginal and Torres Strait Islander Australians and 32.0 deaths per 100 000 population for non-Indigenous Australians due to mental and behavioural disorders. The majority of deaths for both Aboriginal and Torres Strait Islander and non-Indigenous Australians were for people aged 45 years and over (table 8A.7.40).

---

Over the period 2008–2012, after adjusting for differences in population age structures, the rate of deaths for Aboriginal and Torres Strait Islander Australians due to mental and behavioural disorders was 41.9 deaths per 100 000 population, compared with 29.0 deaths per 100 000 population for non-Indigenous Australians (table 8A.7.39).

Data on death rates due to mental and behavioural disorders are available by State and Territory by sex in tables 8A.7.39 and 8A.7.41.

## Things that work

Increasingly, research findings suggest that early intervention can prevent the worsening of mental health problems. Early intervention is most appropriate for helping young people, as adolescence is the peak age of onset for a first episode of mental illness (Chalmers et al. 2014).

---

## 8.8 Suicide and self-harm<sup>18</sup>

### Box 8.8.1 Key messages

- Suicide and self-harm cause great grief in both Aboriginal and Torres Strait Islander communities and non-Indigenous communities.
- For the period 2008–2012, after adjusting for differences in population age structures, the rate of deaths from suicide for Aboriginal and Torres Strait Islander Australians was almost twice the rate for non-Indigenous Australians (table 8A.8.1).
- The rate of deaths from suicide was higher for males than for females for both Aboriginal and Torres Strait Islander Australians (2.9 times higher) and non-Indigenous Australians (3.4 times higher) (table 8A.8.1).
- Age-specific rates of deaths from suicide were highest for Aboriginal and Torres Strait Islander people aged 25–34 years (39.9 deaths per 100 000 population), around three times the rate for non-Indigenous Australians of the same age. There was no difference in rates between Aboriginal and Torres Strait Islander and non-Indigenous people aged 45 years and over (figure 8.8.1).
- From 2004–05 to 2012–13, after adjusting for differences in population age structures, the hospitalisation rate for intentional self-harm increased for Aboriginal and Torres Strait Islander Australians by 48.1 per cent, while the rate for other Australians remained relatively stable, resulting in the rate for Aboriginal and Torres Strait Islander Australians increasing from 1.7 to 2.7 times the rate for other Australians (figure 8.8.2).

### Box 8.8.2 Measures of suicide and self-harm

There is one main measure for this indicator. *Suicide deaths* is defined as the number of deaths from intentional self-harm per 100 000 population (NSW, Queensland, WA, SA and NT; age; sex). Data for this measure are sourced from the ABS Causes of Death collection, with the most recent available data for 2012. Due to small numbers, the rate is calculated by averaging the number of deaths over a five year period.

Data are also provided for one supplementary measure, the number of non-fatal hospitalisations from intentional self-harm per 100 000 population (all jurisdictions; sex; remoteness).

Suicide and self-harm cause great grief in both Aboriginal and Torres Strait Islander and non-Indigenous communities (Senate Community Affairs References Committee 2010). However, Aboriginal and Torres Strait Islander Australians experience disproportionately high rates of suicide, and it has become increasingly prevalent over recent decades, accelerating after the 1980s (DOHA 2013). Suicide is most prevalent among young Aboriginal and Torres Strait Islander males, while suicide attempts seem to be more

---

<sup>18</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

prevalent for Aboriginal and Torres Strait Islander females (AHA 2014; Clifford, Doran and Tsey 2013; Elliott-Farrelly 2004).

Mental illness is the largest risk factor for suicide, with psychological distress often being the final factor leading to spontaneous acts of suicide and self-harm (Australian Government 2013). Section 8.7 reports on mental health in more detail.

Environmental risk factors that contribute to high levels of suicide in Aboriginal and Torres Strait Islander Australians include: lower levels of education, employment, service access, health and income; and increased levels of remoteness, domestic violence or abuse, alcohol and other drug abuse (DOHA 2008). Trauma and grief as a result of past dislocation and mistreatment, and a loss of cultural identity, and lack of access to culturally appropriate services can also contribute to higher levels of suicide (DOHA 2008).

Studies have found that suicides among Aboriginal and Torres Strait Islander Australians appear to occur in clusters, and that victims may share common age groups, genders and methods (Elliott-Farrelly 2004). Aboriginal and Torres Strait Islander Australians have been more exposed to suicide than most non-Indigenous Australians, which can lead to situations of ‘bereavement overload’ and may contribute to suicidal behaviours (AHA 2014).

The continued exposure of Aboriginal and Torres Strait Islander Australians to multiple risk factors has led to calls for increased suicide prevention interventions (Clifford, Doran and Tsey 2013). Broadly protective factors against suicide include connectedness with family, friends, culture, school and communities; having someone who cares about you and having someone you care about; having positive attitudes and ways to tackle problems; financial stability, good health and access to mental health support when required (NMHC 2012).

## **Suicide deaths**

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

For the period 2008–2012, after adjusting for differences in population age structures, the rate of deaths for Aboriginal and Torres Strait Islander Australians due to suicide was almost twice the rate for non-Indigenous Australians (table 8A.8.1).

The rate of deaths from suicide was higher for males than for females for both Aboriginal and Torres Strait Islander Australians (2.9 times higher) and non-Indigenous Australians (3.4 times higher) (table 8A.8.1).

Figure 8.8.1 **Rates of deaths from intentional self-harm (suicide) by age, NSW, Queensland, WA, SA and the NT, 2008–2012<sup>a</sup>**

<sup>a</sup> Deaths from intentional self-harm are defined as causes of death with ICD-10 codes X60–X84, Y87.0.  
Source: ABS (unpublished) Causes of Death, Australia collection; table 8A.8.2.

For the period 2008–2012, suicide death rates varied by age group, with the highest rate for Aboriginal and Torres Strait Islander Australians aged 25–34 years (39.9 per 100 000 population), around three times the rate for non-Indigenous Australians of the same age. For those aged 45 years and over, there was no difference in rates between Aboriginal and Torres Strait Islander and non-Indigenous Australians (figure 8.8.1). Data on suicide death rates by State and Territory by sex are available in table 8A.8.1 and by State and Territory by age in table 8A.8.2.

## Hospitalisations for self-harm

From 2010–11, Indigenous status in hospital separations data is considered of sufficient quality for reporting in all jurisdictions. Prior to 2010–11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010–11 to 2012–13 as well as data for the six jurisdictions for 2004–05 to 2012–13.

Nationally in 2012–13, after adjusting for differences in population age structures, the rate of hospitalisation for intentional self-harm for Aboriginal and Torres Strait Islander Australians was around two and a half times the rate for non-Indigenous Australians (table 8A.8.3).

---

In 2012-13, for Aboriginal and Torres Strait Islander Australians, the rate was:

- higher for females than males. There was a similar trend for non-Indigenous Australians (table 8A.8.3)
- higher in remote areas than other areas. Rates for non-Indigenous Australians were highest in regional areas, followed by remote areas and major cities (table 8A.8.5).

---

**Figure 8.8.2 Rates of hospitalisation for intentional self-harm, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2012-13<sup>a, b</sup>**

<sup>a</sup> Other includes hospitalisations where Indigenous status was recorded as non-Indigenous or not stated. <sup>b</sup> Rates are age standardised.

Source: AIHW (unpublished) National Hospital Morbidity Database; table 8A.8.4

---

Comparable time series data from 2004-05 to 2012-13 are available for NSW, Victoria, Queensland, WA, SA and the NT. After adjusting for differences in population age structures, the hospitalisation rate for intentional self-harm increased for Aboriginal and Torres Strait Islander Australians by 48.1 per cent, while the rate for other Australians remained relatively stable, resulting in the rate for Aboriginal and Torres Strait Islander Australians increasing from 1.7 to 2.7 times the rate for non-Indigenous Australians (figure 8.8.2).

## Things that work

One initiative that may have contributed to a reduction in suicide and self-harm is described in box 8.8.3.

---

### Box 8.8.3 Things that work

The **Yiriman Project** (WA), auspiced by the Kimberly Aboriginal Law and Culture Centre, commenced in 2000. The Project takes young people, accompanied by elders, on trips back to country, to immerse them in the stories, song and knowledge that are their cultural heritage. This builds young people's confidence and improves their self-worth, and is considered to have helped curb suicide, self-harm and substance abuse in the participating communities (RA 2013).

The Yiriman project was the winner of Reconciliation Australia's 2012 Indigenous Governance Awards in Category B: non-incorporated projects and initiatives. Project outcomes were summarised in Taylor's (2010) qualitative study:

- the healing of young people as they walk on country and look after it
- the opportunity to develop and assert culture, language and bush skills
- meaningful employment that values and maintains culture.

Further information about this program, focusing on the program's successful governance arrangements, is in section 5.4.

TABLE 8A.1.1

Table 8A.1.1

**Self-assessed health status, by age and Indigenous status, 2004-05, 2008 and 2011-13 (a), (b)**

<i>Unit</i>	<i>0-4</i>	<i>5-14</i>	<i>15-24</i>	<i>25-34</i>	<i>35-44</i>	<i>45-54</i>	<i>55 and over</i>	<i>Total non-age- standardised 15 years and over</i>	<i>Total age- standardised 15 years and over</i>	<i>Rate ratio (c)</i>	<i>Total persons non-age- standardised</i>	<i>Total persons age- standardised</i>
-------------	------------	-------------	--------------	--------------	--------------	--------------	------------------------	--	--	-------------------------------	--	--

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. A 95 per cent confidence interval (CI) is also reported against each estimate.

(b) Data for Indigenous children aged 0-14 years, and for some young people aged 15-17 years, were obtained from an adult proxy. For the majority of Indigenous and non-Indigenous people aged 15 years and over, responses were self-reported.

(c) The rate ratio is calculated by dividing the rate for Indigenous people by the corresponding rate for non-Indigenous people.

Poor	±	2.2	0.6	..	2.2	0.4	..
Subtotal fair/poor	±	2.9	1.0	..	2.6	0.8	..

(a) Information for some young people aged 15–17 years was provided by an adult proxy. For the majority of people aged 15 years and over, data were self-reported.

(b) The rate ratio is calculated by dividing the rate for Indigenous people by the corresponding rate for non-Indigenous people.
