---

Following feedback on previous editions of the report, this report generally uses the term ‘Aboriginal and Torres Strait Islander Australians’ to describe Australia’s first peoples and ‘non-Indigenous Australians’ to refer to Australians of other backgrounds, except where quoting other sources, and in charts, figures and attachment tables.

---

# Foreword

This is the sixth report in the Overcoming Indigenous Disadvantage (OID) series, which can trace its origins to the final report of the Council for Aboriginal Reconciliation in 2000. The report measures the wellbeing of Aboriginal and Torres Strait Islander Australians, and I would like to thank the many Aboriginal and Torres Strait Islander organisations and individuals that have been actively involved in its production. My particular thanks to the National Congress of Australia's First Peoples, which participated on the working group that advised the Steering Committee on all aspects of the report.

The OID report serves as a public report card on progress in overcoming Indigenous disadvantage. It can help governments assess the effectiveness of current policies and inform the development of new approaches. It can assist Aboriginal and Torres Strait Islander Australians to hold governments to account, and to develop their own responses to the disadvantage that limits the opportunities of too many Aboriginal and Torres Strait Islander Australians.

For the first time, this report includes a 'traffic light' summary of trends in outcomes. Among key national results for Aboriginal and Torres Strait Islander Australians:

- economic outcomes have improved over the longer term, with higher incomes, lower reliance on income support, increased home ownership, and higher rates of full time and professional employment. However, improvements have slowed in recent years
- several health outcomes have improved, including increased life expectancy and lower child mortality. However, rates of disability and chronic disease remain high, mental health outcomes have not improved, and hospitalisation rates for self-harm have increased
- post-secondary education outcomes have improved, but there has been virtually no change in literacy and numeracy results, which are particularly poor in remote areas
- justice outcomes continue to worsen, with adult imprisonment rates worsening from already high rates, and no change in high rates of juvenile detention and family and community violence.

This edition of the report has benefited from an independent review of the previous report and extensive consultations. On behalf of the Steering Committee, I record our gratitude to all those who have contributed to this report. Special thanks are due to members of the Working Group overseeing the development of the report, particularly its Convenor, Patricia Scott. I am also very grateful for the support of staff in the Secretariat at the Productivity Commission, led by the Head of Secretariat, Lawrence McDonald.

Peter Harris  
Chairman  
November 2014

# Terms of reference

Prime Minister  
Canberra

Reference: B08/2004

11 Mar 2009

Mr Gary Banks AO  
Chairman  
Steering Committee for the Review of Government Service Provision

Dear Mr Banks

I am writing in my capacity as Chair of the Council of Australian Governments (COAG) to convey to you updated Terms of Reference for the Overcoming Indigenous Disadvantage (OID) Report.

Since it was first published in 2003, the OID report has established itself as a source of high quality information on the progress being made in addressing Indigenous disadvantage across a range of key indicators. The OID report has been used by Governments and the broader community to understand the nature of Indigenous disadvantage and as a result has helped inform the development of policies to address Indigenous disadvantage. The OID report is highly regarded and I commend the Steering Committee for the Review of Government Services (the Steering Committee) for its efforts in preparing the report every two years.

In December 2007 and March 2008, COAG committed to six ambitious targets to close the gap in Indigenous disadvantage:

- closing the life expectancy gap within a generation;
- halving the gap in the mortality rate for Indigenous Children under five within a decade;
- ensuring all Indigenous four year olds in remote communities have access to quality early childhood programs within five years;

- 
- halving the gap in reading, writing and numeracy achievements for children within a decade;
  - halving the gap for Indigenous students in Year 12 attainment rates or equivalent attainment by 2020; and
  - halving the gap in employment outcomes within a decade.

Without high quality data, it is impossible to understand where we are headed in terms of overcoming Indigenous disadvantage. Through the National Indigenous Reform Agreement, all Governments have committed to ensuring their data is of high quality, and moreover, is available for reporting purposes. This undertaking has been made with specific reference to the need for data to be provided for the OID report.

In August 2008, the Chair of the COAG Working Group on Indigenous Reform (WGIR), the Hon Jenny Macklin MP, wrote to you requesting the Steering Committee work with the WGIR to align the OID framework to the Closing the Gap targets.

As a result, on 29 November 2008, COAG agreed a new framework for the OID report which takes account of the six ambitious targets to Close the Gap in Indigenous disadvantage. The Steering Committee should take account of this new framework in preparing future OID reports thereby ensuring the report continues to provide Governments and the broader community with an understanding of the progress being made to overcome Indigenous disadvantage.

I have copied this letter to the Treasurer, Ms Macklin and the Chair of MCATSIA the Deputy Premier of the Government of Western Australia and Minister for Indigenous Affairs, the Hon Dr Kim Hames MLA.

Yours sincerely

Kevin Rudd

# Steering Committee

This report was produced under the direction of the Steering Committee for the Review of Government Service Provision (SCRGSP). The Steering Committee comprises the following current members:

Mr Peter Harris	Chairman	Productivity Commission
Mr Mark Thomann	Aust. Govt.	Department of Finance and Deregulation
Mr Peter Robinson	Aust. Govt.	The Treasury
Ms Josephine Laduzko	Aust. Govt.	Department of the Prime Minister and Cabinet
Mr Rick Sondalini	NSW	NSW Treasury
Ms Janet Schorer	NSW	Department of Premier and Cabinet
Ms Katherine Whetton	Vic	Department of Premier and Cabinet
Mr Jeremy Nott	Vic	Department of Treasury and Finance
Mr Chris Chinn	Qld	Department of the Premier and Cabinet
Ms Janelle Thurlby	Qld	Queensland Treasury
Ms Marion Burchell	WA	Department of the Premier and Cabinet
Mr Barry Thomas	WA	Department of Treasury
Ms Katrina Ball	SA	Department of Treasury and Finance
Mr Chris McGowan	SA	Department of the Premier and Cabinet
Ms Rebekah Burton	Tas	Department of Premier and Cabinet
Mr Geoffrey Rutledge	ACT	Chief Minister, Treasury and Economic Development Directorate
Ms Linda Weatherhead	NT	Department of the Chief Minister
Ms Jean Doherty	NT	Department of the Chief Minister
Mr Craig Graham	NT	Department of Treasury and Finance
Mr Peter Harper		Australian Bureau of Statistics
Mr David Kalisch		Australian Institute of Health and Welfare

---

People who also served on the Steering Committee during the production of this report include:

Ms Madonna Morton	Aust. Govt.	Department of the Prime Minister and Cabinet
Mr Kevin Cosgriff	NSW	NSW Treasury
Mr Shane McMahon	NSW	Department of Premier and Cabinet
Dr Meg Montgomery	NSW	Department of Premier and Cabinet
Mr Simon Kent	Vic	Department of Premier and Cabinet
Mr Paul Cantrall	Qld	Department of the Premier and Cabinet
Mr Coan Harvey	WA	Department of Treasury
Mr David Reynolds	SA	Department of Treasury and Finance
Ms Pam Davoren	ACT	Department of the Chief Minister
Ms Nicole Masters	ACT	Department of the Chief Minister
Ms Jenny Coccetti	NT	Department of the Chief Minister
Mr Leigh Eldrige	NT	Department of the Chief Minister
Mr Bruce Michael	NT	Department of Treasury and Finance
Ms Anne Tan	NT	Department of the Chief Minister

---

# Acknowledgments

The Overcoming Indigenous Disadvantage Working Group undertakes the development and production of the Overcoming Indigenous Disadvantage Report under the auspice of the Steering Committee. The Working Group comprises the following members:

Ms Patricia Scott	Commissioner	Productivity Commission
Mr Matthew James	Aust. Govt.	Department of the Prime Minister and Cabinet
Ms Kristy Delaney	NSW	Department of Human Services
Mr David Robinson	Vic	Department of Premier and Cabinet
Ms Emma Ogilvie	Qld	Department of the Premier and Cabinet
Mr Stephen Jones	WA	Department of Aboriginal Affairs
Ms Katy Burns	SA	Department of the Premier and Cabinet
Mr Nick Evans	Tas	Department of Premier and Cabinet
Mr Colin Farlow	ACT	Community Services Directorate
Ms Linda Weatherhead	NT	Department of the Chief Minister
Mr Geoff Scott		National Congress of Australia's First Peoples
Dr Fadwa Al-Yaman		Australian Institute of Health and Welfare
Ms Julie Nankervis		Australian Bureau of Statistics

People who also served on the Working Group during the production of this report include:

Ms Gina Overall	Aust. Govt.	Department of the Prime Minister and Cabinet
Mr Trevor Fleming	Vic	Department of Premier and Cabinet
Ms Prudence Phillips-Brown	Qld	Department of the Premier and Cabinet
Mr Garrick Stanley	WA	Department of Aboriginal Affairs
Mr Chris Parry	WA	Department of Aboriginal Affairs
Ms Lisa Perre	SA	Department of the Premier and Cabinet
Ms Michelle Brown	NT	Department of Regional Development and Women's Policy
Mr Scott Avery		National Congress of Australia's First Peoples

---

The Steering Committee acknowledges the contribution of the staff of the secretariat at the Productivity Commission who produced this report, and of the many organisations and individuals in the review of the 2011 report and consultations on this report. It particularly thanks the following organisations and individuals for reviewing sections of this report.

Australian Institute of Aboriginal and Torres Strait Islander Studies

Dr Gawaian Bodkin-Andrews (Department of Indigenous Studies, Macquarie University)

Closing the Gap Clearinghouse (Australian Institute of Health and Welfare and Australian Institute of Family Studies)

Dr Kyllie Cripps (Indigenous Law Centre, University of New South Wales)

Dr Payi Linda Ford (Northern Institute, Charles Darwin University)

Ms Heron Loban (James Cook University)

National Health Leadership Forum

National Indigenous Drug and Alcohol Committee

Ms Robynne Quiggin (Australian Indigenous Governance Institute)

Reconciliation Australia

Working Group on Aboriginal and Torres Strait Islander Environmental Health

# Glossary

<b>Aboriginal</b>	A person who identifies as being of Aboriginal origin. May also include people who identify as being of both Aboriginal and Torres Strait Islander origin.
<b>Age standardised rates</b>	Age standardised rates enable comparisons to be made between populations that have different age structures. Age standardisation is often used when comparing the Indigenous and non-Indigenous populations because the Indigenous population is younger than the non-Indigenous population. Outcomes for some indicators are influenced by age, therefore, it is appropriate to age standardise the data when comparing the results. When comparisons are not being made between the two populations, the data are not age standardised.
<b>CDEP</b>	Community Development Employment Projects (CDEP) is an Australian Government funded program that provides activities for unemployed Aboriginal and Torres Strait Islander Australians to develop work skills and move into employment. For statistical purposes the ABS classifies participants in CDEP receiving CDEP 'wages' as employed rather than as unemployed or not in the labour force see section 4.6).
<b>Core activity limitation (ABS SDAC definition)</b>	<p>Four levels of core activity limitation are determined based on whether a person needs help, has difficulty, or uses aids or equipment with any of the core activities (mobility, self-care and communication). A person's overall level of core activity limitation is determined by their highest level of limitation in these activities.</p> <p>The four levels of limitation are:</p> <ul style="list-style-type: none"><li>• profound - the person is unable to do, or always needs help with, a core activity task.</li><li>• severe - the person:<ul style="list-style-type: none"><li>– sometimes needs help with a core activity task, and/or</li><li>– has difficulty understanding or being understood by family or friends, or</li><li>– can communicate more easily using sign language or other non-spoken forms of communication.</li></ul></li></ul>

- 
- moderate - the person needs no help, but has difficulty with a core activity task.
  - mild - the person needs no help and has no difficulty with any of the core activity tasks, but:
    - uses aids or equipment, or has one or more of the following limitations
    - cannot easily walk 200 metres
    - cannot walk up and down stairs without a handrail
    - cannot easily bend to pick up an object from the floor
    - cannot use public transport
    - can use public transport, but needs help or supervision
    - needs no help or supervision, but has difficulty using public transport.

**Confidence intervals**

Survey data, for example data from the Australian Aboriginal and Torres Strait Islander Health Survey, are subject to sampling error because they are based on samples of the total population. Where survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals. There is a 95 per cent chance that the true value of the data item lies within the interval shown by the error bars. See ‘statistical significance’.

See also ‘Error bars’.

**Disability (ABS SDAC definition)**

A person has a disability if he or she has a limitation, restriction or impairment, which has lasted, or is likely to last, for at least six months and restricts everyday activities. These activities include: loss of sight (not corrected by glasses or contact lenses); loss of hearing where communication is restricted, or an aid to assist with, or substitute for, hearing is used; speech difficulties; shortness of breath or breathing difficulties causing restriction; chronic or recurrent pain or discomfort causing restriction; blackouts, seizures, or fits, or loss of consciousness; difficulty learning or understanding; incomplete use of arms or fingers; difficulty gripping or holding things; incomplete use of feet or legs; nervous or emotional condition causing restriction; restriction in physical activities or in doing physical work; disfigurement or deformity; mental illness or condition requiring help or supervision; long-term effects of head injury, stroke or other brain damage causing restriction; receiving treatment or medication for any other long-term conditions or ailments and still restricted; or any other long-term conditions resulting in a restriction.

---

<b>ICD</b>	ICD is the International Statistical Classification of Diseases and Related Health Problems, endorsed by the World Health Organization (WHO). It is primarily designed for the classification of diseases and injuries with a formal diagnosis. ICD-10-AM is the Australian modification of the tenth revision and was adopted for Australian use from 1 January 1999 (superseding ICD-9).
<b>Equivalised household income</b>	Equivalised household income adjusts the actual incomes of households to make households of different sizes and compositions comparable. It results in a measure of the economic resources available to members of a standardised household (see section 4.9).
<b>Error bars</b>	<p>Survey data, for example data from the Australian Aboriginal and Torres Strait Islander Health Survey, are subject to sampling error because they are based on samples of the total population. Where survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals. There is a 95 per cent chance that the true value of the data item lies within the interval shown by the error bars. See ‘statistical significance’.</p> <p>See also ‘Confidence intervals’.</p>
<b>Hospitalisation</b>	Hospitalisations recorded in this report refer to ‘hospital separations’. A ‘separation’ is an episode of care, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change of type of care (for example, from acute to rehabilitation). It is also defined as the process by which an admitted patient completes an episode of care by being discharged, dying, transferring to another hospital or changing type of care. For measuring a hospital’s activity, separations are used in preference to admissions because diagnoses and procedures can be more accurately recorded at the end of a patient’s stay and patients may undergo more than one separation from the time of admission. Admitted patients who receive same day procedures (for example, renal dialysis) are recorded in hospitalisation statistics.
<b>Income ranges</b>	See ‘quintiles’.
<b>Indigenous</b>	A person of Aboriginal and/or Torres Strait Islander origin who identifies as an Aboriginal and/or Torres Strait Islander.
<b>Indigenous status not stated/ Indigenous status unknown</b>	Where a person’s Indigenous origin has either not been asked or not recorded.

---

---

<b>Infant mortality</b>	Deaths of children between birth and exactly one year of age.
<b>Inner regional</b>	See ‘remoteness areas’.
<b>Jurisdiction</b>	The Australian Government or a State or Territory Government and areas that it has legal authority over.
<b>Labour force</b>	The labour force is the most widely used measure of the economically active population or the formal supply of labour. It is a measure of the number of people contributing to, or willing to contribute to, the supply of labour and, as defined by the ABS, comprises two mutually exclusive categories of population: the employed (people who have worked for at least one hour in the reference week, including those who have participated in Community Development Employment Projects (CDEP)), and the unemployed (people who are without work, but had actively looked for work in the four weeks up to the end of the reference week and were available to start work in the reference week).
<b>Major cities</b>	See ‘remoteness areas’.
<b>Mean and median income measures</b>	<p>A mean income value is the average value of a set of income data. It is calculated by adding up all the values in the set of data and dividing that sum by the number of values in the dataset. Median value is the middle point of a set of income data. Lining up the values in a set of income data from largest to smallest, the one in the centre is the median income value (if the centre point lies between two numbers, the median value is the average value of the two numbers).</p> <p>Median value is a better measure for income than mean as mean income values are more influenced by extreme income values (including the lowest and highest incomes). Therefore, median income value is a more accurate measure of income for an average household or average individual income earner.</p> <p>For example, the gross monthly incomes for 9 households are: \$10 000, \$5000, \$2500, \$1500, \$1500, \$1500, \$1000, \$450, \$450.</p> <p>The <b>mean income value</b> among the 9 households is <math>(\\$10\,000 + \\$5\,000 + \\$2500 + \\$1500 + \\$1500 + \\$1500 + \\$1000 + \\$450 + \\$450) / 9 = \\$2655.6</math>. The <b>median income value</b> is the fifth value (the mid-point), \$1500.</p>
<b>Non-Indigenous</b>	A person who does not identify as Aboriginal and/or Torres Strait Islander.

---

<b>Non-school qualification</b>	Non-school qualifications include vocational or higher education qualifications.
<b>Non-remote</b>	See ‘remoteness areas’.
<b>Outer regional</b>	See ‘remoteness areas’.
<b>Perinatal mortality</b>	Feotuses delivered with a gestational age of 20 weeks or more, or weighing at least 400 grams, and all neonatal deaths – infant deaths within 28 days of birth.
<b>Post-school qualification</b>	Post-school qualifications include vocational or higher education qualifications.
<b>Quintiles</b>	Income quintiles are groups that result from ranking all people in the population in ascending order (from the lowest to the highest) according to their (as an example) incomes and then dividing the population into five equal groups, each comprising 20 per cent of the population.
<b>Rate ratio</b>	The rate ratio is the rate for the Indigenous population divided by the rate for the non-Indigenous (or other) population. See ‘relative Indigenous disadvantage’.
<b>Regional</b>	See ‘remoteness areas’.
<b>Relative Indigenous disadvantage</b>	Relative Indigenous disadvantage is measured by comparing the rate of Indigenous disadvantage (for example, the proportion of Indigenous people reporting they do not have a non-school qualification) with the rate for the non-Indigenous (or other) population. See ‘rate ratio’.
<b>Relative standard error (RSE)</b>	The relative standard error (RSE) of a survey data estimate is a measure of the reliability of the estimate and depends on both the number of people giving a particular answer in the survey and the size of the population. The RSE is expressed as a percentage of the estimate. The higher the RSE, the less reliable the estimate. Relative standard errors for survey estimates are included in the attachment tables. See also ‘statistical significance’.
<b>Remote</b>	See ‘remoteness areas’.
<b>Remoteness</b>	See ‘remoteness areas’.

---

**Remoteness areas** Remoteness areas are defined in the Australian Statistical Geographical Standard (ASGS) developed by the ABS.<sup>1</sup> The ASGS remoteness classification identifies a place in Australia as having a particular degree of remoteness. The remoteness of each place is determined using the Accessibility/Remoteness Index of Australia (ARIA). The ABS generates an average ARIA score for each location based on its distance from population centres of various sizes. Locations are then added together to form the remoteness areas in each State and Territory. Remoteness areas comprise the following six categories:

- major cities of Australia
- inner regional Australia
- outer regional Australia
- remote Australia
- very remote Australia
- migratory regions (comprising off-shore, shipping and migratory places).

The aim of the ASGS remoteness structure is not to provide a measure of the remoteness of a particular location but to divide Australia into five broad categories (excluding migratory regions) of remoteness for comparative statistical purposes.

**Statistical  
significance**

Statistical significance is a measure of the degree of difference between survey data estimates. The potential for sampling error — that is, the error that occurs by chance because the data are obtained from only a sample and not the entire population — means that reported responses may not indicate the true responses.

Using the relative standard errors (RSE) of survey data estimates, it is possible to use a formula to test whether the difference is statistically significant. If there is an overlap between confidence intervals for different data items, it cannot be stated for certain that there is a statistically significant difference between the results. See ‘confidence intervals’ and ‘relative standard error’.

---

<sup>1</sup> The ASGS replaced the Australian Standard Geographical Classification (ASGC) from 1 July 2013.

---

<b>Torres Strait Islander people</b>	People who identify as being of Torres Strait Islander origin. May also include people who identify as being of both Torres Strait Islander and Aboriginal origin.
<b>Unemployment rate</b>	<p>The unemployment rate is defined as the proportion of people in the labour force who:</p> <ul style="list-style-type: none"> <li>• had actively looked for full-time or part-time work at any time in the four weeks up to the end of the reference week, or</li> <li>• were waiting to start a new job within four weeks from the end of the reference week and could have started in the reference week if the job had been available then.</li> </ul>
<b>Very remote</b>	See ‘remoteness areas’.

---

# OVERVIEW

---

## Key points

- This report measures the wellbeing of Aboriginal and Torres Strait Islander Australians, and was produced in consultation with governments and Aboriginal and Torres Strait Islander Australians. Based on 2011 Census data, as at June 2011, around 3 per cent of the Australian population (approximately 670 000 people) were estimated as being of Aboriginal or Torres Strait Islander origin.
- Outcomes have improved in a number of areas, including some COAG targets.
  - The gap in life expectancy narrowed from 11.4 years to 10.6 years for males and from 9.6 years to 9.5 years for females from 2005–2007 to 2010–2012.
  - Mortality rates for children improved significantly between 1998 and 2012, particular for 0<1 year olds, whose mortality rates more than halved (from 14 to 5 deaths per 1000 live births). In addition, the proportion of low birthweight babies has decreased.
  - The proportion of 20–24 year olds completing year 12 or above increased from 45 per cent in 2008 to 59 per cent in 2012-13.
  - The proportion of 20–64 year olds with or working towards post-school qualifications increased from 26 per cent in 2002 to 43 per cent in 2012-13.
  - The proportion of adults whose main income was from employment increased from 32 per cent in 2002 to 41 per cent in 2012-13, with a corresponding decrease in the proportion on income support. Increasing proportions of employed people were in full time and managerial positions.
- However, there has been little or no change for some indicators.
  - There was virtually no change in the proportions of students achieving national minimum standards for reading, writing and numeracy from 2008 to 2013.
  - Relatively high rates of family and community violence were unchanged between 2002 and 2008, and there was little change in alcohol and substance use and harm over time.
  - Relatively high rates of disability and chronic disease have not changed.
- Outcomes have worsened in some areas.
  - The proportion of adults reporting high/very high levels of psychological distress increased from 27 per cent in 2004-05 to 30 per cent in 2012-13, and hospitalisations for intentional self-harm increased by 48 per cent over this period.
  - The adult imprisonment rate increased 57 per cent between 2000 and 2013. Juvenile detention rates increased sharply between 2000-01 and 2007-08, and fluctuated since at around 24 times the rate for non-Indigenous youth.
- Change over time cannot be assessed for all the indicators — some indicators have no trend data; some indicators report on use of services and change over time might be due to changing access to services rather than changes in the underlying outcome (for example, child protection rates); and some indicators include related measures that have moved in different directions (for example, children's hospitalisations for injury and disease have increased but death rates have decreased).

---

## How have trends in outcomes over time been assessed?

The figure on the next page summarises changes in outcomes over time. The following approach was taken to assessing change over time:

- The key consideration was change over time in outcomes for Aboriginal and Torres Strait Islander Australians NOT the gap to non-Indigenous Australians. It is important to acknowledge improvements in outcomes for Aboriginal and Torres Strait islander Australians, even if improvements for non-Indigenous Australians mean that the gap has not narrowed.
- Change has been assessed by comparing the latest available data to the earliest available data for each indicator in this report. Therefore, the time period may be different for different indicators.
- If apparent change was not statistically significant this was recorded as no change.
- The focus has been on the main measure/s identified for each indicator. Supplementary measures for some indicators may show different trends.
- No trend has been identified where it is not clear whether an observed change in the main measure is positive or negative, or where improvements to data collections have created a break in series.

Results have been summarised into the following five categories:

- **progress** — where the main measure for an indicator shows outcomes for Aboriginal and Torres Strait Islander Australians improving over time
- **no significant change** — where the main measure for an indicator shows no meaningful change in outcomes for Aboriginal and Torres Strait Islander Australians
- **regress** — where the main measure for an indicator shows a decline in outcomes for Aboriginal and Torres Strait Islander Australians
- **data gap** — where no suitable trend data are available (this does not include indicators where improvements to data collections have created a break in series, which are labelled ‘unclear’)
- **unclear** — where it is not clear whether an observed change in the main measure is positive or negative, or where improvements to data collections have created a break in series. Results should be considered in the light of the contextual material in the relevant section of the report.

There are 52 indicators in this report. However, one indicator (5.4 Case studies in governance) is not designed to include quantitative measures.

## Overcoming Indigenous Disadvantage: Key Indicators 2014 – trends in national outcomes

### COAG targets and headline indicators

COAG Targets		Headline Indicators	
✓	4.1	Life expectancy	✓
✓	4.2	Young child mortality	✓
?	4.3	Early childhood education	?
—	4.4	Reading, writing and numeracy	—
✓	4.5	Year 12 attainment	✓
?	4.6	Employment	?
✓	4.7	Post-secondary education – participation and attainment	✓
—	4.8	Disability and chronic disease	—
✓	4.9	Household and individual income	✓
?	4.10	Substantiated child abuse and neglect	?
—	4.11	Family and community violence	—
✗	4.12	Imprisonment and juvenile detention	✗

### Strategic areas for action

Governance, leadership and culture	Early child development	Education and training	Healthy lives	Economic participation	Home environment	Safe and supportive communities
5.1 Valuing Indigenous Australians and their cultures —	6.1 Antenatal care —	7.1 Year 1 to 10 attendance —	8.1 Access to primary health care ?	9.1 Employment by full time/ part time status, sector and occupation ✓	10.1 Overcrowding in housing ✓	11.1 Alcohol consumption and harm —
5.2 Participation in decision making —	6.2 Health behaviours during pregnancy ✓	7.2 Teacher quality —	8.2 Potentially preventable hospitalisations ?	9.2 Indigenous owned or controlled land and business ✓	10.2 Rates of disease associated with poor environmental health ?	11.2 Drug and other substance use and harm —
5.3 Engagement with services —	6.3 Teenage birth rate ?	7.3 School engagement —	8.3 Potentially avoidable deaths ✓	9.3 Home ownership ✓	10.3 Access to clean water and functional sewerage and electricity services ✗	11.3 Juvenile diversions —
5.4 Case studies in governance*	6.4 Birthweight ✓	7.4 Transition from school to work ✓	8.4 Tobacco consumption and harm ✓	9.4 Income support ✓		11.4 Repeat offending —
5.5 Indigenous language revitalisation and maintenance —	6.5 Early childhood hospitalisations ?		8.5 Obesity and nutrition ?			11.5 Community functioning —
5.6 Indigenous cultural studies —	6.6 Injury and preventable disease ?		8.6 Oral health —			
5.7 Participation in community activities ?	6.7 Ear health ✓		8.7 Mental health ✗			
5.8 Access to traditional lands and waters —	6.8 Basic skills for life and learning ✓		8.8 Suicide and self-harm ✗			

Number beside indicator refers to section numbers in main report.  
Code for each indicator determined using criteria on previous page.

- ✓ The main measure has shown progress
  - No significant change
  - ✗ The main measure has shown regress
  - Data Gap
  - ? Results are unclear
- \*Not applicable (case studies only)

---

# Overview

## What is the Overcoming Indigenous Disadvantage report?

The Overcoming Indigenous Disadvantage (OID) report measures the wellbeing of Aboriginal and Torres Strait Islander Australians. It is the sixth report in a series commissioned by all Australian governments, designed to measure progress in overcoming the disadvantage faced by many Aboriginal and Torres Strait Islander Australians. It complements a range of other reports on aspects of Indigenous policy (see figure on following page).

The OID report is produced by the Steering Committee for the Review of Government Service Provision, which is made up of representatives of the Australian Government and all State and Territory governments, and observers from the Australian Bureau of Statistics and the Australian Institute of Health and Welfare. The Steering Committee is chaired by the chairman of the Productivity Commission (see page iii for a list of members), and is supported by a Secretariat from the Productivity Commission.

The Steering Committee is advised by the OID working group, which is made up of representatives of the Australian Government, all State and Territory governments, the Australian Bureau of Statistics, the Australian Institute of Health and Welfare and the National Congress of Australia's First Peoples (see page iv for a list of members).

The information in the OID report can be used to examine the nature of disadvantage experienced by Aboriginal and Torres Strait Islander Australians and can help inform the design of policies. However, the report is not designed to evaluate specific policies or programs and, except for the COAG targets (which were agreed by all governments), the report does not include targets.

The OID report has several elements:

- this overview, which summarises the report's key messages
- the main report (available electronically), which provides the evidence base supporting the report's framework, and more detailed information on outcomes
- attachment tables (available electronically), which expand on the data used in the report.

## National reports on Aboriginal and Torres Strait Islander Australians

### Report on Government Services Indigenous Compendium

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Annual**

**Purpose:** Performance of (mostly mainstream) government funded and/or provided services to Indigenous Australians.

### Indigenous Expenditure Report

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Biennial**

**Purpose:** Assist governments to understand levels and patterns of expenditure on services that relate to Indigenous Australians.

### National Indigenous Reform Agreement Performance Report

Requested by **COAG**

Produced by **CRC<sup>a</sup>**

Frequency **Annual**

**Purpose:** Independent assessment of Australian Government and State and Territory government progress towards the six Closing the Gap targets, and associated performance indicators.

### The Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples: an overview

Requested by **AIHW**

Produced by **AIHW**

Frequency **2-3 yearly**

**Purpose:** A comprehensive statistical overview of topics important to the health and welfare of Indigenous Australians.

### Overcoming Indigenous Disadvantage

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Biennial**

#### Purpose

The nationally recognised set of indicators on the wellbeing of Australia's Indigenous peoples.

#### Content

Strategic framework of outcome indicators, whole of government perspective to achievement of agreed priority outcomes.

### Aboriginal and Torres Strait Islander Health Performance Framework Report

Requested by **CHC**

Produced by **AHMAC**  
(summary policy report) &  
**AIHW** (detailed analysis)

Frequency **Biennial**

**Purpose:** Measures health outcomes, determinants of health and health system performance.

### Closing the Gap Clearinghouse Publications

Requested by **COAG**; Produced by **AIHW** in  
collaboration with **AIFS**

Frequency **Regular**

**Purpose:** The Closing the Gap Clearinghouse publications synthesise research and evaluation evidence about what works to overcome Indigenous disadvantage. The Clearinghouse provides a single point for gathering and disseminating reliable information to underpin policy development in Indigenous affairs.

### Closing the Gap – Prime Minister's Report

Requested by **Prime Minister**

Produced by: **PM&C<sup>b</sup>**

Frequency **Annual**

**Purpose:** Prime Minister's report to Parliament on progress against the six Closing the Gap targets and developments in Australian Government Indigenous policies and programs.

**Abbreviations:** **ABS** Australian Bureau of Statistics. **AHMAC** Australian Health Ministers Advisory Council. **AIFS** Australian Institute of Family Studies. **AIHW** Australian Institute of Health and Welfare. **COAG** Council of Australian Governments. **CHC** COAG Health Council. **CRC** COAG Reform Council. **PM&C** Department of the Prime Minister and Cabinet. **SCRGSP** Steering Committee for the Review of Government Service Provision.

<sup>a</sup> The CRC was responsible for producing the NIRA report until 30 June 2014. The May 2014 Commonwealth Budget gave the Department of the Prime Minister and Cabinet an ongoing role in monitoring performance under National Agreements. <sup>b</sup> The Closing the Gap report was previously produced by the Commonwealth Department of Families, Housing, Community, on behalf of the Australian Government.

---

## How were Aboriginal and Torres Strait Islander Australians involved in the OID report?

Aboriginal and Torres Strait Islander Australians were actively involved in producing this report:

- the report had its origins in a recommendation of the Council for Aboriginal Reconciliation in 2000
- Aboriginal and Torres Strait Islander individuals and organisations from cities and regional and remote areas across Australia participated in consultations and information sessions during the development of this and previous editions of the report
- the National Congress of Australia's First Peoples is a member of the working group that advises the Steering Committee on the content of the report
- a wide range of Aboriginal and Torres Strait Islander organisations and experts reviewed relevant sections of the report, and are acknowledged in the introduction to each section of the main report
- Aboriginal and Torres Strait Islander Australians contributed to a key development in this Report — a broadening of focus from *overcoming disadvantage* to *improving wellbeing*. The report framework has been amended to highlight new indicators that focus on outcomes that Aboriginal and Torres Strait Islander Australians said are important to them (see 'Changes for this edition of the report' for details).

## Understanding Indigenous disadvantage

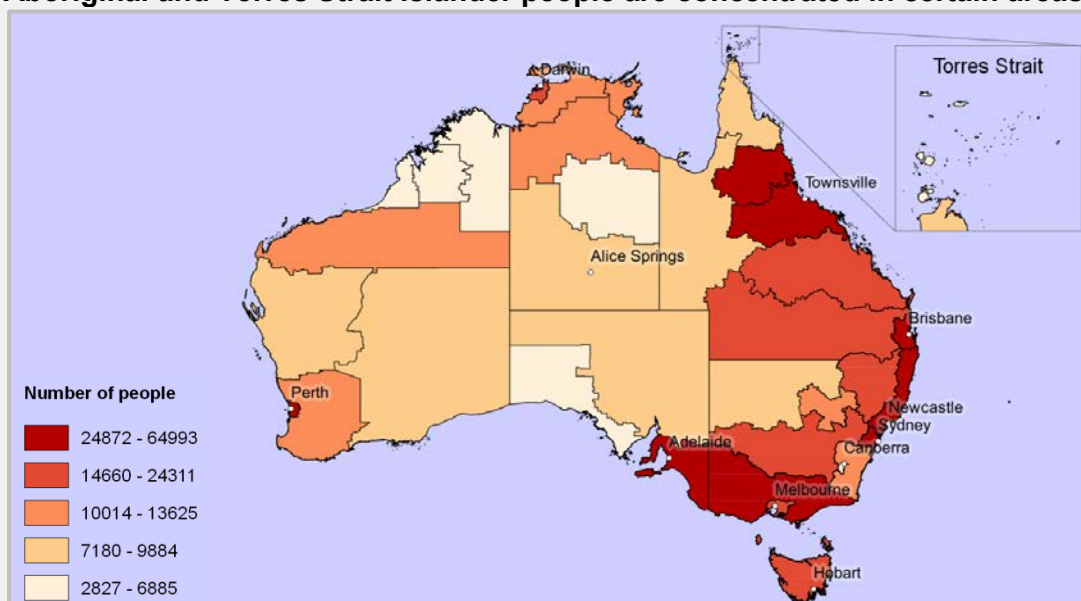

Some Aboriginal and Torres Strait Islander Australians experience little or no disadvantage compared with non-Indigenous Australians (although available data suggest that this is a relatively small group). However, other Aboriginal and Torres Strait Islander Australians are highly disadvantaged, and outcomes can vary markedly by geography, age, sex and other socioeconomic factors.

To understand the information in this report, it is important to consider the factors that have affected the outcomes being measured. Disadvantage may have both immediate social and cultural determinants, and deeper causes. Many readers will be familiar with much of the history of Australia's Indigenous peoples since European settlement, and will be conscious of the importance of seeing the information in this report in the context of that history. The main report includes a brief summary of the historical context, and an extensive list of additional sources providing a range of views on how historical events may have affected the contemporary lives of Aboriginal and Torres Strait Islander Australians.

## Aboriginal and Torres Strait Islander Australians demographics

Based on the most recent national Census, as at 30 June 2011, an estimated 670 000 people identified as Aboriginal and/or Torres Strait Islander Australians. This was 3 per cent of the estimated total Australian population of 22 340 000 people. In 2011, an estimated 606 000 people (90 per cent of the 'Indigenous' population) were of Aboriginal origin only, 38 100 people (6 per cent) were of Torres Strait Islander origin only and 25 600 people (4 per cent) were of both origins.

### Aboriginal and Torres Strait Islander people are concentrated in certain areas<sup>a,b</sup>

<sup>a</sup> The estimated Aboriginal and Torres Strait Islander population by Indigenous regions at 30 June 2011. <sup>b</sup> The legend is not continuous as there are no regions with numbers in between these five categories.

At 30 June 2011, large proportions of the Aboriginal and Torres Strait Islander population lived in NSW (31 per cent), Queensland (28 per cent), WA (13 per cent) and the NT (10 per cent). The largest proportions of non-Indigenous people lived in NSW (32 per cent), Victoria (25 per cent) and Queensland (20 per cent).

### Proportion of population by State and Territory, 30 June 2011

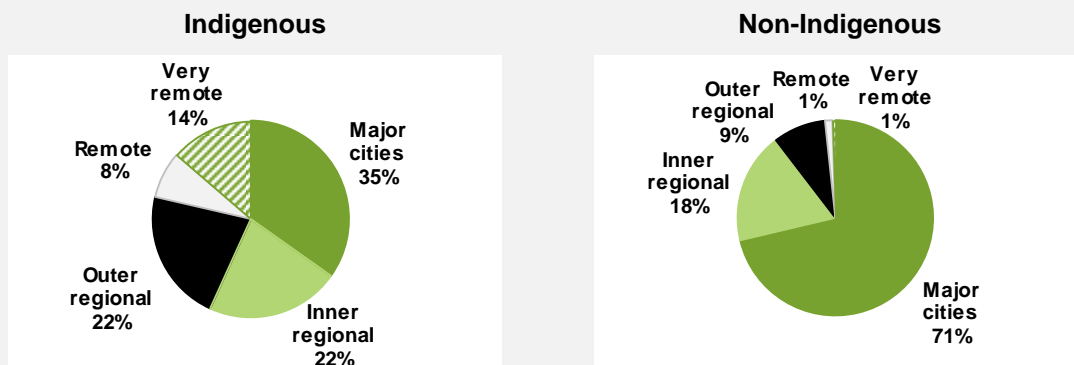

Sources: ABS 2013, Estimates of Aboriginal and Torres Strait Islander Australians, June 2011, Cat. no. 3238.0.55.001; ABS 2014, Estimates and projections, Aboriginal and Torres Strait Islander Australians 2001 to 2026, Cat. no. 3238.0.

## Remoteness is a key variable for some outcomes

Most Aboriginal and Torres Strait Islander Australians lived in major cities or regional areas as at 30 June 2011 (35 per cent in major cities, 22 per cent in inner regional areas and 22 per cent in outer regional areas). However, significant proportions lived in more remote areas (8 per cent in remote areas and 14 per cent in very remote areas). Less than 2 per cent of non-Indigenous Australians lived in remote plus very remote areas.

### Proportion of the Australian population by remoteness area, 30 June 2011

Source: ABS 2013, Estimates of Aboriginal and Torres Strait Islander Australians, June 2011, Cat. no. 3238.0.55.001.

For most indicators that can be disaggregated by remoteness, outcomes for Aboriginal and Torres Strait Islander Australians worsen as remoteness increases.

### Selected outcomes for Indigenous people by remoteness, 2012-13

<sup>a</sup> Fully engaged in post-school education, training and/or employment.

Sources: See main report: Year 12 — section 4.5; Cert III or above — section 4.7; Home ownership — section 9.3; Youth fully engaged — section 7.4; Overcrowding — section 10.1.

---

## **Why is so much of the information reported at the national level?**

This report measures outcomes for Aboriginal and Torres Strait Islander Australians, often at the aggregate (national and State and Territory) level. It is important to have an aggregate picture of outcomes, because Aboriginal and Torres Strait Islander Australians are over-represented among Australians facing disadvantage, and this disadvantage appears more persistent over time and across generations. The indigenous peoples of countries with similar colonial histories to Australia, such as Canada, the United States of America and New Zealand, also experience high rates of disadvantage. A focus on what is happening at the aggregate level is important, to help ensure the underlying causes of Indigenous disadvantage are being addressed.

However, the Steering Committee acknowledges that the outcomes measured in this report can vary markedly by geography, age, sex, employment and other factors. Throughout the report and in the attachment tables, outcomes are presented by remoteness and other relevant characteristics wherever possible. In addition, the analysis of multiple disadvantage in chapter 13 explores many of the complex factors that contribute to disadvantage.

There are particular differences between Aboriginal Australians and Torres Strait Islander Australians. The small number of Torres Strait Islander people makes reporting difficult, but available data are presented in chapter 12 of the main report and summarised in this overview in the section on ‘Outcomes for Torres Strait Islander people’.

## **The OID indicator framework**

The OID report is based on a framework of indicators that aim to measure the wellbeing of Aboriginal and Torres Strait Islander Australians. The framework is based on evidence about the underlying causes of disadvantage, and the positive factors that contribute to wellbeing.

At the top of the framework, three closely linked priority outcomes reflect a vision of how life should be for Aboriginal and Torres Strait Islander Australians. These priority outcomes have been endorsed by Aboriginal and Torres Strait Islander Australians and by governments.

It is difficult to measure progress against such broadly stated outcomes. So the framework includes two layers of measurable indicators.

- The first layer of indicators is made up of the six Closing the Gap targets agreed by Australian governments, and six headline indicators developed by the Steering

---

Committee. These indicators measure important high level outcomes, which typically require coordinated, long term action to achieve significant progress.

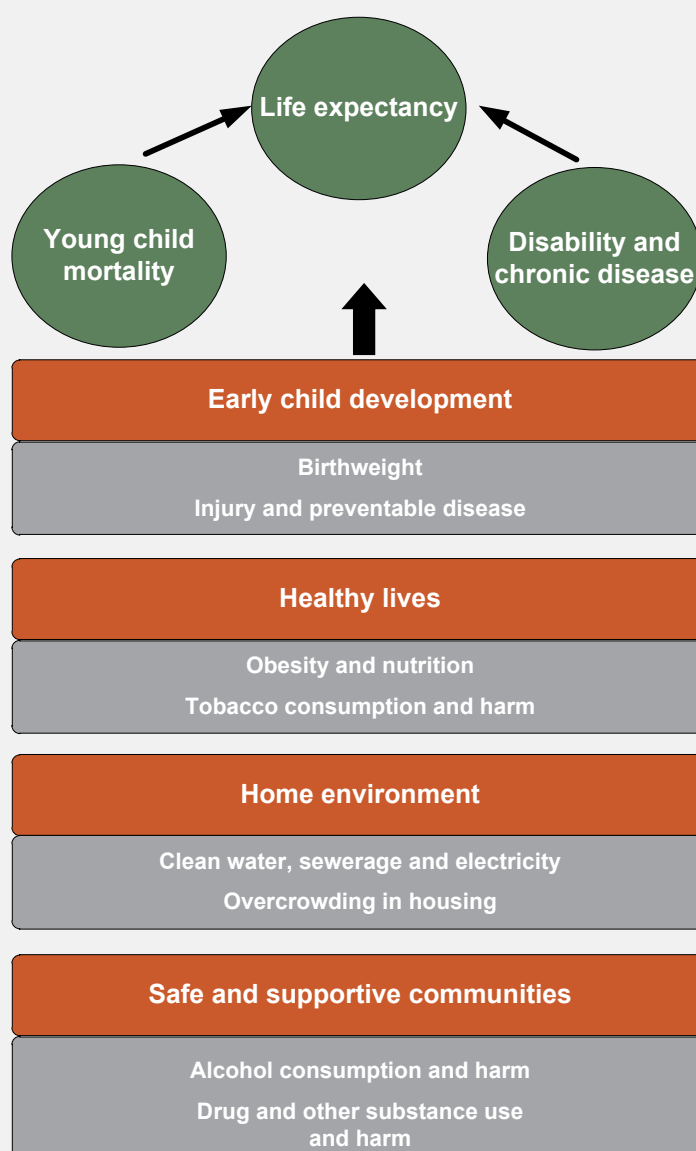

- The second layer of indicators measure shorter-term outcomes in seven strategic areas. Evidence shows that targeted action in these areas is needed in order to achieve the COAG targets and headline indicators.

The logic behind the framework is that, over time, improvements in the strategic change indicators will lead to changes in the COAG targets and headline indicators, demonstrating progress toward the priority outcomes.

As illustrated in the diagrams below, coordinated action across strategic areas is usually required to achieve better outcomes. And conversely, sometimes a single, well-targeted action can lead to improvements across many strategic areas.

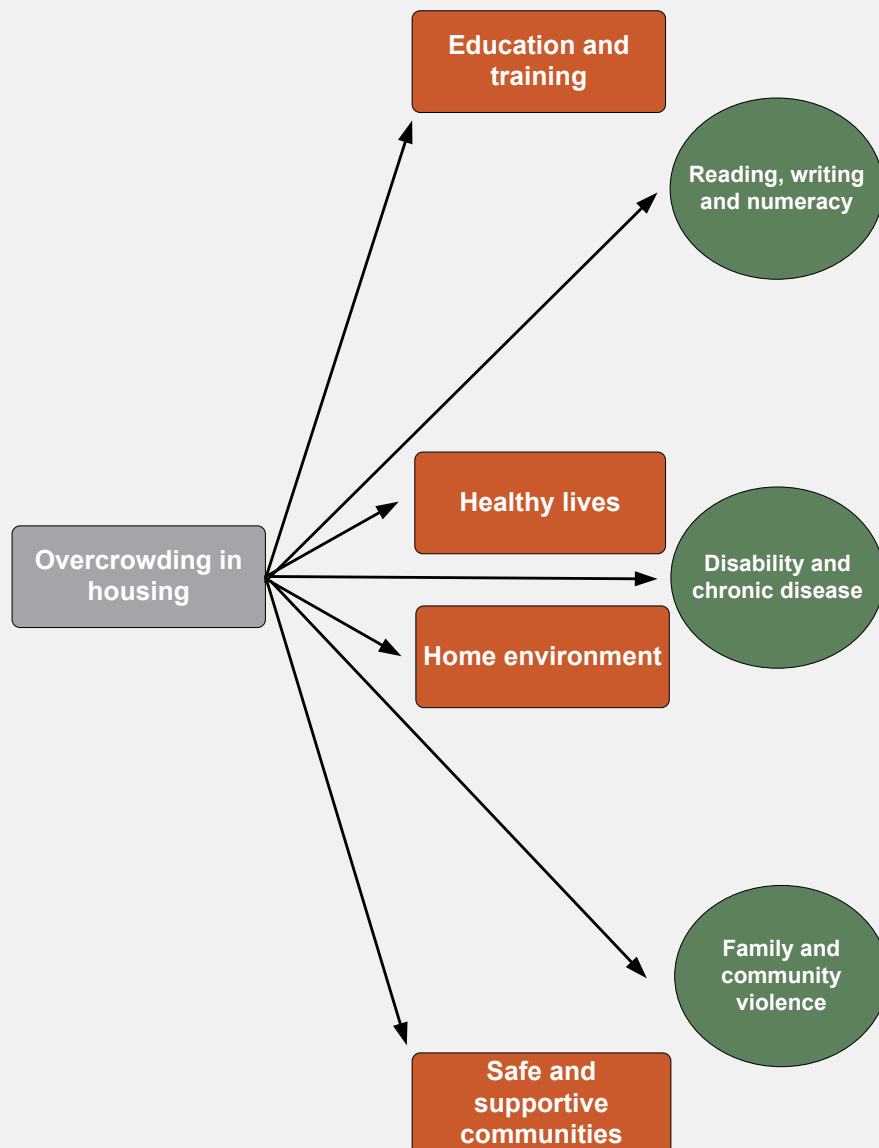

## Disadvantage can have multiple causes

The COAG target of 'Life expectancy' is linked to the 'Young child mortality' target and the 'Disability and chronic disease' headline indicator. In turn, these outcomes are influenced by outcomes such as 'Birthweight' and 'Injury and preventable disease' in the 'Early child development' strategic area for action, and 'Obesity and nutrition' and 'Tobacco consumption and harm' in the 'Healthy lives' strategic area. But actions in these areas must be supported by actions to address outcomes such as 'Access to clean water and functional sewerage and electricity' and 'Overcrowding in housing' in the 'Home environment' strategic area, and 'Alcohol and drug consumption and harm' in the 'Safe and supportive communities' area. Other social determinants of health in the education and employment areas must also be addressed.

### Some actions can have multiple effects

Reducing overcrowding can affect outcomes in the 'Education and training', 'Healthy lives', 'Home environment' and 'Safe and supportive communities' strategic areas, and can contribute to the COAG target of 'Reading, writing and numeracy' and the headline indicators of 'Disability and chronic disease' and 'Family and community violence'. Other influences are also important but there is sufficient evidence for education, health and justice departments to be concerned about housing issues.

### Changes for this edition of the report

The indicator framework has evolved over time. Following the 2011 OID report, the Steering Committee agreed to an independent review of the report. After broad consultation with Aboriginal and Torres Strait Islander Australians and organisations,

---

governments and academics, the review found a general desire for more 'strengths-based' reporting and for more visible engagement with Aboriginal and Torres Strait Islander Australians.

The Steering Committee developed a set of proposed responses to the review and conducted further consultations before introducing the following changes:

- an increased focus on 'strengths-based' reporting and Aboriginal and Torres Strait Islander concepts of wellbeing (see particularly the renamed 'Governance, leadership and culture' strategic area)
- increased engagement with Aboriginal and Torres Strait Islander Australians in all phases of the reporting process, including:
  - inviting the National Congress to join the OID Working Group that advises the Steering Committee
  - seeking the advice of Aboriginal and Torres Strait Islander organisations and experts on report content.

Detailed information about the independent review and the Steering Committee's responses is available on the Review website ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)).

---

## Things that work

Not everything can be reported using indicators. This report includes many ‘things that work’ — case studies of actions that are making a difference for Aboriginal and Torres Strait Islander Australians. Several of these case studies are drawn from the Closing the Gap Clearinghouse, established by COAG to gather information on what works to overcome Indigenous disadvantage.

Potential case studies were assessed against a set of formal criteria to ensure they genuinely contribute to improved outcomes. However, formal evaluations of Indigenous programs are relatively scarce. In order to provide a range of examples, the Steering Committee has also included some promising programs that have not undergone rigorous evaluation — such case studies are clearly identified in the report.

The Clearinghouse identified the following high level factors that underpin successful programs:

- flexibility in design and delivery so that local needs and contexts can be taken into account
- community involvement and engagement in both the development and delivery of programs
- trusting relationships
- a well-trained and well-resourced workforce, with an emphasis on retention of staff
- continuity and coordination of services.

The Clearinghouse factors are closely aligned to the success factors identified by the Steering Committee in previous editions of the OID report:

- cooperative approaches between Aboriginal and Torres Strait Islander Australians and government — often with the non-profit and private sectors as well
- community involvement in program design and decision-making — a ‘bottom-up’ rather than ‘top-down’ approach
- good governance — at organisation, community and government levels
- ongoing government support — including human, financial and physical resources.

Government acting alone is unable to overcome Indigenous disadvantage. Meaningful change also requires continuing involvement and action by Aboriginal and Torres Strait Islander Australians themselves, with support from the private and non-profit sectors and the general community.

---

## 4 COAG targets and headline indicators

The six COAG targets and six headline indicators are high level social and economic outcomes that must improve in order to achieve the priority outcomes. Numbers beside each indicator refer to section numbers in the main report.

These indicators are often closely inter-related and positive change will generally require action across a range of areas. In addition, most of these high level indicators are likely to take some time to improve, even if effective policies are implemented.

### 4.1 Life expectancy

Closing the Indigenous life expectancy gap within a generation (by 2031) is a COAG target.

Life expectancy is a broad indicator of a population's long-term health and wellbeing.

From 2005–2007 to 2010–2012:

- life expectancy at birth for Aboriginal and Torres Strait Islander Australians increased from 67.5 years to 69.1 years for males and from 73.1 years to 73.7 years for females.
- the gap between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians narrowed from 11.4 years to 10.6 years for males and from 9.6 years to 9.5 years for females.

## 4.2 Young child mortality

Halving the gap in mortality rates for children under five within a decade (by 2018) is a COAG target.

Young child mortality (particularly infant mortality) is a long established indicator of child health and the physical and social environment.

From 1998 to 2012, there was a significant decline in mortality rates for Aboriginal and Torres Strait Islander children aged 0–4 years (from 217 to 146 deaths per 100 000 population), with the greatest decrease in the infant (0<1 year) mortality rate (from 14 to 5 deaths per 1000 live births).

### Infant mortality rates, 1998 to 2012<sup>a,b</sup>

<sup>a</sup> Small numbers of Indigenous infant (0<1 year old) deaths contribute to variability in the reported rates. <sup>b</sup> Totals here include NSW, Queensland, WA, SA and the NT. These five jurisdictions have sufficient numbers of Indigenous deaths for reporting purposes.

Source: Figure 4.2.3 in the main report.

---

### 4.3 Early childhood education

Ensuring all Indigenous four year olds in remote communities have access to quality early childhood education within five years (by 2013) is a COAG target.

High quality early childhood education can provide children with a head start, and is associated with enhanced literacy, numeracy and social skills, and improved school completion.

In 2013, for Aboriginal and Torres Strait Islander children in the year before full time schooling:

- 74 per cent were enrolled in preschool
- 70 per cent were attending preschool, with attendance highest in remote/very remote areas (75 per cent).

This compares to 91 per cent enrolment and 89 per cent attendance for non-Indigenous children.

*Results for this indicator are unclear as improvements to the collection mean there is no comparable time series.*

#### *Things that work*

**Families as First Teachers** (NT) is a promising early learning and parenting support program, operating in 21 remote Indigenous communities since mid-2011. Preschool enrolments increased in half the sites surveyed and 95 per cent of parents were satisfied with the program and felt more skilled and able to support their child's learning and development (box 4.3.3).

## 4.4 Reading, writing and numeracy

Halving the gap for Indigenous students in reading, writing and numeracy within a decade (by 2018) is a COAG target.

Improved literacy and numeracy levels can improve social, educational and employment outcomes.

Across all subjects and year levels, the proportion of Aboriginal and Torres Strait Islander students achieving national minimum standards was lower than the proportion of non-Indigenous students, and declined as remoteness increased.

Between 2008 and 2013, the proportion of Aboriginal and Torres Strait Islander Year 3 students achieving national minimum standards for reading increased slightly, but there was no change for numeracy. There was no change for reading or numeracy for those in Years 5 and 7, no change for reading in Year 9 and a decrease for numeracy in Year 9.

### Proportion of students achieving at or above the national minimum standard for reading, by remoteness area, 2013<sup>a,b</sup>

<sup>a</sup> Exempt students were not assessed and were deemed not to have met the national minimum standard. <sup>b</sup> Error bars represent 95 per cent confidence intervals for within year comparisons. These error bars should be not be used for across year comparisons.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.25 and 34.

#### Things that work

The **Cape York Aboriginal Australian Academy Initiative** (Qld) is a pilot program operating in primary schools in Coen, Hope Vale and Aurukun. Early evaluations found general agreement among school staff and most parents that student literacy is improving (box 4.4.3).

---

## 4.5 Year 12 attainment

Halving the gap for Indigenous 20–24 year olds in year 12 or equivalent attainment rates by 2020 is a COAG target.

Students who complete year 12 or equivalent are more likely to go on to further education and training, have better employment options, and have improved economic and social wellbeing.

The proportion of Aboriginal and Torres Strait Islander 20–24 year olds completing year 12 or equivalent or above increased from 45 per cent in 2008 to 59 per cent in 2012-13. For non-Indigenous Australians, the proportion remained between 86 and 88 per cent.

### *Things that work*

The national **Australian Indigenous Mentoring Experience** program was established in 2005, with university students mentoring Aboriginal and Torres Strait Islander students in years 7 to 12. A 2012 evaluation found that the program was effective in strengthening school and post-school aspirations, sense of engagement, and sense of identity. Outcomes for mentored students were better than the national average (box 4.5.3).

## 4.6 Employment

Halving the gap in employment outcomes between Indigenous and non-Indigenous Australians within a decade (by 2018) is a COAG target.

Being employed directly improves social and economic wellbeing, and contributes to improved outcomes for individuals, families and communities.

?

The employment to population rate for Aboriginal and Torres Strait Islander 15–64 year olds increased from 38 per cent in 1994 to 54 per cent in 2008, before decreasing to 48 per cent in 2012–13 (potentially because of changes to the CDEP program).

Data on the employment to population ratio for non-Indigenous 15–64 year olds are available from 2004–05. The rate increased from 74 per cent in 2004–05 to 77 per cent in 2011–12.

*Data for this indicator are difficult to interpret due to changes over time to the Community Employment Development Projects (CDEP) program.*

### Indigenous employment to population rate, 1994 to 2012–13<sup>a</sup>

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: Figure 4.6.1 in the main report.

### Things that work

The national **Working on Country** program provides employment and training opportunities to assist Aboriginal and Torres Strait Islander Australians in rural and remote areas to undertake work in natural resource management. In May 2012 there were over 690 rangers. A 2011 evaluation found that the rangers saw the jobs as ‘real jobs’ that provided better income and conditions, more interesting work and ongoing employment, than the CDEP alternative (box 4.6.4).

The **Aboriginal Workforce Development Centre** (WA) has assisted over 900 Aboriginal job seekers into employment and over 450 into training linked to employment opportunities. A formative evaluation in 2012 reported early positive employment outcomes (box 4.6.4).

## 4.7 Post-secondary education — participation and attainment

People with a skilled vocational or higher qualification are more likely to be employed than those without. Other potential benefits include a positive influence on health outcomes and inter-generational flow-ons.

In 2012-13, 43 per cent of Aboriginal and Torres Strait Islander 20–64 year olds had a Certificate level III or above or were studying, a 17 percentage point increase from 2002. The gap between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians remained steady around 24–25 percentage points over the period.

## 4.8 Disability and chronic disease

High rates of disability and chronic disease affect the quality of life of many Aboriginal and Torres Strait Islander Australians. Disability can affect other outcomes, by creating barriers to social interaction and reducing access to services, education and employment.

In 2012, the overall rate of disability among Aboriginal and Torres Strait Islander Australians was 23 per cent, little changed from 21 per cent in 2009. After adjusting for differences in population age structures, the rate for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians.

**Disability prevalence, by age, 2012<sup>a,b,c</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The data do not include people in very remote areas. <sup>c</sup> AS = Age standardised rate.

Source: Figure 4.8.1 in the main report.

## 4.9 Household and individual income

Income levels provide an indicator of material advantage, and are an important determinant of socioeconomic status.

After adjusting for inflation, median real equivalised gross weekly household (EGWH) income for Aboriginal and Torres Strait Islander Australians increased from \$385 in 2002 to \$492 in 2008, but did not change significantly between 2008 and 2012-13 (\$465). In 2011-12, non-Indigenous median EGWH income was \$869.

### *Things that work*

The **MoneyMob Talkabout (MMT)** program (SA) assists people in remote Indigenous communities to develop basic financial management skills. A 2013 evaluation found that MMT clients were more likely than non-clients to have developed basic financial management skills (saved money, able to access bank account in emergency, know bank balance) (box 4.9.3).

The **MPower program** (Qld) operates in four Cape York communities and assists individuals and families to meet basic material needs, develop financial literacy and build assets, through saving and money management. Membership in the program ranged from 70 to 100 per cent across the communities. A 2012 evaluation found the program improved money management and assisted with budgeting and saving (box 4.9.3).

## 4.10 Substantiated child abuse and neglect

Adverse experiences in childhood can have lifelong impacts, affecting the ability of the child to regulate their own behaviour and to build trusting relationships with others.

Child protection substantiations for Aboriginal and Torres Strait Islander children increased from 30 per 1000 children in 2009-10 to 38 per 1000 children in 2012-13. The rate of Aboriginal and Torres Strait Islander children on care and protection orders increased from 11 per 1000 children in 2003-04 to 49 per 1000 children in 2012-13. Over this period, substantiations and orders for non-Indigenous children were around 3–6 per 1000 children.

*Data for this indicator are difficult to interpret, as increases in substantiations and orders might reflect a mix of changes in laws and policies relating to mandatory reporting, increased propensity to report, increased services and/or an increase in prevalence.*

---

## 4.11 Family and community violence

Family violence has a significant impact on the short- and long-term health and welfare of individuals, families and communities.

In 2008, around 23 per cent of Aboriginal and Torres Strait Islander adults reported being a victim of physical or threatened violence — similar to the rate in 2002. After adjusting for differences in population age structures, this was 2.2 (in 2002) and 1.8 (in 2008) times the rate for non-Indigenous adults, reflecting an increase in the non-Indigenous rate over this period.

### *Things that work*

The **Alice Springs Domestic and Family Violence Outreach Service** (NT) provides targeted support to women experiencing domestic and family violence. In 2012-13, almost 400 women were assisted, with around 80 per cent identified as Aboriginal. A 2012-13 evaluation found that all of the 19 women interviewed reported their safety had improved. Almost half of the women who had previously used the crisis accommodation services had not used crisis accommodation since receiving outreach services (box 4.11.3).

## 4.12 Imprisonment and juvenile detention

Imprisonment has a heavy social and economic impact. High rates of imprisonment remove adults from their roles caring for the next generation, and can lead to the 'normalisation' of incarceration among community members.

x

In 2013, after adjusting for differences in population age structures, Aboriginal and Torres Strait Islander adults were imprisoned at 13 times the rate for non-Indigenous adults. From 2000 to 2013, the imprisonment rate for Aboriginal and Torres Strait Islander adults increased 57 per cent, while the non-Indigenous rate remained fairly constant, resulting in a widening of the gap.

The daily average detention rate for Aboriginal and Torres Strait Islander youth in 2012-13 was 365 per 100 000 10–17 year olds, around 24 times the rate for non-Indigenous youth. Aboriginal and Torres Strait Islander detention rates increased sharply between 2000-01 and 2007-08, then fluctuated with no clear trend to 2012-13.

Age standardised adult imprisonment rate as at 30 June, 2000 to 2013

Source: Figure 4.12.2 in the main report.

---

## **Strategic areas for action**

The following sections summarise the key messages and ‘things that work’ for each strategic area for action. Much more information can be found in the main report. The strategic areas deliberately do not mirror typical government service areas. In some cases (such as healthy lives, or education and training), a specific service area can be expected to play a major role but, in all strategic areas, more than one government agency is relevant to achieving better outcomes. Conversely, sometimes a single, well-targeted action by one agency can lead to improvements across many strategic areas.

## **5 Governance, leadership and culture**

Effective governance and leadership, and recognition of culture, play essential parts in the social and economic development of Aboriginal and Torres Strait Islander Australians, and influence virtually all indicators in the framework. Governance refers to the way the members of a group or community organise themselves to make decisions that affect themselves and others, and includes both Aboriginal and Torres Strait Islander governance and government governance. Leadership is important to the development of a strong governance culture, and there are specific cultural aspects to Aboriginal and Torres Strait Islander leadership.

## 5.1 Valuing Indigenous Australians and their cultures

Culture is a key aspect of Aboriginal and Torres Strait Islander wellbeing — both knowledge and practice of culture by Aboriginal and Torres Strait Islander Australians, and respect for that culture among the wider community.

In 2012, four out of five general community respondents regarded Aboriginal and Torres Strait Islander culture (81 per cent) and history (85 per cent) as important, and half (50 per cent) reported feeling personally proud of the culture, all similar to responses in 2008.

### *Things that work*

**Reconciliation Action Plans (RAPs)** are formal reconciliation commitments undertaken by organisations, promoted by Reconciliation Australia. Reconciliation Australia found that RAP organisations are more likely to be proud of, and trust, Aboriginal and Torres Strait Islander Australians and their cultures, and to take action to support reconciliation (box 5.1.3).

**National Indigenous Television (NITV)** is a free to air channel that aims to inform, entertain and educate Aboriginal and Torres Strait Islander and non-Indigenous audiences. Indigenous radio and television help to sustain language and culture; provide a vital channel of news and information for Aboriginal and Torres Strait Islander Australians; and have the potential to provide better communication between Aboriginal and Torres Strait Islander and non-Indigenous Australians. A positive 2009 review resulted in continued Australian Government funding to the broadcaster, which was supported by a 2010 review that also made a number of recommendations to enhance the broadcaster's operations (box 5.1.3).

## 5.2 Participation in decision making

Participation in decision making is a key element of self-determination, which in turn is a critical part of governance. Participation includes both wanting to participate, and feeling that one can.

### **Data gap**

As at 30 June 2014, 13 members of parliament across Australia identified as being Aboriginal and Torres Strait Islander. Parity of representation with population share is mixed across jurisdictions.

*There are no data available on Aboriginal and Torres Strait Islander Australians wanting to, and feeling that they can, participate in decision making.*

### *Things that work*

The **Australian Electoral Commission's Indigenous electoral participation program** is aimed at empowering Aboriginal and Torres Strait Islander Australians to exercise their right to vote. A 2011 evaluation found that the program's early results were positive, that it 'has a significant role to play in addressing the barriers to participation of Indigenous people in democratic processes' and made a number of recommendations to improve the program's performance (box 5.2.3).

---

### 5.3 Engagement with services

Positive engagement with services is critical to improve outcomes for Aboriginal and Torres Strait Islander Australians. Engagement covers both access to services and the culturally appropriate delivery of services.

#### Data gap

In 2008, 30 per cent of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported problems accessing services in the previous 12 months, with this proportion highest in very remote areas (48 per cent).

*There are no time series data available on problems accessing services and no comparable times series data on communication with service providers. It is anticipated that time series data will be available for the next report.*

#### Things that work

The **Anyinginyi Health Aboriginal Corporation's Eye Program** (NT) is a promising program that coordinates optometrist and eye specialist visits, and runs culturally appropriate clinics in the Tennant Creek and Barkly region. Program successes over 2007–2008 included:

- an increase from 7 to 78 days of services offered each year
- an increase from 52 to 82 per cent in clients receiving custom made spectacles
- improved continuity of care, which gained respect from patients and community members (box 5.3.3).

---

## 5.4 Case studies in governance

Good governance contributes to the success of organisations and of government engagement with Aboriginal and Torres Strait Islander Australians.

Since 2006, the Indigenous Governance Awards (IGA) have recognised successful organisations that contribute to positive social and economic outcomes for Aboriginal and Torres Strait Islander Australians.

Research has identified six determinants of good governance that apply to Aboriginal and Torres Strait Islander organisations and communities, and governments:

- governing institutions
- leadership
- self-determination
- capacity building
- cultural match
- resources.

*There is no trend category for this indicator, which is based on qualitative case studies.*

### *Things that work*

The **NPY Women's Council** (2012 IGA Winner — incorporated organisations) is a major provider of human services in the Ngaanyatjarra, Pitjantjatjara and Yankunytjatjara lands. The Council's accomplishments include banning take-away alcohol sales at Curtin Springs roadhouse and the introduction of non-sniffable Opal fuel in Central Australia (box 5.4.2).

The **Yiriman Project** (2012 IGA Winner — non-incorporated projects and initiatives) takes young people and elders on trips back to country 'to immerse them in the stories, songs and knowledge that are their cultural heritage.' Outcomes include the healing of young people as they walk on country, and meaningful employment that values and maintains culture (box 5.4.3).

The **Cape York Welfare Reform** (Qld) aims to change social norms and behaviours across the areas of social responsibility, education, housing and economic opportunities. The 2012 CYWR evaluation report found that 'overall there is clear evidence that the wellbeing of residents in the four CYWR communities has improved over the CYWR years. Crime rates are down, infrastructure and services have improved, school attendance has risen or been maintained at high levels, and people appear happier. In no major dimension have outcomes deteriorated in these communities' (box 5.4.5).

*Note:* The winners of the latest round of IGAs were announced on 30 October 2014, too late for inclusion in this report.

## 5.5 Indigenous language revitalisation and maintenance

Language is an important cultural signifier for many Aboriginal and Torres Strait Islander Australians, and plays a significant role in the promotion of resilient communities.

### Data gap

In 2008, for Aboriginal and Torres Strait Islander Australians aged 3 years and over:

- 11 per cent were learning an Indigenous language, with the proportion highest for the youngest age group (19 per cent for 3–14 year olds)
- 17 per cent spoke an Indigenous language, with the proportion highest in remote plus very remote areas (49 per cent).

*There are no time series data on learners (measure for revitalisation) and only limited time series data for speakers (measure of maintenance). It is anticipated that time series data will be available for the next report.*

### Proportion of Indigenous people aged 15 years and over speaking an Indigenous language, by age group, 2002 and 2008<sup>a,b,c</sup>

<sup>a</sup> People whose main language spoken at home was an Aboriginal or Torres Strait Islander language were not asked whether they were learning an Indigenous language. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>c</sup> Data were not collected for persons under 15 years in 2002.

Source: Figure 5.5.3 in main report.

## 5.6 Indigenous cultural studies

Cultural studies can enhance educational achievement for Aboriginal and Torres Strait Islander students, as well as educate all students about Indigenous peoples and cultures.

Data gap

In 2008, almost two-thirds (65 per cent) of Aboriginal and Torres Strait Islander 5–24 year olds reported being taught Indigenous culture as part of their study. (No data are available for non-Indigenous Australians.)

*There is no main measure for this indicator. Data are reported on supplementary measures around students taught Indigenous culture as part of their studies and the proportion of Aboriginal and Torres Strait Islander school staff.*

### Things that work

The **Deadly Ways to Learn project** (WA) aims to promote parity of esteem between Standard Australian English and Aboriginal English. Teachers and Australian Indigenous Education Officers work together to develop two-way teaching practices that enhance literacy levels among Aboriginal students in the participating schools. An early evaluation (2003) found that the project led to more inclusive teaching practices among all participating teachers, and that students' writing and reading scores (English as a second language) exceeded agreed targets by 50 per cent (box 5.6.3).

## 5.7 Participation in community activities

There is a positive association between Aboriginal and Torres Strait Islander Australians' involvement in sporting and cultural events and a range of socioeconomic indicators, including improved mental wellbeing.

?

Between 2002 and 2008, the proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over attending cultural events decreased (from 68 to 63 per cent), while the proportion participating in sport and recreational activities increased (from 49 to 57 per cent).

*Results for this indicator are unclear as one measure (participation in sport and recreational activities) has shown progress while the other measure (participation in cultural events) has declined.*

### Things that work

The **Coonamble Sports Mentoring Program** (north-west NSW) aims to teach life skills to 12–18 year old males, through sports-based mentoring by adults at local sporting clubs. Although the program is small scale, and has not yet been independently evaluated, a 2009 review found that, in the first year of the project, the 15 participants showed 'increased social, emotional and relationship development' and 'skills and motivation to achieve their goals'. Reports from school coordinators in the following year stated that 14 participants either remained in school or gained employment in the following year, 'a figure previously unheard of in this area' (box 5.7.3).

## 5.8 Access to traditional lands and waters

Aboriginal and Torres Strait Islander Australians report that they derive physical, spiritual, emotional and cultural benefits from their connection to country. Access to traditional lands and waters gives an indication of Aboriginal and Torres Strait Islander Australians' connection to country and, for some, is associated with improved health outcomes.

In 2012-13, 72 per cent of Aboriginal and Torres Strait Islander adults recognised traditional homelands, and under 1 per cent reported not being allowed to visit homelands.

In non-remote areas, recognition of homelands decreased from 71 per cent in 1994 to 60 per cent in 2004-05, before increasing to 68 per cent in 2012-13. There was no significant change in remote areas from 2002 (86 per cent) to 2012-13 (88 per cent). (Earlier data are not available for remote areas.)

### Proportion of Indigenous people aged 18 years and over who recognise and live on homelands/traditional country, by remoteness area, 2012-13

<sup>a</sup> Includes respondents that did not know if they were allowed to visit homelands or not. <sup>b</sup> Includes people who refused to answer, or who provided 'don't know' or 'not stated' responses.

Source: Figure 5.8.1 in the main report.

---

## 6 Early child development

Providing children with a good start can have a long lasting effect on the rest of their lives. This early stage can open up opportunities for the future — but can also create barriers that prevent children achieving their full potential. Poor maternal health, growing up in households with multiple disadvantage, or having poor access to effective services can affect children’s development, health, social and cultural participation, educational attainment and employment prospects. The indicators in this strategic area focus on the early drivers of long-term wellbeing or disadvantage.

### 6.1 Antenatal care

Antenatal care provides expectant mothers with information and early screening that can identify and help manage issues that may affect birth outcomes.

#### Data gap

Fifty per cent of Aboriginal and Torres Strait Islander women who gave birth in 2011 attended at least one antenatal visit in the first trimester. Time series data are limited but gaps in antenatal care attendance rates narrowed in some jurisdictions between 2007 and 2011.

In 2011, after adjusting for differences in population age structures, Aboriginal and Torres Strait Islander mothers attended their first antenatal visit later in pregnancy than non-Indigenous mothers and attended less frequently.

*Nationally comparable time series data are not currently available for this indicator but are anticipated to be available for the next report.*

#### Things that work

The **Aboriginal Midwifery Access** program (ACT) provides culturally appropriate midwifery services to parents and newborns, and has encouraged more Aboriginal women to visit midwives at an early stage of pregnancy. A 2011 evaluation found the service was a benchmark program for parents and newborns (box 6.1.3).

The promising **Bumps, Babies and Beyond** program (Mildura, Victoria) supports parents, particularly mothers, to develop positive interactions with their babies, improve connectedness to support networks, reduce depression and anxiety, and assist development of secure parent/child attachments. The success of the program has been recognised at a local and State level, resulting in an invitation to present at the World Association for Infant Mental Health International conference (box 6.1.3).

---

## 6.2

### Health behaviours during pregnancy

The health behaviours of women during and after pregnancy can be important for the wellbeing of the women and their children.

Nationally (excluding Victoria) the proportion of Aboriginal and Torres Strait Islander mothers who smoked during pregnancy decreased from 55 per cent in 2005 to 51 per cent in 2011. In 2011, after adjusting for differences in population age structures, the smoking rate for Aboriginal and Torres Strait Islander mothers was four times the rate for non-Indigenous mothers.

#### *Things that work*

The **Aboriginal Maternal and Infant Health Service** (NSW) has improved health outcomes for Aboriginal mothers and babies by providing culturally appropriate maternity care, including secondary programs on mental health, drug and alcohol, and Quit for Life Smoking cessation in pregnancy. A 2012 evaluation found an increase in women receiving antenatal care before 20 weeks gestation, and a reduction in pre-term births (box 6.2.3).

The **Stop Smoking in its Tracks** project (NSW North Coast) is a promising program that has led to a reduction in smoking, through incentives and intensive counselling, education and support. The completion rate for the trial was 86 per cent (19 women), with 84 per cent of the participants making a quit attempt and 42 per cent not smoking at 36 weeks (box 6.2.3).

### 6.3 Teenage birth rate

Teenage births are associated with poorer educational and employment outcomes for the mother, which in turn influence outcomes for the child.

?

The teenage birth rate for Aboriginal and Torres Strait Islander mothers increased from 65 births per 1000 population in 2004 to 77 births per 1000 population in 2009, before decreasing to 68 births per 1000 population in 2012. The non-Indigenous rate was consistently lower but followed a similar trend, increasing from 13 births per 1000 population in 2004 to 15 births per 1000 population in 2008, before decreasing to 13 births per 1000 population in 2012.

*Results for this indicator have fluctuated over time with no clear trend.*

#### Rate of births to Indigenous females aged 15–19 years, by single year of age, 2004 to 2012

Source: Figure 6.3.1 in the main report.

#### Things that work

The **Ngala Nanga Mai PAREnT Group Program** (La Perouse, NSW) facilitates access to health care for young Aboriginal parents and their children, with improvements reported in mental health, wellbeing and social connectedness. A 2011 evaluation found that, between 2009 and 2012, 94 participants attended the group at least once, with 31 participants regular attendees. Twenty-five participants enrolled in higher education, and at least five participants gained full time employment with support from the program (box 6.3.3).

---

## 6.4 Birthweight

Low birthweight babies have a greater risk of dying in their first year, and can have more health problems in later life.

In 2011, 11 per cent of Aboriginal and Torres Strait Islander mothers had low birthweight babies, compared with 5 per cent of non-Indigenous mothers.

For available jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT), the proportion of Aboriginal and Torres Strait Islander mothers who had low birthweight babies decreased from 12 per cent in 2000 to 11 per cent in 2011.

### *Things that work*

The national **Healthy for Life** program focuses on continuous quality improvement in maternal health, child health and chronic disease, with measured increases in birthweight for participating Aboriginal Community Controlled Health Services. An evaluation found that, over the year to June 2008, there was a decrease in the proportion of low birthweight babies and an increase in the proportion of high birthweight babies. More recent data found an increase in the proportion of normal birthweight babies from 82 per cent in 2007-08 to 84 per cent in 2010-11 (box 6.4.3).

## 6.5 Early childhood hospitalisations

Hospitalisation data provide a broad indicator of the scale of significant health issues. However, a high rate of hospitalisation may also indicate lower access and use of primary health care, as many hospital admissions could be prevented if more effective non-hospital care were available and used.

?

From 2004-05 to 2012-13, (for NSW, Victoria, Queensland, WA, SA and the NT combined), the hospitalisation rate for Aboriginal and Torres Strait Islander 0–4 year olds increased from around 23 700 to 30 400 per 100 000 population. Rates for other children remained relatively stable around 23 800 per 100 000 population, leading to a widening of the gap.

*Results for this indicator are difficult to interpret, as an increase in hospitalisations may indicate improved access to services rather than an increase in prevalence of underlying conditions. It is important to consider the leading causes, duration and frequency of children's hospitalisations.*

### Hospitalisation rates for children aged 0–4 years, NSW, Victoria, Queensland, WA, SA and public hospitals in the NT, 2004-05 to 2012-13<sup>a</sup>

<sup>a</sup> 'Other' includes non-Indigenous children and children for whom Indigenous status was not stated.

Source: Figure 6.5.1 in the main report.

---

## 6.6 Injury and preventable disease

Many hospital admissions can be prevented if effective non-hospital care is available and used.

Between 2004-05 and 2012-13 (for NSW, Victoria, Queensland, WA, SA and the NT combined), potentially preventable hospitalisation rates increased for Aboriginal and Torres Strait Islander 0–4 year olds (from around 14 700 to 16 600 per 100 000 population) and decreased for other children (from around 10 800 to 9900 per 100 000 population), leading to a widening of the gap.

From 2003–2007 to 2008–2012 (for NSW, Queensland, WA, SA and the NT combined), the potentially preventable death rate decreased for both Aboriginal and Torres Strait Islander children (from 42 to 36 deaths per 100 000 population) and non-Indigenous children (from 16 to 11 deaths per 100 000 population), with little change to the gap.

*The two main measures for this indicator have moved in opposite directions over time — an increase in the hospitalisation rate and a decrease in the death rate.*

## 6.7 Ear health

Ear infections can become a chronic disease leading to hearing impediments, and can affect children's capacity to learn and socialise.

The proportion of Aboriginal and Torres Strait Islander 0–14 year olds with a hearing condition decreased from 11 per cent in 2001 to 7 per cent in 2012-13. However, this rate is still twice the rate for non-Indigenous children.

Available data indicate that, between 2004-05 and 2012-13, hospitalisation rates for Aboriginal and Torres Strait Islander children for ear and hearing problems:

- increased for 0–3 year olds from 7 to 10 per 1000, while the rate for other children declined slightly to 12 per 1000 population
- increased for 4–14 year olds from 5 to 7 per 1000, while the rate for other children declined slightly to 5 per 1000 population.

### Prevalence of hearing conditions in children aged 0–14 years, 2001 to 2011–13<sup>a,b</sup>

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011-12).

Source: Figure 6.7.1 in the main report.

(continued next page)

---

## 6.7 (continued)

### *Things that work*

The national **Care for Kids' Ears** initiative aims to increase awareness of ear disease and hearing loss in Aboriginal and Torres Strait Islander communities. An evaluation over the two years to June 2013 found the campaign had a positive impact on awareness of ear health. Those exposed to the campaign were more likely than those who weren't to identify at least one prevention action unprompted and were more likely to have their children's ears checked in the last 12 months when they did not have any signs or symptoms (box 6.7.3).

---

## 6.8 Basic skills for life and learning

Young children who are well nurtured do better in school and develop the skills needed to be productive and responsible adults.

From 2009 to 2012, the proportions of Aboriginal and Torres Strait Islander children classified as developmentally 'on track' increased across all domains of the Australian Early Development Index (from 48–61 to 57–65 per cent). These proportions remain lower than those for non-Indigenous children (between 75–84 per cent) but the gap has narrowed across all domains since 2009 (between 1 and 6 percentage points).

### *Things that work*

The national **Home Interaction Program for Parents and Youngsters** (HIPPY) provides home tutors to work with parents from disadvantaged backgrounds for two years, to support children to transition to school. A 2011 evaluation found that the program had early positive outcomes for parents and children. Outcomes for parents, included increased confidence to teach the child and talk to teachers, improved parenting skills, better relationships with children, connectedness with other parents; knowledge of school's requirements; awareness of the child's skills and abilities, and pride in the child's achievements. Early positive outcomes for children included improved familiarity and confidence with school work (box 6.8.3).

---

## 7 Education and training

Education and training is a life-long activity, from learning and development in the home through to more formal settings of school education, vocational education and training and higher education. Education and training can help strengthen communities and regions both economically and socially, and there are strong links between higher levels of education and improved health outcomes.

### 7.1 Year 1 to 10 attendance

In May 2014, COAG agreed to a target to close the gap in school attendance between Aboriginal and Torres Strait Islander children and non-Indigenous children within 5 years. Detailed measures are yet to be determined.

Regular school attendance is important to achieving core skills, such as literacy and numeracy.

**Data  
gap**

In 2013, within individual school sectors within a State or Territory, Aboriginal and Torres Strait Islander students generally had lower attendance than non-Indigenous students, and this difference was larger in year 10 compared to year 5.

*Nationally comparable data are not currently available for this indicator but are anticipated to be available for the next report.*

### 7.2 Teacher quality

Teacher quality is considered the most important 'in school' influence on student educational outcomes.

Increasing the number of Aboriginal and Torres Strait Islander teachers could help foster student engagement and improve educational outcomes for Aboriginal and Torres Strait Islander students.

**Data  
gap**

There is currently no nationally agreed measure of teacher quality.

In 2013, Aboriginal and Torres Strait Islander Australians made up a much lower proportion of teachers than students (around 1 per cent of teachers and 5 per cent of students for both primary and secondary schools).

*There is currently no nationally agreed measure of teacher quality. Mapping the professional and personal capability dimensions of teaching is complex.*

---

### 7.3 School engagement

Attendance alone is not enough to ensure improved educational outcomes.

Data  
gap

Research suggests that school engagement is made up of three main elements: attendance, interest and motivation/effort.

*There is no nationally agreed definition of school engagement. Further work is required to develop measures and data sources.*

#### *Things that work*

The national **Sporting Chance Program** aims to improve educational outcomes for Aboriginal and Torres Strait Islander students through school-based Sports Academies in secondary schools, and Education Engagement Strategies for primary and secondary school students. A 2010 evaluation found that school staff considered that the program was having a moderate (positive) impact on school engagement (although the degree and nature of improvement varied between schools) (box 7.3.2).

## 7.4 Transition from school to work

Young people who do not successfully make the transition from education to work are at risk of long-term disadvantage.

The proportion of Aboriginal and Torres Strait Islander 17–24 year olds participating in post-school education, training or employment increased from 32 per cent in 2002 to 40 per cent in 2012–13. The non-Indigenous rate was stable (75 per cent in 2011–12), leading to a narrowing of the gap.

### Proportion of people aged 17–24 years who are fully engaged in post-school education, training or employment, 2002 to 2011–13<sup>a,b,c</sup>

<sup>a</sup> Data exclude people enrolled in secondary school. <sup>b</sup> Relative standard errors and 95 per cent confidence intervals should be considered when interpreting these data, and are available in table 7A.4.2. <sup>c</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

Source: Figure 7.4.2 in the main report.

---

## 8 Healthy lives

Health outcomes directly affect the quality of people's lives, including their ability to socialise with family and friends, to participate in the community and to work and earn an income. Physical health outcomes are affected by the living environment, access to and use of health services, and lifestyle choices. Health risk behaviours, such as smoking and poor diet, are strongly associated with many aspects of socioeconomic disadvantage. Mental health issues are affected by a complex range of medical issues, historical factors, the stressors associated with entrenched disadvantage and drug and substance misuse.

### 8.1 Access to primary health care

Primary health care services allow for the early detection and treatment of illness, active management of chronic conditions and use of prevention programs.

Access to services is a complex concept, involving sufficient supply of services and the ability and willingness to use them (which may be influenced by affordability, location and perceptions of the services).

The proxy measures of access to primary health care in this report give mixed results. For example:

- the proportion of Aboriginal and Torres Strait Islander Australians reporting their health as excellent or very good decreased from 44 per cent in 2008 to 39 per cent in 2012-13
- the proportion of Aboriginal and Torres Strait Islander adults reporting not seeing a GP/specialist in the previous 12 months fell from 19 per cent in 2001 to 14 per cent in 2012-13. This decrease was largest in remote areas (from 30 per cent to 16 per cent).

*There is no single measure of access to primary health care and the proxy measures reported have shown different trends over time.*

---

## 8.2 Potentially preventable hospitalisations

Potentially preventable hospitalisations are an indirect measure of adequate primary health care. In many cases, hospital admissions can be prevented if more effective non-hospital care is available, either at an earlier stage in disease progression or as an alternative to hospital care.

In 2012-13, after adjusting for differences in population age structures, hospitalisation rates for potentially preventable conditions were higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians:

- for chronic conditions, more than four times the rate
- for acute conditions, more than twice the rate
- for influenza and pneumonia, more than 3 times the rate and for other vaccine preventable conditions almost 6 times the rate.

*There are currently no national time series data due to improvements in coding of selected diseases over time.*

### 8.3 Potentially avoidable deaths

Reducing potentially avoidable deaths is a key contributor to life expectancy. Potentially avoidable deaths can be reduced through changes to lifestyle health behaviours and access to effective primary prevention, early intervention and appropriate medical treatment.

For the period 2008–2012, three-quarters of Aboriginal and Torres Strait Islander deaths were potentially avoidable (7079 out of 9438 deaths), compared with two-thirds of non-Indigenous deaths (112 076 out of 169 111 deaths).

Between 1998 and 2012, for available jurisdictions and after adjusting for differences in population age structures, mortality rates from potentially avoidable deaths declined at a greater rate for Aboriginal and Torres Strait Islander 0–74 year olds than for non-Indigenous 0–74 year olds, and the gap narrowed from 368 to 298 deaths per 100 000 population.

**Age standardised mortality rates for potentially avoidable deaths for people aged less than 75 years, NSW, Queensland, WA, SA and the NT, 1998 to 2012<sup>a</sup>**

<sup>a</sup> Data are reported for NSW, Queensland, WA, SA and the NT only. These five jurisdictions are considered to have adequate levels of Indigenous identification in mortality data. They do not represent an Australian total.

Source: Figure 8.3.1 in the main report.

## 8.4 Tobacco consumption and harm

Among Aboriginal and Torres Strait Islander Australians, tobacco use is the leading risk factor contributing to disease and death. It is often associated with other lifestyle health risk factors, such as excessive alcohol consumption and poor diet.

Between 2001 and 2012-13, the proportion of Aboriginal and Torres Strait Islander adults who were current daily smokers decreased from 51 per cent to 44 per cent. There was a similar decline for non-Indigenous adults from 2001 to 2011-12, with the gap relatively stable around 26 percentage points.

### Age standardised rates of current daily smokers aged 18 years and over, 2001 to 2011-13<sup>a,b</sup>

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> Current period data for Aboriginal and Torres Strait Islander Australians are from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011-13 AHS (for the period (2011-12)).

Source: Figure 8.4.1 in the main report.

## 8.5 Obesity and nutrition

High body mass and physical inactivity are significant risk factors for poor health outcomes, including cardiovascular disease, Type 2 diabetes, and some musculoskeletal conditions and cancers.

In 2012-13, 69 per cent of Aboriginal and Torres Strait Islander adults were overweight or obese. After adjusting for differences in population age structures this was 1.2 times the proportion for non-Indigenous adults in 2011-12.

*Trend results are difficult to interpret as the measurement of body mass (BMI) has improved over time.*

## 8.6 Oral health

Oral health contributes to overall health and wellbeing. Two of the most frequently occurring oral diseases are tooth decay and periodontal disease. Both are preventable and, with early treatment, curable.

Data  
gap

In 2008, 32 per cent of Aboriginal and Torres Strait Islander 0–14 year olds were reported as having teeth or gum problems, and 35 per cent had not visited a dentist in the previous 12 months. 'Waiting time' (32 per cent) and 'cost' (21 per cent) were the most common reasons for not visiting a dentist. Comparable data for non-Indigenous children are not available.

In NSW (2007) and SA, Tasmania and the NT (2008), 29 to 43 per cent of Aboriginal and Torres Strait Islander 5–10 year olds had no decayed, missing or filled baby teeth, compared with 48 to 60 per cent of non-Indigenous children.

*Nationally comparable time series data on tooth decay are not available.*

## 8.7 Mental health

Mental health is essential to the overall health and wellbeing of individuals, and includes both mental illness and overall mental wellbeing. Mental wellbeing can be affected by a broad range of factors, including domestic violence, substance misuse, physical health problems, incarceration, family breakdown and social disadvantage.

x

In 2012-13, almost one-third of Aboriginal and Torres Strait Islander adults (30 per cent) reported high/very high levels of psychological distress, an increase from 27 per cent in 2004-05.

After adjusting for population age structures, the proportion of Aboriginal and Torres Strait Islander adults experiencing high/very high psychological distress in 2012-13 was almost three times the proportion for non-Indigenous adults in 2011-12.

## 8.8 Suicide and self-harm

Mental illness is the largest risk factor for suicide, with psychological distress often being the final factor leading to spontaneous acts of self-harm. Suicide by Aboriginal and Torres Strait Islander Australians is also influenced by complex factors relating to social disadvantage and a history of trauma and grief resulting from past dislocation and mistreatment.

x

After adjusting for differences in population age structures:

- the suicide death rate for Aboriginal and Torres Strait Islander Australians in 2008–2012 was almost twice the rate for non-Indigenous Australians
- the hospitalisation rate for intentional self-harm for Aboriginal and Torres Strait Islander Australians increased by almost 50 per cent from 2004-05 to 2012-13, while the rate for other Australians remained relatively stable.

### Age standardised hospitalisation rates for intentional self-harm, NSW, Victoria, Queensland, WA, SA and the NT, 2004-05 to 2012-13<sup>a</sup>

<sup>a</sup> 'Other' includes hospitalisations where Indigenous status was recorded as non-Indigenous or not stated.

Source: Figure 8.8.2 in the main report.

### Things that work

The **Yiriman Project** (WA) takes young people, accompanied by elders, on trips back to country, to immerse them in the stories, song and knowledge that are their cultural heritage. This builds young people's confidence and improves their self-worth, and is considered to have helped curb suicide, self-harm and substance abuse in the participating communities. A 2010 qualitative study of the program found that it contributed to healing of young people as they walk on country, provided an opportunity to develop and assert culture, language and bush skills, and created meaningful employment that valued and maintained culture (box 8.8.3 and section 5.4).

## 9 Economic participation

Participation in the economy can significantly influence living standards. Having a job can lead to improved incomes for families and communities, and also enhance self-esteem and reduce social alienation. Long-term reliance on income support is correlated with the disadvantages that accompany low socioeconomic status.

### 9.1 Employment by full time/part time status, sector and occupation

The type of employment undertaken can affect rates of pay, job satisfaction, security and opportunities for advancement.

Employment data are influenced by the CDEP program. CDEP participants were counted as employed in official statistics. The phasing out of the program means that some people previously on CDEP (and counted as employed) are now counted as unemployed.

For employed Aboriginal and Torres Strait Islander Australians:

- the proportion aged 18–64 years in full time employment increased from 54 per cent in 2002 to 65 per cent in 2012–13, around 5 percentage points from the proportion for non-Indigenous Australians (70 per cent in 2011–12)
- the proportion aged 15–64 years in professional or managerial positions increased from 16 per cent in 2001 to 20 per cent in 2011, while the proportion of non-Indigenous Australians increased from 33 to 35 per cent.

**Proportion of employed people aged 18–64 years in full time employment, 2002 to 2011–13<sup>a,b,c,d</sup>**

<sup>a</sup> Includes CDEP employment. <sup>b</sup> There is no non-Indigenous comparator available for 2002. <sup>c</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>d</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

Source: Figure 9.1.1 in the main report.

(continued next page)

---

## 9.1 (continued)

### *Things that work*

The **Mossman Gorge Centre** (Qld) is a promising program that offers residential training facilities to increase Aboriginal and Torres Strait Islander employment. After one year of operation, 90 per cent of staff were Aboriginal and Torres Strait Islander Australians. A residential training facility for up to 20 students was built adjacent to the Centre. In 2012-13, 21 out of 29 students in a 20-week Certificate II in Hospitality graduated, and 15 students were placed into employment at the Centre and elsewhere (box 9.1.3).

---

## 9.2 Indigenous owned or controlled land and business

Ownership and control of land and business can provide a range of social and economic benefits, including increased income and employment.

Indigenous Land Corporation data show that, in April 2014, Aboriginal and Torres Strait Islander Australians collectively owned or controlled 16 per cent of land in Australia, with most of this land (98 per cent) in very remote areas.

Nationally in 2013, native title had been determined to exist in 21 per cent of Australia (up from 5 per cent in 2004) and registered Indigenous Land Use Agreements covered 24 per cent of Australia.

*The different forms of reported land tenure overlap and cannot be added together.*

### *Things that work*

**Indigenous Landholder Services** (WA) is a promising program that focusses on technical support, governance development and business management mentoring, to increase economic benefits to Aboriginal pastoral and agricultural producers. In the six months to June 2014, 72 properties gained sufficient capability and independence to reduce the need for ILS assistance, and three properties reached independence (box 9.2.3).

The national **Supply Nation** program assists Indigenous businesses with Certified Supplier status to enter into commercial relationships with large corporations and agencies. A post-implementation review of its predecessor program found that the concept was achieving success. Supply Nation currently works with 274 certified Indigenous suppliers and 141 member organisations (box 9.2.4).

---

---

### 9.3 Home ownership

Home ownership, although not an aspiration of all Aboriginal and Torres Strait Islander Australians, is an important indicator of wealth and saving. Home ownership also provides security of tenure and allows control over living arrangements.

The proportion of Aboriginal and Torres Strait Islander adults living in a home owned or being purchased by a member of their household increased from 22 per cent in 1994 to 27 per cent in 2002 and 30 per cent in 2012-13. The proportion for non-Indigenous Australians decreased from 74 to 72 per cent between 2002 and 2011-12 (earlier data are not available).

### 9.4 Income support

Aboriginal and Torres Strait Islander Australians are overrepresented in the Australian income support system. Although income support can provide a valuable safety net, recipients usually fall within the lowest income groups, with associated disadvantages.

From 2002 to 2012-13, the proportion of Aboriginal and Torres Strait Islander 18–64 year olds whose main source of income was employee income increased from 32 per cent to 41 per cent, with corresponding decreases in the proportions on government pensions/allowances (from 50 to 46 per cent) and CDEP/other cash income (from 15 to 5 per cent). The proportion of non-Indigenous Australians whose main source of income was employee income fluctuated over this period with no clear trend (62 per cent in 2011-12).

## 10 Home environment

Better environmental health is especially beneficial for children's physical and emotional wellbeing. Safe and healthy living conditions are influenced by the homes in which people live, the water they drink and the safe removal of waste.

### 10.1 Overcrowding in housing

Better, less cramped living conditions are linked to positive effects on health, education and family relationships.

Cultural and social factors influence the way housing is used by different peoples. This indicator emphasises the adequacy of housing to the preferred household composition — not household composition on its own.

The proportion of Aboriginal and Torres Strait Islander Australians living in overcrowded households decreased from 27 per cent in 2004-05 to 23 per cent in 2012-13, including a decrease in overcrowding in very remote areas (from 63 to 53 per cent).

The proportion of Aboriginal and Torres Strait Islander adults reporting overcrowding as a stressor halved from 21 per cent in 2002 to 10 per cent in 2012-13.

**Proportion of Indigenous people living in overcrowded households, by remoteness, 2004-05 to 2012-13<sup>a,b</sup>**

<sup>a</sup> Households requiring at least one additional bedroom, based on the Canadian National Occupancy Standard for Housing Appropriateness. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Source: Figure 10.1.2 in the main report.

## 10.2 Rates of disease associated with poor environmental health

Sanitation, water quality, food safety, disease control and housing conditions all contribute to public health. However, many rural and remote Indigenous communities struggle to achieve the basic level of environmental health that has been achieved for the rest of the population.

For NSW, Victoria, Queensland, WA, SA and the NT combined, from 2004-05 (2008-09 for intestinal infectious diseases) to 2012-13, Aboriginal and Torres Strait Islander Australians experienced higher rates of hospitalisation than other Australians for all selected diseases.

For NSW, Queensland, WA, SA and the NT combined, from 2003-2007 to 2008-2012, the death rate for Aboriginal and Torres Strait Islander Australians from diseases associated with poor environmental health decreased by 20 per cent, but was still 1.7 times the non-Indigenous rate in 2008-2012.

*The two main measures for this indicator have moved in opposite directions over time — an increase in the hospitalisation rate but a decrease in the death rate.*

### Things that work

The **East Arnhem Scabies Control Program** (NT) was established in early 2011. An evaluation in 2011-2013 found positive results (a 44 per cent decrease in total recurrences), although the generalisability of the results may be limited by the small sample size. Despite this limitation, the Central Australian Rural Practitioners Association Standard treatment manual (2014) has been updated to feature the program's model of care (box 10.2.3).

## 10.3 Access to clean water and functional sewerage and electricity services

Communities need a clean, adequate and reliable supply of water for drinking, cooking and washing; a functional sewerage system to prevent sewerage from contaminating drinking water and food; and access to a reliable electricity (or gas) supply for cooking, refrigeration, and running household appliances.

The proportion of Aboriginal and Torres Strait Islander households living in houses of an acceptable standard (including structural issues and working facilities) decreased from 83 per cent in 2008 to 78 per cent in 2012-13.

*Data on access to water, sewerage and electricity services in discrete Indigenous communities are relatively old and with limited time series.*

---

## 11 Safe and supportive communities

Safe and supportive families and communities provide a resilient, caring and protective environment, promoting a range of positive outcomes. However, problems in families and communities can contribute to disrupted relationships, social alienation, alcohol and drug misuse and family violence.

### 11.1 Alcohol consumption and harm

Alcohol is a major risk factor for Aboriginal and Torres Strait Islander wellbeing and a significant contributor to violence in Aboriginal and Torres Strait Islander communities.

According to self-reported alcohol consumption by Aboriginal and Torres Strait Islander adults in 2012-13:

- 20 per cent reported exceeding lifetime alcohol risk guidelines (the main measure for this indicator). This was similar to the proportion in 2004-05, and after adjusting for differences in population age structures, was similar to the proportion for non-Indigenous adults in 2011-12
- 23 per cent reported not consuming alcohol in the previous 12 months. After adjusting for differences in population age structures, this was 1.6 times the rate for non-Indigenous adults
- 57 per cent reported exceeding single occasion risk guidelines in the previous 12 months. After adjusting for differences in population age structures, this was 1.1 times the rate for non-Indigenous adults.

#### *Things that work*

The **Fitzroy Crossing Liquor Restriction** (Kimberley region, WA) restricted the supply of alcohol into the community. A 2008–2009 evaluation involving interviews and police data found positive effects on domestic violence, public violence and antisocial behaviour, and an increase in families purchasing food and clothes (box 11.1.3).

---

## 11.2 Drug and other substance use and harm

The misuse of legal drugs and substances and use of illegal drugs can have major negative effects on individuals, families and communities. The use of illicit drugs contributes to illness and disease, accidents and injury, violence and crime, family and social disruption, and workplace problems.

According to self-reported substance use by Aboriginal and Torres Strait Islander adults in 2012-13:

- around half (47 per cent) of adults in non-remote areas reported having never used illicit substances, similar to the proportions in 2004-05 and 2008.
- 23 per cent reported use of illicit substances in the previous 12 months, a decrease from 28 per cent in 2004-05, but not statistically significantly different to 26 per cent in 2002.

### *Things that work*

**OPAL fuel** (a low aromatic fuel) was introduced in the NT and WA to reduce petrol sniffing. It has contributed to reductions in associated antisocial behaviour, offending and contact with the criminal justice system. An evaluation in 2008 found that the prevalence of sniffing had declined in 17 out of 20 sample communities (and the number of communities with no petrol sniffing increased from two to nine) (box 11.2.3).

---

## 11.3 Juvenile diversions

Diversions, such as police cautioning and conferencing, prevent young people from entering or continuing in the formal criminal justice system.

Diversions are swift and economically efficient processes, and can reduce stigmatisation and contact with other offenders.

Data  
gap

Across jurisdictions, diversion rates for Aboriginal and Torres Strait Islander young people aged 10–17 years are around one-half to two-thirds those for non-Indigenous young people, and have remained relatively unchanged over recent years.

*Nationally comparable data are not currently available.*

### *Things that work*

**Ignite Basketball** (WA) aims to divert young people from the Armadale to Perth train lines and Northbridge on Saturday nights, as a way of reducing crime and antisocial behaviour. This promising program hosts basketball games and provides psychological support and counselling. Over 360 young people are registered in the program, with approximately 85 per cent identifying as Aboriginal and/or Torres Strait Islander. Since the inception of the program, the number of youth being detained in the Northbridge precinct has decreased from 102 in 2009 to 27 in 2013 (box 11.3.3).

The **Regional Youth Justice Services** (WA) is a promising program that focuses on the diversion of young people from formal justice processes, through the provision of advice and support, youth bail options, in-court assistance and supervision of community based orders. The program was initially trialled in Kalgoorlie and Geraldton. The number of police cautions in Kalgoorlie increased by 41.4 per cent and the number of police and judge referrals to a Juvenile Justice Service team in Geraldton increased by 82 per cent (box 11.3.3).

---

## 11.4 Repeat offending

Repeat offending and re-incarceration are significant contributors to the over-representation of Aboriginal and Torres Strait Islander Australians in the youth justice and criminal justice systems.

On 30 June 2013, 77 per cent of Aboriginal and Torres Strait Islander prisoners had a known prior imprisonment, compared with 51 per cent of non-Indigenous prisoners. These proportions have remained relatively unchanged since 2000.

In 2011-12, Aboriginal and Torres Strait Islander young people returned to youth justice supervision at between 1.3 and 1.5 times the rate of non-Indigenous young people. (This is the first year for which data are available for this measure.)

### *Things that work*

The **Magistrates Early Referral into Treatment** drug diversion program (NSW) is a tailored, case management program that diverts adult defendants in local courts with demonstrable drug problems to an intensive three-month drug treatment program. Aboriginal and Torres Strait Islander defendants make up around 18 per cent of the program. A 2009 evaluation found that, compared with similar defendants who did not participate in the program, completion of the program reduced reoffending by 12 per cent over a two-year follow up period (box 11.4.3).

---

## 11.5 Community functioning

For many people, individual wellbeing is closely tied to the wellbeing of their community as a whole.

### Data gap

Community functioning scores are based on Aboriginal and Torres Strait Islander perspectives.

In 2008, median (middle) community functioning scores were similar across sex and geographic location for children aged 0–14 years and for those aged 15 years and over, reflecting consistent experiences of community functioning.

*There are no time series data for this measure as 2008 was the first year of full reporting. Time series data are anticipated for the next report.*

### Things that work

The **Family Wellbeing Program** (northern Australia) is a cultural healing program that aims to enhance participants' capacity to deal with day-to-day stresses and to help others. It uses a group format, in which the experiences of the facilitators and participants are the main learning resource. A 2010 review of seven formative evaluations of the program concluded that it increased the capacity of participants to exert greater control over their health and wellbeing (box 11.5.3).

## 12 Outcomes for Torres Strait Islander people

Torres Strait Islander people are a culturally distinct group of Indigenous Australians. The relatively small number of Torres Strait Islander Australians limits the ability to report separately on outcomes, but data are available for some indicators.

### Outcomes for Torres Strait Islander people

Available data suggest that outcomes for Torres Strait Islander Australians are similar to those for Aboriginal Australians for: year 12; post-secondary education; home ownership; personal income; and self-assessed health status.

Labour force participation rates for 18–64 year olds in 2011–13 were higher for Torres Strait Islander Australians (71 per cent) than for Aboriginal Australians (62 per cent), although still lower than for non-Indigenous Australians (82 per cent). The unemployment rate was similar for Torres Strait Islander Australians (20 per cent) and Aboriginal Australians (19 per cent), but was lower for non-Indigenous Australians (4 per cent).

### Outcomes for 18–64 year olds, 2011–13<sup>a,b</sup>

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate <sup>b</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12). <sup>c</sup> Age range is 18 years and over.

Source: Chapter 12 in the main report; tables 9A.3.2, 12A.1.1, 12A.1.2 and 12A.1.4.

## 13 Multiple disadvantage

Different aspects of disadvantage often seem to occur together — for example, poor education appears to be linked with poor employment outcomes, and both are linked with low income. The main report presents information on the associations between different aspects of disadvantage and an overview of recent research into factors associated with the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians.

### Multiple disadvantage

#### *Associations between indicators of disadvantage*

If people who experience one type of disadvantage also experience another kind of disadvantage, the two aspects of disadvantage may be linked or associated in some way. Analysis in the main report found that rates of multiple disadvantage are higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians.

The example below shows that Aboriginal and Torres Strait Islander Australians who are not in the labour force are more likely than non-Indigenous Australians who are not in the labour force to experience other disadvantages.

#### **People aged 15–64 years not in the labour force — associations with selected characteristics, 2011–13<sup>a,b</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

Source: Figure 13.1.2 in the main report.

#### *Recent research into factors associated with disadvantage*

The main report summarises recent research by the Centre for Aboriginal Economic Policy Research (CAEPR) and the Telethon Kids Institute.

---

## Future directions in data

All Australian governments have agreed that improvement of data on Aboriginal and Torres Strait Islander Australians is a high priority, and there have been improvements in many data sources since the first OID report in 2003. However, there are still some key data gaps.

---

<i>Indicator</i>	<i>Data priority</i>
Life expectancy and mortality	Continue work on improving Indigenous mortality (deaths) data, to inform estimation of life expectancy by jurisdiction/remoteness. (Recognising the data limitations in jurisdictions with relatively small Aboriginal and Torres Strait Islander populations.)
Substantiated child abuse and neglect	Collect data on the underlying extent of child protection issues.
Participation in decision making	Collect data on the preferred measure of 'wanting to, and ability to' participate in decision making.
Indigenous cultural studies	Develop a measure and data source for this indicator.
Teacher quality	Develop a measure and data source for this indicator.
School engagement	Develop a measure and data source for this indicator.
Tobacco, alcohol and drug and other substance use and harm	Collect regular, comparable data on Aboriginal and Torres Strait Islander and non-Indigenous consumption by jurisdiction and remoteness.
Access to traditional lands and waters	Expand the availability of data on reasons why people do not identify with or recognise homelands. Collect data on access to traditional waters.
Oral health	Expand the availability of comparable data on tooth decay.
Juvenile diversions	Develop and collect nationally comparable data.
Self-employment and Indigenous business	Collect data on Indigenous business.
Access to clean water and functional sewerage and electricity services	Collect regular data allowing comparison between services in Indigenous communities and those delivered by major utilities.

# 1 About this report

## **Aboriginal and Torres Strait Islander terminology**

The Steering Committee acknowledges current debate around appropriate terminology to refer to the Indigenous peoples of Australia.

Following feedback on previous editions of the report, this report generally uses the term 'Aboriginal and Torres Strait Islander Australians' to describe Australia's first peoples and 'non-Indigenous Australians' to refer to Australians of other backgrounds, except where quoting other sources, and in charts, figures and attachment tables.

This is the sixth report in the Overcoming Indigenous Disadvantage (OID) series. The OID report measures the wellbeing of Aboriginal and Torres Strait Islander Australians, and Aboriginal and Torres Strait Islander Australians have been actively involved in the development and production of the report.

Section 1.1 describes the origins of the report, and section 1.2 describes its key objectives. Section 1.3 provides a brief historical narrative to help put the information in the report into context. Section 1.4 summarises some recent developments in government policy that have influenced the report and section 1.5 provides further information on the Steering Committee and the Overcoming Indigenous Disadvantage Working Group that advises it.

## **1.1 Origins of the OID report**

The origins of this report can be traced back to the Council for Aboriginal Reconciliation's final report, *National Strategies to Advance Reconciliation* (CAR 2000), which called on all governments to report against measurable program performance benchmarks.

In December 2000, the (then) Prime Minister wrote to the (then) Ministerial Council for Aboriginal and Torres Strait Islander Affairs (MCATSIA), requesting it to develop performance reporting strategies and benchmarks. When the Council of Australian Governments (COAG) commissioned the OID report in 2002, the MCATSIA work formed the basis of extensive consultations to develop the framework for the first report.

The original terms of reference for the OID report requested the Steering Committee for the Review of Government Service Provision to:

... produce a regular report against key indicators of Indigenous disadvantage. This report will help to measure the impact of changes to policy settings and service delivery and provide a

---

concrete way to measure the effect of the Council's commitment to reconciliation through a jointly agreed set of indicators (COAG 2002, appendix 1).

The report's terms of reference was updated in 2009. The new terms of reference noted the report's significance as:

... a source of high quality information on the progress being made in addressing Indigenous disadvantage across a range of key indicators. The OID report has been used by governments and the broader community to understand the nature of Indigenous disadvantage and, as a result, has helped inform the development of policies to address Indigenous disadvantage. (p. IV)

Following an independent review of the report in 2012, the Steering Committee adopted suggestions from Aboriginal and Torres Strait Islander Australians that the focus of the report be expanded to incorporate more strengths-based reporting (see section 2.2 in chapter 2). In September 2014, COAG Senior Officials endorsed the Steering Committee's proposed changes to the framework, including the addition of several new indicators that measure outcomes that Aboriginal and Torres Strait Islander Australians said are important to them.

## **1.2 Role of the OID report**

COAG nominated two core objectives for the Overcoming Indigenous Disadvantage: Key Indicators report:

- to inform Australian governments about whether policy programs and interventions are achieving improved outcomes for Aboriginal and Torres Strait Islander Australians
- to be meaningful to Aboriginal and Torres Strait Islander Australians.

The report therefore aims to be more than a collection of data — numerous other reports and academic publications have been produced containing statistical information on Aboriginal and Torres Strait Islander Australians (box 1.2.1). This report aims to provide a practical tool for both government agencies and Aboriginal and Torres Strait Islander people and organisations.

The information in this report provides a high level view of the wellbeing of Aboriginal and Torres Strait Islander Australians. It identifies where progress is being made and draws attention to where more change is needed. The report's framework of indicators focuses on some of the factors that ultimately cause disadvantage and the factors that can contribute to wellbeing — those areas where evidence, logic and experience suggest that targeted policies will have the greatest impact.

## Box 1.1.1 National reports on Aboriginal and Torres Strait Islander Australians

### Report on Government Services Indigenous Compendium

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Annual**

**Purpose:** Performance of (mostly mainstream) government funded and/or provided services to Indigenous Australians.

### Indigenous Expenditure Report

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Biennial**

**Purpose:** Assist governments to understand levels and patterns of expenditure on services that relate to Indigenous Australians.

### National Indigenous Reform Agreement Performance Report

Requested by **COAG**

Produced by **CRC<sup>a</sup>**

Frequency **Annual**

**Purpose:** Independent assessment of Australian Government and State and Territory government progress towards the six Closing the Gap targets, and associated performance indicators.

### The Health and Welfare of Australia's Aboriginal and Torres Strait Islander Peoples: an overview

Requested by **AIHW**

Produced by **AIHW**

Frequency **2-3 yearly**

**Purpose:** A comprehensive statistical overview of topics important to the health and welfare of Indigenous Australians.

### Overcoming Indigenous Disadvantage

Requested by **COAG**

Produced by **SCRGSP**

Frequency **Biennial**

#### Purpose

The nationally recognised set of indicators on the wellbeing of Australia's Indigenous peoples.

#### Content

Strategic framework of outcome indicators, whole of government perspective to achievement of agreed priority outcomes.

### Aboriginal and Torres Strait Islander Health Performance Framework Report

Requested by **CHC**

Produced by **AHMAC**  
(summary policy report) &  
**AIHW** (detailed analysis)

Frequency **Biennial**

**Purpose:** Measures health outcomes, determinants of health and health system performance.

### Closing the Gap Clearinghouse Publications

Requested by **COAG**

Produced by **AIHW in collaboration with AIFS**

Frequency **Regular**

**Purpose:** The Closing the Gap Clearinghouse publications synthesise research and evaluation evidence about what works to overcome Indigenous disadvantage. The Clearinghouse provides a single point for gathering and disseminating reliable information to underpin policy development in Indigenous affairs.

### Closing the Gap – Prime Minister's Report

Requested by **Prime Minister**

Produced by: **PM&C<sup>b</sup>**

Frequency **Annual**

**Purpose:** Prime Minister's report to Parliament on progress against the six Closing the Gap targets and developments in Australian Government Indigenous policies and programs.

**Abbreviations:** **ABS** Australian Bureau of Statistics. **AHMAC** Australian Health Ministers Advisory Council. **AIFS** Australian Institute of Family Studies. **AIHW** Australian Institute of Health and Welfare. **COAG** Council of Australian Governments. **CHC** COAG Health Council. **CRC** COAG Reform Council. **FaHCSIA** Department of Family and Housing, Community Services and Indigenous Affairs. **PM&C** Department of the Prime Minister and Cabinet. **SCRGSP** Steering Committee for the Review of Government Service Provision.

<sup>a</sup> The CRC was responsible for producing this report until 30 June 2014. The May 2014 Commonwealth Budget gave PM&C an ongoing role in monitoring performance under National Agreements. <sup>b</sup> This report was previously produced by FaHCSIA, on behalf of the Australian Government.

The information in the report can help inform the design of policies, by illustrating the nature of the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians, and identifying some of the significant sources of their wellbeing.

---

The report draws on many examples of evaluated programs to identify the factors behind policies and programs that have been successful in addressing Indigenous disadvantage. However, while this report draws on evaluations conducted by other bodies, this report does not attempt to evaluate specific policies or programs — rigorous evaluations require detailed information about the aims, costs and benefits of individual programs and are beyond the scope of this report.

Similarly, the report does not include targets for most of its indicators (the COAG targets, which have been agreed by all governments, are an exception, and the report does not specifically assess performance against these targets). While the aim is to close the gap in outcomes, more information about the policies and programs of all governments would be necessary to set meaningful targets.

Data limitations, and a desire to keep the report to a manageable size, mean that much of this report concentrates on outcomes at the national and State and Territory level. A focus on what is happening at the aggregate level is important, to help ensure the underlying causes of disadvantage and foundations of wellbeing are being addressed.

However, the Steering Committee recognises the diversity of Aboriginal and Torres Strait Islander cultures and experiences and acknowledges that the outcomes measured in this report can vary markedly by geography, age, sex, employment status and other factors. Some Aboriginal and Torres Strait Islander Australians experience little or no disadvantage compared to non-Indigenous Australians (although the data suggest that this is a relatively small group), while some Aboriginal and Torres Strait Islander Australians are highly disadvantaged. Throughout the report, outcomes are presented by remoteness and other characteristics wherever possible. In addition, the analysis of multiple disadvantage in chapter 13 explores some of the complex factors that contribute to disadvantage.

In particular, there are significant differences between Aboriginal Australians and Torres Strait Islander Australians. The small number of Torres Strait Islander people makes it difficult to report about them separately, but available data are summarised in chapter 12.

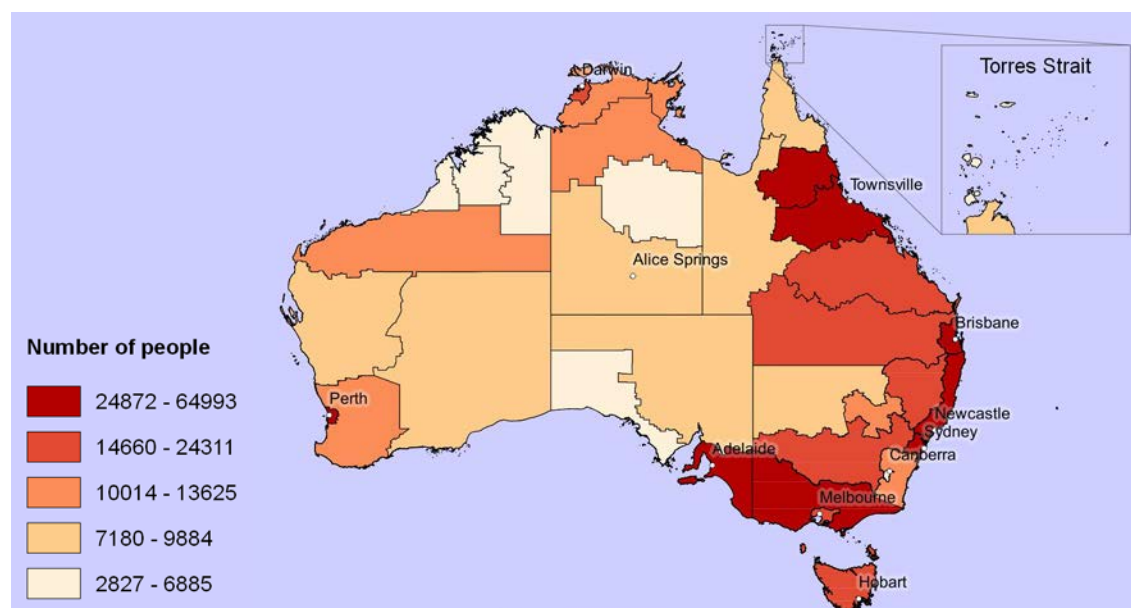

## **1.3 Putting the the OLD report into context**

This report presents information for key indicators of the disadvantage and wellbeing of Aboriginal and Torres Strait Islander Australians.

Following the 2011 Census, 670 000 Australians were identified as being of Aboriginal and/or Torres Strait Islander origin. This Aboriginal and Torres Strait Islander population is diverse — made up of many different nations, clans and skin groups with different cultures, languages histories and perspectives (Flood 2006, p. 17; Broome 2010, p. 12). Aboriginal and Torres Strait Islander Australians may live in metropolitan, rural and remote settings, in urbanised, traditional or other lifestyles, and may move between these ways of living. Overall, the Aboriginal and Torres Strait Islander population is relatively

young, largely urbanised and fast-growing. Figure 1.3.1 shows the estimated distribution of Aboriginal and Torres Strait Islander people in Australia in 2011 — the heavier shades indicate higher numbers of Indigenous people living in those areas.

**Figure 1.3.1 Where do Aboriginal and Torres Strait Islander Australians live?<sup>a,b</sup>**

<sup>a</sup> The estimated number of Aboriginal and Torres Strait Islander Australians by ABS Indigenous regions as at 30 June 2011. <sup>b</sup> The legend is not continuous as some there are no regions with numbers in between the five categories derived.

Source: ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0, Canberra.

Torres Strait Islander Australians continue to maintain a unique cultural identity. They are a separate people in origin, history and way of life, with many cultural connections to New Guinea and nearby islands (Shnukel 2001; AIATSIS 2008, pp. 2, 6, 24, 30). In 2011, 38 100 people identified as being of Torres Strait Islander origin only, with over 80 per cent living on the Australian mainland. The small numbers involved make it difficult to report separately on their outcomes, but available data are summarised in chapter 12.

Over time, community and individual attitudes toward Aboriginal and Torres Strait Islander people have changed, and recent surveys indicate high levels of recognition of the importance of Aboriginal and Torres Strait Islander cultures to Australia's identity as a nation (RA 2013). Similarly, over time there has been an encouraging increase in the willingness of Aboriginal and Torres Strait Islander Australians to identify in official data collections. The ABS found that this was at least partly driven by a sense of pride and confidence in their identity, and the perception that identification can promote recognition of issues and lead to benefits for Aboriginal and Torres Strait Islander peoples

(ABS 2013b, pp. 10, 11). Nationally, just over one third (27 800) of the increase in the count of Aboriginal and/or Torres Strait Islander people in the 2011 Census cannot be explained by the standard demographic components of population change, such as births and deaths. This represents 5 per cent of the total 2011 Census count for Aboriginal and Torres Strait Islander people in 2011 (ABS 2013a). This unexplained increase may affect the comparability over time of outcomes measured using Census data.

This report focusses on relatively aggregated data (although behind the figures there is great diversity in the lives of Aboriginal and Torres Strait Islander Australians). On average, Aboriginal and Torres Strait Islander Australians experience poorer outcomes than non-Indigenous people wherever they live. For many indicators in the report, the level of disadvantage tends to increase with remoteness (figure 1.3.2), although for some important cultural indicators, such as connection with country and language maintenance and revitalisation, outcomes improve with remoteness.

**Figure 1.3.2 Selected outcomes for Aboriginal and Torres Strait Islander Australians vary by remoteness, 2012-13<sup>a,b</sup>**

<sup>a</sup> More detail on all of these outcomes can be found in the relevant sections of the report. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>c</sup> Fully engaged in post-school education, training and/or employment.

---

## 1.4 Purpose of the report

It is important to have an overall picture of outcomes for Aboriginal and Torres Strait Islander Australians, because they are over-represented among Australians facing disadvantage, and this disadvantage appears more persistent over time and across generations. The Indigenous peoples of countries with similar colonial histories to Australia, such as Canada, the United States of America and New Zealand, also experience high rates of disadvantage (Cooke et al. 2007; Armitage 1995 cited in Cornell 2006).

This report tracks progress against the COAG targets, plus a number of other indicators of disadvantage and wellbeing, to provide accountability for overcoming Indigenous disadvantage.<sup>1</sup> In this report, a number of indicators show improvements, particularly some population health and higher education measures. However, significant gaps in outcomes remain. Particularly concerning, it appears that drug and alcohol and family/community violence outcomes have stalled, while involvement with the child protection system remains high, and mental health and youth and adult criminal justice outcomes appear to be worsening.

## 1.5 The historical context<sup>2</sup>

Disadvantage may have both immediate social, economic and cultural determinants, and deeper underlying causes. For example, the relatively high rates of violence in Aboriginal and Torres Strait Island communities are influenced by immediate factors such as alcohol and illicit drug use, mental health issues and childhood experience of violence. However, a number of researchers also suggest that deeper underlying causes include ‘intergenerational trauma’ resulting from the ongoing and cumulative effects of colonisation, loss of land, language and culture, the erosion of cultural and spiritual identity, forced removal of children, and racism and discrimination (Bryant 2009; Clapham, Stevenson and Lo 2006; HREOC 1997).

Many readers will be familiar with much of the history of Aboriginal and Torres Strait Islander Australians since European settlement, and will be conscious of the importance of seeing the information in this report in the context of that history. For other readers, the following material provides a very brief introduction to a complex and sometimes contentious subject. For readers interested in exploring the historical context further, the reference list provides a range of views on the impact of past events on Aboriginal and Torres Strait Islander Australians living now.

---

<sup>1</sup> A number of other reports include information on outcomes for Aboriginal and Torres Strait Islander people. A diagram of the key national reports is in box 1.2.1 in this chapter.

<sup>2</sup> The Steering Committee notes its appreciation to Reconciliation Australia, who reviewed a draft of this section of the report.

---

Aboriginal people have lived in Australia for some 40 000 to 60 000 years, with the Torres Strait Islands settled some 10 000 years ago (AIATSIS 2008). It is estimated that, prior to European settlement, there were some 250 distinct nations, with different languages and social systems. Much diversity remains today, with many distinct Aboriginal and Torres Strait Islander peoples of Australia.

Attachment to the land was a central element of traditional (and ongoing) Aboriginal and Torres Strait cultures, customs and laws. Yet, when the British established the penal colony of New South Wales in January 1788, the legal system operated as if Australia belonged to no one, and denied that Aboriginal and Torres Strait Islander people had sovereignty or property rights over the land.

The colonisation period resulted in many Aboriginal and Torres Strait Islander people being dispossessed of their traditional lands, at times through violence and murder. Aboriginal people began resisting European occupation within months of the founding of the colony of NSW, and there are accounts of fighting as late as the early 1930s (Egan 1996; Elder 2003; Expert Panel 2012, p. 23; Read 2007; Reynolds 2006).

Dispossession, violence and the introduction of new diseases had a devastating effect on the local populations. Although it is difficult to estimate the size of pre-settlement populations, researchers suggest that, in different locations across mainland Australia, the number of Aboriginal people declined by between 30 and 80 per cent from the time of European settlement to the early 1900s (Madden and Pulver 2009; (eds) Briscoe and Smith 2002; Smith 1980; Department of Aboriginal Affairs 1981; Butlin 1983, pp. 119–148; Diamond 1998, p. 320).

From 1860, ‘protective’ legislation (known as the ‘Aborigines Acts’) required many Aboriginal people to live on reserves. In practice, these laws placed almost unlimited discretion in the hands of reserve superintendents and police protectors — lives on the reserves were highly regulated and basic human rights were suppressed (Chesterman and Galligan 1997, p. 41; Cunneen 2001, pp. 57–58; Morris 1988, p. 50). Aboriginal people living outside reserves were spared the worst of the reserve regime, but their rights were still limited (AIATSIS 2008; Blake 1998, p. 53). Torres Strait Islander people faced special laws, including segregated cinemas, schools, churches and housing, travel restrictions and poorer health and educational opportunities (AIATSIS 2008).

From the late 1800s through much of the twentieth century, governments in several jurisdictions controlled many Aboriginal people’s wages, pensions and endowments, with much of the money mismanaged or diverted — a practice now called ‘stolen wages’ (AIATSIS 2008, p. 122; Thornton and Luker 2009, p. 647). Some governments have since put in place reparation schemes, although the passage of time and lack of records have made it very difficult to determine the full impact of ‘stolen wages’ or to determine the true value of any compensation (Western Australia Stolen Wages Taskforce 2008).

In the 1900s, governments adopted a more assimilationist approach, with explicit goals of integrating Aboriginal and Torres Strait Islander people into ‘mainstream’ society, initially

---

focused on ‘the natives of Aboriginal origin but not of the full blood’ and later extended to all Aboriginal (and Torres Strait Islander) people (Rowley 1978, pp. 320-321). The policy was defined at the 1961 Native Welfare Conference of Federal and State Ministers in these terms:

The policy of assimilation means that all Aborigines [*sic*] and part-Aborigines [*sic*] are expected to attain the same manner of living as other Australians and to live as members of a single Australian community, enjoying the same rights and privileges, accepting the same customs and influenced by the same beliefs as other Australians. (Reynolds 1972, p. 175)

Removal of Aboriginal and Torres Strait Islander children from their families became common. Between 10 and 30 per cent of Aboriginal and Torres Strait Islander children were forcibly removed from their families and communities between 1910 and 1970, now referred to as ‘the stolen generations’ (HREOC 1997, p. 31).

Aboriginal and Torres Strait Islander people did not passively accept these experiences. Some directly petitioned governments — in 1935 and 1937, petitions were presented to the Commonwealth Government seeking representation in the Parliament and the establishment of a national department of native affairs and state advisory councils. Following the lack of a response, in 1938 Aborigines from around Australia established a National Aboriginal Day Observance Committee (NADOC).<sup>3</sup> In August 1963, a further petition was presented as a pair of bark paintings, signed by 131 clan leaders of the Yolngu region (Gove Peninsula) of the Northern Territory. The bark petitions are considered ‘founding documents’ of Australia’s democracy (Australian Government nd).

Other Aboriginal and Torres Strait Islander people took more direct action, such as the ‘Gurindji Walk-Off’ in 1966, when about 250 Aboriginal pastoral workers and their families walked off the Wave Hill Station in response to the low rates of pay and poor living conditions. The action developed as a wholesale rejection of the governmental and industrial framework applying to Aboriginal pastoral populations and included a demand for the return of traditional lands (Australian Heritage Database nd).

This activism led to increasing community concern about Indigenous policy. By 1967, there was widespread support to make two amendments to the Australian constitution — to allow the Commonwealth Government to legislate with respect to Aboriginal people, and to include Aboriginal people in the Census.<sup>4</sup> The referendum, commonly regarded as a watershed in relations between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, was supported by over 90 per cent of voters, the largest majority for any Australian referendum (Expert Panel 2012, p. 32).

Rights to vote varied across states and territories (and there were often differences between legal entitlements and the practical exercise of those entitlements). The Commonwealth

---

<sup>3</sup> NADOC later became NAIDOC to include Torres Strait Islander Australians.

<sup>4</sup> In all censuses up until 1966, the Bureau of Census and Statistics (now the ABS) included ‘aboriginal natives’ in the Census count but published them in attachments to the official population count (Expert Panel 2012, p. 21).

---

*Electoral Act 1962* gave Aboriginal and Torres Strait Islander Australians the right to register and vote in federal elections, but voting was not made compulsory until 1984.

Land rights were, and continue to be, a prominent focus of Aboriginal and Torres Strait Islander activism. In the 1970s, these efforts led to governments passing various forms of land rights legislation. In the 1992 Mabo case, the High Court recognised native title, overturning the previous legal fiction that the land had belonged to no one at the time of European settlement (Expert Panel 2012, p. 35). This decision led to the Commonwealth *Native Title Act 1993*, which provides a court process for determining native title claims. However, in many circumstances, Indigenous native title is found to have been extinguished.

In the late 1960s and early 1970s, overtly paternalistic policies were formally abandoned (including the Aboriginal Acts) and a new policy of self-determination introduced. The Commonwealth Racial Discrimination Act was introduced in 1975, as a result of Australia becoming a signatory to the International Covenant on the Elimination of All Forms of Racial Discrimination.

However, actions that sought to establish equal rights for Aboriginal and Torres Strait Islander Australians sometimes had perverse effects. The successful 1966 equal pay case for Aboriginal pastoral workers led to many workers and their families being forced off the land and, over time, onto welfare (ABC Radio National 2003; Chaney 2013, p. 54; Flood 2006, p. 215). Extensive lobbying by the Federal Council for Aboriginal Advancement (later the Federal Council for the Advancement of Aborigines and Torres Strait Islanders) led to different groups of Aboriginal and Torres Strait Islander people receiving access to social security benefits at different times (Chesterman 2005). In 1959, legislation was amended to provide access to social security benefits to Aboriginal people who were not ‘nomadic’ (Chesterman 2005), with the legislation further amended in 1966 so that all Aboriginal people were eligible. However, in practice, many Aboriginal people living on government and mission stations were excluded from some welfare payments (particularly unemployment benefits) until 1976 (HREOC 1997). In 1997, the Community Development Employment Projects program was introduced, pooling unemployment benefits to create local employment opportunities in remote communities where the labour market might not otherwise offer employment. The program was later extended to all areas (including non-remote) then again restructured in 2007 when it was restricted to remote areas. From 1 July 2013, remote CDEP was rolled into the Australian Government’s Remote Jobs and Communities Program.<sup>5</sup>

Over the 1970s and 1980s, increasing desires for self-determination saw the establishment of many community controlled services, particularly primary health and legal services, many of which continue to operate today. In 1990, an elected Aboriginal and Torres Strait Islander Commission (ATSIC) was established, both to provide advice to the government and to deliver some services (although it never had responsibility for any mainstream

---

<sup>5</sup> See box 4.6.3 in section 4.6 ‘Employment’ for further information on CDEP including change in CDEP participation rates over time.

---

services delivered to Aboriginal and Torres Strait Islander people, and its level of responsibility for Indigenous-specific services declined over time) (Australia 2003).

A 2003 review of ATSIC found that it was in urgent need of structural change. While the regional council structure was considered to be working well, major changes were recommended to the governing body. The review recommended that any changes to ATSIC's program delivery role be considered as part of a Commonwealth/State examination of the most effective delivery of services and programs of significance to Aboriginal and Torres Strait Islander Australians (Australia 2003, pp. 5-6). However, following a series of national board scandals, ATSIC was abolished with bipartisan support in 2004 (AIATSIS 2008), and responsibility for services delivered by ATSIC returned to line departments. At the time, it was emphasised that 'mainstreaming' was not intended to reduce funding of services to Aboriginal and Torres Strait Islander Australians (Howard 2004).

The emphasis placed on Indigenous-specific services versus mainstream services has varied over time and across jurisdictions (for example, the majority of clients of many 'mainstream' services in the NT are Aboriginal). Both pre- and post-ATSIC, there were widespread concerns around the provision of services to Aboriginal and Torres Strait Islander Australians (by both mainstream and Indigenous-controlled service providers). In many circumstances, lack of services or poorer quality services for Aboriginal and Torres Strait Islander people appeared to be tolerated (Chaney 2013, p. 57). These concerns led to an increasing focus on monitoring of expenditure on services provided to Aboriginal and Torres Strait Islander Australians. In 2001 the Commonwealth Grants Commission was requested to conduct an inquiry into Indigenous funding, to assist the Commonwealth Government to target resources to areas of greatest need (CGC 2001). For many years the AIHW has produced a report into Aboriginal and Torres Strait Islander health expenditure (AIHW 2013). In 2008, COAG commissioned the Indigenous Expenditure Report, to estimate government expenditures on both Indigenous specific and mainstream services to Aboriginal and Torres Strait Islander Australians (SCRGSP forthcoming).

In the late 1980's and early 1990's, two Royal Commissions helped promote a deeper understanding of the issues facing Aboriginal and Torres Strait Islander Australians, and led to the establishment of some of the current institutional arrangements.

The Royal Commission into Aboriginal Deaths in Custody reported on the complex effects of dispossession, colonisation and institutional racism on Aboriginal peoples (RCADIC 1991). Partly in response to the findings of the Royal Commission, the position of the Aboriginal and Torres Strait Islander Social Justice Commissioner was created (AHRC 2013) as well as the Council for Aboriginal Reconciliation. One of the final recommendations of the Council was the establishment of a regular report on outcomes for Indigenous Australians — the origins of the Overcoming Indigenous Disadvantage report (CAR 2000). In 2000, Reconciliation Australia was established to continue the national focus for reconciliation (RA nd).

---

A national inquiry into the separation of Indigenous children from their families resulted in the 1997 report on the Stolen Generations (HREOC 1997). In 2008, the Prime Minister of Australia, with bipartisan support, made a formal apology to the Stolen Generations (Rudd 2008; Nelson 2008).

Following the ‘Little Children are Sacred’ report into the Protection of Aboriginal Children from Sexual Abuse in 2007 (Wild and Anderson 2007), the Commonwealth Government assumed a greater responsibility for Aboriginal affairs in the Northern Territory, under the Northern Territory Emergency Response (also known as the ‘Intervention’). The response has been the subject of controversy, particularly the (temporary) suspension of the Racial Discrimination Act, the initial involvement of the military, and mandatory income management for those on welfare payments (AHRC nd; FaHCSIA 2011, p. 3; Shaw and d’ Abbs 2011, p. 4). In late 2007, a change of government maintained a modified Northern Territory Emergency Response, and in 2012 a modified policy ‘Stronger Futures in the Northern Territory’ was introduced.

Since 2008, COAG has agreed and implemented the ‘closing the gap’ policy. COAG identified Indigenous issues as one of seven priority areas of national reform, set six targets for closing the gaps in outcomes for Indigenous and non-Indigenous Australians, and identified seven ‘building blocks’ that underpinned a National Indigenous Reform Agreement (NIRA). At its May 2014 meeting, COAG agreed to a new target — to close the gap in school attendance within five years (COAG 2014).<sup>6</sup> The OID report framework is aligned with the NIRA, but has a much broader focus, with the indicator framework extending beyond the NIRA indicators and targets.

In 2009, Australia adopted the UN Declaration on the Rights of Indigenous Peoples, which recognises Indigenous peoples’ rights to the full enjoyment of all human rights, plus non-discrimination, self-determination and autonomy, maintenance of Indigenous institutions, and the right to a nationality (AHRC 2010).

In 2010, the National Congress of Australia’s First Peoples was established. Made up of Aboriginal and Torres Strait Islander individuals and organisations, it provides independent advocacy on behalf of First Nation peoples in Australia (National Congress of Australia’s First Peoples nd). Originally funded by the Australian Government, this support was withdrawn in the May 2014 budget.

Over several decades, there have been calls for recognition of Aboriginal and Torres Strait Islander peoples in the Australian Constitution. In December 2010, the Australian Government appointed an Expert Panel on Constitutional Recognition of Aboriginal and Torres Strait Islander Peoples (the Expert Panel) to consult on options for a constitutional amendment on recognition of Aboriginal and Torres Strait Islander peoples. The Expert Panel found that 88 per cent of non-Indigenous individuals and 80 per cent of Aboriginal and Torres Strait Islander Australians supported constitutional recognition (Expert Panel 2012, p. 264). Following the work of the Expert Panel, a parliamentary Joint Select

---

<sup>6</sup> The details around this target are not yet publicly available.

---

Committee has been appointed to report on steps that can be taken towards a successful referendum (Joint Select Committee on Constitutional Recognition of Aboriginal and Torres Strait Islander Peoples 2013). The *Aboriginal and Torres Strait Islander Peoples Recognition Act 2013* formalised Commonwealth Parliament's recognition of Aboriginal and Torres Strait Islander peoples and established a review of support for a referendum to amend the Constitution.

## 1.6 Recent COAG developments

In December 2007 and March 2008, COAG agreed to explicit targets for improving the lives of Aboriginal and Torres Strait Islander Australians (COAG 2007, 2008a).<sup>7</sup> In November 2008, COAG established the National Indigenous Reform Agreement (NIRA), which was most recently revised in late 2012 (COAG 2012). The NIRA provides an integrated framework for the task of Closing the Gap, setting out the policy principles, objectives and performance indicators underpinning Closing the Gap and the specific steps governments are taking to meet the targets.

For the 2009 OID report, the Steering Committee liaised with jurisdictions and COAG committees to align the OID report framework with the COAG targets and the NIRA (box 1.6.1). COAG agreed to the new framework at its meeting in November 2008 (COAG 2008b) and the then Prime Minister wrote to the Chair of the Steering Committee with new terms of reference for the report in 2009. The report framework for the OID has been further amended over editions to reflect changes to the NIRA over time.

### Box 1.6.1 The Overcoming Indigenous Disadvantage (OID) report and the National Indigenous Reform Agreement (NIRA)

The COAG Reform Council reports annually to COAG on progress against the NIRA. The first of these reports was published in 2010 (CRC 2010).<sup>8</sup>

The OID report framework is aligned to the NIRA and consequently the data in the two reports overlap.

However, the NIRA is specifically focused on progress against the targets in the agreement, and comparisons of outcomes by State and Territory. The OID report has a broader focus and covers more areas than the NIRA. The OID report also includes available time series data that predate the NIRA baseline of 2008, and, where State and territory data are not available, reports available information at the national level.

---

<sup>7</sup> In December 2007, three targets were agreed (closing the life expectancy gap within a generation, halving the mortality gap for children under five within a decade and halving the gap in reading, writing and numeracy within a decade). Three further targets were agreed in March 2008 (all four year olds in remote communities access early childhood education within five years, at least halve the gap for students in year 12 attainment or equivalent by 2020, and halve the gap in employment outcomes within a decade) (COAG 2007, 2008a).

<sup>8</sup> The COAG Reform Council ceased operation on 30 June 2014.

---

## 1.7 The Review of Government Service Provision

### The Steering Committee

The Review of Government Service Provision was an initiative of the Prime Minister, Premiers and Chief Ministers at the Premiers' Conference in July 1993 and now operates under the auspices of COAG. The Review is overseen by a Steering Committee, which comprises senior representatives from the Prime Minister's, Premiers' and Chief Ministers' departments, and Treasury and Finance departments in the Australian, State and Territory Governments, and observers from the Australian Bureau of Statistics (ABS) and the Australian Institute of Health and Welfare (AIHW). It is chaired by the Chairman of the Productivity Commission, which also provides the Secretariat. (A list of current members is provided as part of the preliminaries to this report).

### The Overcoming Indigenous Disadvantage Working Group

The Steering Committee is advised on production of this report by a working group comprising representatives from the Australian, State and Territory governments, as well as observers from the National Congress of Australia's First Peoples and the ABS and the AIHW. The Working Group was convened by Commissioner Patricia Scott of the Productivity Commission.

### Other Steering Committee reports

The Steering Committee undertakes three other major exercises for COAG:

- the annual *Report on Government Services*, now in its nineteenth edition. This report provides information on the efficiency and effectiveness of, and equity of access to, mainstream government services in the areas of education, justice, emergency management, health, community services and housing. Since 2003, the Review has published a separate Compendium of information from the Report on Government Services relating to the delivery of mainstream services to Aboriginal and Torres Strait Islander Australians, with the most recent in April 2014 (SCRGSP 2014)
- from 2008 to 2014, the annual collation of performance information relating to the six National Agreements between the Australian Government and the State and Territory governments, for analysis by the COAG Reform Council, including the National Indigenous Reform Agreement (the most recent in December 2013 [SCRGSP 2013]). (Collation of National Agreement performance data was transferred to the COAG Reform Council during 2014).

- 
- a biennial report on expenditure related to Aboriginal and Torres Strait Islander Australians.<sup>9</sup> The *Indigenous Expenditure Report* estimates government expenditure on both Indigenous-specific and mainstream services provided to Aboriginal and Torres Strait Islander Australians. The report is aligned with the Overcoming Indigenous Disadvantage framework, potentially enabling expenditure to be linked to high level outcomes. Two editions of the report have been published, with the next edition due for release in December 2014 (SCRGSP forthcoming).

## 2 The framework

This chapter explains the *Overcoming Indigenous Disadvantage: Key Indicators* report framework. As noted in chapter 1, the report aims to be more than a compilation of statistics. The report is intended to provide meaningful information to Aboriginal and Torres Strait Islander Australians and governments to assist in targeting efforts to improve the wellbeing of Aboriginal and Torres Strait Islander Australians.

Section 2.1 describes how the key elements of the framework fit together. Section 2.2 summarises changes to the framework of indicators for this report following feedback from a review of the report in 2012, including the report's broader focus on Aboriginal and Torres Strait Islander wellbeing.

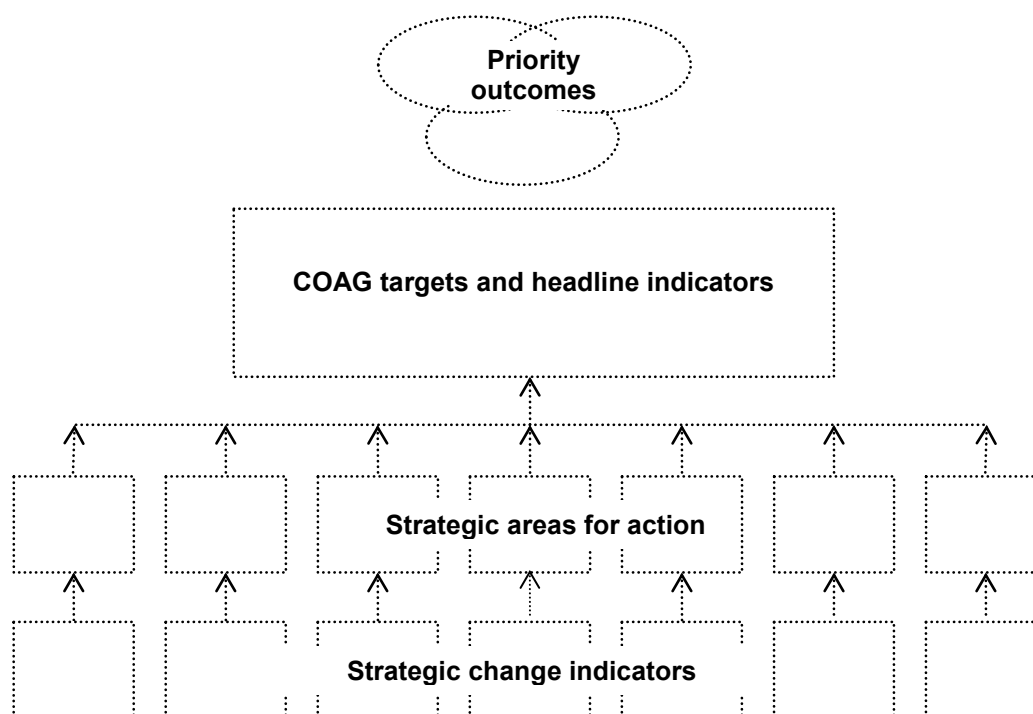

### 2.1 The framework

While there are many reports on the experiences of Aboriginal and Torres Strait Islander Australians, reports about the performance of governments often focus on specific programs or policies, and take a 'silo' approach — education is reported by departments of education, health by health departments — and tend to focus on service inputs (how budgets are spent) and outputs (the actual services delivered), rather than on the outcomes achieved. While information on inputs and outputs is valuable, particularly when evaluating the efficiency of a specific program or service, this report focuses on outcomes — the actual lived experiences of Aboriginal and Torres Strait Islander Australians. Information on outcomes is crucial to measure whether progress is actually being made in closing the gap, regardless of the level of inputs and outputs.

The key elements of the indicator framework are shown in a simplified form in figure 2.1.1. The framework is based on the best available evidence about the root causes of disadvantage, in order to ensure that policy attention is directed to prevention, as well as responding to existing disadvantage. Each of the framework elements is discussed briefly below.

---

Figure 2.1.1 **Framework elements**

---

## Priority outcomes

Three interlinked priority outcomes sit at the top of the framework — no single aspect of the priority outcomes can be achieved in isolation:

- safe, healthy and supportive family environments with strong communities and cultural identity
- positive child development and prevention of violence, crime and self-harm
- improved wealth creation and economic sustainability for individuals, families and communities.

These outcomes reflect COAG’s vision for Aboriginal and Torres Strait Islander Australians to have the same life opportunities as other Australians. Aboriginal and Torres Strait Islander Australians and their organisations have also expressed support for these outcomes, in extensive consultations over several years.

It is extremely difficult to measure progress in achieving such broadly stated, aspirational outcomes, and to hold governments and service providers accountable. Therefore, the framework includes two layers of quantifiable indicators. The logic of the framework is

---

that, over time, measurable improvement in these indicators will demonstrate progress toward the priority outcomes.

## COAG targets and headline indicators

The first layer of indicators is made up of the six targets COAG has set for closing the gaps between outcomes for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, and a further six headline indicators selected by the Steering Committee to represent significant, high level outcomes.

In October 2008, COAG announced six closing the gaps targets (the name of the indicator as presented in the OID report framework is in *italics*, followed by the full text of the target, and the COAG-agreed target date in square brackets):

- *life expectancy* — close the life expectancy gap within a generation [by 2031]
- *young child mortality* — halve the gap in mortality rates for Indigenous children under five within a decade [by 2018]
- *early childhood education* — ensure all Indigenous four year olds in remote communities have access to quality early childhood education within five years [by 2013]
- *reading, writing and numeracy* — halve the gap for Indigenous students in reading, writing and numeracy within a decade [by 2018]
- *year 12 attainment* — halve the gap for Indigenous 20–24 year olds in year 12 or equivalent attainment rates [by 2020]
- *employment* — halve the gap in employment outcomes between Indigenous and non-Indigenous Australians within a decade [by 2018] (COAG 2008).

In May 2014 COAG agreed to a new target on student attendance, but a specific measure has not yet been determined. Student attendance data are included in this report as an indicator in the Education and training chapter (chapter 7, section 7.1).

These ambitious targets highlight specific outcomes in areas that are either significant in their own right (life expectancy and early childhood mortality) or are important preconditions or preventative factors for addressing long term disadvantage (access to preschool, learning outcomes and school attainment, and employment).

The Steering Committee has selected six headline indicators that sit alongside the COAG targets in the first layer of indicators. These headline indicators are all important outcomes in their own right, and will require whole-of-government action over the long term before significant progress can be seen:

- post-secondary education, participation and attainment
- disability and chronic disease

- 
- household and individual income
  - substantiated child abuse and neglect
  - family and community violence
  - imprisonment and juvenile detention.

Together, the COAG targets and headline indicators provide an overview of progress in overcoming the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians, and act as proxy measures for the priority outcomes.

Chapter 4 includes a discussion of the evidence base supporting the selection of each indicator, the definitions of the specific measures used to report against each indicator, and the available data.

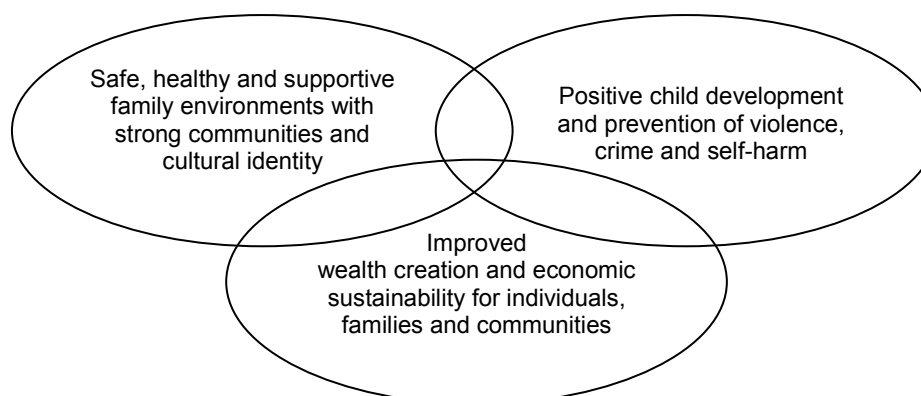

### **Strategic areas for action and strategic change indicators**

The COAG targets and headline indicators, by their very nature, are extremely important, but their whole-of-government, long term nature can make it difficult to hold specific governments or agencies accountable for short to medium term outcomes. The second layer of the framework seeks to overcome this limitation by identifying ‘strategic areas for action’ — specific areas of policy where immediate action is needed to drive improvement in the COAG targets and headline indicators. Each strategic area for action has a small number of ‘strategic change indicators’ that measure short term progress.

The full strategic framework is presented in figure 2.1.2. Chapters 5 to 11 include the evidence base supporting the selection of each strategic area for action and its associated indicators, the definitions of the specific measures used to report against each indicator, and the available data.

Figure 2.1.2 Multi-level indicator framework

Priority outcomes

COAG targets and headline indicators

COAG targets	Headline indicators
4.1 Life expectancy	4.7 Post-secondary education — participation and attainment
4.2 Young child mortality	4.8 Disability and chronic disease
4.3 Early childhood education	4.9 Household and individual income
4.4 Reading, writing and numeracy	4.10 Substantiated child abuse and neglect
4.5 Year 12 attainment	4.11 Family and community violence
4.6 Employment	4.12 Imprisonment and juvenile detention

Strategic areas for action

Governance, leadership and culture	Early child development	Education and training	Healthy lives	Economic participation	Home environment	Safe and supportive communities
5.1 Valuing Indigenous Australians and their cultures 5.2 Participation in decision making 5.3 Engagement with services 5.4 Case studies in governance 5.5 Indigenous language revitalisation and maintenance 5.6 Indigenous cultural studies 5.7 Participation in community activities 5.8 Access to traditional lands and waters	6.1 Antenatal care 6.2 Health behaviours during pregnancy 6.3 Teenage birth rate 6.4 Birthweight 6.5 Early childhood hospitalisations 6.6 Injury and preventable disease 6.7 Ear health 6.8 Basic skills for life and learning	7.1 Year 1 to 10 attendance 7.2 Teacher quality 7.3 School engagement 7.4 Transition from school to work	8.1 Access to primary health care 8.2 Potentially preventable hospitalisations 8.3 Potentially avoidable deaths 8.4 Tobacco consumption and harm 8.5 Obesity and nutrition 8.6 Oral health 8.7 Mental health 8.8 Suicide and self-harm	9.1 Employment by full time/part time status, sector and occupation 9.2 Indigenous owned or controlled land and business 9.3 Home ownership 9.4 Income support	10.1 Overcrowding in housing 10.2 Rates of disease associated with poor environmental health 10.3 Access to clean water and functional sewerage and electricity services	11.1 Alcohol consumption and harm 11.2 Drug and other substance use and harm 11.3 Juvenile diversions 11.4 Repeat offending 11.5 Community functioning

---

## Strategic areas for action

The seven strategic areas for action were chosen for their potential to have a significant and lasting impact in reducing disadvantage and improving wellbeing. Each strategic area represents a set of related activities that evidence suggests have the potential to drive improvement in the headline indicators and progress toward the COAG targets.

The strategic areas for action in this report are aligned with the seven ‘building blocks’ identified by COAG to support the reforms aimed at achieving the six COAG targets (COAG 2011). The seven strategic areas are:

- governance, leadership and culture (chapter 5)
- early child development (chapter 6)
- education and training (chapter 7)
- healthy lives (chapter 8)
- economic participation (chapter 9)
- home environment (chapter 10)
- safe and supportive communities (chapter 11).

The strategic areas do not mirror typical government service silos. Closing the gaps in outcomes will require the combined efforts of governments, the community and Aboriginal and Torres Strait Islander Australians themselves. In some cases, a specific service area will logically play a major role, but in all strategic areas, more than one government agency will have to take action in order to achieve better outcomes. For example, in the area of ‘education and training’, the school system has an important role to play, but so do agencies dealing with transport, housing and health. Chapter 3 discusses in more detail the need for coordinated government action to address the complex interactions between different aspects of disadvantage, and chapter 13 provides some analysis of the interactions that contribute to multiple disadvantage.

During consultations, many people asked how governments’ progress in addressing the strategic areas for action would be monitored. The monitoring of specific government programs and services is beyond the scope of this report, but a summary of implementation measures being adopted by individual governments is contained in appendix 2. Information about Aboriginal and Torres Strait Islander Australians’ access to a range of government services is included in the Indigenous Compendium to the Steering Committee’s annual *Report on Government Services* (SCRGSP 2014b). Estimates of government expenditure on services to Aboriginal and Torres Strait Islander Australians are contained in the biennial *Indigenous Expenditure Report* (SCRGSP forthcoming).

---

## Strategic change indicators

A small number of targeted, shorter term ‘strategic change indicators’ measure progress for each strategic area for action. These indicators make it easier to track short term progress, and improve accountability for outcomes. (The term ‘indicator’ has a particular meaning in this report, and is distinguished from the term ‘measure — see box 2.1.1).

### Box 2.1.1 Indicators and measures

In this report, the term ‘indicator’ refers to a broad statement of what outcome is to be measured. Indicators are usually described in general terms, to allow for developments in the evidence base and changing data sets over time.

In this report, the term ‘measure’ refers to how an indicator will be measured. Data limitations mean that, sometimes, proxy measures must be used to report against indicators, and multiple measures may be required to illustrate a single indicator. Information on the measures reported for each indicator is provided at the beginning of each indicator section.

Linkages across the framework mean that some indicators potentially could be placed in more than one strategic area for action (for example, alcohol consumption and harm is relevant to both the ‘Healthy lives’ and ‘Safe and supportive communities’ strategic areas). Indicators have been placed in the strategic area where the evidence base suggests they will have greatest effect, but their potential to influence other outcomes is acknowledged by cross-references in the text.

Many indicators could have been included in this report. Potential strategic change indicators were assessed against the criteria listed in box 2.1.2 before they were added to the framework. Most of the indicators in the report meet all the criteria — but a few indicators are regarded as so important that they are included even though they do not meet some criteria.

---

### Box 2.1.2      **Criteria used to select strategic change indicators**

1. Required by alignment with National Indigenous Reform Agreement indicators
2. Measures an outcome (rather than an input or output) or a close proxy for an outcome
3. Relevance to priority outcomes
4. Improvement in the strategic change indicator result in improvement over time in the COAG targets and headline indicators
5. Supported by strong logic or empirical evidence
6. Sensitive to policy interventions and changes in policy settings
7. Meaningful to stakeholders and principally to Aboriginal and Torres Strait Islander Australians
8. Unambiguous and clear in meaning and interpretation
9. The existence, or ease, of developing supporting data sets.

The first criterion notes the requirement to align relevant indicators in the OID report with indicators in the NIRA. The second criterion notes the OID report's emphasis on measurable *outcomes* (impacts on individuals or communities) rather than inputs (resources spent) or outputs (services provided). In some cases, where there is strong evidence that certain inputs or outputs are closely linked to an outcome, those inputs or outputs may be included as proxy indicators of that outcome (for example, access to primary health care and quality antenatal care).

The next three criteria are closely related — the whole framework is geared toward measuring progress toward the priority outcomes. The report draws its strength from the evidence base or underlying theory of causality that links improvement in a strategic change indicator to improvement in the COAG targets and headline indicators, and therefore progress toward the priority outcomes. For most indicators, empirical evidence provides the causal link. For some indicators, despite limited empirical evidence, persuasive logic and compelling feedback from consultations provide the link.

The sixth and seventh criteria are also closely linked. The terms of reference for the report require it to inform Australian governments about the impact of policy programs and interventions, and to be meaningful to Aboriginal and Torres Strait Islander Australians. All indicators have been formally agreed by all Australian governments, and accepted as meaningful by a broad range of Aboriginal and Torres Strait Islander organisations and individuals (see chapter 1 on engagement with Aboriginal and Torres Strait Islander Australians).

The eighth criterion recognises that, to be most useful, an indicator should be clear and unambiguous. Most indicators in this report are relatively easy to understand, and it is intuitively obvious whether progress is being made. However, in some cases, important indicators may yield ambiguous results; for example, an increase in notifications of child abuse or neglect might reflect declining child welfare but, alternatively, might reflect an

---

increase in the proportion of incidents being reported, investigated and addressed. Where indicators are potentially ambiguous, the report includes explanatory text to assist interpretation.

The final criterion recognises the practical need for relevant data to report against an indicator. In some cases, proxy measures are reported and, in a few cases, important indicators have been included even though data are substantially qualified, not available for all jurisdictions or not available at all (and qualitative information is reported instead). Some of these indicators have been identified as high priorities by COAG (for example, ‘teacher quality’ and ‘school engagement’) and data strategies are being developed.

## **Relationships between the indicators**

Causal relationships are at the heart of the indicator framework, linking strategic change indicators with the COAG targets and headline indicators, and therefore the priority outcomes. Chapter 3 looks at interactions across the framework and chapter 13 examines interactions and multiple disadvantage in more detail. More information about relationships between indicators is provided in the evidence base for each indicator.

However, much of the available information about links between indicators is at a fairly general level. More sophisticated statistical analysis is only possible where a range of information has been collected on a consistent basis for each individual or household, preferably over time. The AIHW and ABS, in partnership with states and territories, have developed national best practice guidelines for data linkage and have completed an examination of current and planned data linkage work relevant to Indigenous identification (AIHW and ABS 2012). There are also a number of linkage projects underway bringing together data from the 2011 Census with other datasets (for example, the Indigenous mortality project (ABS 2013)). At the jurisdictional level, WA has coordinated data linkage activities through a number of agencies and academia, which connects all available health and related information for the WA population. Since 1995, more than 700 projects have made use of WA linked data (see [www.data-linkage-wa.org/projects](http://www.data-linkage-wa.org/projects)).

## **Things that work**

The Steering Committee recognises that data alone cannot tell the complete story about the wellbeing of Aboriginal and Torres Strait Islander Australians. Although there are gaps in almost all reported outcomes, there are many examples of successful initiatives, often at the community level, that are acting to close those gaps. These successes are often not apparent from the aggregate data in this report.

For many indicators, the Steering Committee has included brief case studies of programs or services that are making a difference — examples of ‘things that work’. The ‘things that work’ demonstrate that things can change for the better, and provide models that other governments or communities can draw upon and adapt for their own use.

---

Feedback from the review of the report in 2012 (covered in more detail in section 2.2) indicated that, although many readers of the report valued the ‘things that work’ case studies, there was a general desire to improve the rigour of the case studies, to ensure that highlighted programs and services really were making a difference. For this report, the Steering Committee agreed that, wherever possible, ‘things that work’ case studies will be drawn from the Closing the Gap Clearinghouse evidence based evaluations of specific programs.

The Closing the Gap Clearinghouse, jointly managed by the Australian Institute of Family Studies and the Australian Institute of Health and Welfare, was established by COAG to collate evidence on what works to overcome Indigenous disadvantage (AIHW and AIFS nd).<sup>1</sup> This report draws on a range of Clearinghouse outputs to inform the ‘things that work’:

- the Assessed collection of selected research and evaluations
- Issues Papers reviewing the findings on what works on specific topics
- Resource Sheets summarising the evidence on more narrowly defined topics and its applicability to specific policies and/or programs.

Where no relevant material has been available from the Clearinghouse, other potential ‘things that work’ case studies were assessed against the criteria in box 2.1.3. A very high threshold was applied to ensure appropriate rigour. In a few cases, the Steering Committee has included case studies of innovative reforms that appear worthwhile, but which have not been evaluated. In such cases, the Steering Committee has explicitly noted the desirability of formal evaluation.

#### **Box 2.1.3 ‘Things that work’ criteria**

‘Things that work’ case studies highlight programs or services that are successfully acting to close the gap between Indigenous and non-Indigenous outcomes. Case studies must:

- be relevant to a report indicator
- have measurable, up to date outcomes
- have a reasonable track record of success
- be supported by local Indigenous people who use or are affected by the case study
- be agreed for inclusion by all jurisdictions.

The increased rigour in the selection of case studies has resulted in an overall decrease in the number included in this report. This reflects a lack of rigorously evaluated programs in

---

<sup>1</sup> Commonwealth funding for the Closing the Gap Clearinghouse (CTGCH) ceased in June 2014. The AIHW and AIFS have advised the Steering Committee that all resources and publications currently on the website will continue to be publicly available, but once all commissioned issues papers and resource sheets have been released, no new material will be added to the CTGCH website (see [www.aihw.gov.au/closingthegap/](http://www.aihw.gov.au/closingthegap/)).

---

the Indigenous policy area. As noted by participants in the Productivity Commission's Roundtable on Indigenous policy evaluation in 2013 'Significant gaps exist in the Australian evidence base, due to [the] lack of mandated evaluations' (PC 2013, page 6, summary of roundtable discussions).

## **2.2 Changes to the framework for this report**

The OID report's strategic framework has changed over time, responding to changes in government priorities, developments in the evidence base and feedback from consultations with Aboriginal and Torres Strait Islander Australians and their organisations, academics, researchers and service providers.

Following the release of the 2011 OID report, the Productivity Commission, on behalf of the Steering Committee, commissioned the Australian Council for Educational Research Ltd (ACER) to review the report. The ACER review found that most users considered the report to be a useful compendium of information on the wellbeing of Indigenous Australians. However, the review made a number of recommendations for changes to the report's production and content (ACER 2012). The Steering Committee developed a set of proposed responses to the ACER review (SCRGSP 2013), which formed the basis of national consultations. Following those consultations, the Steering Committee agreed a set of final responses, which have been implemented for this report (SCRGSP 2014a).

The following sections discuss two major changes for this edition of the OID report:

- increased Aboriginal and Torres Strait Islander engagement in all phases of the reporting process
- a greater focus on 'strengths-based' reporting and Aboriginal and Torres Strait Islander Australians' conceptions of wellbeing.

### **2.2.1 Increased Aboriginal and Torres Strait Islander engagement**

Aboriginal and Torres Strait Islander Australians have been actively involved with the OID report since its inception. The report had its origins in a recommendation of the Council for Aboriginal Reconciliation in 2000, and ATSIC was a member of the working group that advised the Steering Committee on the first edition of the report. Each edition of the report has benefited from consultations with Aboriginal and Torres Strait Islander Australians in all states and territories, and in a range of remoteness areas. Since the 2005 report, a different Indigenous academic referee has reviewed each edition of the report and advised the Steering Committee on the appropriateness of the report's language, presentation and content.

However, the ACER review of the report identified a need for more visible engagement with Aboriginal and Torres Strait Islander Australians, and the Steering Committee has introduced some significant changes for this edition of the report.

- 
- The National Congress of Australia's First Peoples (established in 2010) was invited to join the working group that advised the Steering Committee on this report. As an independent representative body, the National Congress is an advocate for Aboriginal and Torres Strait Islander Australians. (The Congress has made clear to the Steering Committee that its involvement is not a substitute for engagement with the broader Aboriginal and Torres Strait Islander community.)
  - The previous practice of engaging a single Indigenous academic referee has been expanded, with different Aboriginal and Torres Strait Islander organisations or experts reviewing each section of the report. The name of the reviewer is noted in relevant sections of the report, and all reviewers are acknowledged on p. xi but the final content of the report remains the responsibility of the Steering Committee. The Steering Committee is extremely grateful to these organisations and individuals, and acknowledges the significant contributions they have made to the report.

### **2.2.2 Strengths-based reporting and wellbeing**

The involvement of Aboriginal and Torres Strait Islander Australians contributed to a key development in this report — a greater focus on strengths-based reporting with a reframing from 'overcoming disadvantage' to 'improving wellbeing'.

#### **Strengths-based reporting**

The original terms of reference for this report called for '...a regular report to COAG against key indicators of disadvantage ... that are of relevance to all governments and Indigenous stakeholders ...'. In previous editions of the report, nearly all indicators compared outcomes for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, with a particular focus on the 'gap'.

Many Aboriginal and Torres Strait Islander people and organisations that participated in the ACER review criticised this essentially negative, or deficit, approach, and called for an appropriate acknowledgment of Aboriginal and Torres Strait Islander strengths, as well as objective reporting on disadvantage. Strengths-based approaches have been adopted in other high profile reports, such as the National Aboriginal and Torres Strait Islander Health Plan, which:

... adopts a strengths based approach to ensure policies and programs improve health, social and emotional wellbeing and resilience, and promote positive health behaviours. It emphasises the centrality of culture in the health of Aboriginal and Torres Strait Islander people and the rights of individuals to a safe, healthy and empowered life. (Australian Government 2013, p. 4).

For this report, the Steering Committee has implemented a more strengths-based approach by:

- giving greater emphasis to previously reported strengths-based indicators (including indicators of culture), and including additional strengths-based indicators (see below)

- 
- where relevant, noting positive outcomes for the majority of Aboriginal and Torres Strait Islander Australians before discussing the gap in outcomes between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians
  - expressing existing 'negative' indicators in the positive (for example, changing 'tooth decay' to 'oral health')
  - retaining the 'things that work' examples of successful programs, with increased rigour to ensure that highlighted examples really are making a difference
  - renaming the former 'Governance and Leadership' area as 'Governance, leadership and culture' (the most significant Aboriginal and Torres Strait Islander specific conceptions of wellbeing were around 'culture') and making it the first strategic area, to emphasise its significance as underpinning all other outcomes
  - grouping the 'cultural' indicators together under this strategic area, to increase their prominence and allow for a discussion about the connections between culture and other outcomes.

## Measuring wellbeing

Respondents to the ACER review noted a distinction between 'reducing disadvantage' and 'improving wellbeing'. The broad term 'wellbeing' encompasses a number of related concepts, and there can be specific Indigenous conceptions of wellbeing. Table 2.2.1 sets out the broad elements of three Indigenous strengths-based frameworks:

- the ABS Indigenous wellbeing framework
- the Maori wellbeing framework
- National Aboriginal and Torres Strait Islander Health Performance Framework.

There is a high degree of overlap between these frameworks and the indicators in previous OID reports — for example, all include measures of community safety, health, education and employment — and previous editions included some indicators that were specific to Aboriginal and Torres Strait Islander wellbeing. However, as discussed below, the ACER review found that the report could do more to reflect other outcomes that Aboriginal and Torres Strait Islander Australians themselves viewed as important.

**Table 2.2.1 Wellbeing framework elements**

<i>ABS Indigenous wellbeing framework</i>	<i>Māori wellbeing framework</i>	<i>National Aboriginal and Torres Strait Islander Health Performance Framework</i>
Culture, heritage and leisure	Subjective wellbeing (life satisfaction; sense of control; health status; connections)	Health status and outcomes (health conditions; human function; life expectancy and wellbeing; deaths)
Family, kinship and community		
Health		
Education, learning and skills	Social wellbeing (whānau <sup>a</sup> contact; access to help; voluntary work; trust; experience of crime and discrimination)	Determinants of health (environmental factors; socioeconomic factors; community capacity; health behaviours; person-related factors)
Customary, voluntary and paid work		
Income and economic resources		
Housing, infrastructure and services	Cultural wellbeing (knowledge of cultures and ability to access in time of need; use and proficiency in language)	Health system performance (effective/appropriate/efficient; responsive; accessible; continuous; capable; sustainable)
Law and Justice		
Citizenship and governance	Economic wellbeing (material standard of living; paid work; housing problems)	

<sup>a</sup> There is no common definition of Whānau, but it is described as connection to a person, either through a common ancestor or through a common purpose or goal (Tibble, A and Ussher, S 2012, *Kei te pewhea to whānau? Exploring whānau using the Māori Social Survey*, Statistics New Zealand).

Sources: ABS 2010, *Framework for Measuring Wellbeing: Aboriginal and Torres Strait Islander Peoples, 2010*, Cat. no. 4703.0, Canberra, ACT; Statistics New Zealand 2014, *Te Kupenga 2013 data dictionary*, <http://www.stats.govt.nz/~media/Statistics/surveys-and-methods/our-surveys/te-kupenga-data-dictionary/te-kupenga-2013-data-dictionary-pdf> (accessed 20 May 2014); AHMAC 2012, *Aboriginal and Torres Strait Islander Health Performance Framework 2012*, Department of Health, Canberra.

## Culture and wellbeing

Two clear messages from consultations with Aboriginal and Torres Strait Islander Australians are that:

- no single indicator can adequately reflect the importance of culture in the lives of Aboriginal and Torres Strait Islander Australians
- culture underpins many of the outcomes across the framework, and the links across the strategic areas for action, and between these areas and the COAG targets and headline indicators, are particularly strong.

In previous editions of the OID report, the cultural indicators were spread across the strategic areas for action, to reflect the way culture pervades every aspect of the lives of Aboriginal and Torres Strait Islander Australians. For this report, the cultural indicators have been grouped together under the ‘Governance, leadership and culture’ strategic area, to allow for a more detailed discussion of the significance of these indicators as a group. In addition, the ‘Governance, leadership and culture’ strategic area has been moved from ‘last’ to ‘first’ in the diagram, to emphasise the importance of cultural outcomes to all other outcomes in the framework.

---

The Steering Committee acknowledges the diversity of Aboriginal and Torres Strait Islander cultures. While there has been general endorsement of the cultural indicators in this report, they may not reflect the aspirations of all Aboriginal and Torres Strait Islander Australians. In addition, it can be very difficult to define aspects of culture in a way that can be measured for inclusion in a largely quantitative report such as this. Acknowledging these constraints, the Steering Committee has agreed to significantly increase the number of indicators of culture and wellbeing included in this report.

The following indicators are included in the ‘Governance, leadership and culture’ strategic area:

- *Valuing Indigenous Australians and their cultures* (section 5.1) (new for this report). One of the principles of the Closing the Gap strategy is emphasising mutual respect between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians, and this is also highlighted in the Australian Government's response to the UN Declaration on the Rights of Indigenous Peoples
- *Participation in decision making* (section 5.2) (new for this report). Participation in decision making is a key element in the UN Declaration on the Rights of Indigenous Peoples, and has been cited as an important factor in self-determination and improving outcomes for Indigenous people. Participation in decision making is important in relation to internal participation (including Aboriginal and Torres Strait Islander governance) and external participation (including government governance)
- *Engagement with services* (section 5.3) (in this strategic area in previous reports). ‘Engagement’ is a broad concept that encompasses both accessibility (including barriers to access) and appropriate delivery (including recognition of Aboriginal and Torres Strait Islander cultural perspectives in designing and delivering programs)
- *Case studies in governance* (section 5.4) (in this strategic area in previous reports). The case studies emphasise the importance of culture as an essential determinant of good governance
- *Indigenous language revitalisation and maintenance* (section 5.5) (new for this report). For many Aboriginal and Torres Strait Islander Australians, language is an important aspect of culture and wellbeing
- *Indigenous cultural studies* (section 5.6) (in the ‘Education and training’ strategic area in previous reports). Cultural studies can benefit both Aboriginal and Torres Strait Islander Australians (culturally appropriate education can contribute to good ‘mainstream’ academic outcomes) and non-Indigenous Australians (increasing knowledge can lead to shared views and increased respect)
- *Participation in community activities* (section 5.7) (in the ‘Safe and supportive communities’ strategic area in previous reports). Art and ceremony are significant markers of cultural strength, and there is evidence that a range of sport and community activities can foster self-esteem, social interaction and the development of skills and teamwork, leading to good physical and mental health and wellbeing

- 
- *Access to traditional lands and waters* (section 5.8) (*Access to traditional lands* in the ‘Safe and supportive communities’ strategic area in previous reports — the addition of access to *waters* is new for this report). Access to land and waters may allow Aboriginal and Torres Strait Islander Australians to practise and maintain their knowledge of ceremonies, rituals and history. There may also be other social and economic benefits from connection to traditional country, and the ‘Economic participation’ strategic area for action includes the related indicator ‘Indigenous owned or controlled land and business’ (section 9.2).

Other sections of the report also examine aspects of wellbeing:

- *Mental health* (section 8.7) (in the ‘Healthy lives’ strategic area). Mental health is explored as part of the broader concept of social and emotional wellbeing
- *Indigenous owned or controlled land and business* (section 9.2) (in the ‘Economic participation’ strategic area). Ownership of land can provide cultural, social and economic benefits for Aboriginal and Torres Strait Islander Australians
- *Community functioning* (section 11.5) (in the ‘Safe and supportive communities’ strategic area is new for this report). Consultations emphasised the importance of community wellbeing to individual wellbeing. Whilst many of the individual components of the community functioning measure are reported elsewhere in the OID, drawing the components together provides an overall assessment of community functioning
- *Measuring multiple disadvantage* (chapter 13). This chapter explores the relationships between different aspects of disadvantage, including cross-tabulations against some broader aspects of wellbeing, such as removal from family, core activity restriction and absence of non-school qualifications.

### Other potential culture and wellbeing indicators

Consultations suggested some other indicators that were highly meaningful to Aboriginal and Torres Strait Islander Australians. However, some of these potential indicators were in areas that Aboriginal and Torres Strait Islander Australians regarded as their own responsibility, not that of governments (for example, ‘spirituality’). For other potential indicators, there was no consensus on specific indicators or no supporting data which would allow reporting.

The Steering Committee is committed to ongoing research into other potential culture and wellbeing indicators for future reports, and welcomes suggestions of potential concepts, indicators and data sources that it should consider.

## 3 Key themes and interpretation

This chapter provides some background to assist readers to interpret the data in this report, and draws together some of the report's overarching issues and themes.

- Interpreting the data in this report requires an understanding of the difficulties associated with accurately estimating the number of Aboriginal and Torres Strait Islander Australians, and an awareness of other issues that may affect the quality of data used for reporting (section 3.1).
- As well as an awareness of the historical context that has influenced current outcomes (chapter 1, section 1.3), it is also important to be aware of the demographic characteristics of the Aboriginal and Torres Strait Islander population, which differ markedly from those of the non-Indigenous population (section 3.2).
- Although the majority of Aboriginal and Torres Strait Islander Australians live in cities or regional areas, a relatively high proportion live in remote areas, and there is a particular policy focus on improving outcomes for those living in remote areas (section 3.3).
- There are significant interactions across many of the outcomes measured in this report. Different aspects of disadvantage are often interrelated, and coordinated action by many areas of government may be needed to address the drivers of disadvantage (section 3.4).
- Not everything that matters can be captured in indicators. This report includes numerous case studies of projects and programs that are successfully addressing the disadvantage experienced by many Aboriginal and Torres Strait Islander Australians. These 'things that work' have some common characteristics or 'success factors' (section 3.5).
- Finally, while this report focuses on Australia, it contains a small amount of information on comparisons with outcomes for indigenous peoples in other countries including the many challenges in making international comparisons (section 3.6).

---

## **3.1 Estimating the Aboriginal and Torres Strait Islander populations**

### **How are Aboriginal and Torres Strait Islander Australians identified?**

All the information in this report is based on self-identification by Aboriginal and Torres Strait Islander Australians and, therefore, relies on an individual's view of their Indigenous status. A small number of administrative data collections require people who identify as Aboriginal and Torres Strait Islander to provide proof of Indigenous descent or acceptance by an Indigenous community, but this is not necessary for most data collections. Therefore, the accuracy and reliability of the data in this report depend on the opportunities provided to identify as Aboriginal and Torres Strait Islander, and people's willingness to do so. In some collections, Indigenous status for a relatively large proportion of people may be recorded incorrectly — either as not stated or as non-Indigenous. The ABS and the AIHW are progressing work funded under Schedule F of the National Indigenous Reform Agreement (NIRA) to improve the quality of Indigenous identification in Census and administrative data collections.

The level of Aboriginal and Torres Strait Islander identification can vary over time and across data collections. Improvements over time in data collections (for example, the adoption or correct application of the standard ABS question on Indigenous status) will improve the accuracy of identification data but, in some cases, will also make trend analysis difficult — for example, it might be difficult to establish whether an increase in the recorded use of a service by Aboriginal and Torres Strait Islander Australians reflects an actual increase in use, or an increase in self-identification of existing Aboriginal and Torres Strait Islander service users.

### **How are Aboriginal and Torres Strait Islander and non-Indigenous populations estimated?**

Estimates of the Aboriginal and Torres Strait Islander and non-Indigenous populations are used extensively in this report for calculating rates (for example, hospitalisations per 100 000 people) and percentages (for example, percentage of people aged 18 years and over). Using rates and percentages makes it easier to compare outcomes for Aboriginal and Torres Strait Islander Australians with outcomes for non-Indigenous Australians.

#### **Estimating the Aboriginal and Torres Strait Islander population**

The five-yearly Census provides the basis for estimates of the Aboriginal and Torres Strait Islander population. Despite efforts by the ABS to improve the enumeration of Aboriginal and Torres Strait Islander Australians in the Census, the ABS estimates that the 2011 Census did not count around 17 per cent of Aboriginal and Torres Strait Islander

---

Australians (ABS 2012b). The ABS therefore adjusts the Census count to derive the estimated resident Indigenous population (ABS 2012a). As explained in the section ‘Interpreting data in the report’, the Census undercount may affect analysis of outcomes measured using the Census.

For non-Census years, the ABS calculates estimates and projections of the Aboriginal and Torres Strait Islander population. The most recent projections were based on adjusted 2011 Census data and a set of assumptions about likely trends in Aboriginal and Torres Strait Islander population growth (box 3.1.1).

**Box 3.1.1      Aboriginal and Torres Strait Islander population estimates and projections**

On 30 April 2014, the ABS published estimates of the Aboriginal and Torres Strait Islander population for 2001 to 2011, and projections for 2012 to 2026, for Australia and each State and Territory and by remoteness (ABS 2014). These estimates are adjusted to account for the undercount of Indigenous people in the 2011 Census, but are not adjusted for the unexpected rise in Indigenous identification from the 2006 Census to the 2011 Census.

The Aboriginal and Torres Strait Islander population of Australia as at 30 June 2011 is used as the base for the projection series. Using assumptions about future fertility, paternity, life expectancy at birth and migration, the 2014 publication provided three main sets of projections:

- series A assumes a higher amount of growth
- series B assumes a moderate amount of growth
- series C assumes a smaller amount of growth.

The specific assumptions used to calculate these projections are described in ABS (2014).

The ABS suggests that series B will be the most appropriate choice for most users and, in this report, series B projections have been used.

*Source:* ABS 2014, *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0, Canberra.

Between the 2006 and 2011 Censuses, there was a 21 per cent increase in the number of people identified as being of Aboriginal and Torres Strait Islander origin. Nationally, almost one third of the increase (30 per cent) could not be explained by the standard assumptions about the likely trends in the population. After each Census, the ABS produces time series estimates of the Aboriginal and Torres Strait Islander population based on that Census count, by backcasting around this estimate. The backcast series shows what the currently identified Aboriginal and Torres Strait Islander population (based on the latest Census) would have been in previous periods, based purely on demographic change. As explained in the section ‘Interpreting data in the report’, the unexplained increase in the Aboriginal and Torres Strait Islander population between the 2006 and 2011 Census affects analysis of outcomes measured using the Census. This change is dealt with in this report by using revised 2011 Census based population estimates for historical rates.

---

## Estimating the non-Indigenous population

The ABS only publishes official non-Indigenous population data for Census years. For other years, non-Indigenous population data are derived by subtracting Aboriginal and Torres Strait Islander population data from total population data. (Based on ABS advice, this report derives the non-Indigenous population by subtracting Aboriginal and Torres Strait Islander population projections from the total estimated resident population).<sup>1</sup> Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

## 3.2 Interpreting data in the report

The data used in this report, like all data, have limitations. Readers should bear the following issues in mind when interpreting the data. (Appendix 4 contains more information about data limitations.)

### Timeliness

The data in this report are the most recent available. Many data collections are not updated annually (particularly surveys and the Census), and some administrative data collections require significant time for processing and validation between collection and publication (creating lags in reporting annual data).

There are often trade-offs between timeliness and cost, or timeliness and respondent burden. Where outcomes are not expected to change rapidly, the benefits of more timely reporting may not outweigh the costs. However, timeliness can be crucial for data that relate to quickly moving outcomes.

### Census data

The 2011 ABS Census of Population and Housing was a major data source for this report. The Census is rich in information and has the potential for extensive disaggregation (for example, by State and Territory, remoteness and age group).

### Indigenous undercount

As noted above in the section ‘Estimating the Aboriginal and Torres Strait Islander population’, the ABS estimates that the 2011 Census did not count around 17 per cent of Aboriginal and Torres Strait Islander Australians (ABS 2012b). This undercount may

---

<sup>1</sup> Where preliminary ERP are used, the Steering Committee follows the approach endorsed for the NIRA of using the first release preliminary ERP. These data are only revised once final ERP are available.

---

affect analysis of outcomes measured using the Census, as it cannot be assumed that those who were not included in the Census share the same characteristics as those who were. This is particularly important where the undercount is concentrated among particular groups of people, such as those in particular geographic or remoteness areas, or in particular age cohorts.

### Unexplained increase in estimated Aboriginal and Torres Strait Islander population

As noted above in the section ‘Estimating the Aboriginal and Torres Strait Islander population’, there was a 21 per cent increase in the number of people identified as being of Aboriginal and Torres Strait Islander origin between the 2006 and 2011 censuses. Nationally, almost one third of the increase (30 per cent) could not be explained by standard assumptions about births, deaths and net migration.

The unexplained increase in the Aboriginal and Torres Strait Islander population may affect analysis of outcomes over time measured using Census data.

- The unexplained increase in Indigenous identification implies that some people who were counted as non-Indigenous (or whose Indigenous status was recorded as unknown) in the 2006 Census were counted as Aboriginal and Torres Strait Islander in the 2011 Census (and ABS analysis indicates this change in identification moves in both directions). It is therefore not possible to say with certainty whether changes in measured outcomes across the two Censuses are due to changes in the outcome being measured, or whether they are due to a change in the group of people whose outcomes are being measured.
- Census-based population data are often used in combination with administrative data to calculate rates or percentages. It is not known whether the unexplained increase in Indigenous identification in the Census has been matched by a similar increase in Indigenous identification in the administrative data.

The impact of the unexplained increase in Indigenous identification in the Census is particularly important where the increase is concentrated among particular groups of people, such as those in particular geographic or remoteness areas, or in particular age cohorts. The unexplained increase in 2011 was concentrated among children and the eastern states. Of the 27 800 unexplained increase:

- 94 per cent (26 100 out of 27 800) was concentrated in NSW, Victoria and Queensland
- 34 per cent (9400 out of 27 800) was attributable to children aged 5–9 years in 2011. About 10 500 more people aged 20–54 years in 2011 identified as being of Aboriginal and/or Torres Strait Islander origin than people aged 15–49 years in 2006. Many of these people would have been parents and completed Census forms on behalf of their children, contributing to the increase in the count of Aboriginal and/or Torres Strait Islander children aged less than 15 years (ABS 2013b).<sup>2</sup>

---

<sup>2</sup> The distribution of the unexplained increase by remoteness area is not available.

---

## Survey data

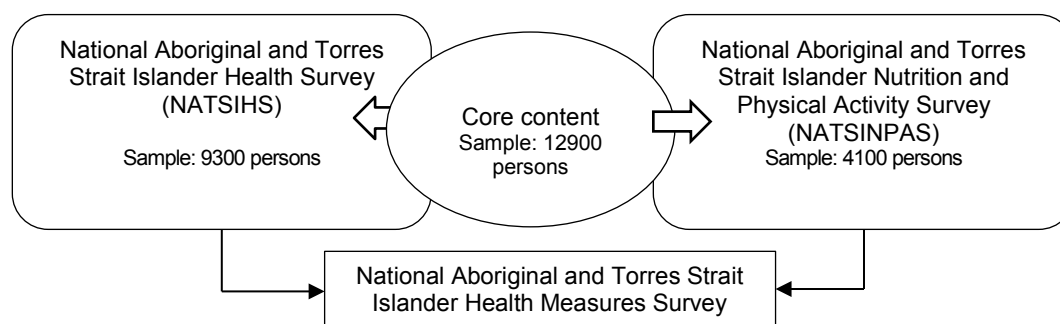

Surveys can provide a rich source of data, but are often only reliable at higher levels of aggregation, for example, national and State and Territory data, and sometimes remoteness area disaggregation. (The reliability of survey data at lower levels of disaggregation is limited by sampling error.)

The ABS has introduced a three-yearly rolling program of Indigenous household surveys, the most recent being the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS). Data from this survey were released from late 2013, and form an important component of this report. The next survey in the program will be the National Aboriginal and Torres Strait Islander Social Survey (NATSISS), which is scheduled for collection in 2014-15.

The AATISHS is made up of three components. Figure 3.2.1 shows the relationship between the three components.

---

**Figure 3.2.1 Structure of the AATSIHS**

*Sources: ABS 2013, Australian Aboriginal and Torres Strait Islander Health Survey: Updated results, Australia, 2012–2013, Cat. no. 4727.0.55.006, Canberra; ABS 2013, Australian Aboriginal and Torres Strait Islander Health Survey: Users guide, 2012-13, Cat. no. 4727.0.55.002, Canberra.*

---

Sample size limits the extent to which data can be disaggregated by different factors such as geography, age and sex, particularly for characteristics that are not widespread across the population. Some data are common to both the 2012-13 NATSIHS and NATSINPAS. For these items, the samples for people aged 2 years and over have been combined to make up the core sample for the AATSIHS. The samples for the NATSIHS and the core were designed to provide reliable estimates for remote and non-remote areas, by State and Territory and for Torres Strait Islander Australians.

Data from other ABS surveys (for example, the Australian Health Survey) are included in this report, often to provide non-Indigenous comparators for AATSIHS data. Most general

---

population surveys do not contain a large enough representative sample of Aboriginal and Torres Strait Islander Australians to allow for disaggregation by Indigenous status.

### Confidence intervals and relative standard errors

Results from sample surveys are subject to sampling error because they are based on samples of the total population, rather than the whole population. (Data collections that seek to include the entire population, including the Census, are not subject to sampling error.)

Where sample survey data are shown in charts in this report, error bars are included, showing 95 per cent confidence intervals<sup>3</sup>. This means that there is a 95 per cent chance that the true value of the measure lies within the interval shown by the error bars. This report only highlights differences if they are statistically significant (although it should be noted that, just because a difference is ‘statistically significant’, that does not mean the difference is necessarily material or important).

Relative standard errors (RSEs) are a statistical measure of the precision of a survey statistic. RSEs for all survey data included in the report are shown in the relevant attachment tables, which are available on the Review website ([www.pc.gov.au/gsp/overcoming-indigenous-disadvantage](http://www.pc.gov.au/gsp/overcoming-indigenous-disadvantage)).

See ABS (2010b) for more information about RSEs, confidence intervals and tests of statistical significance. Information on the calculation of error bars is included in the glossary.

### Administrative data

A range of administrative data is used across this report. These data are collected for different reasons, including for regulatory purposes or administration of government programs. The resulting administrative records can also be used for statistical purposes. These data are constantly updated and new data may be available annually or more frequently. However, Australia’s federal system means that there are often differences across states and territories in the types of services provided, or the definitions used within data collections, which make it difficult to compare results across jurisdictions or to estimate national totals. Major differences in definitions or data collections are noted in this report as appropriate.

In some instances, administrative data can offer important advantages over direct collection of data from the population concerned (particularly in reducing respondent burden). However, administrative data may not represent all of the population of interest

---

<sup>3</sup> Although not sample survey data, literacy and numeracy data include 95 per cent confidence intervals (section 4.4) and mortality data include variability bands (sections 4.1 and 4.2), which account for variability in results due to non-sampling error.

---

(for example, data related to the delivery of a government service will only include people who accessed the service). Alternative methods may be needed in conjunction with the administrative data in order to obtain the full scope of information required (ABS 2011).

Although there is general agreement on a ‘standard Indigenous status question’ to ensure consistency in data collections (ABS 1999), there can be issues with the accuracy of Indigenous identification across jurisdictions and over time. Aboriginal and Torres Strait Islander Australians are not always asked the question, there are situations where they may choose not to identify, and there are also some inconsistencies in the recording of Indigenous status across jurisdictions and collections. Governments have committed to improve Indigenous identification in data collections as part of the National Indigenous Reform Agreement (NIRA).

Administrative data can also be affected by the availability or accessibility of services, and by Aboriginal and Torres Strait Islander Australian’s willingness (or ‘propensity’) to access those services. For example, different rates of substantiated child abuse and neglect across jurisdictions or over time may be the result of differential access to services or different propensities to report child abuse, rather than differences in its occurrence (see section 4.10).

## Rate ratios and rate differences

For some indicators, rate differences and rate ratios are calculated to compare rates between different groups, consistent with the approach in NIRA reporting. They are most commonly used when comparing age standardised rates.

- A *rate ratio* compares rates, to allow statements such as ‘the rate for Aboriginal and Torres Strait Islander Australians is three times as high as the rate for non-Indigenous Australians’. For example, if the rate for Aboriginal and Torres Strait Islander Australians is 30 per cent and the rate for non-Indigenous Australians is 10 per cent, the rate ratio would be three to one (or 3:1).
- A *rate difference* highlights the difference between rates, to allow statements such as ‘the rate for Aboriginal and Torres Strait Islander Australians is 20 percentage points higher than the rate for non-Indigenous Australians’. For example, if the rate for Aboriginal and Torres Strait Islander Australians is 30 per cent and the rate for non-Indigenous Australians is 10 per cent, the rate difference is 20 percentage points. The six COAG Closing the Gap targets and many other indicators are expressed primarily using rate differences, to measure the change in the gap over time.

---

### **3.3 Demographics of the Aboriginal and Torres Strait Islander population**

This section provides a brief introduction to some of the key Aboriginal and Torres Strait Islander demographics. More information is provided in appendix 3.

#### **How many people?**

At 30 June 2011, the estimated resident Aboriginal and Torres Strait Islander population of Australia was 670 000 people, out of a total population of 22.3 million people (approximately 3 per cent of the total Australian population, up from 2.9 per cent in 2006 using recast 2011 Census-based estimates). Within the Aboriginal and Torres Strait Islander population, an estimated 606 000 people (90 per cent) were of Aboriginal origin, 38 100 people (6 per cent) were of Torres Strait Islander origin and 25 600 people (4 per cent) were of both origins (ABS 2013c). The projected Aboriginal and Torres Strait Islander population at 30 June 2014 was 713 600 (ABS 2013c), which was 3 per cent of the projected total population of 23.5 million (ABS 2013d)<sup>4</sup>.

#### **Population distribution**

Service providers need to consider the geographic and age distribution of the Aboriginal and Torres Strait Islander population, and the requirements of different groups if they are to meet people's needs and address disadvantage. Services must also accommodate Aboriginal and Torres Strait Islander Australians' relatively high rates of temporary mobility and anticipate medium to long term demographic trends.

Higher proportions of the estimated residential populations of both the Aboriginal and Torres Strait Islander Australians (31 per cent) and the non-Indigenous Australians (32 per cent) lived in NSW than in other states and territories in 2011. Other states and territories with significant shares of the national Aboriginal and Torres Strait Islander population included Queensland (28 per cent), WA (13 per cent) and the NT (10 per cent). (Figure 3.3.1).

---

<sup>4</sup> Projections for both populations based on ABS series B.

**Figure 3.3.1 Population distribution, June 2011**

Proportion of national population in each State and Territory

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001, Canberra. See appendix 3 for more information.

## Mobility

A range of evidence suggests that Aboriginal and Torres Strait Islander Australians are more mobile than non-Indigenous Australians. Rather than living permanently in a single location, Aboriginal and Torres Strait Islander Australians may move between locations (including between remoteness areas) for a range of cultural and family reasons (DEST et al. 2002) and also to access health, housing, employment and education services (Prout 2008). This mobility can make it difficult for governments to plan for the delivery of services, if shifting populations cause unexpected variations in the level of demand at different times in different places (Markham et al. 2013). However, Dockery (2014) states that mobility must be considered in light of its importance in maintaining Aboriginal and Torres Strait Islander culture and identity, and therefore more information is required about the reasons for temporary mobility, how it contributes to wellbeing and how it can be accommodated within models of service delivery (Dockery 2014).

Aboriginal and Torres Strait Islander Australians were substantially more likely than non-Indigenous Australians to be away from their place of usual residence on the night of the 2011 Census, and more likely to have made permanent moves over the five years leading up to the Census. In addition, Aboriginal and Torres Strait Islander Australians are more likely to make moves that involve a change in location type (Biddle and Markham 2013). Aboriginal and Torres Strait Islander Australians in remote areas have much higher temporary mobility than non-Indigenous people (and Aboriginal and Torres Strait Islander Australians in non-remote areas) (Biddle and Prout 2009).

---

## Age profile of the Aboriginal and Torres Strait Islander population

The Aboriginal and Torres Strait Islander population has a much younger age structure than the non-Indigenous population. In 2011, more than one third (35.9 per cent) of the estimated Aboriginal and Torres Strait Islander population was aged under 15 years, compared with 18.4 per cent of the estimated non-Indigenous population. At the other end of the life course, an estimated 1.0 per cent of the Aboriginal and Torres Strait Islander population was aged 75 years and over in 2011, compared with 6.5 per cent of the non-Indigenous population. (Figure 3.3.2).

The different age structures can make it difficult to compare outcomes across the two populations, if outcomes can be expected to vary markedly by age. Therefore, a technique called ‘age standardisation’ is used to adjust relevant data for differences in population age structures. In this report, this includes data on disability, health and justice outcomes. Data in this report have been age standardised using the direct method, as it is best suited to comparisons over time.

---

<sup>a</sup> Includes other territories. <sup>b</sup> Estimates of the Australian Indigenous populations at 30 June 2011 are final based on the 2011 Census of Population and Housing.

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001; table A.1 in appendix 3.

---

---

## 3.4 Remoteness

Data on the population distribution of Aboriginal and Torres Strait Islander Australians by remoteness raise two contrasting points:

- the majority of Aboriginal and Torres Strait Islander Australians live in urban areas (57 per cent in major cities or inner regional areas) (figure 3.4.1)
- although they only make up 3 per cent of the total population, Aboriginal and Torres Strait Islander Australians make up relatively large proportions of the total population in remote (16 per cent) and very remote (45 per cent) areas (table A.2 in appendix 3).

---

Figure 3.4.1 **Proportion of the population by remoteness area, 2011**

Source: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, June 2011*, Cat. no. 3238.0.55.001, Canberra. See appendix 3 for more information.

---

An estimated 35 per cent of Aboriginal and Torres Strait Islander Australians (233 000 people) lived in major cities in 2011. A further 22 per cent (148 000 people) lived in inner regional areas, and another 22 per cent (146 000 people) in outer regional areas. An estimated 8 per cent (50 000 people) lived in remote areas and 14 per cent (92 000 people) in very remote areas. In comparison, almost 90 per cent of non-Indigenous Australians (over 19 million people) lived in major cities or inner regional areas. (Figure 3.4.1.)

Census data show that, over time, Aboriginal and Torres Strait Islander Australians are gradually becoming more urbanised, with a noticeable decrease in the number living in remote towns and settlements, and increasing numbers living in larger regional towns. At the same time, the non-Indigenous population of some of these regional towns is declining, and so, Aboriginal and Torres Strait Islander Australians are becoming a larger proportion of the populations of those towns (Biddle and Markham 2013; Taylor and Biddle 2008).

In this report, relevant indicators are disaggregated by remoteness wherever possible. For many indicators, remoteness data are only available at the national level. However, disaggregation by remoteness at the national level often shows patterns of disadvantage

---

more clearly than disaggregation by State and Territory (but not remoteness). However, outcomes can vary across places with similar degrees of remoteness in different states and territories.

For many of the indicators in this report, average outcomes for Aboriginal and Torres Strait Islander Australians in remote areas are poorer than outcomes for Aboriginal and Torres Strait Islander Australians in major cities and regional areas, including for: health — life expectancy (section 4.1), health behaviours during pregnancy (section 6.2), birthweight (section 6.3), potentially preventable hospitalisations (section 8.2); education — reading, writing and numeracy (section 4.4), year 12 attainment (section 4.5), post-secondary education (section 4.7); employment — employment to population rate (section 4.6); income (section 4.9); and housing — home ownership (section 9.3) and overcrowding in housing (section 10.1).

However, it is important to note there is significant variation within location types. There are many disadvantaged urban areas and many relatively advantaged regional and remote areas (Biddle 2009, 2013). The majority of Aboriginal and Torres Strait Islander Australians do not live in remote areas, and wherever Aboriginal and Torres Strait Islander Australians live, on average, their outcomes are poorer than outcomes for non-Indigenous Australians in those same areas. Aboriginal and Torres Strait Islander Australians in cities and large regional towns are concentrated in neighbourhoods with low socioeconomic outcomes, and tend to have poorer outcomes than non-Indigenous Australians in those same neighbourhoods (Biddle 2009, 2013; Taylor 2006).

## **Measuring remoteness**

For most indicators in this report, remoteness is measured according to the ABS Australian Statistical Geography Standard (ASGS). (Prior to 2011 the Australian Standard Geographical Classification [ASGC] was used). The ASGS (as per the ASGC) identifies a location in Australia as having a particular degree of remoteness based on its distance from population centres of various sizes. Some indicators are disaggregated into five remoteness area categories (major cities, inner regional, outer regional, remote, and very remote). When data quality does not support disaggregation into five categories, indicators may be collapsed into three categories (major cities, regional, and remote) or two categories (non-remote and remote). For more information on how remoteness is defined, see (ABS 2001a, 2001b, 2010a, 2013a).

As discussed in chapter 1, the primary focus of this report is on aggregate results at the national and State and Territory level, to help ensure the underlying causes of disadvantage and foundations of wellbeing are being addressed. However, the ability to disaggregate data into finer geographic classifications is essential for planning and coordinating the delivery of services. Some approaches include:

- the ABS Australian Indigenous Geography Structure (AIGS), which provides a geographical standard for the publication of statistics about the Aboriginal and Torres

---

Strait Islander population, with a three level hierarchy from very small Indigenous Locations up to larger Indigenous Areas and even larger Indigenous Regions (ABS 2011)<sup>5</sup>

- Taylor and Biddle's alternative geographic classification based on structural settings (that is, the types of places people live) — city areas; large regional towns; small regional towns and localities; regional rural areas; remote towns; Indigenous towns; town camps; and remote dispersed settlements (Taylor and Biddle 2008).

At present, the lower levels of the ABS AIGS and Taylor and Biddle's structural settings approach currently can only be readily applied to Census data.

### **3.5 Interactions across the report**

As noted in chapter 2, there are many interactions across the report's framework of indicators. Many of these are noted in the discussion of relevant indicators. However, in many areas, research on the underlying causal factors linking different outcomes is still thin.

Chapter 13 of this report presents information on the associations between different aspects of disadvantage. Section 13.1 presents information on the interactions between selected proxy measures of the COAG targets and headline indicators, using 2012-13 AATSIHS data. Section 13.2 presents an overview of recent work into Aboriginal and Torres Strait Islander multiple disadvantage conducted by other organisations, including the Centre for Aboriginal Economic Policy Research (CAEPR) and the Telethon Kids Institute.

This section of the report looks more generally at the potential for multiple causes to contribute to a single measured outcome, and the potential for some actions to affect multiple outcomes.

#### **Multiple causes**

Prevention and early intervention lie at the heart of the report framework. The focus is on encouraging action in the strategic areas that, over time, will lead to improvements in the COAG targets and headline outcomes, and progress toward the priority outcomes. However, in many cases, coordinated action is required across multiple areas if high level outcomes are to improve. Figures 3.5.1 and 3.5.2 illustrate just some of the many linked factors that can affect outcomes.

Figure 3.5.1 illustrates how the COAG targets of employment (section 4.6), year 12 or equivalent attainment (section 4.5) and reading, writing and numeracy (section 4.4), plus

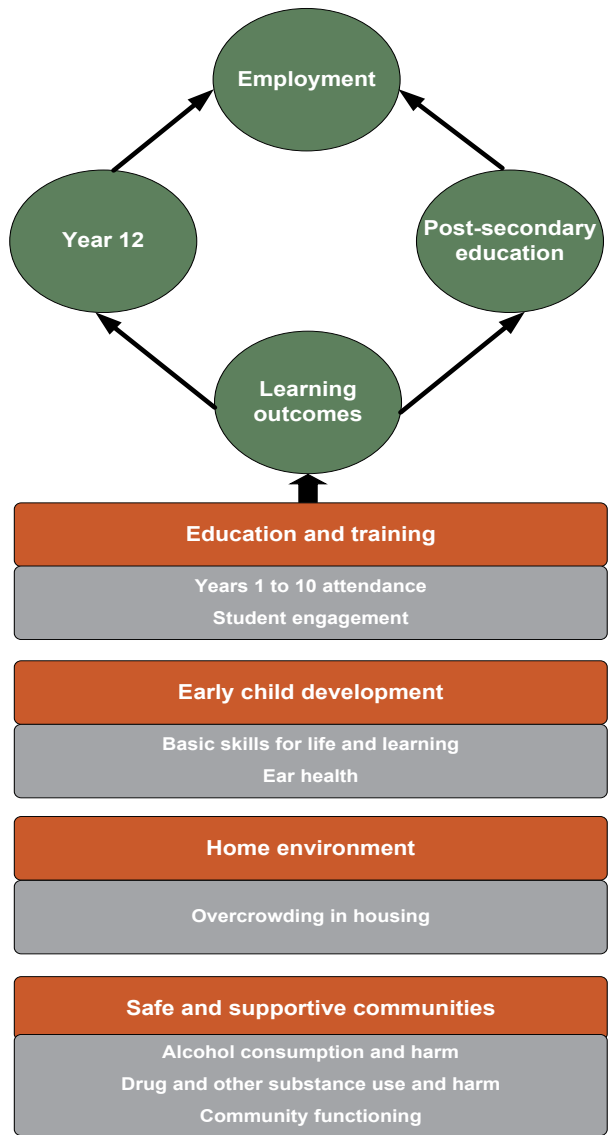

---

<sup>5</sup> The ABS is currently reviewing the Australian Indigenous Geography Structure in the lead up to the 2016 Census of Population and Housing.

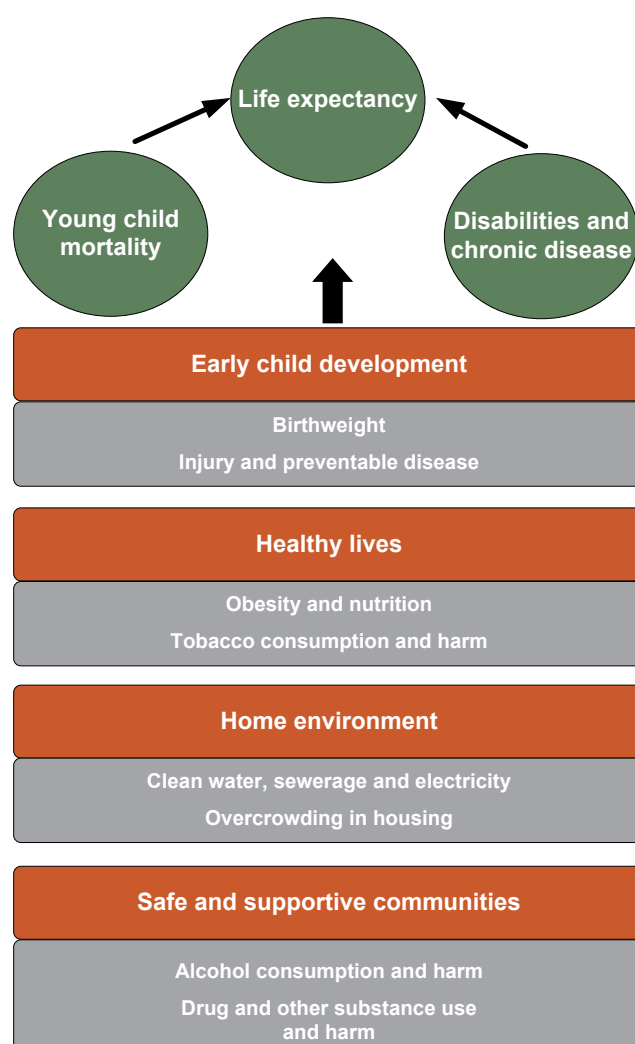

the headline indicator of post-secondary education (section 4.7), are influenced by outcomes across the framework. It is obvious that educational success will depend on outcomes in the ‘Education and training’ strategic area, which in turn depend on the achievement of outcomes in the ‘Early child development’ strategic area. However, social and environmental factors, such as those in the ‘Home environment’ and ‘Safe and supportive communities’ strategic areas affect all these outcomes. Of course, these are not the only factors at work — employment and education outcomes can also be influenced by the inter-generational effects of parental income, employment and education levels. The message from the framework is that, although educational services play an important role in achieving these COAG targets and headline indicators, many other services must also play a part.

Figure 3.5.1 Multiple causes — employment and education

In figure 3.5.2, the COAG targets of ‘Life expectancy’ (section 4.1) and Young child mortality’ (section 4.2) are clearly linked, and are closely related to the headline indicator of ‘Disability and chronic disease’ (section 4.8). In turn, these outcomes will be influenced by outcomes in the ‘Early child development’ and ‘Healthy lives’ strategic areas. But actions in these areas must be supported by actions to address outcomes in the ‘Home environment’ and ‘Safe and supportive communities’ strategic areas. Actions must also address other social determinants of health in the education and employment areas.

Figure 3.5.2 **Multiple causes — health**

## Multiple effects

Although some high level outcomes may require actions across a range of areas, sometimes a single, well-targeted action can influence a range of outcomes. These

interactions emphasise the need for a whole-of-government approach to assessing the costs and benefits of such actions.

For example, housing typically is regarded as the responsibility of State and Territory departments of housing. But as illustrated in figure 3.5.3, reducing overcrowding can affect the COAG target of ‘Reading, writing and numeracy’ (section 4.4), and headline indicators of ‘Disability and chronic disease’ (section 4.8) and ‘Family and community violence’ (section 4.11) as well as outcomes in the ‘Education and training’, ‘Healthy lives’, ‘Home environment’ and ‘Safe and supportive communities’ strategic areas. Although other influences are also important in each of these areas, there is sufficient evidence for education, health and justice departments to be concerned about housing issues.

Figure 3.5.3 Multiple effects — overcrowding

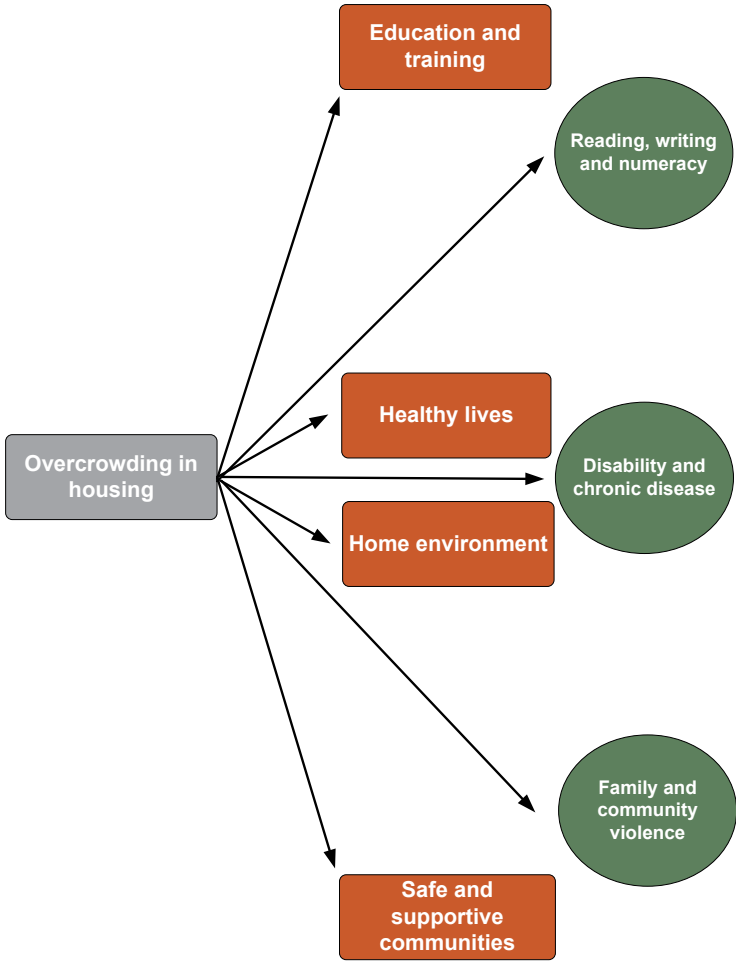

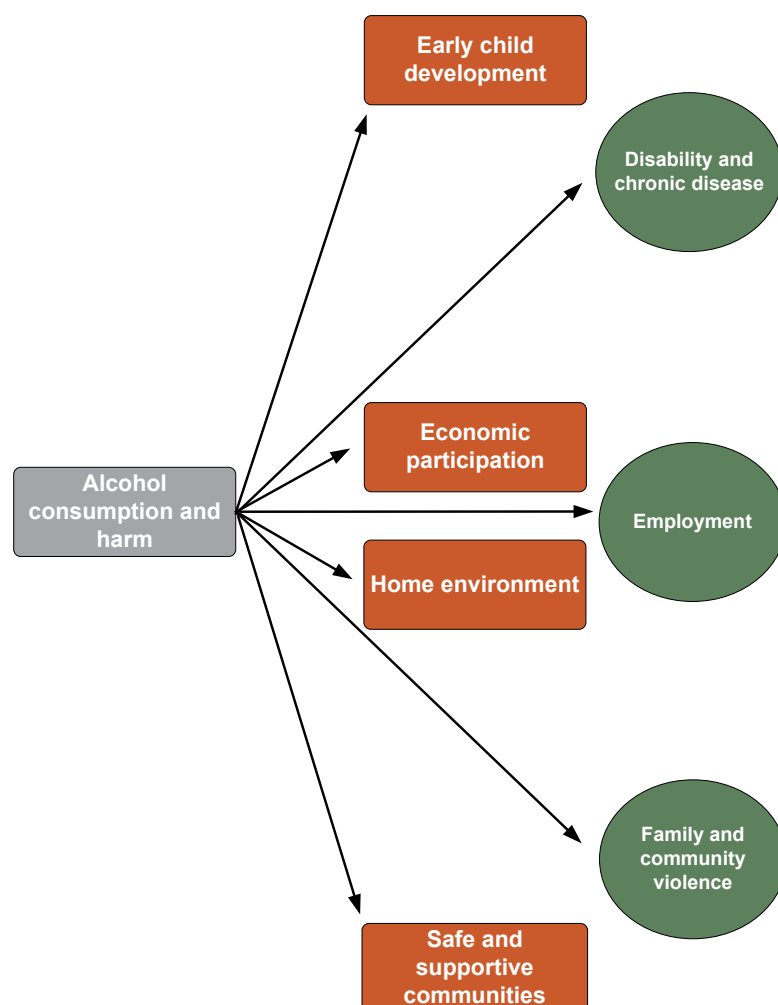

Figure 3.5.4 illustrates similar links for actions designed to address excessive alcohol consumption and associated harm. Misuse of alcohol can contribute to the COAG target of ‘Employment’ (section 4.6) and the headline indicators of ‘Disability and chronic disease’ (section 4.8) and ‘Family and community violence’ (section 4.11) and affect outcomes in

---

the ‘Early child development’, ‘Healthy lives’, ‘Economic participation’, and ‘Safe and supportive communities’ strategic areas, among others. Although alcohol misuse is not the only influence in these areas, a range of studies have identified the significant part this risk factor can play in a broad range of outcomes (section 11.1).

---

Figure 3.5.4 **Multiple effects — alcohol**

### 3.6 Things that work — success factors

Brief case studies of ‘thing that work’ in improving outcomes for Aboriginal and Torres Strait Islander Australians have been a part of this report since 2005. Not everything that matters can be captured in indicators, and some information is better presented in words, rather than numbers. In particular, community level change may not show up in State and Territory or national data.

---

As noted in chapter 2, ‘Things that work’ in this report were assessed against a broad set of criteria before they were included. However, formal evaluations of programs for Aboriginal and Torres Strait islander Australians are relatively scarce (PC 2013). In order to provide a range of examples to illustrate how things can change for the better, the Steering Committee has included case studies of some promising programs that have not undergone rigorous evaluation (noting the desirability of formal evaluation for these programs). There is an urgent need for more research and evaluation to identify successful programs and the reasons for their success (PC 2013).

The Closing the Gap Clearinghouse (AIHW and AIFS nd) was the source of many of the ‘things that work’ case studies in this report. The Clearinghouse has identified the following high level principles and practices that underpin successful programs for Aboriginal and Torres Strait Islander Australians:

- flexibility in design and delivery so that local needs and contexts can be taken into account
- community involvement and engagement in both the development and delivery of programs
- the importance of building trust and relationships
- a well-trained and well-resourced workforce, with an emphasis on retention of staff
- continuity and coordination of services (AIHW and AIFS 2013).

These success factors are closely related to the six determinants of good governance described in chapter 5, section 5.4 (governing institutions; leadership; self-determination; capacity building; cultural match; and resources) and the success factors identified by the Steering Committee in previous reports:

- cooperative approaches between Aboriginal and Torres Strait Islander Australians and government — often with the non-profit and private sectors as well
- community involvement in program design and decision-making — a ‘bottom-up’ rather than ‘top-down’ approach
- good governance — at organisation, community and government levels
- ongoing government support — including human, financial and physical resources.

## **Cooperative approaches**

Cooperation between Aboriginal and Torres Strait Islander Australians and governments seems an obvious ingredient for successful programs. Nevertheless it does not always occur. Cooperative approaches require Aboriginal and Torres Strait Islander communities and organisations, governments, non-profit organisations and private businesses to work as partners. Hunt (2010) has explored some aspects of cooperative partnerships between non-government organisations, Aboriginal organisations and communities. Success is

---

much more likely where each party acknowledges the value, and supports the contributions of, the other partners (Hunt 2010).

Most case studies in the report are based on cooperative approaches between governments, communities and other organisations. Examples include:

- the Anyinginyi Health Aboriginal Corporation's Eye Program in the NT, which coordinates optometrist and eye specialist visits with culturally appropriate clinics in the Tennant Creek and Barkley region (box 5.3.3)
- The Deadly Ways to Learn project in WA, under which teachers and Australian Indigenous Education Officers work together to enhance literacy levels among Aboriginal students (box 5.6.3)
- the Aboriginal and Maternal and Infant Health Service in NSW, which operates through the collaboration of Aboriginal Health Workers and midwives, in partnership with Aboriginal people and Aboriginal health educators (box 6.2.3)
- the Aboriginal Parent Group Program in NSW, which operates as a partnership between the Ngala Nanga Mai pARenT Program (the community) and the NSW Department of Child Health (box 6.3.3)
- the national Supply Nation program, which assists Indigenous businesses to enter into commercial relationships with large corporations and agencies (box 9.2.4).

Cooperative approaches are closely related to the second success factor — community involvement in program design and decision making.

## **Community involvement**

Community involvement in program design and decision-making is closely related to self-determination, one of the determinants of good Indigenous governance (see section 5.4). The Harvard Project on American Indian Economic Development found that self-determination led to improved outcomes for North American Indigenous people:

When [Indigenous people] make their own decisions about what development approaches to take, they consistently out-perform [non-Indigenous] decision makers. (Harvard Project nd)

The former Aboriginal and Torres Strait Islander Social Justice Commissioner, Tom Calma, considered that much of the failure of service delivery to Aboriginal and Torres Strait Islander Australians was a direct result of the failure to engage and to support and build the capacity of communities:

Put simply, governments risk failure if they develop and implement policies about Indigenous issues without engaging with the intended recipients of those services. Bureaucrats and governments can have the best intentions in the world, but if their ideas have not been subject to the 'reality test' of the life experience of the local Indigenous peoples who are intended to benefit from this, then government efforts will fail. (Calma 2006)

---

Community involvement is a key factor in the success of most case studies in this report. Some specific examples of successful community involvement include:

- the Families as First Teachers program in the NT, which involves parents and families in young children's early learning and development (box 4.3.3)
- The Ngaanyatjarra Pitjantjatjara Yankunytjatjara (NPY) Women's Council in central Australia, a major provider of human services and whose accomplishments include banning take-away alcohol sales at Curtin Springs roadhouse and the introduction of non-sniffable Opal fuel in Central Australia (box 5.4.2)
- the Yiriman Project in WA, under which Elders take young people on trips back to country 'to immerse them in the stories, songs and knowledge that are their cultural heritage' (boxes 5.4.3 and 8.8.3).

## **Good governance**

Good governance — at organisation, community and government levels — is closely related to several of the key determinants of good Indigenous governance (see section 5.4):

- governing institutions
- leadership
- capacity building
- cultural match.

Unless organisations, communities and governments demonstrate principles of good governance, programs are likely to fail.

Good governance is essential to all successful case studies in the report. Particular examples include:

- the Cape York Welfare Reform Trial in Queensland, which operates as a partnership between four local communities, the Queensland Government and the Australian Government (box 5.4.6)
- the Mossman Gorge Centre in Queensland, which was developed by the Indigenous Land Corporation (ILC) in collaboration with the local Kuku Yalanji people, on land purchased through the ILC's Land Acquisition program (box 9.1.3)
- Indigenous Landholder Services in WA, which focusses on technical support, governance development and business management mentoring, to increase economic benefits to Aboriginal pastoral and agricultural producers (box 9.2.3)
- finalists and winners of the BHP Billiton Reconciliation Australia Indigenous Governance awards, including the Ngaanyatjarra Pitjantjatjara Yankunytjatjara (NPY) Women's Council in central Australia (box 5.4.2) and the Yiriman Project in WA (boxes 5.4.3 and 8.8.3), which have demonstrated excellence across key determinants of good governance (section 5.4).

---

## **Ongoing government support**

Virtually all the case studies in this report rely on government support to some extent — although many organisations are seeking greater financial diversity, to provide the independence to run programs as Aboriginal and Torres Strait Islander Australians want them to be run.

Resources is one of the key determinants of good governance (see section 5.4), and ongoing government support is closely related to this. Many programs for Aboriginal and Torres Strait Islander Australians are funded as short-term pilots with no guaranteed continuity. Several successful programs included as ‘Things That Work’ in previous editions of this report no longer exist, because government support has been withdrawn.

In addition, many Aboriginal and Torres Strait Islander organisations, including successful organisations with long track records, are funded through multiple, short term government contracts that increase red tape and uncertainty, and place pressure on capacity and sustainability.

## **3.7 International comparisons**

Comparisons of outcomes for Aboriginal and Torres Strait Islander Australians with outcomes for indigenous peoples in other countries could help identify areas where Australia could learn from other approaches to overcoming Indigenous disadvantage. However, such comparisons are not attempted in this report, due to lack of suitable current data.

The most meaningful comparisons of outcomes for Aboriginal and Torres Strait Islander Australians are likely to be with indigenous peoples from countries such as the United States, Canada, and New Zealand — developed countries with a history of relatively recent European colonisation, and a non-indigenous majority.

Many Latin American countries also have relatively recent European colonisation and indigenous minorities. However, most Latin American countries are less developed than Australia, have different economic, legal and social systems and typically have less developed statistical collections. In some other countries, particularly in Africa and Asia, groups of people may be identified as indigenous to specific areas where various ethnic groups have lived together for significant periods. In such cases, the distinction between indigenous and non-indigenous people can be less clear cut.

### **Comparability of international data**

Very little internationally comparable data are available for outcomes for indigenous people. Although many countries have agreed to adopt international definitions for statistics such as life expectancy, disease codes for mortality and hospitals, international

---

testing of learning outcomes, and labour force participation, data are often only available for each country's total population — comparable data on indigenous people are not commonly available.

Even where data are available, caution must be used in comparing data with other countries, due to:

- different definitions used to identify who is an indigenous person
- variations in estimation methods, data quality and scope
- different economic, social and political environments.

The United Nations prepared a comprehensive assessment of the state of the world's indigenous peoples (UNPFII 2009). The report is largely qualitative, and focuses on the human rights of indigenous people. The limited quantitative data on outcomes for indigenous people in different countries are significantly older than those available for Aboriginal and Torres Strait Islander Australians included in this report.

Cooke et al. (2007) compared outcomes for indigenous peoples in Australia, Canada, New Zealand and the United States for life expectancy, income, educational attainment and the Human Development Index used by the United Nations Development Programme (UNDP) (Cooke et al. 2007). However, the most recent data assembled are from 2001. The compilation of data on Aboriginal and Torres Strait Islander Australians has progressed substantially since then, including the introduction by the ABS of a substantially revised method for estimating Indigenous life expectancy.

## 4 COAG TARGETS AND HEADLINE INDICATORS

---

Figure 4.1 **Priority outcomes**

---

### Box 4.1 **COAG targets and headline indicators**

#### **COAG targets**

- 4.1 Life expectancy
- 4.2 Young child mortality
- 4.3 Early childhood education
- 4.4 Reading, writing and numeracy
- 4.5 Year 12 attainment
- 4.6 Employment

#### **Headline indicators**

- 4.7 Post-secondary education — participation and attainment
- 4.8 Disability and chronic disease
- 4.9 Household and individual income
- 4.10 Substantiated child abuse and neglect
- 4.11 Family and community violence
- 4.12 Imprisonment and juvenile detention

The three priority outcomes that sit at the top of the report's framework (figure 4.1) reflect COAG's vision for Aboriginal and Torres Strait Islander Australians to have the same life opportunities as other Australians. The priority outcomes are interlinked — no single aspect of the priority outcomes can be achieved in isolation. 'Positive child development

---

and prevention of violence, crime and self-harm’ are key determinants in the achievement of ‘safe, healthy and supportive family environments with strong communities and cultural identity’. Without these conditions in place, it is very difficult to achieve ‘improved wealth creation and economic sustainability’.

Progress against the COAG targets and headline indicators (box 4.1) reflects the extent to which this vision is becoming a reality. Like the priority outcomes themselves, these indicators are strongly inter-dependent. Few of the COAG targets or headline indicators are likely to improve solely as the result of a single policy or a single agency — positive change will generally require action across a range of areas. In addition, most of these high level indicators are likely to take some time to improve, even if effective policies are implemented in the strategic areas for action.

The COAG targets and headline indicators are high level indicators:

- life expectancy — life expectancy is a broad indicator of the long-term health and wellbeing of a population
- young child mortality — young child mortality (particularly infant (<1 year old) mortality) is an indicator of the general health of a population
- early childhood education — children’s experiences in their early years influence lifelong learning, behaviour and health. High quality early childhood education can enhance the social and cognitive skills necessary for achievement at school and later in life
- reading, writing and numeracy — improved educational outcomes are key to overcoming many aspects of disadvantage
- year 12 attainment — a Year 12 or equivalent qualification significantly increases the likelihood of a successful transition to post-school activities, including further education, training and employment
- employment — employment contributes to living standards, self-esteem and overall wellbeing. It is also important to families and communities
- post-secondary education—participation and attainment — education can affect employment prospects and incomes, and also health and the ability to make informed life decisions
- disability and chronic disease — high rates of disability and chronic disease affect the quality of life of many Indigenous people. Disability and chronic disease can also affect other outcomes, by creating barriers to social interaction and reducing access to services, employment and education
- household and individual income — the economic wellbeing of families and individuals is largely determined by their income and wealth. Higher incomes can enable the purchase of better food, housing, recreation and health care. There may also be psychological benefits, such as a greater sense of personal control and self-esteem

- 
- substantiated child abuse and neglect — many Aboriginal and Torres Strait Islander families and communities live under severe social strain, caused by a range of social and economic factors. Alcohol and substance misuse, and overcrowded living conditions are just some of the factors that can contribute to child abuse and neglect
  - family and community violence — family and community violence problems are complex, and the impact of such violence may be felt from one generation to another
  - imprisonment and juvenile detention — Aboriginal and Torres Strait Islander Australians are over-represented in the criminal justice system, as both young people and adults. Poverty, unemployment, low levels of education and lack of access to social services are all associated with high crime rates and high levels of imprisonment.

### **Attachment tables**

Attachment tables for this chapter are identified in references throughout this chapter by an ‘A’ suffix (for example, table 4A.2.3). These tables can be found on the Review web page ([www.pc.gov.au/gsp](http://www.pc.gov.au/gsp)), or users can contact the Secretariat directly.

---

## 4.1 Life expectancy<sup>1</sup>

### Box 4.1.1 Key messages

Life expectancy is a broad indicator of a population's long-term health and wellbeing.

- From 2005–2007 to 2010–2012, the gap in life expectancy for Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians has narrowed for both males and females (from 11.4 to 10.6 years for males, and from 9.6 to 9.5 years for females) (tables 4A.1.3 and 4A.1.1).
- From 1998 to 2012, the Aboriginal and Torres Strait Islander crude mortality rate decreased from 448.7 to 408.6 deaths per 100 000 population (figure 4.1.1). After adjusting for differences in population age structures, the gap between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians narrowed slightly from 479.4 to 402.3 deaths per 100 000 population (figure 4.1.2).
- Nationally for children born in 2010–2012, estimated life expectancy at birth for Aboriginal and Torres Strait Islander Australians was 69.1 years for males and 73.7 years for females (table 4A.1.1), compared to 79.7 years for non-Indigenous males and 83.1 years for non-Indigenous females.

### Box 4.1.2 Measures of life expectancy

There is one main measure for this indicator (aligned with the associated NIRA indicator). *Estimated life expectancy at birth* is defined as the average number of years new born babies could expect to live, if they experienced the age/sex specific death rates that applied at their birth throughout their lifetimes.

The most recent available data are from the ABS Aboriginal and Torres Strait Islander and non-Indigenous life tables, with the most recent available data for 2010–2012 (NSW, Queensland, WA, the NT and national; sex; remoteness). Life expectancy estimates for Victoria, SA, Tasmania and the ACT are not available by Indigenous status because of their small Aboriginal and Torres Strait Islander populations (although data are included in national totals).

Data are also provided for one supplementary measure (aligned with the associated NIRA indicator). *Mortality rate by leading causes* is defined as the number of deaths per 100 000 population (considered a proxy annual measure for life expectancy). The most recent available data for mortality rates are from the ABS Deaths Collection (all cause totals) and the ABS Causes of Death Collection, with the most recent available data for 2012 (NSW, Queensland, WA, SA and the NT; age; sex; remoteness).

Life expectancy is an indicator of long-term health and wellbeing, and a key measure of the health of populations. Life expectancy is influenced by employment, education, housing, sanitation and access to healthcare (Becker, Philipson and Soares 2003; Carson et

---

<sup>1</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

al. 2007; Mariani, Perez-Barhona and Raffin 2010). The Council of Australian Governments (COAG) has committed to ‘closing the life expectancy gap [between Indigenous and non-Indigenous Australians] within a generation’ (COAG 2012).

Life expectancy can be increased by positive health behaviours (see sections 8.4, 8.5, and 11.1), improving access to high quality health services, greater levels of preventative care, early diagnosis of diseases and more effective treatment of chronic diseases (see sections 4.8, 8.1 and 8.2). Poverty, disadvantage and stress can lead to unhealthy behaviours (Marmot and Wilkinson 2009; Renzaho et al. 2013). People from lower socioeconomic groups suffer from higher rates of ill health and death at younger ages (Turrell and Mathers 2000). On average, Aboriginal and Torres Strait Islander people also experience a larger health gap due to risk factors such as smoking, excessive alcohol consumption, illicit drug use, insufficient physical activity, and poor nutrition which, in turn, contribute to higher rates of chronic disease (AIHW 2012). On the other hand, positive cultural, social and economic factors all help to make healthier choices viable. There is some evidence that influencing the social and economic determinants of Aboriginal and Torres Strait Islander health can contribute to closing the life expectancy gap between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (Osborne, Baum and Brown 2013).

## **Life expectancy**

Aboriginal and Torres Strait Islander males born between 2010 and 2012 can expect to live 69.1 years, 10.6 years less than non-Indigenous males. Aboriginal and Torres Strait Islander females can expect to live 73.7 years, 9.5 years less than non-Indigenous females (table 4A.1.1). (Females live longer than males in both the Aboriginal and Torres Strait Islander and non-Indigenous populations.) The life expectancy gap for both sexes has narrowed since 2005–2007 (from 11.4 to 10.6 years for males, and from 9.6 to 9.5 years for females) (tables 4A.1.3 and 4A.1.1).

An improvement has been made to the calculation of Aboriginal and Torres Strait Islander life expectancy at the national level for 2010–2012 (with comparable data produced for 2005–2007). However, this improved method (which takes age-specific identification rates into account) could not be used for individual jurisdictions and remoteness areas. Comparable, non-age-adjusted national level data are provided in tables 4A.1.1 and 4A.1.3 to enable jurisdictional and remoteness comparisons.

Life expectancy for Aboriginal and Torres Strait Islander Australians is available for the first time by remoteness. For 2010–2012, life expectancy for those living in major cities/inner regional areas is around 0.7 years longer for males and 0.8 years longer for females, than for those living in outer regional, remote and very remote areas (68.0 years compared with 67.3 years for males, and 73.1 years compared with 72.3 years for females) (table 4A.1.2).

**Table 4.1.1 Estimated life expectancies at birth, 2010–2012 and 2005–2007<sup>a</sup>**

	Indigenous				Non-Indigenous	
	Life expectancy at birth		95 per cent confidence intervals		Life expectancy at birth	
	Males	Females	Males	Females	Males	Females
2010-2012						
NSW	70.5	74.6	69.0-72.0	73.3-75.9	79.8	83.1
Queensland	68.7	74.4	67.3-70.1	73.2-75.6	79.4	83.0
WA	65.0	70.2	63.4-66.6	68.8-71.6	80.1	83.7
NT	63.4	68.7	61.3-65.5	66.8-70.6	77.8	83.1
Australia <sup>b</sup>	69.1	73.7	67.8-70.4	72.5-74.9	79.7	83.1
2005-2007						
NSW	68.3	74.0	66.3-70.3	72.3-75.7	78.8	82.6
Queensland	67.1	72.7	65.6-68.6	71.4-74.0	78.8	82.7
WA	64.5	70.0	62.9-66.1	68.5-71.5	79.2	82.9
NT	61.5	69.4	60.1-62.9	68.1-70.7	75.5	81.0
Australia <sup>b</sup>	67.5	73.1	66.1-68.9	71.9-74.3	78.9	82.6

<sup>a</sup> Indigenous estimates of life expectancy are not produced for Victoria, SA, Tasmania or the ACT due to the small number of Indigenous deaths reported in these jurisdictions. <sup>b</sup> Headline estimates for Australia include all states and territories, and are calculated using an improved methodology (taking into account age-specific identification rates) that could not be applied at the state and territory or remoteness area levels. Therefore these data should not be compared with data for an individual State, Territory or remoteness area.

Source: ABS (2013) *Life Tables for Aboriginal and Torres Strait Islander Australians, 2010–2012*, Cat. no. 3302.0.55.003, Canberra; tables 4A.1.1 and 4A.1.3.

Available data suggest that the gap in life expectancy between Aboriginal and Torres Strait Islander and non-Indigenous people in Australia is larger than in other countries where Indigenous peoples share a similar history (table 4A.1.4). In New Zealand, in 2010–2012, there was a Māori/non Māori gap of 7.4 years for males and 7.2 years for females (Statistics New Zealand 2013). However, caution should be used in comparing data across countries, due to a range of conceptual, methodological and data issues (AIHW 2011).

## Mortality rates by leading causes

Mortality rates (defined as the number of deaths per 100 000 population) are considered an annual proxy measure for life expectancy. The following caveats apply:

- five year aggregate data are used for current period analysis, due to the volatility of the small number of deaths. Single year data are presented for time series analysis only
- data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT only, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

---

## All-cause mortality

From 1998 to 2012, Aboriginal and Torres Strait Islander crude mortality rates declined from 448.7 to 408.6 deaths per 100 000 population (table 4A.1.6).

---

Figure 4.1.1 **Indigenous mortality rates, NSW, Queensland, WA, SA and the NT, by sex 1998 to 2012 a, b**

**a** Rates are crude rates. **b** Data for these five jurisdictions are not representative of rates in other jurisdictions.

Source: ABS (unpublished) Deaths, Australia; table 4A.1.6.

---

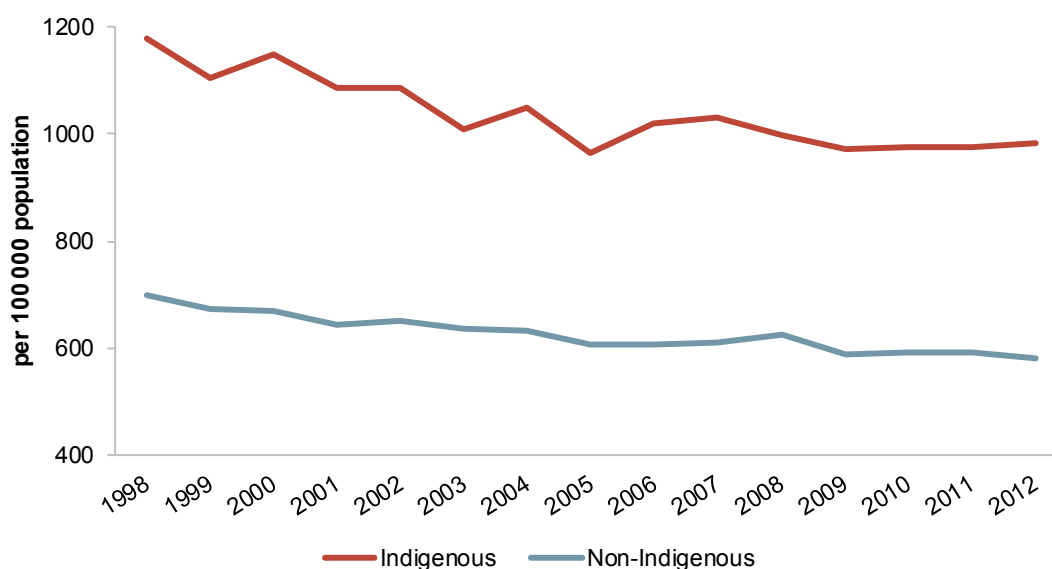

Mortality rates for Aboriginal and Torres Strait Islander females were consistently lower than those for males from 1998 to 2012, but the gap between male and females has narrowed (from 156.5 to 79.7 deaths per 100 000 population) (figure 4.1.1).

For 2008–2012, after adjusting for differences in population age structures, the mortality rate for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians (table 4A.1.7).

For specific age groups for 2008–2012:

- the 35–44 year age group had the greatest rate ratio, with the Aboriginal and Torres Strait Islander mortality rate around four times the non-Indigenous rate (397.0 compared with 97.8 deaths per 100 000 population).
- The 55–64 year age group had the largest absolute difference in mortality rates between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians (1377.0 compared with 511.0 deaths per 100 000 population — a difference of 866.0 deaths per 100 000 population) (table 4A.1.5).

Figure 4.1.2 **Mortality rates, NSW, Queensland, WA, SA and the NT 1998 to 2012<sup>a,b</sup>**

<sup>a</sup> Rates have been directly age-standardised using the 2001 Australian standard population. <sup>b</sup> Data for these five jurisdictions are not representative of rates in other jurisdictions.

Source: ABS (unpublished) Deaths, Australia; table 4A.1.6

From 1998 to 2012, after adjusting for differences in population age structures, the gap in mortality rates between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians narrowed from 479.4 to 402.3 deaths per 100 000 population (figure 4.1.2).

Data for all-cause mortality rates reported for selected states and territories are also available in table 4A.1.7.

The ABS has published mortality data disaggregated by remoteness in Deaths, Australia, 2012 (ABS Cat. no. 3302.0). These data are not included in this report, as they are not adjusted for the under-identification of Indigenous status. Under-identification of Indigenous status in deaths registrations increases as remoteness decreases, which makes interpretation of the results difficult.

---

## Causes of death

Leading causes of death provide further context for understanding trends in mortality and life expectancy.<sup>2</sup>

For 2008–2012, the leading causes of death for Aboriginal and Torres Strait Islander Australians were: diseases of the circulatory system (25.5 per cent of all deaths); cancers (neoplasms) (20.2 per cent); external causes (15.2 per cent); endocrine, nutritional and metabolic diseases (9.1 per cent); and diseases of the respiratory system (7.6 per cent) (table 4A.1.11).

From 1998 to 2012, after adjusting for differences in population age structures, the gap in mortality rates between Aboriginal and Torres Strait Islander and non-Indigenous Australians:

- narrowed for deaths where the leading causes were:
  - diseases of the circulatory system — from a gap of 169.4 deaths per 100 000 population to 108.3 deaths per 100 000 population. However, the rate for Aboriginal and Torres Strait Islander Australians remained 1.6 times that for non-Indigenous Australians (table 4A.1.19)
  - diseases of the respiratory system — from a gap of 81.7 deaths per 100 000 population to 46.2 deaths per 100 000 population (table 4A.1.19)
- widened where the leading cause was neoplasms (cancers), from a gap of -5.0 deaths per 100 000 population to 55.4 deaths per 100 000 population (table 4A.1.19).

Higher Aboriginal and Torres Strait Islander cancer mortality rates may be partly due to factors such as later diagnoses, lower likelihood of receiving treatment and greater likelihood of being diagnosed with cancers for which the prospect of successful treatment and survival is poorer (AHMAC 2012).

Data for cause of death reported for selected state and territories are available in tables 4A.1.8–18.

## Future directions in data

The primary measure for this indicator, estimated life expectancy at birth, is based on a three-year average, published every five years (related to the availability of Census data). Currently, data are only able to be reported at the jurisdictional level for NSW, Queensland, WA and the NT. Further work is required to enable reporting of life expectancy estimates separately for all states and territories (subject to limitations imposed by the small number of Aboriginal and Torres Strait Islander deaths in some jurisdictions).

---

<sup>2</sup> Data are provided for selected causes of death according to the ICD-10 codes used for leading cause of death in the Aboriginal and Torres Strait Islander Health Performance Framework. This approach aligns with that used for the National Indigenous Reform Agreement performance reporting.

## 4.2 Young child mortality<sup>3</sup>

### Box 4.2.1 Key messages

- From 1998 to 2012, there was a significant decline in mortality rates for Aboriginal and Torres Strait Islander children aged 0–4 years (from 216.8 to 146.0 deaths per 100 000 population). This decline was greater than that for non-Indigenous children (from 114.9 to 79.2 deaths per 100 000 population), resulting in a narrowing of the gap from 101.8 to 66.8 deaths per 100 000 population (table 4A.2.1).
- The major contributor to the decrease in Aboriginal and Torres Strait Islander child mortality rates was a significant decrease in the infant (0–1 year) mortality rate (from 13.5 to 5.0 deaths per 1000 live births). The infant mortality gap narrowed from 9.0 to 1.7 deaths per 1000 live births (table 4A.2.1).

### Box 4.2.2 Measures for young child mortality

There is one main measure for this indicator (aligned with relevant NIRA indicator) *mortality rates for children aged less than five years, by leading cause of death*. The measure is reported for:

- *perinatal* — perinatal deaths as a rate of all live births.
- *infant* — deaths among children under one year as a rate of live births
- *children aged 1–4 years* — deaths among children 1–4 years as a rate of the total population of children aged 1–4 years
- *children aged 0–4 years* — deaths among children 0–4 years as a rate of the total population of children aged 0–4 years

Data are available for NSW, Queensland, WA, SA and the NT.

Infant and child mortality data are sourced from the ABS Deaths Australia collection. Perinatal mortality data are sourced from the ABS Perinatal Deaths collection.

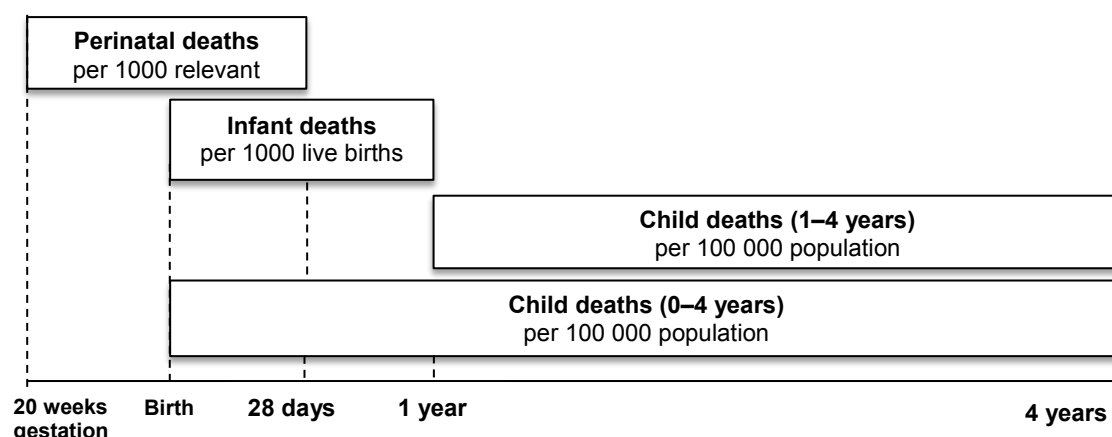

Causes of death are sourced from the ABS Causes of Death collection.

The mortality rate for children under five years is a key indicator of the general health and wellbeing of a population. The Council of Australian Government (COAG) has committed to ‘halving the gap in mortality rates for Indigenous children under five within a decade’ (COAG 2012). Mortality rates are reported in this section for perinatal, infant, children aged 1–4 years and children aged 0–4 years (figure 4.2.1).

---

<sup>3</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

Figure 4.2.1 Young child mortality rates

Perinatal mortality is associated mainly with complications arising from pregnancy and childbirth, and rates may reflect access to antenatal services and health care in the neonatal period, as well as social determinants including maternal education, nutrition, smoking, alcohol use in pregnancy and socioeconomic disadvantage. Related information are presented in the early childhood development section of this report (6.1 (antenatal care); 6.2 (health behaviours during pregnancy); and 6.4 (birth weight)).

Most childhood deaths occur in the first year of life and are captured in the infant mortality rates. In 2010, infant deaths comprised 1 per cent of all deaths, but almost three-quarters of deaths among children aged less than 14 years (AIHW 2012).

There was a dramatic decline in overall infant mortality rates in Australia over the 20th century. Infant death rates decreased from 103 deaths per 1000 live births in 1900 to 4.3 deaths per 1000 live births in 2009 (ABS 2002, 2010). During the first half of the 20th century, a significant share of this decline was associated with improvements in public sanitation and health education, followed by the development of immunisation programs. Improved neonatal and intensive care, education campaigns on immunisation and infant sleeping position have led to further modest declines in infant deaths (ABS 2000, 2010; AHMAC 2012; AIHW 2012; d' Espaignet et al. 2008). There have been significant reductions in perinatal mortality rates among Aboriginal and Torres Strait Islander Australians since the 1990s, but a gap still remains to non-Indigenous rates (AHMAC 2012).

The overall mortality rate for Australian children aged 1–4 years has declined over the 20th century, but not as significantly as infant and perinatal death rates. Once infancy has passed, injury emerges as one of the leading causes of death for all children. There has been an overall decline in injury-specific child deaths over the last two decades, partly due to a decline in transport and drowning deaths (ABS 2005).

---

## **Mortality rates for children aged less than five years, by leading cause of death**

Child mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis. Data are presented as five year aggregates to account for the volatility of small numbers.

For 2008–2012, the mortality rate for Aboriginal and Torres Strait Islander children aged 0–4 years was 166.6 deaths per 100 000 population, compared with a rate of 92.6 deaths per 100 000 population for non-Indigenous children (a ratio of 1.8:1) (table 4A.2.8). The majority of deaths occur in the first year of life — the infant mortality rates for Aboriginal and Torres Strait Islander children was 6.2 per 1000 live births, compared with a rate of 3.7 per 1000 live births for non-Indigenous children (a rate ratio of 1.7:1) (table 4A.2.4).

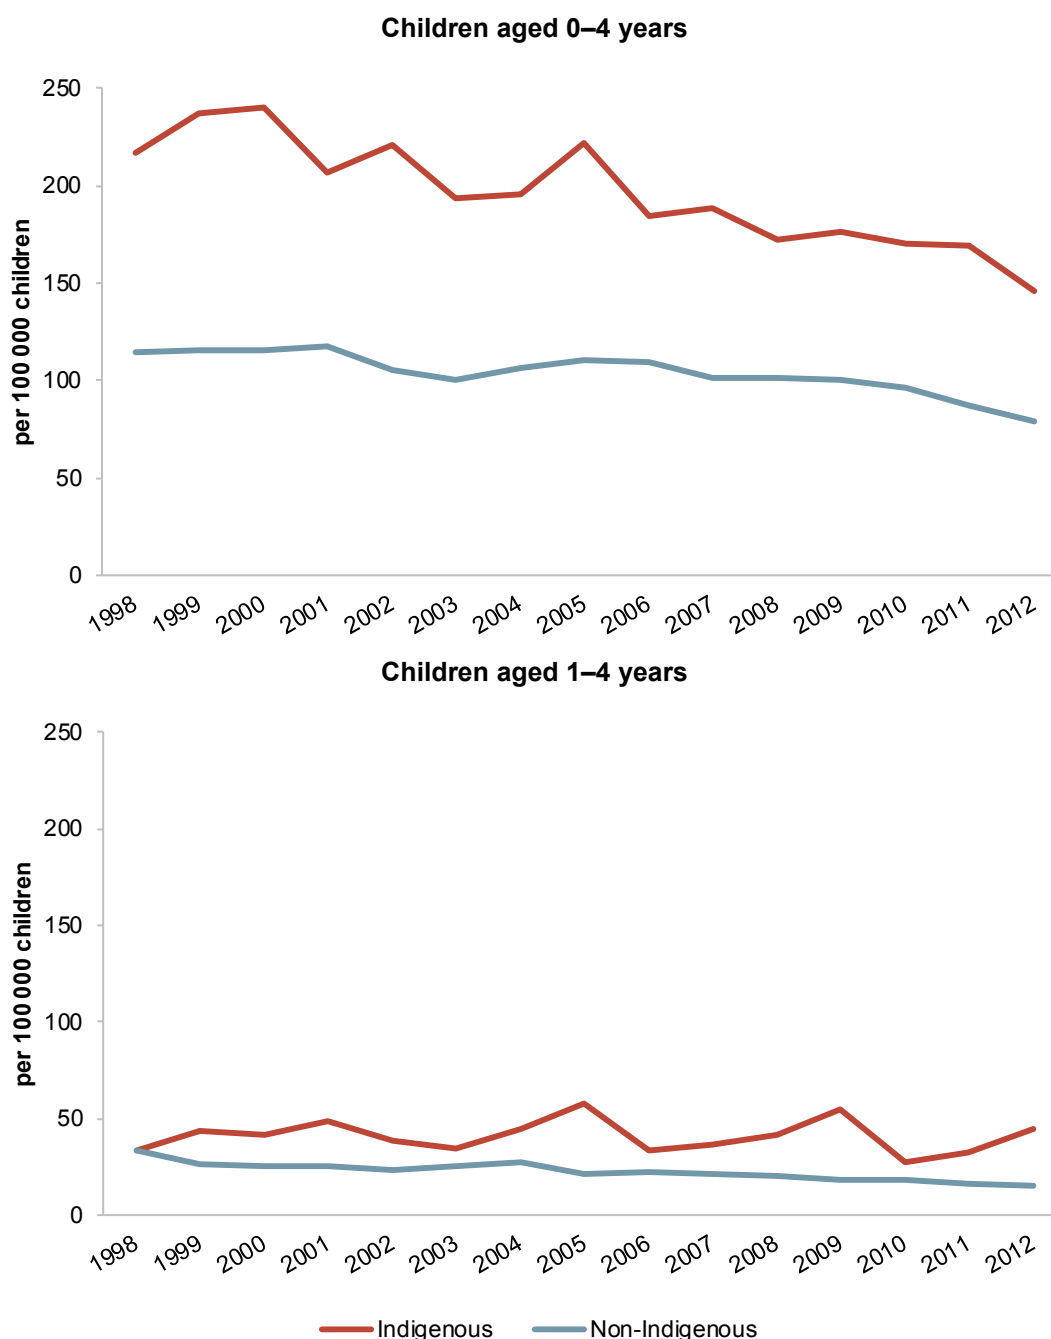

The 1–4 year old mortality rate was lower than the infant mortality rate for both Aboriginal and Torres Strait Islander children (40.0 deaths per 100 000 population) and non-Indigenous children (17.5 deaths per 100 000 population) but the rate ratio — (2.3:1) was higher than that for infant mortality (1.7:1) (table 4A.2.6).

Perinatal mortality<sup>4</sup> cannot be compared to the other child mortality measures, as rates are calculated based on the relevant births and include a subset of infant deaths. For 2008–2012, the Aboriginal and Torres Strait Islander perinatal mortality rate was 9.6 per 1000 relevant births (comprising a fetal mortality rate of 5.7 and neonatal mortality rate of 3.9 per 1000 relevant births). The non-Indigenous perinatal mortality rate was 8.1 per relevant live births (comprising a fetal mortality rate of 5.4 and neonatal mortality rate of 2.7 per 1000 relevant births) (table 4A.2.2).

---

<sup>4</sup> Foetuses delivered with a gestational age of 20 weeks or more, or weighing at least 400 grams, and all neonatal deaths — infant deaths within 28 days of birth.

Figure 4.2.2 **Child mortality rates, NSW, Queensland, WA, SA and the NT, 1998 to 2012**

Source: ABS (unpublished) Deaths Australia, 2012; table 4A.2.1

From 1998 to 2012, Aboriginal and Torres Strait Islander mortality rates remained relatively constant for children aged 1–4 years, but the rate for children aged 0–4 years decreased significantly, from 216.8 to 146.0 deaths per 100 000 population, due to a strong decrease in infant mortality rates. During that period, the gap in mortality rates

between Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0–4 years narrowed from 101.8 to 66.8 deaths per 100 000 population (figure 4.2.2).

**Figure 4.2.3 Infant mortality rates (aged 0<1 year), NSW, Queensland, WA, SA and the NT, 1998 to 2012**

Sources: ABS (unpublished) Causes of Death, Australia, 2012; ABS (unpublished) Births, Australia, 2012; table 4A.2.1

Infant mortality declined significantly from 1998 to 2012 for Aboriginal and Torres Strait Islander children, from 13.5 to 5.0 deaths per 1000 live births, with the gap to non-Indigenous children narrowing from 9.0 to 1.7 deaths per 1000 live births (figure 4.2.3).

Aboriginal and Torres Strait Islander perinatal mortality rates also decreased between 1998 and 2012, decreasing from 15.8 to 7.2 deaths per 1000 relevant births. There was also a narrowing of the gap between Aboriginal and Torres Strait Islander and non-Indigenous perinatal mortality, from 7.9 to -0.7 deaths per 1000 relevant births. Due to small numbers, data are volatile and should be interpreted with caution (table 4A.2.1).

Data on mortality rates for perinatal, infant, and children aged 0–4 years and 1–4 years are also available for selected states and territories in tables 4A.2.2, 4A.2.4, 4A.2.6 and 4A.2.8.

### Mortality rates by leading causes

The leading cause of death for both Aboriginal and Torres Strait Islander children and non-Indigenous children aged 0<1 year and 0–4 years for 2008–2012 was ‘certain

---

conditions originating in the perinatal period’.<sup>5</sup> This cause accounted for 48.1 per cent of all Aboriginal and Torres Strait Islander infant (0<1 year) deaths (3.0 deaths per 1000 live births) and 49.9 per cent of all non-Indigenous infant deaths (1.9 deaths per 1000 live births) (a rate ratio of 1.6:1) (table 4A.2.12). This cause also accounted for 39.2 per cent of all Aboriginal and Torres Strait Islander child (0–4 years) deaths (65.3 deaths per 100 000 population) and 42.7 per cent of non-Indigenous child deaths (39.6 deaths per 100 000 population) (a rate ratio of 1.6:1) (table 4A.2.16). Single year time series data are available for this leading cause for infants (table 4A.2.18), but due to the small numbers and the relatively short time period covered, the data are unlikely to reflect a statistically significant trend.

The major cause of perinatal mortality for 2008–2012 was ‘disorders related to length of gestation and fetal growth’, which accounted for 35.6 per cent of Aboriginal and Torres Strait Islander perinatal deaths and 30.5 per cent of non-Indigenous perinatal deaths (table 4A.2.10).

Once the infancy period has passed, the leading cause of death for children aged 1–4 years is injury and poisoning. For 2008–2012, injury and poisoning accounted for 53.0 per cent of Aboriginal and Torres Strait Islander deaths of children aged 1–4 years (21.2 deaths per 100 000 population) and 36.4 per cent of deaths of non-Indigenous children (6.4 deaths per 100 000 population) (a rate ratio of 3.3:1) (table 4A.2.14).

## Future directions in data

There is limited information on the under-coverage of Aboriginal and Torres Strait Islander identification in mortality data. The ABS has examined the quality of Indigenous identification in deaths data, including a national analysis by age, which showed that the identification rate for 0–14 year olds (0.83) was similar to the national all-age identification rate (0.82). The AIHW is undertaking research linking Aboriginal and Torres Strait Islander death registration records to perinatal deaths, deaths recorded in hospital and deaths recorded in aged care facilities.

Aboriginal and Torres Strait Islander child mortality rates are not available by remoteness. ABS has advised that further analysis is required to determine what adjustments are required for performance reporting purposes. The ABS has published some unadjusted data in *Deaths Australia, 2012*, but these data should be used with caution, as the under-identification of Indigenous status in deaths registrations increases as remoteness decreases (ABS 2013).

---

<sup>5</sup> Conditions originating in the perinatal period — such as birth trauma, disorders related to fetal growth, complications of pregnancy, labour and delivery, and respiratory and cardiovascular disorders specific to the perinatal period.

---

---

## 4.3 Early childhood education<sup>6</sup>

### Box 4.3.1 Key messages

- Nationally in 2013, almost three-quarters (73.9 per cent) of Aboriginal and Torres Strait Islander children in the year before full time schooling were enrolled in preschool and almost 7 in 10 were attending preschool (tables 4A.3.2-3).
- Early childhood education can provide children with a head start, and is associated with improved school completion and enhanced literacy, numeracy and social skills. Nationally in 2013, 73.9 per cent of Aboriginal and Torres Strait Islander children in the year before full time schooling were enrolled in a preschool program and 69.9 per cent were attending a preschool program in the year before full time schooling. This compares to 90.8 per cent (enrolment) and 88.7 per cent (attendance) for non-Indigenous children (tables 4A.3.2–3.3).
- Ensuring all Indigenous four year olds in remote communities have access to quality early childhood education within five years [by 2013] is a COAG target. Rates for Aboriginal and Torres Strait Islander children varied by remoteness. In 2013:
  - enrolment rates ranged from 66.7 per cent in major cities to 85.0 per cent in remote/very remote areas (table 4A.3.4)
  - attendance rates ranged from 65.1 per cent in major cities to 74.9 per cent in remote/very remote areas (table 4A.3.5).
  - however, while both enrolment rates and attendance rates increased as remoteness increased, the proportion of enrolled children attending decreased (from 97.5 per cent in major cities to 88.1 per cent in remote/very remote areas) (tables 4A.3.4–3.5).

### Box 4.3.2 Measures of early childhood education

There are two primary measures for this indicator (aligned with the NIRA indicator).

- *Indigenous children aged 4 and 5 years enrolled in a preschool program* is defined as the number of Aboriginal and Torres Strait Islander children aged 4 and 5 years as at 1 July of the collection year, who are enrolled in a preschool program in the year before full time schooling, as a proportion of the estimated number of Aboriginal and Torres Strait Islander children aged 4 years, by remoteness.
- *Indigenous children aged 4 and 5 years attending a preschool program* is defined as the number of Aboriginal and Torres Strait Islander children aged 4 and 5 years as at 1 July of the collection year, who are attending a preschool program in the year before full time schooling, as a proportion of the estimated number of Aboriginal and Torres Strait Islander children aged 4 years, by remoteness.

(continued next page)

---

<sup>6</sup> The Steering Committee notes its appreciation to Dr Payi Linda Ford, Charles Darwin University, who reviewed a draft of this section of the report.

---

**Box 4.3.2 (continued)**

The data collection for these measures is the ABS National Early Childhood Education and Care Collection (NECECC), with the most recent available data for 2013 (national: Indigenous only; geolocation). For both measures, supplementary data are provided on non-Indigenous children to enable comparisons (all jurisdictions: Indigenous status). Data for non-Indigenous children exclude counts of children for whom Indigenous status is unknown or not stated.

The denominator used for reporting is the four year old population. For Aboriginal and Torres Strait Islander children, this is based on single year population projections. There is no annual estimate/projection for non-Indigenous children, so this population is derived by subtracting the Aboriginal and Torres Strait Islander population projections from the estimated resident population for all four year olds.

Previous editions of this report used data from the National Preschool Census (NPC). NPC data are not comparable to NECECC data.

In 2008, the Council of Australian Governments (COAG) recognised the importance of early childhood education for Aboriginal and Torres Strait Islander children by including it as one of its six Closing the Gap targets. The target was to ensure that, within five years (ie, by 2013), all Aboriginal and Torres Strait Islander four year olds in remote communities have access to early childhood education (operationalised in the NIRA as 95 per cent (COAG 2012, page 13)).

In 2008 (amended in 2009), COAG endorsed a National Partnership Agreement (NPA) for Indigenous Early Childhood Development, which emphasised the importance of reducing the gap in developmental outcomes between Aboriginal and Torres Strait Islander and non-Indigenous children. COAG also endorsed the NPA on Early Childhood Education, which set a national priority of increasing early childhood education participation rates, particularly for Aboriginal and Torres Strait Islander and disadvantaged children (this NPA expired in mid-2013, but a new NPA on Universal Access to Early Childhood Education was endorsed to extend to end-2014).

Further to these NPAs, in 2009 COAG endorsed the National Quality Framework for early childhood education and care, and outside school hours care, which was established in 2012, and replaced existing separate licensing and quality assurance processes for early childhood education and care (COAG 2009).

These policy developments have been informed by research on the benefits of early childhood education, particularly for disadvantaged groups. Although early childhood education is important, research shows that childhood development is also influenced by a wide variety of other factors, such as their antenatal, family and social environments (Harrison et al. 2009; McCain, Mustard and Shanker 2007; Moore 2006; Mustard 2007; Schweinhart 2007). More information on some of the factors that influence early childhood development for Aboriginal and Torres Strait Islander children are included in chapter 6 of this report.

---

High quality early childhood education and care services can provide development opportunities for children, as well as supporting the needs of families (McCain, Mustard and Shanker 2007). Early childhood education programs can provide a head start at school and are associated with increased levels of school completion and enhanced literacy, numeracy and social skills (De Bortoli and Thomson 2010); Harrison 2008; Mustard 2007; Schweinhart 2007). Investment in early childhood education, particularly for disadvantaged children, is more effective than intervention at later ages (Heckman 2006). The provision of services to Aboriginal and Torres Strait Islander children during their early years may also provide an opportunity for early intervention to address developmental problems (Hewitt and Walter 2011).

The quality of early childhood education programs, including program content and staff quality, can influence attendance and outcomes for children (DoE 2014). The provision of culturally appropriate programs is an important influence on Aboriginal and Torres Strait Islander children's attendance at preschool (Fordham and Schwab 2007; High 2008; Hutchins, Saggars and Frances 2009; Mann, Knight and Thomson 2011; Sims et al. 2008). For families of Aboriginal and Torres Strait Islander children, the presence of an Aboriginal and Torres Strait Islander preschool worker is likely to have a positive influence on preschool attendance (Biddle 2007; Fordham and Schwab 2007; Mann, Knight and Thomson 2011).

Participation in preschool is also influenced by factors outside the early childhood education environment (Biddle 2011; Bowes and Kitson 2011; Hewitt and Walter 2011). Biddle (2011), in his analysis of the ABS NATSISS data, found that going to cultural events and identifying with a cultural/language group were strongly associated with higher rates of preschool participation for Aboriginal and Torres Strait Islander children (section 5.7 has further information on children's participation in cultural activities), whilst children who have lived in two or more homes since birth and those who had a carer who felt discriminated against were less likely to participate in preschool (section 5.1 has further information on people identifying as being discriminated against). A NSW study from 2008–2010 found that, for Aboriginal and Torres Strait Islander families in remote areas (compared to other areas), the travel and distance involved in accessing services had large financial and family support implications for parents (Bowes and Kitson 2011) (section 5.3 has further information on engagement with services).

## **Data issues**

Data on the number of Aboriginal and Torres Strait Islander children enrolled in, and attending, preschool are available from the NECECC. The NECECC is an administrative data collection with data sourced from Australian, State and Territory government education departments. Three years of data are available from the NECECC (2011, 2012 and 2013). However, due to iterative improvements in data collection over time, 2013 represents the first year for which data are available for all states and territories on children

---

in the year before full time schooling (noting that attendance data have been used as proxy for enrolment data for WA).<sup>7</sup>

These data should be interpreted with care, as there are different preschool arrangements across states and territories (including different starting ages for preschool and primary school) (table 4A.3.1).

## **Preschool enrolment and attendance**

Nationally in 2013, 73.9 per cent of Aboriginal and Torres Strait Islander 4 and 5 year olds were enrolled in preschool in the year before full time schooling (table 4A.3.2):

- 66.7 per cent in major cities
- 73.9 per cent in inner/regional areas
- 85.0 per cent in remote/very remote areas (table 4A.3.4).

The non-Indigenous enrolment rate was 90.8 per cent. Data by State and Territory are available in table 4A.3.2.

In 2013, 69.9 per cent of Aboriginal and Torres Strait Islander 4 and 5 year olds were attending preschool (table 4A.3.3):

- 65.1 per cent in major cities
- 70.7 per cent in inner/outer regional areas (combined)
- 74.9 per cent in remote/very remote areas (combined) (table 4A.3.5).

The non-Indigenous attendance rate was 88.7 per cent. Data by State and Territory are available in table 4A.3.3.

For Aboriginal and Torres Strait Islander children, while enrolment and attendance rates increased as remoteness increased, the proportion of enrolled children attending decreased with remoteness (from 97.5 per cent in major cities to 88.1 per cent in remote/very remote areas) (tables 4A.3.4–3.5).

Nationally in 2013, most Aboriginal and Torres Strait Islander children enrolled in a preschool program in the year before full time schooling were enrolled in a standalone or school-operated preschool (72.2 per cent), with a further 25.4 per cent enrolled in a preschool within a long day care centre (the remaining 2.5 per cent were enrolled in a preschool program which combined both types of settings). The proportion enrolled in a standalone or school-operated preschool increased as remoteness increased, from 59.2 per cent in major cities to 93.0 per cent in remote/very remote areas (table 4A.3.6).

---

<sup>7</sup> 'Year before full time schooling' refers to counts of children enrolled or attending preschool excluding those repeating preschool.

---

## Things that work

The case study in box 4.3.3 describes a program that is improving Aboriginal and Torres Strait Islander people's engagement in early childhood education.

### Box 4.3.3 'Things that work' – Early childhood education

**Families as First Teachers** (FaFT) (NT) is an early learning and parenting support program. Although it has operated on a small scale since 2009, it was rolled out across 21 remote Indigenous communities in the NT (around 1700 children) in mid-2011. Although FaFT has not been formally evaluated, the Steering Committee has identified it as a promising program worth further examination.

The FaFT program is provided from school sites and supports families from the birth of their children, providing families with the opportunity to learn about child development, health, hygiene and parenting skills while engaging in early learning service.

Surveys in 2011 and 2012 found that 95 per cent of parents were satisfied with the program and felt more skilled and able to support their child's learning and development. There was also an increase in preschool enrolments in 50 per cent of the FaFT sites surveyed. A survey in 2012 of the principals in the schools where the services were located found that the principals highly valued the program's ability to identify, enrol and prepare children for preschool entry.

The program outputs to date have been the participation of children and families in the program itself, and increased participation in preschool. The program has submitted a research grant application for a more rigorous outcomes evaluation over three to five years, focusing on whether the program produces improved and sustained learning outcomes for children.

Closing the Gap Clearinghouse, Canberra.

## Future directions in data

The ABS NECECC is the only comprehensive national source of data on early childhood education participation. This collection receives funding from the Australian Government under the NPA on Universal Access to Early Childhood Education, for which the Australian Government is negotiating with States and Territories on funding for an additional 12 months to the end of the 2015 calendar year (Ley 2014).

Data on the number of service providers by provider type by remoteness area would provide important contextual information to assist in interpretation of enrolment patterns by provider type by remoteness area.

## 4.4 Reading, writing and numeracy<sup>8</sup>

### Box 4.4.1 Key messages

- Improving literacy and numeracy levels can improve education and employment outcomes for Aboriginal and Torres Strait Islander people. Measuring literacy and numeracy achievement against national minimum standards (NMSs) is an indicator of progress against COAG's agreed closing the gap target. The key messages focus on Year 3 (the first year of NAPLAN testing). Data for Years 5, 7 and 9 are in the full report and attachment tables.
- In 2013, the proportions of Year 3 Aboriginal and Torres Strait Islander students achieving at or above the NMS were 81.5 per cent for reading, 78.9 per cent for writing and 81.6 per cent for numeracy, lower than those of non-Indigenous students (96.2 per cent for reading, 96.0 per cent for writing and 95.7 per cent for numeracy). Results for Aboriginal and Torres Strait Islander students declined as remoteness increased (under 55 per cent in very remote areas for reading, writing and numeracy) (tables 4A.4.25–27).
- From 2008 to 2013, the proportion of Aboriginal and Torres Strait Islander Year 3 students achieving at or above the NMS for reading improved, and the gap in Year 3 results between Aboriginal and Torres Strait Islander and non-Indigenous students narrowed for reading and numeracy (from 25.2 to 14.7 percentage points for reading and from 17.4 to 15.0 percentage points for numeracy — trend data for writing are not comparable) (tables 4A.4.25–27 and 4A.4.85–87).
- There was no national improvement over this period in the proportion of Aboriginal and Torres Strait Islander or non-Indigenous students achieving at or above the numeracy NMS (tables 4A.4.27, 30, 33 and 36).

### Box 4.4.2 Measures of reading, writing and numeracy

There are two main measures for this indicator (aligned with the NIRA indicator).

- *NAPLAN student achievement* is defined as the proportion of students at or above the national minimum standard for NAPLAN reading, writing and numeracy, in Years 3, 5, 7 and 9.
- *NAPLAN student participation* is defined as the rate of student participation in the NAPLAN reading, writing and numeracy tests in Years 3, 5, 7, and 9.

The most recent available data for both measures are from the 2013 National Assessment Program — Literacy and Numeracy (NAPLAN) (all jurisdictions: Indigenous status; geolocation; parental education; parental occupation). Data are comparable over time for reading and numeracy. However, data for writing from 2011 onwards are not comparable to prior years due to a change in the type of test used.

A supplementary measure on average student achievement (based on NAPLAN mean scale scores) is also reported (all jurisdictions: Indigenous status; remoteness).

---

<sup>8</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, who reviewed a draft of this section of the report.

---

Halving the gap for Indigenous students in reading, writing and numeracy achievements within a decade is one of the six closing the gap targets announced by COAG (COAG 2009). Improving literacy and numeracy levels and increasing year 12 completion rates (see section 4.5) could significantly improve education and employment outcomes for Aboriginal and Torres Strait Islander Australians (ACER 2004; Nguyen 2010).

Studies have shown that many Aboriginal and Torres Strait Islander children start school at a disadvantage. On average, they have lower levels of attendance at preschool (see section 4.3), have less access to home educational resources, and their parents tend to have lower levels of education (Biddle and Cameron 2012; Bortoli and Thomson 2010). Unless quality preschool and early primary school assistance are provided, disadvantaged students are rarely able to keep pace with their peers (Anderson 2012; Biddle 2010; Bortoli and Thomson 2010).

Regular school attendance is important to developing core skills, such as literacy and numeracy (Purdie and Buckley 2010). On average, Aboriginal and Torres Strait Islander students have higher rates of: late arrival at school; absence for consecutive months of schooling; and multiple changes of school (Bortoli and Thomson 2010; Hughes and Hughes 2010; Taylor 2010; Zubrick et al. 2006). Section 7.1 has more information on student attendance. For students at school, the quality of teaching is the most important variable in predicting student achievement in literacy (Hattie 2002). Section 7.2 has more information on teacher quality.

Academic performance can also be affected by emotional distress. Aboriginal students at low risk of clinically significant emotional or behavioural difficulties have higher academic performance compared to those at high risk (Zubrick et al. 2006). Section 8.7 has more information on mental health and social and emotional wellbeing issues for Aboriginal and Torres Strait Islander children.

## **NAPLAN student achievement**

In 2008, national common tests (the NAPLAN) were introduced to assess student achievement against ‘National Minimum Standards’. NAPLAN data are not directly comparable with previous learning outcomes data (data for 1999 to 2007 can be found in the 2009 edition of this report).

Measuring literacy and numeracy achievement against national minimum standards (NMSs) provides an indicator of progress against COAG’s closing the gap target. However, the NMS is set at a very low level — indicating that a student has demonstrated only the basic elements of literacy and numeracy for the relevant year level. In addition, there is volatility in NMS results, as only a small number of test items fall below the NMS. An alternative measure is the mean scale score (MSS), which is more reliable as it is based on all test items. For this reason, MSS is included in this report as a supplementary measure.

Care needs to be taken in interpreting the NAPLAN data, because differences in achievement may sometimes be the result of sampling or measurement error. Confidence intervals are available for all results and are included in the attachment tables. For comparisons over time involving 2013 results, the tables include an additional ‘nature of the difference’ measure, which combines statistical significance tests with an ‘effect size measure’. This can help identify whether a difference is substantive (as well as statistically significant).

Although this indicator relates to reading, writing and numeracy, only reading and numeracy results are discussed in detail in this report, as data for writing from 2011 onwards are not comparable to prior years, due to change in the type of test used (full results for writing are included in the attachment tables).

All NAPLAN data discussed below and reported in tables 4A.4.25-128 are reported by State and Territory and by remoteness (geolocation).

## Reading

**Table 4.4.1 Proportion of students achieving at or above the national minimum standard for reading, 2008 to 2013<sup>a</sup>**

▲ = achievement is substantially higher than and is statistically significantly different from the base year (or previous years). △ = achievement is above and is statistically significantly different from the base year (or previous year) at the national level. ■ = achievement is close to or not statistically significantly different from the base year (or previous year).

	Year						Nature of difference	
	2008 %	2009 %	2010 %	2011 %	2012 %	2013 %	2008 and 2103	2012 and 2013
<b>Indigenous</b>								
Year 3	68.3	75.1	75.1	76.3	74.2	81.5	△	△
Year 5	63.4	66.7	66.2	66.4	64.7	83.3	▲	▲
Year 7	71.9	73.2	76.6	77.1	75.4	73.2	■	■
Year 9	70.7	67.0	64.2	71.9	67.2	73.9	■	■
<b>Non-Indigenous</b>								
Year 3	93.5	94.8	95.0	94.9	94.7	96.2	△	△
Year 5	92.6	93.1	92.7	92.9	93.1	96.9	▲	▲
Year 7	95.4	95.0	95.9	95.7	95.1	95.4	■	■
Year 9	94.2	93.5	92.2	93.5	92.7	94.5	■	■

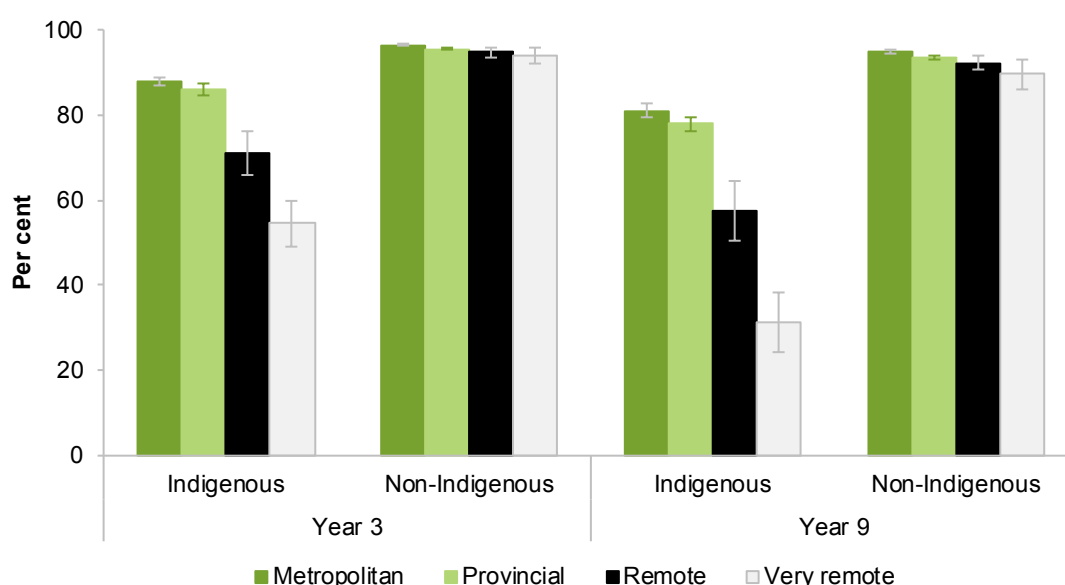

<sup>a</sup> Exempt students were not assessed and were deemed not to have met the national minimum standard.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.25–94.

Nationally in 2013, the proportions of Aboriginal and Torres Strait Islander students achieving at or above the NMS for reading were 81.5 per cent for Year 3, 83.3 per cent for

year 5, 73.2 per cent for Year 7 and 73.9 per cent for Year 9. Across all Year levels results were from 15 to 20 percentage points lower than for non-Indigenous students (table 4.4.1).

**Figure 4.4.1 Proportion of students achieving at or above the national minimum standard for reading, by remoteness, 2013<sup>a,b</sup>**

<sup>a</sup> Exempt students were not assessed and were deemed not to have met the national minimum standard. <sup>b</sup> Error bars represent 95 per cent confidence intervals for within year comparisons. These error bars should not be used for across year comparisons.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.25 and 34.

The gap in achievement against the reading NMS widened as remoteness increased. For Year 3 reading, for example, the gap ranged from 8.6 percentage points in metropolitan areas to 39.3 percentage points in very remote areas (figure 4.4.1).

There was some limited national improvement in reading achievement against the NMS over time. From 2008 to 2013, the proportion of Aboriginal and Torres Strait Islander students achieving at or above the NMS was substantially higher for Year 5 reading, higher for Year 3 reading and relatively unchanged for Year 7 and Year 9 reading (table 4.4.1). The gap to non-Indigenous students narrowed for Year 3 (from 25.2 to 18.7 percentage points) and Year 5 (from 29.2 to 13.6 percentage points).

Mean scale scores (average achievement) for reading showed similar patterns to the proportions at or above NMSs (table 4A.4.121–128). Time series data for mean scale scores provides a measure of gain (difference between the average scores) for a cohort of students over time — for this report, students who were in Year 3 in 2009, Year 5 in 2011 and Year 7 in 2013 (tables 4A.4.121, 123, 125, 127). Nationally, the gain for Aboriginal and Torres Strait Islander students (145.0 points — from 327.4 in Year 3 to 472.4 in Year

7) was higher than for non-Indigenous students (129.3 points — from 415.0 in Year 3 to 544.3 in Year 7), albeit from a lower base. For both, the gain is greater between Years 3 and 5 than between Years 5 and 7, with the exception of Aboriginal and Torres Strait Islander students in very remote areas where the gain between Years 5 and 7 is higher.

## Numeracy

**Table 4.4.2 Proportion of students who achieved at or above the national minimum standard for numeracy, 2008 to 2013<sup>a</sup>**

△ = achievement is above and is statistically significantly different from the base year (or previous year). ■ = achievement is close to or not statistically significantly different from the base year (or previous year). ▽ = achievement is lower than and is statistically significantly different from the base year (or previous year).

	Year						Nature of difference	
	2008 %	2009 %	2010 %	2011 %	2012 %	2013 %	2008 and 2103	2012 and 2013
<b>Indigenous</b>								
Year 3	78.6	74.0	76.6	83.6	72.7	81.6	■	△
Year 5	69.2	74.2	71.4	75.2	69.2	73.0	■	■
Year 7	78.6	75.8	77.0	76.5	74.4	78.1	■	■
Year 9	72.5	75.0	70.4	72.0	74.2	65.7	■	▽
<b>Non-Indigenous</b>								
Year 3	96.0	95.2	95.3	96.4	95.1	96.6	■	△
Year 5	94.0	95.3	95.0	95.5	94.6	94.6	■	■
Year 7	96.4	95.8	96.1	95.5	94.9	96.0	■	■
Year 9	94.8	96.0	94.3	94.1	94.7	92.0	▽	▽

<sup>a</sup> Exempt students were not assessed and were deemed not to have met the national minimum standard.

Source: ACARA (unpublished) National Assessment Program — Literacy and Numeracy: Achievement in Reading, Writing, Language Conventions and Numeracy, various years; tables 4A.4.27–93.

Nationally in 2013, the proportion of Aboriginal and Torres Strait Islander students achieving at or above the NMS for numeracy was 81.6 per cent for Year 3, 73.0 per cent for Year 5, 78.1 per cent for Year 7 and 65.7 per cent for Year 9. Across all year levels results were from 15 to 26 percentage points lower than for non-Indigenous students (table 4.4.2).

The gap in achievement against the numeracy NMS widened as remoteness increased. For Year 3, for example, the gap ranged from 8.9 percentage points in metropolitan areas to 42.3 percentage points in very remote areas (table 4A.4.27).

---

There was no national improvement in the proportion of Aboriginal and Torres Strait Islander students achieving at or above the numeracy NMS from 2008 to 2013, while there was a decline in Year 9 numeracy for non-Indigenous students (tables 4A.4.27, 30, 33, 36).

Mean scale scores (average achievement) for numeracy showed similar patterns to NMSs (tables 4A.4.122, 124, 126, 128).

Time series data for mean scale scores provides a measure of gain (difference between the average scores) for a cohort of students over time — for this report, students who were in Year 3 in 2009, Year 5 in 2011 and Year 7 in 2013. Nationally, the gain for Aboriginal and Torres Strait Islander students was 155.2 points (from 320.5 in Year 3 to 475.7 in Year 7) — higher than the gain of 148.1 points for non-Indigenous students (from 397.7 in Year 3 to 545.8 in Year 7), albeit from a lower base (tables 4A.4.122, 124, 126).

## **NAPLAN student participation**

NAPLAN participation rates record the proportion of students who participated in NAPLAN testing. Higher participation rates are desirable, as they increase the level of confidence that the results reflect the performance of the population of interest (because the level of performance of students who do not participate is unknown). Students who are exempt from testing because of their lack of proficiency in English (important for some Aboriginal and Torres Strait Islander students) or because of significant intellectual and/or functional disability are included in the participation rate.

Nationally in 2013, the participation rate for Aboriginal and Torres Strait Islander students was around 88 per cent for reading, writing and numeracy for Years 3, 5 and 7, and decreased to around 77 per cent for Year 9. The rate for non-Indigenous students was around 96 per cent for reading, writing and numeracy for Years 3, 5 and 7, and decreased to around 93 per cent for Year 9 (tables 4A.4.97–100). These rates are similar to those in previous years (tables 4A.4.101–120).

## **Things that work**

An example of a promising initiative to improve educational outcomes for Aboriginal and Torres Strait Islander students is summarised in box 4.4.3.

---

#### Box 4.4.3 'Things that work' — literacy and numeracy engagement

The **Cape York Aboriginal Australian Academy Initiative** (Queensland) is a pilot program operating in primary schools at Coen, Hope Vale and Aurukun. The program began in January 2010 in Coen and Aurukun and January 2011 in Hope Vale. The CYAAA educational model organises the curriculum into three separate learning domains.

- The **Class** domain: where literacy, numeracy and English language are taught using a Direct Instruction method and delivered with an English-only immersion environment
- The **Club** domain: which provides children with artistic, musical and sporting activities
- The **Culture** domain: which provides a comprehensive Indigenous culture and language program.

An independent evaluation of the CYAAA Initiative was conducted in late 2012/early 2013 by the Australian Council for Educational Research (ACER 2013). The evaluation found that it was not possible to conclude from the available test (including NAPLAN) data whether or not the Initiative has had an impact on student learning as there was too much missing information to enable a conclusion to be drawn. However, interviews conducted identified general agreement among school staff (mostly teachers) and some parents that students are improving in their literacy as a result of the Initiative (ACER 2013).

The evaluation noted that the CYAAA Initiative has been in operation for only a short period of time, and the extent of the outcomes (particularly around student learning) was difficult to assess (ACER 2013). The Steering Committee considers that a follow up evaluation would be useful to provide a more robust assessment of outcomes from this program.

Source: Australian Council for Educational Research 2013, *Evaluation of the Cape York Aboriginal Australian Academy Initiative*, Final report for the Department of Education, Training and Employment Queensland June 2013, ACER, Melbourne.

## Future directions in data

NAPLAN data are reported for individual bands of performance by Indigenous status, enabling assessment of movement of higher and lower performers. However, confidence intervals are not currently available for these data. The availability of confidence intervals would enable assessment of the gap within individual performance bands over time.

## 4.5 Year 12 attainment<sup>9</sup>

### Box 4.5.1 Key messages

- Halving the gap in year 12 or equivalent attainment rates for Aboriginal and Torres Strait Islander Australians aged 20–24 years by 2020 is a COAG target.
- Nationally in 2011–13, 58.5 per cent of Aboriginal and Torres Strait Islander 20–24 year olds had completed year 12 or equivalent or above, an increase from 45.4 per cent in 2008. The proportion for non-Indigenous Australians was 86.1 per cent, similar to the proportion in 2008 (88.1 per cent) (table 4A.5.1).
- Research suggests that an Aboriginal and Torres Strait Islander student who receives an ATAR score is as likely as a non-Indigenous student to go to university (Biddle and Cameron 2012). Among Aboriginal and Torres Strait Islander young people who could have attended year 12 in 2013, 7.3 per cent achieved an ATAR of 50.00 or above, an increase from 5.7 per cent in 2007. However, the gap between Aboriginal and Torres Strait Islander and non-Indigenous populations achieving at this level widened from 33.6 to 37.0 percentage points over the period (figure 4.5.2).

### Box 4.5.2 Measures of year 12 attainment

There are two main measures for this indicator (aligned with the NIRA indicator):

- *Proportion of the 20–24 year old population who have attained at least a year 12 or equivalent or AQF certificate II or above* is defined as the proportion of people aged 20–24 years who have attained at least a year 12 or equivalent or AQF certificate II or above. The main data source is the Census, with the most recent data available for 2011 (all jurisdictions; remoteness). Supplementary data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2012–13 (all jurisdictions; remoteness; highest level of school completed; age; selected characteristics). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011–12.<sup>10</sup> Indicators using both AATSIHS (2012–13) and AHS (2011–12) are referenced as 2011–13. Survey and Census data are not directly comparable.
- *Year 12 certification*. No measure has been developed for NIRA reporting.

One supplementary measure is reported — Students who have attained an Australian Tertiary Admission Rank (ATAR) of 50.0 or above (all jurisdictions).

‘Halving the gap for Indigenous students in year 12 attainment or equivalent attainment rates by 2020’ is one of six closing the gap targets announced by COAG (COAG 2012).

---

<sup>9</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

<sup>10</sup> NIRA reporting uses the ABS Survey of Education and Work (SEW) non-Indigenous population data. However, this report requires a longer time series for all disaggregations (such as remoteness), which is not available from the SEW.

---

Successful completion of year 12 is important if young people are to have access to the full range of further education, training, employment and life chances consistent with their abilities (AIHW 2013; Biddle and Cameron 2012; OECD 2010).

There is compelling evidence about the importance of completing year 12 (Dandolo Partners 2012; Dusseldorp Skills Forum 2006; Long 2006), and the pivotal role of education in reducing long term disadvantage (ACER 2003, 2004; Biddle 2010; Buckskin 2000; OECD 2013). Education is linked to economic and social wellbeing, and positive health behaviours, and is considered one of the crucial contributors to the formation of human capital (COAG National Reform Initiative Working Group 2006; Council for the Australian Federation 2007; Karmel et al. 2014; Osbourne, Baum and Brown 2013).

What happens after year 12 is also important — but there is limited Australian evidence of what works in transitioning school leavers into further education and training, and looking for work (Hunter 2010). Research by Biddle and Cameron (2012) found that, once an Aboriginal and Torres Strait Islander student receives an ATAR score, they are as likely as non-Indigenous students to go to university, though the *Review of Higher Education Access and Outcomes for Aboriginal and Torres Strait Islander People: Final Report* (Behrendt et al. 2012) noted that high-performing Aboriginal and Torres Strait Islander school students often do not go on to higher education. See section 7.4 for more information on transitioning school leavers to work.

### **Proportion of 20–24 year olds who have completed year 12 or equivalent or AQF certificate level II or above**

Nationally in 2011–13, 58.5 per cent of Aboriginal and Torres Strait Islander 20–24 year olds reported completing year 12 or equivalent or AQF certificate level II or above, an increase from 45.4 per cent in 2008. The proportion for non-Indigenous 20–24 year olds was 86.1 per cent, similar to the proportion in 2008 (88.1 per cent) (table 4A.5.1).

For this measure, Census data are reported for geographical disaggregations below the national level, as relatively small differences are difficult to detect using sample survey data. Whilst the trends are similar between the Census and survey data, the two sources are not directly comparable. The most recent Census data are for 2011.

Figure 4.5.1 **Proportion of 20–24 year olds who had completed year 12 or certificate II or above, by remoteness, 2011**

Source: ABS (unpublished) 2011 Census of Population and Housing; tables 4A.5.3–4.

In 2011, the proportion of Aboriginal and Torres Strait Islander Australians aged 20–24 years with year 12 or above was higher in less remote areas, ranging from 64.1 per cent in major cities to 30.7 per cent in very remote areas. The proportions for non-Indigenous Australians aged 20–24 years did not show the same degree of variation as remoteness increased (figure 4.5.1).

Supplementary data show the proportion of Aboriginal and Torres Strait Islander Australians who have left school and have completed year 12 is higher for younger age groups (in 2012–13, 36.2 per cent for 15–24 year olds compared to 8.8 per cent for those aged 55 years and over) (table 4A.5.5).

More data on the proportion of 20–24 year olds who have completed year 12 or equivalent or AQF certificate level II or above can be found in tables 4A.5.1–7.

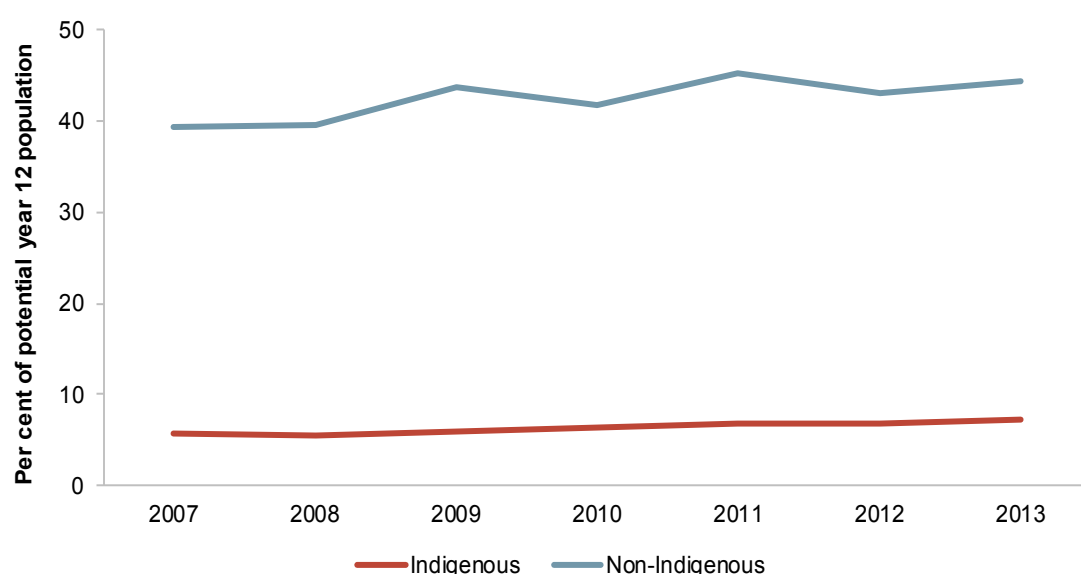

### **Students who attained an Australian Tertiary Admission Rank (ATAR)**

The Australian Tertiary Admission Rank (ATAR) is calculated for the use of tertiary institutions to compare the overall achievement of students who have completed different combinations of year 12 certificate studies. University admission organisations use year 12 certificate results issued by State and Territory assessment bodies to calculate a rank to show a student’s achievement in relation to other students. Not all students who have qualified for a year 12 certificate are eligible for an ATAR.

ATAR scores range from 0.05 (lowest) to 99.95 (highest). At a minimum, an ATAR of 50.00 or above would usually be required for entry into university. (However, most universities, TAFE colleges and other institutions take a holistic approach when assessing applications from Aboriginal and Torres Strait Islander students, looking beyond academic results (QTAC 2013; SATAC 2014; TISC 2014; UAC 2014, 2014; University of Tasmania 2014; VTAC 2013)).

The ATAR rate is the number of students who achieved an ATAR of 50.00 or above, expressed as a proportion of the estimated potential year 12 population. The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five (tables 4A.5.8–10).

**Figure 4.5.2 Year 12 ATAR rates, by Indigenous status, 2007 to 2013<sup>a</sup>**

<sup>a</sup> See table 4A.5.11 for more information on jurisdictional differences and the calculation of the ATAR rate.

Sources: ABS 2013, *Estimates of Aboriginal and Torres Strait Islander Australians, Jun 2011*, Cat. no. 3238.0.55.001; ABS 2014, *Australian Demographic Statistics, Sep 2013*, Cat. no. 3101.0; Queensland Tertiary Admissions Centre (unpublished); South Australian Certificate of Education Board of South Australia (unpublished); Tertiary Institutions Service Centre (WA) (unpublished); Universities Admissions Centre (NSW) (unpublished); Tasmanian Qualifications Authority (unpublished); Victoria Tertiary Admissions Centre (unpublished); ACT Board of Senior Secondary Studies (unpublished); tables 4A.5.8–11.

Nationally in 2013, 7.3 per cent of the Aboriginal and Torres Strait Islander potential year 12 population achieved an ATAR of 50.00 or above, an increase from 5.7 per cent in 2007. For non-Indigenous young people, 44.3 per cent of the potential population achieved an ATAR of 50.00 or above in 2013, an increase from 39.3 per cent in 2007 (figure 4.5.2). Data on ATAR scores and rates by jurisdiction are available in table 4A.5.11.

---

## Things that work

Many factors influence Aboriginal and Torres Strait Islander young peoples' decisions to stay on and complete secondary school, including the students themselves, family, teachers and the role of culture (Rahman 2009). An example of an initiative that has been successful in increasing Aboriginal and Torres Strait Islander secondary school participation and attainment is in box 4.5.3.

### Box 4.5.3 'Things that work' — Year 12 attainment

The **AIME (Australian Indigenous Mentoring Experience) Program** was established in 2005. The goals of the program are to improve retention rates of Aboriginal and Torres Strait Islander high school students to year 12 and, post school, to connect Aboriginal and Torres Strait Islander students to university and employment.

The program is based on the recruitment of university students as mentors, who provide advice and personal support to Aboriginal and Torres Strait Islander school mentees from years 7 to 12. There are two elements to the program:

- the Core Program, which targets local Aboriginal and Torres Strait Islander high school students who attend school, and are able to visit an AIME partner university campus on a weekly basis
- the AIME Outreach Program (AOP), which extends the Core program to Aboriginal and Torres Strait Islander high school students from further afield through a more intensive full day format.

In October 2012, AIME commissioned the University of Wollongong, which worked in collaboration with the University of Western Sydney, to evaluate the 2012 AOP, in comparison to the Core Program. The evaluation included a mixed-method design with the collection of qualitative and quantitative data, incorporating: observation of program delivery; interviews with program facilitators, mentors and mentees; review of AIME documentation and a quantitative survey of mentees.

The evaluation found that, the AIME and AOP are achieving positive results:

- AIME is effective in strengthening and solidifying both the Core and Outreach mentees' school and post-school aspirations, sense of engagement, and sense of identity, and outcomes from both programs are better than the national average
- the achievements and impacts of the AOP are comparable to those of the Core Program, as measured by school progression rates, school completion rates and the AIME evaluation survey results
- in its first year of operation, the AOP reached its objective of encouraging better school grade progression rates for Aboriginal and Torres Strait Islander students, compared with the national average.

---

## Future directions in data

For previous reports, data were reported on the issued number of year 12 certificates. Jurisdictional reporting of the number of year 12 certificates issued to Aboriginal and Torres Strait Islander and non-Indigenous students ceased on 31 December 2008. These data had previously been reported to the [then] Department of Education, Employment and Workplace Relations (DEEWR) in Indigenous Education Performance Reports. The Australian Curriculum, Assessment and Reporting Authority, in consultation with key education and training agencies and data providers, is developing measures of year 12 certification, which could replace the data previously supplied by DEEWR.

## 4.6 Employment<sup>11</sup>

### Box 4.6.1 Key messages

- Halving the gap in employment outcomes between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians within a decade [by 2018] is a COAG target.
- In 2012-13, just under half (47.5 per cent) of Aboriginal and Torres Strait Islander 15–64 year olds were employed. The ratio increased from 37.6 per cent in 1994 to 53.8 per cent in 2008, but then declined to 47.5 per cent, potentially partly driven by changes to the CDEP program (table 4A.6.5).
  - The rate for Aboriginal and Torres Strait Islander females increased from 28.9 per cent in 1994 to 41.0 per cent in 2002, and has been relatively stable since (42.4 per cent in 2012-13) (table 4A.6.5)
  - The rate for Aboriginal and Torres Strait Islander males increased from 47.0 per cent in 1994 to 62.7 per cent in 2008, before declining to 52.8 per cent in 2012-13 (table 4A.6.5).
- Data on the employment to population ratio for non-Indigenous 15–64 year olds are available from 2004-05. The rate increased from 74.2 per cent in 2004-05 to 76.6 per cent in 2011-12 (table 4A.6.5).
- The labour force participation rate for Aboriginal and Torres Strait Islander 15–64 year olds was 60.1 per cent in 2012-13. This rate increased from 60.0 per cent in 2004-05 to 64.5 per cent in 2008, but then declined to 60.1 per cent, largely driven by a decrease in:
  - participation by males aged 15–17 years (a corresponding decrease in the labour force participation rate indicates that they are not actively looking for work and could be engaged in education or training) (table 4A.6.14)
  - participants receiving CDEP wages in very remote areas (from 68.0 per cent of the employed population in 2004-05 to 27.7 per cent in 2012-13) (tables 4A.6.4 and 4A.6.12).
- In 2012-13, the unemployment rate for Aboriginal and Torres Strait Islander 15–64 year olds was 20.9 per cent, an increase from 16.6 per cent in 2008 (table 4A.6.8). The unemployment rate for Aboriginal and Torres Strait Islander Australians was around five times the rate for non-Indigenous Australians (4.2 per cent in 2011-12) (table 4A.6.8).

### Box 4.6.2 Measures for employment

There is one main measure for this indicator (aligned with the NIRA indicator).

- *Employment to population ratio* is defined as the proportion of people aged 15 to 64 years who are employed.

(continued next page)

---

<sup>11</sup> The Steering Committee notes its appreciation to Ms Heron Loban, James Cook University, who reviewed a draft of this section of the report.

---

#### Box 4.6.2 (continued)

Two supplementary measures are reported (aligned with the NIRA indicator).

- *Labour force participation rate* is defined as the proportion of people aged 15 to 64 years who are in the labour force.
- *Unemployment rate* is defined as the proportion of people aged 15 to 64 years in the labour force who are actively looking for employment<sup>12</sup>.

The main data source for the Aboriginal and Torres Strait Islander population for all three measures above is ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2012-13 (all jurisdictions: Full time/part time employment; CDEP participation; remoteness; and national: age; sex). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data available for 2011-12.<sup>13</sup> Where AATSIHS (2012-13) and AHS (2011-12) data are presented together they are referenced singularly as 2011–13.

Supplementary data are also available from the Census of Population and Housing, with the most recent available data for 2011 (all jurisdictions: Indigenous status; remoteness) and from survey data for long term unemployment (national: sex by remoteness).

The Council of Australian Governments (COAG) has committed to ‘halve the gap in employment outcomes between Indigenous and non-Indigenous Australians within a decade’ (COAG 2009). Employment outcomes are directly related to people’s living standards and many aspects of their wellbeing. Being employed leads to improved income for families and communities, which in turn has a positive influence on health and the education of children. Employment also enhances self-esteem, increases opportunities for self-development, influences interaction at the family and community levels and reduces social alienation.

The focus of this section is the extent to which people are participating in the labour force (both employed and unemployed). Employment by part time/full time status and skill level is discussed in more detail in section 9.1.

The labour force is the most widely used measure of the economically active population (or the formal supply of labour). It measures the number of people contributing to, or willing to contribute to, the supply of labour and — as defined by the ABS — comprises two mutually exclusive groups within the population:

- the employed (people who have worked for at least one hour in the reference week, including those who have received wages for participating in CDEP)

---

<sup>12</sup> See Glossary for full definition.

<sup>13</sup> NIRA reporting uses the ABS Survey of Education and Work (SEW) non-Indigenous population data. However, this report requires a longer time series for all disaggregations (such as remoteness), which is not available from the SEW.

- 
- the unemployed (people who are without work, but had actively looked for work in the four weeks up to the end of the reference week and were available to start work in the reference week).

The remainder of the population are not in the labour force. There are many reasons why people are outside the labour force. An analysis of the 2008 NATSISS and HILDA data by (Kalb et al. 2012) found that Aboriginal and Torres Strait Islander Australian's lower attachment to the labour force could to a large extent be explained by their lower levels of education, worse health and larger families.

Labour force, employment and unemployment data should be interpreted bearing in mind the following points.

- People who would like to work may become discouraged and cease actively looking for work (and therefore are not counted in the labour force according to the ABS definition). Discouraged jobseekers might believe that there are no suitable jobs in their area, the costs of searching are too great, or that they do not have the appropriate skills or qualifications (Hunter and Gray 2001; Savvas, Boulton and Jepsen 2011). It is likely that the true extent of unemployment — particularly long term unemployment<sup>14</sup> — is underestimated due to discouraged jobseekers.
- Even if a person is employed, they may not necessarily work the number of hours they would prefer. This is known as underemployment — an issue which has become increasingly prominent in recent decades, as part time employment levels have risen (Hunter 2010). A higher proportion of Aboriginal and Torres Strait Islander people work part time than non-Indigenous people, which implies there could be a greater occurrence of underemployment amongst the Aboriginal and Torres Strait Islander population (see section 9, figure 9.1.1).<sup>15</sup>
- While many Aboriginal and Torres Strait Islander Australians in more remote areas are considered 'outside' of the labour force (because they are not employed or seeking paid employment), many are still actively engaged in productive activities, such as the production of art or participation in customs which may generate income but are not always recorded as employment (Altman, Buchanan and Biddle 2006). Analysis of the 2008 NATSISS found that harvesting and cultural production were significant productive activities, particularly in remote areas (Altman, Biddle and Buchanan 2010).
- Aboriginal and Torres Strait Islander labour force data are influenced by changes over time in the Australian Government's Community Development Employment Projects (CDEP) program (see box 4.6.3).

---

<sup>14</sup> Long term unemployment refers to a period of unemployment of 52 consecutive weeks.

<sup>15</sup> Unemployment and underemployment together provide a measure of underutilisation. Extended labour underutilisation would also capture discouraged job seekers, but data are not available for the Aboriginal and Torres Strait Islander population.

---

### Box 4.6.3      **Community Development Employment Projects (CDEP)**

CDEP had elements of both unemployment and employment, especially in remote and very remote areas. Some CDEP activities were similar to those undertaken by participants in Work for the Dole, while other activities were essential roles in municipal services, health care, community services, education and other sectors that would be considered employment in mainstream communities and organisations.

The scope of CDEP has changed over time. The original aim of the program — introduced in 1977 — was to create local employment opportunities in remote Aboriginal and Torres Strait Islander communities where the labour market might not otherwise offer employment. The program was later extended to all areas (including non-remote). However, in 2009 CDEP was restructured to focus on remote areas, although some non-remote providers continued to operate. From 1 July 2013, remote CDEP was rolled into the Australian Government's Remote Jobs and Communities Program (RJCP).

Up until 1 July 2009, CDEP participants received 'wages' and, for statistical purposes, the ABS counted CDEP participation as employment. However participants engaged from 1 July 2009 received income support payments instead of CDEP 'wages'.

- In the 2012-13 AATSIHS, information about CDEP participation was only collected in remote areas (in earlier ABS surveys, CDEP participation was collected in both remote and very remote areas).
- Future ABS collections will continue to classify remaining CDEP 'wage' participants as employed (because they are receiving a wage), whilst those under the RCJP/CDEP receiving income support will be classified as unemployed.

It is important to consider CDEP when analysing historical labour force data because over time:

- the number of CDEP participants receiving 'wages' has decreased significantly in recent years (from 68.0 per cent of the employed population in very remote areas in 2004-05 to 27.7 per cent in 2012-13) (table 4A.6.4)
- CDEP participant payments comprised a mix of both wages and income support payments such as Newstart Allowance
- some people classified as 'employed' in one period may have been classified as 'unemployed' in another period due to changes in CDEP arrangements, rather than changes in their personal circumstances.

## **Employment to population ratio**

In 2012-13, the employment to population ratio for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 47.5 per cent. The ratio had increased from 37.6 per cent in 1994 to 53.8 per cent in 2008, but has since declined (figure 4.6.1).

**Figure 4.6.1 Employment to population ratio for Indigenous people, by age group, 1994 to 2012-13<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Survey 1994; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Health Survey 2004-05; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) AATSIHS (core component) 2012-13; table 4A.6.5.

A large part of the decrease from 2008 to 2012-13 is explained by a decrease in the ratio for males, and in particular, males aged 15–17 years (a corresponding decrease in the labour force participation rate for males aged 15–17 years indicates that they are not actively looking for work and could be engaged in education or training).<sup>16</sup> When the employment to population ratio is restricted to those aged 18–64 years the rates are similar between 2008 and 2012-13 (figure 4.6.1).

The employment to population ratio for Aboriginal and Torres Strait Islander females aged 15–64 years increased from 28.9 per cent in 1994 to 41.0 per cent in 2002, and has been relatively constant since (42.4 per cent in 2012-13). The rate for Aboriginal and Torres Strait Islander males increased from 47.0 per cent in 1994 to 62.7 per cent in 2008, before declining to 52.8 per cent in 2012-13 (table 4A.6.5).

In 2011-12, the employment to population ratio for non-Indigenous Australians aged 15–64 years was 76.6 per cent, similar to that in 2008. The ratio is similar when the population is restricted to those aged 18–64 years, indicating that there is little difference between the 15–17 year old population and those aged 18–64 years (table 4A.6.5).

<sup>16</sup> In the 2011 Census, 61 per cent of Aboriginal and Torres Strait Islander Australians aged 15–17 years were attending secondary school, up from 53 per cent in 2006 (ABS 2012).

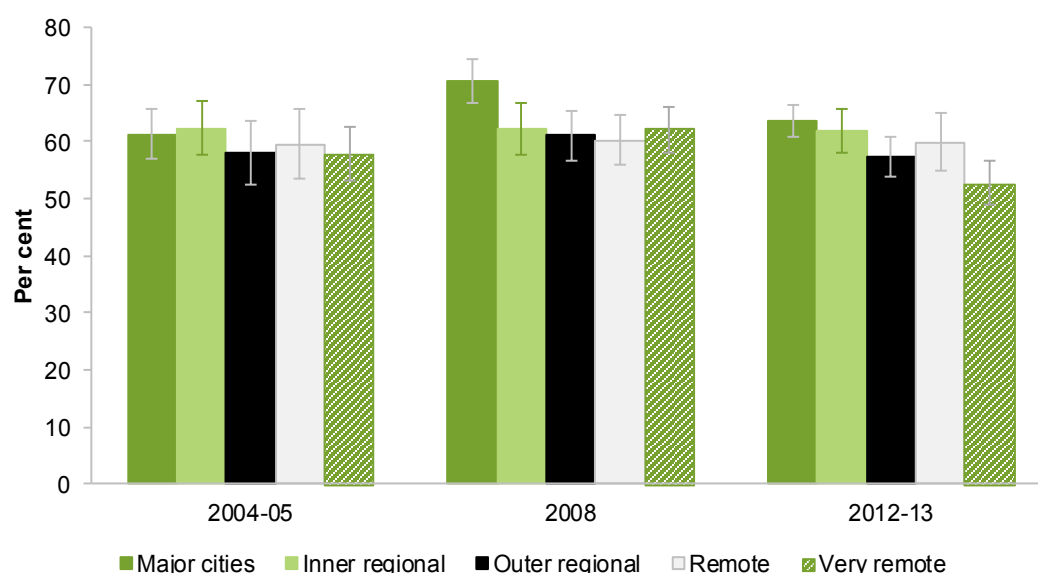

In 2012-13, for Aboriginal and Torres Strait Islander Australians aged 15–64 years, the employment to population ratio was higher in major cities and inner regional areas compared to very remote areas, following a significant decrease in very remote areas from 2008 (table 4A.6.2). This may be influenced by the change in participants receiving CDEP ‘wages’ in very remote areas over time (for those aged 18–64 years, from 68.0 per cent of the employed population in very remote areas in 2004-05 to 46.7 per cent in 2008 and then 27.7 per cent in 2012-13) (table 4A.6.4).

For non-Indigenous Australians, the employment to population ratio was higher in remote areas (82.9 per cent) (data not collected in very remote areas) compared to major cities (76.7 per cent) and inner regional areas (75.2 per cent) (table 4A.6.2). Data are also reported by State and Territory, by remoteness in table 4A.6.2.

### Labour force participation rate

In 2012-13, the proportion of Aboriginal and Torres Strait Islander Australians aged 15–64 years employed or actively looking for work was 60.1 per cent. This was the same as in 2004-05 (60.0 per cent), and lower than in 2008 (64.5 per cent). The non-Indigenous rate rose over the same period (from 77.6 per cent in 2004-05 to 80.0 per cent in 2011-12), leading to an increase in the gap (table 4A.6.12).

**Figure 4.6.2 Proportion of Indigenous people aged 15–64 years in the labour force, by remoteness area, 2004-05, 2008 and 2012-13<sup>a</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate.

Sources: ABS (unpublished) NATSIHS 2004-05; ABS (unpublished) NATSISS 2008; ABS (unpublished) AATSIHS (core component) 2012-13; table 4A.6.13.

---

The decrease from 2008 to 2012-13 for Aboriginal and Torres Strait Islander Australians was largest in major cities and very remote areas (ratios were steady over this period for inner regional, outer regional and remote areas) (figure 4.6.2), and for males (ratio was steady over this period for females) (table 4A.6.14).

Data are also reported by State and Territory in table 4A.6.12.

## **Unemployment**

In 2012-13, the unemployment rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years was 20.9 per cent, an increase from 16.6 per cent in 2008 (table 4A.6.8), and around five times the rate for non-Indigenous Australians (4.2 per cent in 2011-12) (table 4A.6.8).

Between 2004-05 and 2012-13, the largest increases in the unemployment rate for Aboriginal and Torres Strait Islander Australians were in major cities (from 13.3 per cent to 21.8 per cent) and remote/very remote areas (from 11.9 per cent to 20.3 per cent), with rates in these areas increasing to be on a par with those in regional areas (table 4A.6.9).

Data are also reported by State and Territory in table 4A.6.8.

## **Things that work**

Gray, Hunter and Lahoar (2012), in a review of available evidence, suggest that the following approaches are likely to be most effective in increasing employment for Aboriginal and Torres Strait Islander Australians:

- increased human capital of Aboriginal and Torres Strait Islander Australians via formal education and training
- pre-employment assessment and customised training for individuals, to ensure Aboriginal and Torres Strait Islander job seekers are employment-ready
- intensive assistance for job seekers who experience multiple barriers to finding employment (for example, drug and alcohol issues, mental and physical health issues, family violence and a lack of literacy and numeracy), policies and programs involving
- non-standard recruitment strategies to increase the likelihood of Aboriginal and Torres Strait Islander Australians having the opportunity to win jobs
- reducing discrimination against Aboriginal and Torres Strait Islander Australians, including through the provision of cross-cultural training
- support mechanisms to improve the retention of Aboriginal and Torres Strait Islander employees, including ongoing mentoring and support, flexible work arrangements and tackling workplace racism through initiatives such as cross-cultural training
- wage subsidy and other labour market programs

- 
- a strong macro-economy, which creates a range of new jobs
  - government programs that deliver goods, environmental or personal services having explicit Aboriginal and Torres Strait Islander employment goals.

Box 4.6.4 describes some initiatives that have been successful in improving employment outcomes for Aboriginal and Torres Strait Islander Australians.

#### Box 4.6.4 'Things that work' — Employment

The **Working on Country** (WoC) program (national) aims to support Aboriginal and Torres Strait Islander aspirations to care for country. The program, funded by the Australian Government and supported through the Indigenous Employment Program, provides employment and training opportunities for Aboriginal and Torres Strait Islander people living in regional and remote Australia to undertake natural resource management work. Program activities include site management, and nationally accredited training and career pathways in land and sea management. In May 2012 there were 690 rangers in 95 ranger teams (DOE 2013).

An independent evaluation was undertaken in 2011 involving 18 case studies, a review of program and policy data and documentation and consultations with key departmental personnel. The evaluation found that the program had a range of economic, social, cultural and environmental benefits. Rangers saw the jobs as 'real jobs' that provided better income and conditions, more interesting work and ongoing employment, compared to the CDEP alternative (Urbis 2012 cited in AIHW, 2014).

The Closing the Gap Clearinghouse found that programs with the following factors have led to improvements in employment outcomes:

- specific objectives about what is to be achieved, and support mechanisms aligned to these objectives; for example, wage subsidies to increase employment outcomes at the local level
- commitment by employers, managers and colleagues for sustained engagement of Indigenous Australians in work and training
- flexible approaches in workplaces that take into account the important role of cultural and family obligations (AIHW, 2014).

The **Aboriginal Workforce Development Centre (AWDC) program** (WA) is a promising program worth further examination. The AWDC program commenced in March 2010, and there are currently AWDCs in five locations across WA (Perth, Kalgoorlie, Geraldton, Bunbury and Broome).

Each AWDC is guided by a local advisory group that includes significant Aboriginal representation. The AWDCs aim to work with employers, government and Aboriginal communities to remove barriers to Aboriginal and Torres Strait Islander participation in the workforce in order to achieve sustainable employment outcomes in a culturally sensitive way (WA Government 2014). In 2012, the AWDC program won the overall Premier's Award for Excellence in Public Sector Management (WA Government 2012).

(continued next page)

---

#### Box 4.6.4 (continued)

As at June 2014, the five AWDCs had assisted over 900 Aboriginal job seekers into employment and over 450 Aboriginal job seekers into training linked to employment opportunities (WA Government unpublished). An independent formative evaluation in 2012 reported early positive employment outcomes (Aquilina and Grace 2012). A further evaluation is planned after four years of operation (WA Government 2014).

### Future directions in data

Annual data are collected for the general population on barriers to labour force participation, including identification of discouraged job seekers. However, these data are not available by Indigenous status. Information on Aboriginal and Torres Strait Islander discouraged workers is important to understand the potential scope of the labour force and employment.

## 4.7 Post-secondary education — participation and attainment<sup>17</sup>

### Box 4.7.1 Key messages

- Nationally in 2012-13, 42.6 per cent of Aboriginal and Torres Strait Islander Australians aged 20–64 years either had a Certificate level III or above or were studying, a 16.6 percentage point increase from 26.0 per cent in 2002 (figure 4.7.1). Between 2002 and 2011–13, the gap in rates between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians remained steady around 24-25 percentage points (figure 4.7.1).
- The gap in the VET load pass rate between Aboriginal and Torres Strait Islander students and non-Indigenous students decreased from 14.2 percentage points in 2004 to 8.7 percentage points in 2013 (figure 4.7.4).
- The gap in the higher education success rate between Aboriginal and Torres Strait Islander students and non-Indigenous students decreased from 22 percentage points in 2001 to 14 percentage points in 2012 (figure 4.7.5).

### Box 4.7.2 Measures of post-secondary education — participation and attainment

There is one main measure for this indicator (aligned with the NIRA indicator).

- *People with or working towards a post-secondary qualification* is defined as the number of 20–64 year old who have attained post school qualifications in AQF Certificate level III or above, or are currently studying at any level, as a proportion of all 20–64 year olds.

The main data source for this measure is the Census, with the most recent data available for 2011 (all jurisdictions: remoteness; age; sex). Supplementary data are available from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent data available for 2012-13 (all jurisdictions: remoteness; age; sex). Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with the most recent data for 2011-12.<sup>18</sup> Indicators using both AATSIHS (2012-13) and AHS (2011-12) are referenced as 2011–13. Survey and Census data are not directly comparable.

This section also includes related data on participation at higher education institutions by course level (broad field of education); VET national load pass rate (all jurisdictions); and higher education success rate (all jurisdictions by sex).

COAG has identified post-secondary education participation and attainment as a progress measure for its Closing the Gap target of ‘halving the gap in employment outcomes

---

<sup>17</sup> The Steering Committee notes its appreciation to Dr Gawaian Bodkin-Andrews, Macquarie University, who reviewed a draft of this section of the report.

<sup>18</sup> NIRA reporting uses the ABS Survey of Education and Work (SEW) non-Indigenous population data. However, this report requires a longer time series for various disaggregations (such as remoteness), which is not available from the SEW.

---

between Indigenous and non-Indigenous Australians by 2018' (COAG 2012). Post-secondary education includes both vocational education and training (VET) at institutions such as technical and further education (TAFE) colleges, and higher education at universities.

People with a skilled vocational qualification or higher qualifications are more likely to be employed than those without such qualifications (see section 7.4). Other potential benefits that flow from higher education include a positive influence on health outcomes (including children's health), and educational performance (AIHW 2014; Biddle and Yap 2010; Wolfe and Haveman 2001; Zubrick et al. 2006).

TAFE is a particularly important destination for Aboriginal and Torres Strait Islander Australians. Nationally in 2012, the participation rate for Aboriginal and Torres Strait Islander Australians aged 15–64 years in VET (24.1 per cent) was higher than the participation rate in higher education (3.2 per cent). In the general population, 12.5 per cent of 15–64 year olds participated in VET and 6.2 per cent participated in higher education (ABS 2014a, 2014b) Higher Education Statistics Collection unpublished; NCVER unpublished). *The Review of Higher Education Access and Outcomes for Aboriginal and Torres Strait Islander People Final Report* (Behrendt et al. 2012) noted that Aboriginal and Torres Strait Islander Australians' lower participation rate in higher education may be due to a range of factors, including their:

- preference for undertaking VET courses rather than university courses
- having lower aspirations compared to non-Indigenous students to participate in university, including among high performing students
- being less likely than non-Indigenous students to attain a sufficiently high score to enable admission to university<sup>19</sup>
- facing other social barriers.

## **People with or working towards a post-secondary qualification**

Education and training are important means of promoting attachment to the labour force (Hunter and Daly 2008). Certificate level III is considered the minimum qualification necessary to provide pathways to further education and training, and improve employment outcomes. Certificate level III or above includes certificate levels III and IV, diplomas, advanced diplomas, bachelor degrees, graduate diplomas or certificates, and postgraduate degrees.

---

<sup>19</sup> Eligibility for admission to a public university in Australia on the basis of merit is determined in each State and Territory through the use of the Australian Tertiary Admission Rank (ATAR). See section 4.5 for further information and data on ATARs.

Figure 4.7.1 **Proportion of 20–64 year olds with a post school qualification of Certificate level III or above or studying, 2002, 2008 and 2011–13<sup>a,b</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The 2011–13 reference year includes data for Aboriginal and Torres Strait Islander Australians from the 2012–13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011–12).

Sources: ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2002; ABS (unpublished) General Social Survey 2002; ABS (unpublished) National Aboriginal and Torres Strait Islander Social Survey 2008; ABS (unpublished) National Health Survey 2007–08; ABS (unpublished) Australian Aboriginal and Torres Strait Islander Health Survey 2012–13 (2012–13 Core Component); ABS (unpublished) Australian Health Survey 2011–13 (2011–12 NHS component); table 4A.7.7.

Nationally in 2011–13:

- 42.6 per cent of Aboriginal and Torres Strait Islander 20–64 year olds either had a Certificate level III or above or were studying at any level, a 16.6 percentage point increase from 26.0 per cent in 2002. The rate increased for both females (from 24.8 to 44.6 per cent) and males (from 27.4 per cent to 40.6 per cent)
- 66.6 per cent of non-Indigenous 20–64 year olds either had a Certificate level III or above or were studying at any level, a 15.1 percentage point increase from 51.5 per cent in 2002. The rate increased for both females (from 45.0 per cent to 65.1 per cent) and males (from 58.0 per cent to 68.1 per cent) (figure 4.7.1).

Between 2002 and 2011–13, the gap between Aboriginal and Torres Strait Islander and non-Indigenous 20–64 year olds remained steady around 24–25 percentage points (figure 4.7.1).

In 2011–13, in all states and territories, lower proportions of Aboriginal and Torres Strait Islander Australians than non-Indigenous Australians aged 20–64 years had a qualification

at Certificate level III or above or were studying at any level. The gap was widest in the NT (22.8 per cent for Aboriginal and Torres Strait Islander Australians compared with 64.8 per cent for non-Indigenous Australians — a 42 percentage point gap) and smallest in Victoria (58.8 per cent for Aboriginal and Torres Strait Islander Australians compared with 67.7 per cent for non-Indigenous Australians — a 9 percentage point gap) (table 4A.7.8).

More survey data on post-school qualifications, by jurisdiction, by remoteness can be found in tables 4A.7.7–13. National data by age for those aged 18 years or over can be found in tables 4A.7.14–15.

Although not directly comparable with survey results, data from the Census show similar trends. Census data show that the proportion of Aboriginal and Torres Strait Islander 20–64 year olds with a Certificate level III or above or who were studying at any level increased from 25.3 per cent in 2001 to 35.6 per cent in 2011. Over the same period, the rate for non-Indigenous Australians increased from 48.6 per cent in 2001 to 61.1 per cent (table 4A.7.1).

Figure 4.7.2 presents Census data by remoteness (survey data are not available or not published for non-Indigenous Australians for 2008 and 2011–13).

**Figure 4.7.2 Proportion of 20–64 year olds with a post-school qualification at Certificate level III or above or studying, by remoteness, 2011**

Source: ABS (unpublished) Census of Population and Housing, 2011; table 4A.7.2.

In 2011, the proportion of Aboriginal and Torres Strait Islander 20–64 year olds who had a qualification at Certificate level III or above or were studying at any level decreased with remoteness, from 44.8 per cent in major cities to 16.8 per cent in very remote areas

(figure 4.7.2). There has been an increase in the rate over time in all remoteness areas (2001 — major cities 34.7 per cent, very remote areas 8.7 per cent; 2006 — major cities 39.4 per cent, very remote areas 13.3 per cent) (tables 4A.7.3–4).

More Census data on post-school qualifications, by jurisdiction, by remoteness can be found in tables 4A.7.2, 4A.7.3 and 4A.7.4. National data by age for those aged 18 years or over can be found in tables 4A.7.5–6.

**Figure 4.7.3 Post-secondary participation at higher education institutions, by course level, 2004 to 2012<sup>a</sup>**

<sup>a</sup> 'Other' includes international students and those with not stated or unknown Indigenous status.

Source: Department of Education (unpublished) Higher education statistics collection; tables 4A.7.16–24.

In all years between 2004 and 2012, Aboriginal and Torres Strait Islander students who were participating at higher education institutions were more likely than non-Indigenous students to be enrolled in enabling and non-award courses, and less likely to be enrolled in postgraduate courses (figure 4.7.3)

More data on the types of courses Aboriginal and Torres Strait Islander students were undertaking can be found in tables 4A.7.16–24.

## VET load pass rate and higher education success rate

One measure of post-secondary attainment is the extent to which people complete or pass the course they are undertaking. In the VET system this is known as the load pass rate. In the higher education system it is known as the success rate.

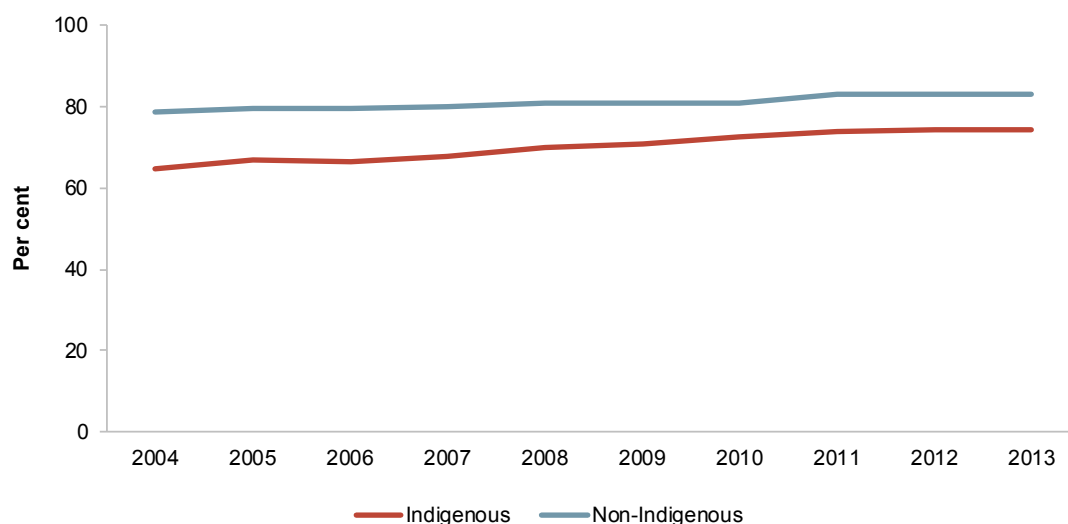

---

## VET load pass rate

The VET load pass rate indicates the extent to which students pass assessment in an assessable module or unit of competency. Load pass rates are calculated as the ratio of hours attributed to students who passed assessment to all students who were assessed and either passed, failed or withdrew. The calculation is based on the nominal hours supervised for each assessable module or unit of competency. Care needs to be taken in making comparisons, because average module durations and standards of competencies achieved by students can vary across courses, institutions and jurisdictions.

---

**Figure 4.7.4 VET national load pass rate, 2004 to 2013<sup>a</sup>**

<sup>a</sup> Includes all VET delivered by TAFE and other government providers and publicly funded VET programs delivered by private providers. Excludes VET delivered in schools, where the delivery was undertaken by schools.

Source: NCVER (unpublished) National VET Provider Collection, 2004–2013; table 4A.7.37.

---

In 2013, the national load pass rate for Aboriginal and Torres Strait Islander students was 74.5 per cent, a 10 percentage point increase since 2004. Over the same period, the national load pass rate for non-Indigenous students increased at a slower rate (from 78.8 per cent to 83.1 per cent), and the gap between Aboriginal and Torres Strait Islander students and non-Indigenous students decreased from 14.2 percentage points in 2004 to 8.7 percentage points in 2013 (figure 4.7.4). These data are also reported by State and Territory in table 4A.7.37.

The load pass rates for Aboriginal and Torres Strait Islander and non-Indigenous students by remoteness area for 2011 to 2013 are reported in table 4A.7.16. These data are not comparable to data from previous years. The *Report on Government Services* (SCRGSP 2014) contains further data on VET system outcomes.

---

## Higher education success rate

The success rate is the proportion of units passed within a year compared with the total units enrolled. Although this measure is based on a different calculation to the VET load pass rate, a similar positive trend in outcomes for Aboriginal and Torres Strait Islander students can be observed.

---

**Figure 4.7.5 Higher education success rate, 2001–2012<sup>a,b</sup>**

<sup>a</sup> Success is defined as the student progress rate, which is the proportion of units passed within a year compared with the total units enrolled. <sup>b</sup> The non-Indigenous category for 2001 includes 'Indigenous status unknown'.

Source: Department of Education (unpublished) Higher education statistics collection; tables 4A.7.25–36.

---

From 2001 to 2012, the higher education success rate for Aboriginal and Torres Strait Islander students increased from 65 per cent to 73 per cent, and the gap compared to the rate for non-Indigenous students decreased (from 22 percentage points in 2001 to 14 percentage points in 2012) (figure 4.7.5). For both Aboriginal and Torres Strait Islander students and non-Indigenous students, females had higher success rates than male students across all years (tables 4A.7.25–36). These data are also available by State and Territory in tables 4A.7.25–36.

## Future directions in data

The survey and Census data presented in this section provide information on qualification levels for those who have completed studies at Certificate level III or above and those currently studying at any level. Data on current study is not restricted by qualification level (to those currently studying at Certificate level III or above) as the Census does not collect

---

data about the level of current study. Therefore, data for this indicator provide an overestimate of the proportion of the population with or working toward post-school qualification at certificate level III or above. The level of current study was collected in the 2012-13 AATSIHS, and will be collected in the 2014 NATSISS. Further work to refine the Census data would assist future reporting.

## 4.8 Disability and chronic disease<sup>20</sup>

### Box 4.8.1 Key messages

- In 2012, the overall rate of disability among Aboriginal and Torres Strait Islander Australians was 23.4 per cent, little changed from 21.1 per cent in 2009 (after adjusting for differences in population age structures, in both 2009 and 2012 the rate of disability for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians) (table 4A.8.1).
- In 2012-13, 'physical' disability was the most common disability type for Aboriginal and Torres Strait Islander adults living in non-remote areas (31.8 per cent) followed by 'sight, hearing, speech' (19.6 per cent) (table 4A.8.10).
- In 2012-13, hospitalisation rates for all chronic diseases (except cancer) were higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (ranging from 9.9 times the rate for kidney failure to 1.6 times for circulatory disease) (table 4A.8.18).

### Box 4.8.2 Measures of disability and chronic disease

There are two main measures for this indicator.

- *Disability prevalence* is defined as the proportion of people with disability. The main data source for this measure is the ABS Survey of Disability Ageing and Carers, with the most recent data available for 2012 (national; age; sex). Supplementary data are available from the NATSIHS component of the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS) for 2012-13, with comparable non-Indigenous data from the NHS component of the ABS Australian Health Survey (AHS) for 2011-12. Indicators using both AATSIHS (2012-13) and AHS (2011-12) are referenced as 2011-13. SDAC and AATSIHS data are not directly comparable (SDAC excludes very remote areas, and AATSIHS has a less refined scope of disability).
- *Hospitalisation rates* is defined as the rate of hospital separations for people hospitalised for chronic diseases (after adjusting for differences in population age structures). The most recent available data are for 2012-13 from the AIHW National Hospital Morbidity Database (all jurisdictions; sex; remoteness).

Two supplementary measures are reported:

- Participation in society by people with disability (national; all jurisdictions for labour force profile)
- Carers of people with disability (all jurisdictions; sex; remoteness).

Aboriginal and Torres Strait Islander Australians experience significantly higher rates of disability and chronic disease than other Australians. This is driven in part by socioeconomic disadvantage and a range of risk factors that increase the chance of

---

<sup>20</sup> The Steering Committee notes its appreciation to the National Health Leadership Forum, which reviewed a draft of this section of the report.

---

acquiring a disability, such as: smoking (section 8.4); high body mass; physical inactivity; poor nutrition (section 8.5); substance abuse (sections 11.1 and 11.2); and violence (section 4.11) (PC 2011). Disability can also entrench socioeconomic disadvantage — for example, Aboriginal and Torres Strait Islander children with hearing loss (section 6.7) have poorer education outcomes (sections 4.4, 4.5 and 4.7), which in turn limits their employment and income prospects (sections 4.6 and 4.9). Another example is violence against people with disabilities. There is evidence that women with disabilities are more likely than those without disabilities to experience domestic violence (Healy et al. 2008), perpetuating the cycle of disadvantage.

Disability is complex, reflecting an interaction between features of a person's body and features of the society in which he or she lives (WHO 2009). People with disability may have long-term physical, mental, intellectual or sensory impairments, that can hinder their participation in society on an equal basis with others (UN 2006). The extent to which people with disability or chronic disease are able to be fully involved in society varies; an impairment may not be as severely limiting if there is a sufficiently supportive and enabling environment from both informal carers and formal support services (Aboriginal Disability Network of NSW 2007; Priestly 2001). However, some Aboriginal and Torres Strait Islander Australians face significant barriers to accessing disability support services, due to social marginalisation, concern about approaching government agencies, cultural attitudes towards disability and services that are not mindful of cultural differences (PC 2011) (see section 5.3 Engagement with services).

Chronic diseases place a significant health and disability burden on Aboriginal and Torres Strait Islander Australians (Vos et al. 2007). The majority (68 per cent) of Aboriginal and Torres Strait Islander deaths in 2006–2010 were due to chronic diseases (for example, circulatory disease, cancer, diabetes, respiratory disease, kidney disease). Aboriginal and Torres Strait Islander Australians died from diabetes, at almost seven times the rate of non-Indigenous Australians and at twice the rate from circulatory diseases (AIHW 2013a).

## **Disability prevalence**

The Survey of Disability, Ageing and Carers (SDAC) is designed to measure the prevalence of disability in Australia and the need for support by people with disability. In the SDAC, disability is defined as 'any limitation, restriction or impairment which restricts everyday activities and has lasted or is likely to last for at least six months'. The SDAC does not survey people in very remote areas.

There may be specific cultural dimensions to the concept of disability, which are not reflected in the SDAC questions, as this survey was not specifically designed to collect disability data from Aboriginal and Torres Strait Islander Australians, particularly those living more traditional lifestyles. For example, the First Peoples Disability Network suggested that 'in traditional language there was no comparable word to disability, which

suggests that disability may have been accepted as part of the human experience’ (sub. 542, p. 8 cited in PC 2011).

In 2012, the reported rate of disability for Aboriginal and Torres Strait Islander Australians was 23.4 per cent, similar to the 2009 rate (21.1 per cent) (table 4A.8.1). In both 2009 and 2012, rates for males and females were similar (tables 4A.8.1–3 ).

After adjusting for differences in population age structures, in both 2009 and 2012 the disability rate for Aboriginal and Torres Strait Islander Australians was 1.7 times the rate for non-Indigenous Australians (table 4A.8.1).

Figure 4.8.1 **Disability prevalence, by age, 2012<sup>a,b,c</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> The SDAC does not survey people in very remote areas. <sup>c</sup> AS = Age standardised rate.

Source: ABS (unpublished) 2012 Survey of Disability Ageing and Carers; table 4A.8.2.

Across all age groups, reported disability prevalence was higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (figure 4.8.1).

### Profound or severe core-activity limitation

A core-activity refers to one of three main everyday activities — self-care, mobility and communication. A person with ‘profound core-activity limitation’ is unable to do at least one of these activities at any time or needs constant help. A person with ‘severe core-activity limitation’ needs help some of the time with at least one of these activities. The combined measure ‘profound or severe core-activity limitation’ therefore identifies people at the more severe end of the disability spectrum (ABS 2013).

---

In 2012, an estimated 34 500 Aboriginal and Torres Strait Islander Australians (7.8 per cent) had a profound or severe core activity limitation (table 4A.8.1). After adjusting for differences in population age structures, the proportion of Aboriginal and Torres Strait Islander Australians living with a profound or severe core-activity limitation was 1.7 times the proportion of non-Indigenous Australians (table 4A.8.1).

Whilst not directly comparable to the SDAC, AATSIHS/AHS data for 2011–13 show similar trends. Nationally in 2011–13, after adjusting for differences in population age structures, the rate of profound or severe core activity restriction for Aboriginal and Torres Strait Islander Australians (for people of all ages) was twice the rate for non-Indigenous Australians (table 4A.8.4). Rates of profound or severe core-activity restriction for Aboriginal and Torres Strait Islanders adults were lower in remote areas (6.8 per cent) than in non-remote areas (8.1 per cent) (ABS unpublished).

Data on the proportion of people with disability by disability status (in non-remote areas) across the three survey periods reported by State and Territory are available in tables 4A.8.5–9.

### Disability type

In 2011–13, the most common disability types for Aboriginal and Torres Strait Islander adults living in non-remote areas were ‘physical disability’ (31.8 per cent) and ‘sight, hearing, speech’ (19.6 per cent). After adjusting for differences in population age structures, these were both 1.5 times the rates for non-Indigenous adults living in non-remote areas (age adjusted disability rates for all disability types were higher for Aboriginal and Torres Strait Islander adults than for non-Indigenous adults) (table 4A.8.10).

In 2011–13, for people under 18 years of age living in non-remote areas, the most common disability type for both Aboriginal and Torres Strait Islander and non-Indigenous youth was ‘sight, hearing, speech’ disability (10.9 per cent and 7.2 per cent respectively) (table 4A.8.11).

## Participation in society by people with disability

### Education, employment and income

A number of potential barriers can prevent a person with a disability from gaining and maintaining employment. For some, their condition is severe enough to preclude any formal engagement with the labour market. However, many others may be willing and able to work but are not able to find a sufficiently supportive employer (Biddle, Yap and Gray 2013). Aboriginal and Torres Strait Islander Australians with a disability tend to have

---

poorer education, employment and income outcomes than Aboriginal and Torres Strait Islander Australians without disability. In 2012-13:

- almost half (45.8 per cent) of Aboriginal and Torres Strait Islander Australians aged 15 years and over who had a profound or severe core activity restriction had left school at year 9 or below. This is twice the proportion of Aboriginal and Torres Strait Islander Australians without disability (20.7 per cent) (table 4A.8.12)
- Aboriginal and Torres Strait Islander Australians in the working age population (15 to 64 years) who had a severe or profound core activity restriction had a lower labour force participation rate (28.2 per cent) and employment rate (20.9 per cent) than those without disability (68.8 per cent and 55.3 per cent) (table 4A.8.13)
- a higher proportion of Aboriginal and Torres Strait Islander Australians aged 15 years and over with disability reported an equivalised household income<sup>21</sup> in the lowest quintile (38.4 per cent) compared to those without disability (31.0 per cent) (table 4A.8.14).

## Receipt of disability support pension

Centrelink data show that:

- disability support pensions were the second most common type of income support received by Aboriginal and Torres Strait Islander Australians aged 15–64 years in 2013, and they received disability support pensions (10.6 per cent) at more than twice the rate of non-Indigenous Australians (5.0 per cent) (table 9A.4.10)
- between 2003 and 2013, the proportion of Aboriginal and Torres Strait Islander Australians receiving the disability support pension almost doubled (from 5.5 per cent to 10.6 per cent), while there was no change for non-Indigenous Australians (5.0 per cent in 2003 and 2013) (table 9A.4.10).

For more information on disability income support, see section 9.4 ‘Income support’.

## Disability service use

Many people with disability are able to live independently and participate in society without assistance, or with the help of informal carers. However, others require formal specialist disability services to study, work, interact with the community or carry out everyday activities (AIHW 2013b).

Aboriginal and Torres Strait Islander Australians may face particular barriers to accessing support services, including a lack of local disability-friendly services (a higher proportion of Aboriginal and Torres Strait Islander Australians live in very small communities which

---

<sup>21</sup> Equivalised household income is a measure which enables comparison between households of different size and composition. For more information on equivalised household income see section 4.9 Household and individual income.

---

may not have accessible services), and a reluctance by some Aboriginal and Torres Strait Islander Australians with disability to engage with available services (Biddle, Yap and Gray 2013; PC 2011).

In 2012-13, 5.8 per cent of disability support service users were Aboriginal and Torres Strait Islander Australians, a slight increase from 4.8 per cent in 2008-09 (AIHW 2014). The *Report on Government Services 2014: Indigenous Compendium*, chapter 14 Services for people with disability, contains more information on Aboriginal and Torres Strait Islander Australians disability support service use (SCRGSP 2014).

## **Carers of people with disability**

Many Aboriginal and Torres Strait Islander Australians have a strong cultural belief that it is the responsibility of family to provide care and support (PC 2011). Providing care to a person with disability can affect a carer's participation in the labour force, with less time for paid employment, reduced household income, reduced superannuation and lower standards of living (ABS 2012; Hill, Thomson and Cass 2011). Care giving is associated with a higher probability of experiencing poverty in Australia compared to most other OECD countries, with carers of working age, and females carers, at the highest risk of poverty (OECD 2011). Female carers have lower rates of employment and labour force participation than their male carer counterparts (Cummins et al. 2007; Edwards et al. 2008).

In 2011:

- 12.9 per cent of Aboriginal and Torres Strait Islander Australians (aged 15 years and over) provided unpaid assistance to a person with disability in the two weeks prior to Census night. After adjusting for differences in population age structures, this was 1.2 times the rate for non-Indigenous Australians (table 4A.8.15).
- after adjusting for differences in population age structures, in both Aboriginal and Torres Strait Islander and non-Indigenous populations, females provided unpaid assistance to a person with disability at 1.5 times the rate of males (table 4A.8.15).

Nationally in 2011, the unemployment rate of Aboriginal and Torres Strait Islander Australians (aged 15–64 years) who in the two weeks prior to Census night provided unpaid assistance for a person with disability was 20.9 per cent — 3.3 times the unemployment rate for non-Indigenous carers (6.3 per cent) (table 4A.8.16). This rate difference increased as remoteness increased, with the unemployment rate for Aboriginal and Torres Strait Islander carers in very remote areas (24.3 per cent) 7.6 times the rate for non-Indigenous carers in very remote areas (3.2 per cent) (table 4A.8.17).

---

## Hospitalisations rates

Hospitalisation rates for various conditions provide some information about the impact of chronic disease on a population, but should be interpreted with caution. Hospitalisation rates are for 'separations' and not individuals, and as there can be multiple separations for the same individual, hospital records do not usually reflect the general prevalence of a disease or condition in the population (for example, it is not possible to identify whether one patient was admitted 5 times or five patients were admitted once). People who receive treatment at hospital but are not admitted are not counted in hospitalisation rates, and hospitalisation rates are affected by variations in admission practices, and the availability of and access to hospital and non-hospital services.

From 2010-11, Indigenous status in hospital separations data are considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13 (table 4A.8.19).

In 2012-13, after adjusting for differences in population age structures:

- hospitalisation rates for Aboriginal and Torres Strait Islander Australians continue to be highest for Kidney failure (end stage renal diseases<sup>22</sup> at a rate of 43 815.0 per 100 000) followed by circulatory diseases (3154.0 per 100 000) and mental and behavioural disorders (2851.2 per 100 000)
- hospitalisation rates for all chronic diseases except cancer were higher for Aboriginal and Torres Strait Islander Australians than for non-Indigenous Australians (ranging from 1.6 times the rate for circulatory disease to 9.9 times for end stage renal diseases) (table 4A.8.18).

In 2012-13, after adjusting for differences in population age structures, hospitalisation rates for most chronic diseases for Aboriginal and Torres Strait Islander Australians increased with remoteness. In remote and very remote areas, the hospitalisation rate for Aboriginal and Torres Strait Islander Australians for end stage renal diseases was 50.8 times the rate for non-Indigenous Australians (table 4A.8.22).

Hospitalisations by chronic disease data reported by sex are available in tables 4A.8.19-20. More information on potentially preventable hospitalisations (admissions that may have been prevented through the provision of appropriate preventive health interventions and early disease management) is available in section 8.2.

---

<sup>22</sup> End stage renal disease is a complete or near complete failure of the kidneys in their function to excrete wastes, concentrate urine, and regulate electrolytes. End stage renal disease occurs when the kidneys are no longer able to function at a level that is necessary for day-to-day life. It usually occurs as chronic renal failure worsens to the point where kidney function is less than 10 per cent of normal (AIHW 2007).

---

## Future directions in data

The disability policy and service delivery environment continues to evolve, with the roll-out over time of the National Disability Insurance Scheme (NDIS). As the scheme is rolled out, monitoring outcomes for participants, particularly Aboriginal and Torres Strait Islander Australians, will be important.

## 4.9 Household and individual income<sup>23</sup>

### Box 4.9.1 Key messages

- Income levels provide an indicator of the material advantage aspect of wellbeing.
- From 2002 to 2008, the median (mid-point) real equivalised gross weekly household (EGWH) income increased for Aboriginal and Torres Strait Islander households from \$385 per week to \$492 per week. However, there was no significant change from 2008 to 2012-13 (figure 4.9.1).
- In 2011-13, the median real EGWH income for Aboriginal and Torres Strait Islander households was \$465 — just over half the median EGWH income of \$869 for non-Indigenous households. This gap has not changed significantly since 2002 (table 4A.9.1).
- The median EGWH income for Aboriginal and Torres Strait Islander households decreased with remoteness, while median EGWH income for non-Indigenous households was highest in remote areas. Across all areas, median EGWH income was higher for non-Indigenous households than for Aboriginal and Torres Strait Islander households (table 4A.9.1).
- The median real gross weekly personal income increased for Aboriginal and Torres Strait Islander Australians aged 18-54 years between 2002 and 2008, with no statistically significant change between 2008 and 2012-13. For those aged 55 years and over there was a statistically significant increase in this income between 2008 and 2012-13 (figure 4.9.4).

### Box 4.9.2 Measures of household and individual income

There are two main measures for this indicator.

- *Median equivalised gross weekly household income* is defined as the mid-point (median) before tax weekly income that has been adjusted for the size and composition of the household.
- *Median gross weekly personal income* is defined as the mid-point before tax weekly personal income.

There are two supplementary measures for this indicator.

- *Mean equivalised gross weekly household income* is defined as the average (mean) before tax weekly income that has been adjusted for the size and composition of the household.
- *Mean gross weekly personal income* is defined as the average before tax weekly personal income.

(continued next page)

---

<sup>23</sup> The Steering Committee notes its appreciation to Ms Heron Loban, James Cook University, who reviewed a draft of this section of the report.

---

**Box 4.9.2 (continued)**

All measures are limited to people aged 18 years and over. Data for these measures are sourced from the ABS Australian Aboriginal and Torres Strait Islander Health Survey (AATSIHS)/National Aboriginal and Torres Strait Islander Social Survey (NATSISS), with the most recent available data for 2012-13. Data for the non-Indigenous population are sourced from the ABS Australian Health Survey (AHS)/National Health Survey (NHS), with data for 2011-12 (all jurisdictions; remoteness, quintiles: national; age, sex). AATSIHS and AHS data are referenced together as 2011-13. Supplementary data are available from the Census, with the most recent available data for 2011 (all jurisdictions, remoteness). Survey and Census data are not directly comparable.

Household and individual income provides an indicator of the material advantage aspect of wellbeing. It is affected by outcomes in other indicators in this report, particularly those relating to education (see chapter 7) and economic participation and development (see chapter 9). Differences in income levels between Aboriginal and Torres Strait Islander Australians and non-Indigenous Australians can be attributed in part to a higher proportion of Aboriginal and Torres Strait Islander Australians on income support (see section 9.4) and higher rates of part time work and/or employment in lower skilled occupations (see section 9.1).

This indicator examines both household and individual income. While income is usually received by individuals, people living in families or groups generally contribute to the purchase of goods and services shared by other household members, particularly children. Therefore, household income measures the economic resources available to the household as a whole, including dependent adults and children. *Equivalised* household income is adjusted to aid comparisons across population groups.

Income is an important determinant of socioeconomic status. Chapter 13 discusses in more detail the association between low incomes and educational outcomes, labour force participation and employment, health risk behaviours (including smoking, risky to high risk alcohol consumption and illicit drug use), and other factors.

In particular, it is widely acknowledged that health status is affected by the availability of material resources and the income to buy them. In Australia, men and women with lower socioeconomic status, including many Aboriginal and Torres Strait Islander Australians, bear a higher burden of disease (AIHW 2010). Higher incomes can enable the purchase of health-related goods and services, such as better food, housing, recreation and health care, and may provide psychological benefits such as a greater sense of security and control. It is also suggested that less favourable social and economic circumstances can cause anxiety, low self-esteem and social isolation, which in turn can influence physical health (AIHW 2010).

However, higher incomes alone will not improve associated outcomes unless individuals and families are financially literate. Poor financial management skills limit people's capacity to improve their own and their family's circumstances. Although information on

---

general levels of financial literacy are limited, available data indicate that the proportion of Aboriginal and Torres Strait Islander people aged 15 years or over that ran out of money for basic living expenses decreased from 43.7 per cent in 2002 to 28.0 per cent in 2008 (no more recent data are available) (ABS 2009). Chapter 9 (section 9.4 income support) discusses income management, where a proportion of a person's income support and family payments can be spent only on priority needs.

## **Equivalised gross weekly household income**

The measure used in this report is equivalised gross weekly household (EGWH) income. The term 'equivalised' means that household income estimates are adjusted to take into account household size and composition, and the economies of scale that arise from the sharing of resources. Research has found substantial differences in the family size and composition of Aboriginal and Torres Strait Islander households and non-Indigenous households. Aboriginal and Torres Strait Islander households are more likely to have a higher number of dependents, multiple generations living together and a large number of transient visitors, all of which are likely to put a strain on resources (Hunter, Kennedy and Biddle 2004; Hunter, Kennedy and Smith 2003).

Although equivalised household income refers to household income, it is not a measure of total income for each household. Rather, it is a measure of the income that a lone person household would need to have the same standard of living as the household in question.

While EGWH income is adjusted for household size and composition, it may not adequately reflect the household circumstances of Aboriginal and Torres Strait Islander Australians. Income can often be shared beyond the immediate household within extended Aboriginal and Torres Strait Islander Australians families (Biddle 2011). In addition, in regional and remote areas of Australia, some Aboriginal and Torres Strait Islander Australians are able to supplement their cash income through traditional hunting, fishing and gathering (Altman 2001; section 4.6). No adjustment is made for differences in the cost of living between different remoteness areas — in remote areas, the cost of fresh food can be relatively high, while rent is, on average, relatively low. Section 10.1 (Overcrowding in housing) provides more information on the housing and living arrangements of Aboriginal and Torres Strait Islander Australians.

## **Median income**

Median (mid-point) household income is the preferred measure, as the mean (average) can be skewed by extreme high or low income values. This is important when comparing two populations with different income distributions. Information on mean incomes is provided in table 4A.9.1.

Income data are adjusted for the effects of inflation, allowing for comparisons to be made across different years. Median income data in this section have been converted into 2012-13 dollars using the ABS consumer price index.

In 2011–13, the median EGWH income for Aboriginal and Torres Strait Islander adults was \$465, compared with a median EGWH income of \$869 for non-Indigenous adults (table 4A.9.1).

**Figure 4.9.1 Median real equivalised gross weekly household income, people aged 18 years and over, 2002 to 2011–13 (2012-13 dollars)<sup>a,b,c</sup>**

**a** Adjusted for changes in the Consumer Price Index. **b** Error bars represent 95 per cent confidence intervals around each estimate. **c** Data for Aboriginal and Torres Strait Islander Australians are from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011–13 AHS (for the period 2011-12).

*Sources:* ABS (unpublished) NATSIS 2002; ABS (unpublished) GSS 2002; ABS (unpublished) NATSIHS 2004-05; ABS (unpublished) NHS 2004-05; ABS (unpublished) NATSISS 2008; ABS (unpublished) NHS 2007-08; ABS (unpublished) AATSIHS 2012-13 (Core component); ABS (unpublished) AHS 2011-13 (core component for 2011-12) table 4A.9.1.

Figure 4.9.1 shows that the median real EGWH income for Aboriginal and Torres Strait Islander adults increased from \$385 in 2002 to \$492 in 2008, with no statistically significant change between 2008 and 2011–13 (\$465 in 2012-13). For non-Indigenous adults, the median real EGWH income increased from \$719 in 2002 to \$858 in 2008, with no statistically significant change between 2008 and 2011–13 (\$869 in 2011-12). There was no significant change in the gap (table 4A.9.1).

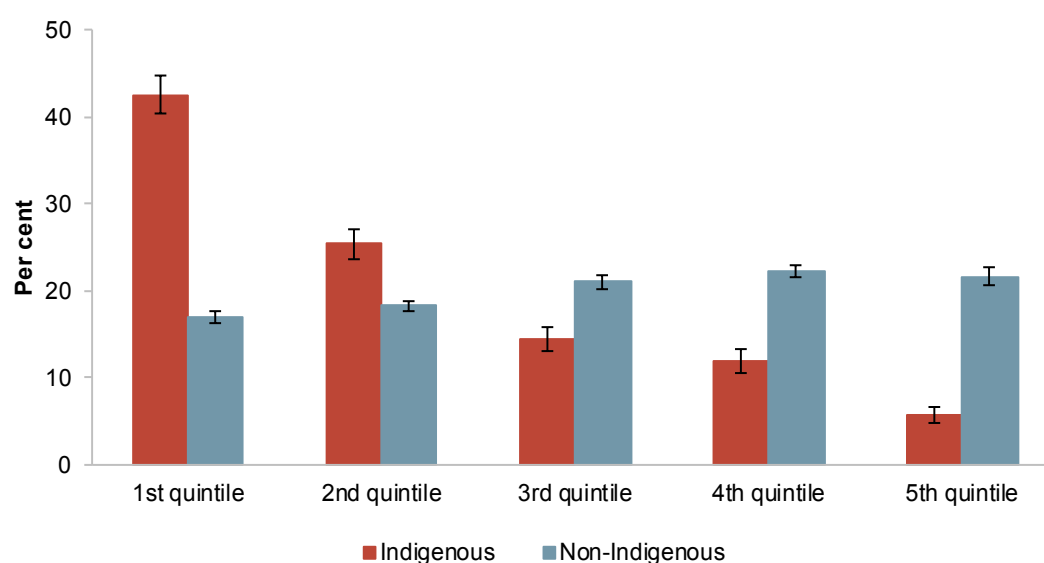

In 2011–13, the median EGWH income for Aboriginal and Torres Strait Islander adults was highest in major cities (\$516), significantly higher than in very remote areas (\$364). In 2011–13, the median EGWH income for non-Indigenous adults was highest in remote

areas (\$966). Across all areas, median EGWH income was higher for non-Indigenous adults than for Aboriginal and Torres Strait Islander adults (table 4A.9.1). Data are also reported by State and Territory in table 4A.9.1.

## Income distribution

The proportion of households with incomes in particular ranges is a measure of relative advantage or disadvantage. This report uses income quintiles to define the boundaries of income ranges — all households in the population are ranked in ascending order (from lowest to highest income) and then divided into five equal groups (five quintiles) each comprising 20 per cent of the population. The proportions of Aboriginal and Torres Strait Islander and non-Indigenous households in each quintile are then calculated. If income distribution was similar across Aboriginal and Torres Strait Islander and non-Indigenous populations, there would be about 20 per cent of Aboriginal and Torres Strait Islander Australians in each quintile.

**Figure 4.9.2 Distribution of equivalised gross weekly household incomes, people aged 18 years and over, 2011–13<sup>a,b,c</sup>**

<sup>a</sup> The income quintiles shown here are groupings that result from ranking all households in the population in ascending order (from lowest to highest) according to their incomes and then dividing them into five equal groups, each comprising 20 per cent of the population. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>c</sup> Data for Aboriginal and Torres Strait Islander Australians are from the 2012-13 AATSIHS. Data for non-Indigenous Australians are from the 2011-13 AHS (for the period 2011-12).

Sources: ABS (unpublished) AATSIHS 2012-13 (core component); ABS (unpublished) Australian Health Survey 2011–13 (2011-12 core component); table 4A.9.2.

In 2011–13, non-Indigenous Australians aged 18 years and over were spread relatively evenly across the EGWH income quintiles — 16.9 per cent were in the lowest income

quintile (less than \$399 per week) and 21.6 per cent were in the highest income quintile (more than \$1438 per week). However, Aboriginal and Torres Strait Islander households were concentrated in the lower quintiles — 42.5 per cent in the lowest income quintile (less than \$407 per week) and only 5.7 per cent in the highest quintile (more than \$1468 per week) (figure 4.9.3). Between 2004-05 and 2011-13, the gap between Aboriginal and Torres Strait Islander and non-Indigenous adults in the lowest quintile increased from 21.0 to 25.6 percentage points, while the gap has remained stable across the other quintiles (table 4A.9.2). Data are also reported by State and Territory (table 4A.9.2).

Additional data from the Census are reported in tables 4A.9.4–6.

## Personal individual income

The main sources of personal income are employment (see sections 4.6 and 9.1), assets (see sections 9.2 and 9.3) and welfare payments (see section 9.4).

**Figure 4.9.3 Median gross weekly personal income, people aged 18 years and over, by age group, 2011–13 (2012-13 dollars)<sup>a,b</sup>**

<sup>a</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>b</sup> Data for Aboriginal and Torres Strait Islander Australians are from the 2012-13 NATSIHS. Data for non-Indigenous Australians are from the 2011-12 NHS.

Sources: ABS (unpublished) AATSIHS 2012-13 (2012-13 NATSIHS component); ABS (unpublished) AHS 2011-13 (2011-12 NHS component); table 4A.9.7.

In 2011–13, the median real gross weekly personal income for Aboriginal and Torres Strait Islander adults was \$430, compared with \$787 for non-Indigenous adults (table 4A.9.7). There was a significant gap in median personal incomes between Aboriginal and Torres

Strait Islander and non-Indigenous adults across all age groups, but in particular for those aged 45–54 years (figure 4.9.3).

**Figure 4.9.4 Median gross weekly personal income, Indigenous people aged 18 years and over, by age group, 2002 to 2012-13 (2012-13 dollars)<sup>a,b,c</sup>**

<sup>a</sup> Adjusted for changes in the Consumer Price Index. <sup>b</sup> Error bars represent 95 per cent confidence intervals around each estimate. <sup>c</sup> The data for this figure are for Aboriginal and Torres Strait Islander adults only and therefore relate to 2012-13.

*Sources:* ABS (unpublished) NATSISS 2002; ABS (unpublished) NATSIHS 2004-05; ABS (unpublished) NATSISS 2008; ABS (unpublished) AATSIHS 2012-13 (2012-13 NATSIHS component); table 4A.9.7.

Median real gross weekly personal income increased for Aboriginal and Torres Strait Islander Australians aged 18–54 years between 2002 and 2008, with no statistically significant change between 2008 and 2012-13. For those aged 55 years and over there was a statistically significant increase in the median gross weekly personal income between 2008 and 2012-13 (figure 4.9.4).

These data are also reported by sex in table 4A.9.7.

---

## Things that work

### Box 4.9.3 Things that work – household and individual income

The **MoneyMob Talkabout (MMT)** program in the Amata, Mimili and Pukatja communities of SA assists people in remote Indigenous communities to manage their money. (Teams also visit other remote communities in SA, WA and NT). Teams spend time listening and learning about how money is viewed and used in Indigenous communities while sharing knowledge and information, through a series of fun, engaging and culturally appropriate learning experiences.

A rigorous evaluation of the MMT completed in 2013 found that, while many community members still had complex barriers to improving their financial literacy, MMT clients were more likely than non-MMT clients to have developed basic financial management skills (for example, know their bank balance, saved some money, be able to access some money from their bank in an emergency) (Pryor & Garner 2013).

The **MPower** program operates in four Cape York communities in Queensland. The previous Family Income Management program (a skill and capability development service) has evolved into a fully integrated money management program. It is a free and voluntary program that assists individuals and families to meet their basic material needs, develop financial literacy and build assets through saving and money management (Cape York Partnerships 2014).

In June 2013, membership of MPower across the four communities ranged from 70 per cent to 100 per cent of the adult community. A CYP survey showed that nearly three quarters of surveyed MPower members found it easier to manage their money than prior to MPower (CYP 2013).

The CYWR Evaluation Report cited improved money management as an important outcome of the trial. It found that MPower is the most commonly used support service introduced by the trial and that it had assisted residents with household budgeting, saving for large expenses and accessing Internet banking (DSS 2012).

*Sources:* MoneyMob Talkabout (2014); Pryor & Garner (2013), Evaluation of MoneyMob Talkabout; Cape York Partnerships (CYP) (2014), MPower; CYP (2013) Family Empowerment Quarterly Report June 2013; DSS (2012) Cape York Welfare Reform (CYWR) Evaluation Report – 2012; AIHW (2014), Success factors for Indigenous entrepreneurs and community-based enterprises, Resource sheet no. 30 produced for the Closing the Gap Clearinghouse.

## Future directions in data

Supplementary data on household and personal income are available from the Census. However, data are collected in pre-determined income ranges, which affects the level of precision of the median and mean income estimates.

## 4.10 Substantiated child abuse and neglect<sup>24</sup>

### Box 4.10.1 Key messages

- Child protection issues continue to be very significant for Aboriginal and Torres Strait Islander families and communities.
- Time series child protection data are difficult to interpret — increases in notifications and orders could reflect changes in laws and policies relating to mandatory reporting, an increased propensity to report or increased services, or an underlying change in prevalence, or a mix of factors. There is also likely to be some under-reporting.
- The substantiation rate for Aboriginal and Torres Strait Islander children aged 0–17 years increased from 29.5 to 37.9 per 1000 children from 2009-10 to 2012-13, while the rate for non-Indigenous children was steady at around 5 per 1000 children over the same period, leading to a widening of the gap from 24.8 to 32.2 substantiations per 1000 children (figure 4.10.1).
- The rate of Aboriginal and Torres Strait Islander children aged 0–17 years on care and protection orders increased from 11.3 to 49.3 per 1000 children from 2003-04 to 2012-13. The rate for non-Indigenous children increased from 2.6 to 5.7 per 1000 children over the same period, leading to a widening of the gap, from 8.7 to 43.6 care and protection orders per 1000 children (figure 4.10.3).

### Box 4.10.2 Measures of substantiated child abuse

There are two main measures for this indicator.

- *Substantiations* is defined as the rate of Aboriginal and Torres Strait Islander children who were the subject of substantiated child protection notifications.
- *Children on care and protection orders* is defined as the rate of Aboriginal and Torres Strait Islander children on care and protection orders.

The most recent available data are for 2012-13 from Australian State and Territory Governments and AIHW (derived from Child Protection Notifications, Investigations and Substantiations, Australia data collection) (all jurisdictions).

Two supplementary measures are also reported:

- placement in accordance with the Aboriginal Child Placement Principle (all jurisdictions)
- diagnoses of sexually transmitted infections in children (national).

Child protection issues continue to be very significant for Aboriginal and Torres Strait Islander families and communities. Child protection issues are associated with many other aspects of Aboriginal and Torres Strait Islander disadvantage, including domestic violence (section 4.11), parental substance abuse (sections 6.2, 11.1 and 11.2) and parental mental health problems (section 8.7) (Bromfield et al. 2010; COAG 2009). Families facing these

---

<sup>24</sup> The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

---

sorts of problems are often affected by other influences including unemployment (section 4.6); lack of education (sections 4.5 and 4.7); young parenthood (section 6.3); overcrowding in housing (section 10.1) and limited access to primary health care (section 8.1) (Bamblett, Bath and Roseby 2010). It also reflects a history of trauma and the consequences of past removal policies (AHMAC 2012).

In 2009, COAG endorsed a national framework on child protection, with an emphasis on prevention. Outcome 5 under the framework states that ‘Indigenous children are supported and safe in their families and communities’ (COAG 2009).

### Longer term effects of child abuse and neglect

Adverse experiences in childhood can have a lifelong legacy, by affecting the developing brain, which in turn can affect a child’s ability to regulate their own behaviour and to build trusting and trusted relationships with others (McGuinness et al. 2013). Research has found children who experience relatively high levels of child abuse and neglect have an increased risk of becoming perpetrators of violence as adults (Wundersitz 2010). Abuse in childhood has been associated with chronic adult health conditions such as heart disease, diabetes, arthritis, bronchitis/emphysema and cancer (section 4.8) (McGuinness et al. 2013). Child sexual abuse can also have long term effects on physical and mental health, and social, sexual and interpersonal functioning (Cashmore and Shackel 2013).

### Substantiations

Child protection data show how many children can come into contact with child protection services. These are the only data routinely collected in Australia on the number of children experiencing child abuse and neglect. Different definitions of what constitutes child abuse and neglect in each State and Territory mean that it is difficult to obtain consistent and comparable national data (Lamont 2011). As many cases of child abuse and neglect are not disclosed to authorities, the data do not reliably indicate how many Aboriginal and Torres Strait Islander children are abused or neglected in any given year (Berlyn and Bromfield 2010).

Time series data should be interpreted with caution, as rates may be affected by changes in community awareness of child abuse and neglect, changes in propensity to report, changes in laws or policies relating to mandatory reporting over time, changes in service levels and (for Aboriginal and Torres Strait Islander children) improvements in Indigenous identification.

Children can come into contact with State and Territory child protection services in various ways, including reports of concerns made by the child, community members, mandated professionals, organisations, and family or relatives. Before a matter is considered ‘substantiated’ by authorities, it must be notified and investigated.

Thresholds for what is substantiated vary across jurisdictions — some jurisdictions substantiate the harm or risk of harm to the child, whilst others substantiate actions by parents or incidents that cause harm (AIHW 2013).

Prior to 2009-10, rates of children in notifications, investigations and substantiations were calculated as the number of children aged 0–16 years, to account for some jurisdictional differences in the way 17 year olds were reported. For the 2009-10 *Child Protection Australia* report (and onwards), a decision was made (in consultation with all states and territories) to report notifications, investigations and substantiations for children aged 0–17 years, to maintain a consistent age group for comparability of analysis across the report (AIHW unpublished). This report includes data for 0–17 year olds for 2009-10 to 2012-13, as well as data for 0–16 years olds for 2001-02 to 2009-10.

**Figure 4.10.1 Rate of children aged 0–17 years who were the subject of a substantiation<sup>a</sup>**

<sup>a</sup> Rates are calculated as the number of children aged 0–17 years in each category (including children whose ages were not stated) divided by the estimated population of children aged 0–17 years at 31 December, multiplied by 1000. For Indigenous children, the estimated population aged 0–17 years at 30 June (using ‘Series B’, Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026, cat. no. 3238.0) for two years were averaged to obtain a population figure for December of the relevant year.

Sources: SCRGSP (2014) *Report on Government Services 2014*, table 15A.8 (cites Australian State and Territory Governments (unpublished) for 2012-13 data; AIHW (unpublished) Child Protection Notifications, Investigations and Substantiations, Australia data collection for data prior to 2012-13; ABS (2014) *Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; ABS (unpublished) Australian Demographic Statistics, December (various years), Cat. no. 3101.0, Canberra; table 4A.10.1.

Nationally in 2012-13, 10 956 Aboriginal and Torres Strait Islander children aged 0–17 years were the subject of a substantiation (table 4A.10.1). The substantiation rate for Aboriginal and Torres Strait Islander children aged 0–17 years increased from

29.5 per 1000 children in 2009-10 to 37.9 per 1000 children in 2012-13 (figure 4.10.1). This trend for children aged 0–17 years is consistent with the historical trend for children aged 0–16 years (which increased from 12.5 per 1000 children in 2003-04 to 30.9 per 1000 children in 2009-10) (table 4A.10.2).

For non-Indigenous children aged 0–17 years, 28 035 were the subject of substantiations in 2012-13 (table 4A.10.1). From 2009-10 to 2012-13, the rate for non-Indigenous children was steady at around 5 per 1000 children, leading to a widening of the gap (from 24.8 to 32.2 substantiations per 1000 children) over the same period (figure 4.10.1).

**Figure 4.10.2 Children aged 0–17 years who were the subject of a substantiation by type of abuse or neglect<sup>a</sup>**

<sup>a</sup> If a child was the subject of more than one type of abuse or neglect as part of the same notification, then the abuse and/or neglect is the one considered by the child protection workers to cause the most harm to the child. Where a child is the subject of more than one substantiation during the year, then the type of abuse reported in this table is the type of abuse and/or neglect associated with the first substantiation decision during the year.

Source: AIHW (2014) *Child Protection Australian 2012-13*; AIHW (unpublished), derived from Child Protection Notifications, Investigations and Substantiations, Australia data collection; table 4A.10.3.

Nationally in 2012-13, the most common reason for substantiation for Aboriginal and Torres Strait Islander children aged 0–17 years was neglect (40.1 per cent) followed by emotional abuse (33.8 per cent). The most common reason for substantiation for non-Indigenous children aged 0–17 years was emotional abuse (40.1 per cent) (figure 4.10.2).

Nationally in 2012-13, rates of substantiations for all types of abuse or neglect were higher for Aboriginal and Torres Strait Islander children than for non-Indigenous children. Rates of substantiations for Aboriginal and Torres Strait Islander children ranged from 3.4 per 1000 children for sexual abuse to 15.2 per 1000 children for neglect. Rates for

---

non-Indigenous children ranged from 0.9 per 1000 children for sexual abuse to 2.3 per 1000 children for emotional abuse (table 4A.10.3). Substantiations by type of abuse and neglect data reported by State and Territory are available in tables 4A.10.3-4.

## **Children on care and protection orders**

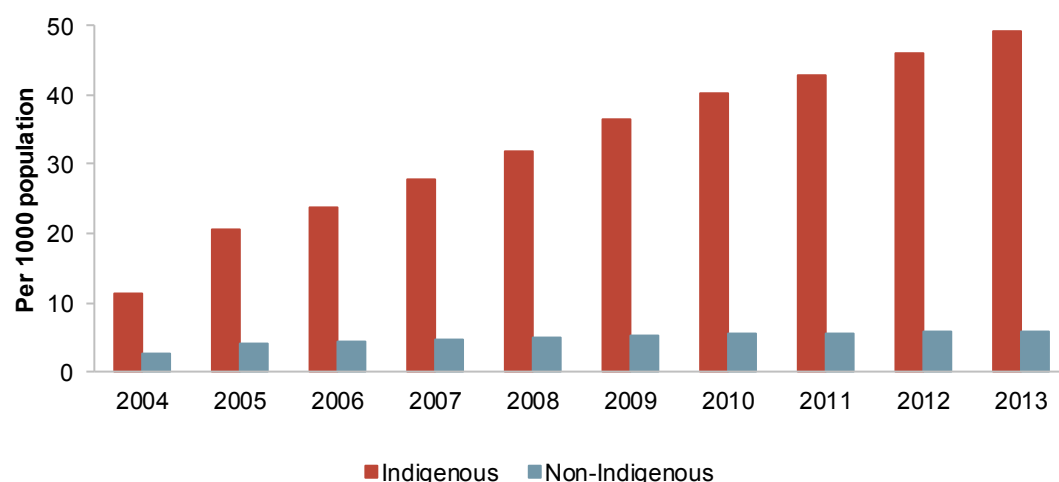

If an investigation results in a substantiation, intervention by child protection services might be needed to protect the child. This intervention can take a number of forms, including one or more of: referral to other services; supervision and support; an application to court; and a placement in out-of-home care.

Although child protection substantiations are often resolved without the need for a court order (which is usually a last resort) recourse to a court may take place at any point in the child protection investigation process. The types of care and protection orders available vary across jurisdictions and may include interim and temporary orders, finalised supervisory orders, and finalised guardianship or custody orders (AIHW 2013).

Nationally, 14 267 Aboriginal and Torres Strait Islander children were on care and protection orders at 30 June 2013 (table 4A.10.5). The rate per 1000 Aboriginal and Torres Strait Islander children increased from 11.3 per 1000 children at 30 June 2004 to 49.3 per 1000 children at 30 June 2013 (figure 4.10.3).

Nationally, 28 171 non-Indigenous children were on care and protection orders at 30 June 2013 (table 4A.10.5). The rate per 1000 non-Indigenous children increased from 2.6 per 1000 children at 30 June 2004 to 5.7 per 1000 children at 30 June 2013 leading to an increase in the gap, from 8.7 per 1000 children to 43.6 per 1000 children (figure 4.10.3). Care and protection order data reported by State and Territory are available in table 4A.10.5.

Figure 4.10.3 **Rate of children aged 0–17 years on care and protection orders, at 30 June<sup>a</sup>**

<sup>a</sup> Rates of Aboriginal and Torres Strait Islander children on care and protection orders were calculated as the number of children aged 0–17 years who were on a care and protection order at 30 June, divided by the estimated population aged 0–17 at 30 June using ‘Series B’, Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026 (cat. no. 3238.0). Rates of non-Indigenous children on care and protection orders were calculated as the number of children aged 0–17 years who were on a care and protection order at 30 June, divided by the estimated population aged 0–17 years at 30 June, multiplied by 1000.

Sources: Australian State and Territory Governments (unpublished) for 2012–13 data; AIHW (unpublished) Child Protection Notifications, Investigations and Substantiations, Australia data collection for data prior to 2012–13; ABS (2014) *Experimental estimates and projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*. Cat. no. 3238.0, Canberra; ABS (unpublished) Australian Demographic Statistics, June (various years), Cat. no. 3101.0, Canberra; table 4A.10.5.

## Aboriginal Child Placement Principle

Out-of-home care is one of a range of responses to child protection issues. The policy is that children are placed in out-of-home care as a last resort when it is not in their best interests to remain with their family (for example, where no one is suitable to provide care) (COAG 2009).

The Aboriginal and Torres Strait Islander Child Placement Principle is aimed at ensuring government intervention into family life does not disconnect children from their family and culture. Since the 1980s, every State and Territory government has adopted the Child Placement Principle in legislation and policy. The Child Placement Principle recognises the ongoing, negative impact of removing Aboriginal and Torres Strait Islander children from their parents and communities. It is founded on the concept that Aboriginal and Torres Strait Islander Australians have the knowledge and experience to make the best decisions concerning their children. It promotes a partnership between government and

---

Aboriginal and Torres Strait Islander communities in decision making about children's welfare, to ensure that the connections are understood and maintained (Tilbury 2013).

According to the Aboriginal Child Placement Principle (NLRC 1997), the following hierarchy or placement preference should be pursued in protecting the safety and welfare of Aboriginal and Torres Strait Islander children:

- placement with the child's extended family (which includes Aboriginal and Torres Strait Islander and non-Indigenous relatives/kin)
- placement within the child's Aboriginal and Torres Strait Islander community
- placement with other Aboriginal and Torres Strait Islander Australians.

While it is desirable that children be placed in accordance with the principle, this is one factor among many that must be considered in the placement decision. Consultations with Aboriginal and Torres Strait Islander Australians have highlighted that the safety of the child needs to be paramount in applying this principle. This may mean that on occasions, placement with a non-Indigenous carer is warranted. To support Aboriginal and Torres Strait Islander children in out of home care, the Secretariat of National Aboriginal and Islander Child Care (SNAICC) have stressed the importance of implementing cultural care plans to ensure children stay connected in meaningful ways to family, communities, culture and country (SNAICC 2014).

---

**Figure 4.10.4 Placement of Indigenous children in out-of-home care, at 30 June<sup>a</sup>**

<sup>a</sup> The denominator for calculating the percentage of children placed in accordance with the principle excludes Indigenous children living independently and those whose living arrangements were unknown.

Sources: SCRGSP (2014) *Report on Government Services 2014*, table 15A.9 (cites Australian State and Territory governments (unpublished) for 2012-13 data; AIHW (unpublished) Child Protection Notifications, Investigations and Substantiations, Australia data collection for data prior to 2012-13; table 4A.10.7.

---

Nationally at 30 June 2013, 68.8 per cent of Aboriginal and Torres Strait Islander children in out-of-home care were placed in accordance with the Aboriginal Child Placement Principle. This was unchanged from 30 June 2012, ending the previous downward trend from a high of 76.7 per cent at 30 June 2005 (figure 4.10.4).

Nationally since 2005, Aboriginal and Torres Strait Islander children have been ‘placed with a relative/kin’<sup>25</sup> in the majority of out-of-home care placements (52.5 per cent at 30 June 2013). Placements with ‘other Aboriginal and Torres Strait Islander carer or Aboriginal and Torres Strait Islander residential care’ has decreased from 27.5 per cent of placements at 30 June 2004 to 16.3 per cent of placements at 30 June 2013. The proportion not placed according with the Aboriginal child placement principle fluctuated between 23.3 per cent and 31.2 per cent from 2004 to 2013 (figure 4.10.4). Data on Aboriginal and Torres Strait Islander children in out-of-home care by relationship of caregiver by State and Territory are available in table 4A.10.7.

## **Diagnoses of sexually transmitted infections in children**

Sexually transmitted infections may be indicative of child sexual assault. Whilst the actual prevalence of child sexual assault by Indigenous status is not known, data from incidents that come to the attention of, and are recorded by, police indicate that in 2013 more than half (55 per cent) of Aboriginal and Torres Strait Islander victims and 41 per cent of non-Indigenous victims were aged less than 15 years (ABS 2014).<sup>26</sup>

Among older Aboriginal and Torres Strait Islander children it is likely that a significant proportion of sexually transmitted infections are the result of early sexual debut and/or sex with peer-aged partners (NCHECR 2010).

From 2008 to 2012, Aboriginal and Torres Strait Islander children:

- aged 0–4 years had higher rates of chlamydia (except for 2012) and gonorrhoea than non-Indigenous 0–4 year olds
- aged 5–14 years had higher rates of chlamydia, gonorrhoea and syphilis than non-Indigenous 5–14 year olds
- aged 0–4 years had an average of 9 diagnoses per 100 000 children, compared with two diagnoses per 100 000 non-Indigenous 0–4 year olds
- aged 5–14 years had an average of 281 diagnoses per 100 000 children, compared with 11 per 100 000 non-Indigenous 5–14 year olds (table 4A.10.8).

---

<sup>25</sup> Relative/kinship care is where the caregiver is a relative (other than parents), considered to be family or a close friend, or is a member of the child or young person’s community (in accordance with their culture) who is reimbursed (or who has been offered but declined reimbursement) by government for the care of the child (AIHW 2014). This may not always be an Aboriginal and Torres Strait Islander person.

<sup>26</sup> Data available for NSW, Queensland, SA and the NT.

---

## Things that work

Addressing Aboriginal and Torres Strait Islander Australians' disadvantage across a broad range of outcomes is critical to addressing the factors that place Aboriginal and Torres Strait Islander children at risk of child abuse and neglect (COAG 2009). There are a range of promising programs in relation to child abuse and neglect in Aboriginal and Torres Strait Islander communities but there is a lack of evaluation on whether they lead to reductions in rates of child abuse and neglect (Higgins 2010). One such program is the Referral for Active Intervention Initiative. It is an intensive family support service for children at risk of entering the child protection system in metropolitan and regional Queensland. A midway evaluation found the program to be successful in preventing children from entering the system during the period of active intervention in almost all cases. Further evaluation is required to confirm the program's effectiveness (CTGCH 2013; QLD DOC 2009).

## Future directions in data

Under the National Framework for Protecting Australia's Children 2009–2020 (COAG 2009), all states and territories committed to the development of a unit record data collection for child protection related measures (currently nearing completion, but not available in time for this report. This collection will improve the comparability of child protection data across jurisdictions and allow for a wider range of policy-relevant analyses. Currently, the aggregate data cannot determine the overlap between substantiated child protection notifications, care and protection orders and out-of-home care collections, nor determine how many children appear in the system on multiple occasions (AIHW 2013, 2014).

The supplementary measure on 'placement in accordance with the Aboriginal Child Placement Principle' reports the placement outcomes of Aboriginal and Torres Strait Islander children rather than compliance with the hierarchy of placement options to be considered when finding suitable out-of-home care environments. As part of the National framework for protecting Australia's children: Second three year action plan, 2012–15, a more robust measure of compliance with the Aboriginal Child Placement Principle is being developed (FAHCSIA 2012).

## 4.11 Family and community violence<sup>27</sup>

### Box 4.11.1 Key messages

- Family violence has a significant impact on the short- and long-term health and welfare of individuals, families and communities.
- In 2002 and 2008, around 23 per cent of Aboriginal and Torres Strait Islander adults reported being a victim of physical or threatened violence (after adjusting for differences in population age structures, this was 1.8 times (in 2008) and 2.2 times (in 2002) the rate for non-Indigenous Australians) (tables 4A.11.1 and 4A.11.3).
- Both Aboriginal and Torres Strait Islander and non-Indigenous women experience physical assault and sexual assault at higher rates than men. In jurisdictions for which police incident data are available, in 2013:
  - the proportions of Aboriginal and Torres Strait Islander women reporting violence by a current partner were 1.2 (NSW), 1.6 (SA) and 2.2 (NT) times the rates for non-Indigenous women (table 4A.11.6)
  - the proportions of Aboriginal and Torres Strait Islander women reporting sexual assault by a family member were 1.4 (Queensland), 1.5 (NSW and SA) and 3.8 (NT) times the rates for non-Indigenous women (table 4A.11.8).
- Between 2004-05 and 2012-13, after adjusting for differences in population age structures, for NSW, Victoria, Queensland, WA, SA and the NT combined, hospitalisation rates for family violence-related assault for Aboriginal and Torres Strait Islander Australians were between 25.1 and 32.8 times the rates for other Australians (table 4A.11.23).

### Box 4.11.2 Measures of family and community violence

There is no main measure for this indicator. Data are reported for four supplementary measures.

- *Incidence and prevalence of violence* is defined by two components — prevalence of violence and victimisation rates.
  - Prevalence of violence is defined as the number of persons who have experienced violence as a ratio of the total number of persons in the population at a specific time. The most recent available prevalence data are from the 2008 ABS National Aboriginal and Torres Strait Islander Social Survey (all jurisdictions; remoteness; sex and age).

(continued next page)

---

<sup>27</sup> The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

---

#### Box 4.11.2 (continued)

- Victimisation rates are expressed as the number of victims recorded by police<sup>28</sup> per 100 000 population for selected offences (sexual assault, assault and robbery). The most recent available data are for 2013 from the ABS Recorded Crime Victims collection (NSW, Queensland, SA and the NT; sex and age).
- *Hospitalisation rates* is defined by two components — non-fatal hospitalisation rates for assault and non-fatal hospitalisation rates for family violence-related assaults.
  - Non-fatal hospitalisation rates for assault is expressed as the rate of hospital separations where an external cause indicating assault was recorded.
  - Non-fatal hospitalisation rates for family violence-related assaults is expressed as the rate of separations where an external cause indicating assault was recorded and the relationship of the perpetrator to the victim was recorded as spouse/domestic partner, parent, or other family member. The most recent available data are for 2012-13 from the AIHW National Hospital Morbidity Database (national; remoteness; sex and age).
- *Homicide rates* is defined as the rate of deaths recorded as homicide. The most recent available data are for 2011-12 from the AIC National Homicide Monitoring Project (for deaths recorded as homicide by police) (all jurisdictions; remoteness and sex) and for 2008–2012 from the ABS Causes of Death collection (for deaths recorded as homicide on death registration forms) (NSW; Queensland, WA, SA and the NT; sex and age) .
- *People who seek services due to family violence* is defined as the proportion of people seeking assistance from Specialist Homelessness Services for reasons of domestic/family violence. The most recent available data are for 2012-13 from the AIHW Specialist Homelessness Services collection (all jurisdictions; remoteness; sex and age).

Family violence remains a serious and widespread issue in Australia, and can have a significant impact on the health and welfare of individuals including physical and mental illness, sexually transmitted diseases, substance use, homelessness and poverty (Hovane and Cox 2011).

The term ‘family violence’, in an Aboriginal and Torres Strait Islander context, is used to describe the range of violence that takes place including the physical, emotional, sexual, social, spiritual, cultural, psychological and economic abuses that may be perpetrated within a family. The term also recognises the broader impacts of violence; on extended families, kinship networks and community relationships (Cripps and Davis 2012; NSW Department of Health 2011; Wild and Anderson 2007).

The lack of a nationally agreed definition and inconsistency in methods of data collection affect the quality and comparability of data on family violence (ALRC 2011; Cripps 2008; Wundersitz 2010; Bryant and Willis 2008). In addition, existing sources of data do not capture the full extent of family and community violence, as they only include data on reported violence (URBIS 2011). For many reasons, not all victims report violence or seek assistance (Cripps 2008; Willis 2011).

---

<sup>28</sup> An individual may be counted more than once. See ABS (2014) for further information.

---

Aboriginal and Torres Strait Islander Australians experience violence at rates well above those of non-Indigenous Australians (Bryant 2009). A greater proportion of violent incidents in Aboriginal and Torres Strait Islander communities are family violence-related (Bryant and Willis 2008). Aboriginal and Torres Strait Islander females are disproportionately affected by violence when compared with non-Indigenous females (Bryant 2009). Some reports show that violence and abuse is so prevalent in some communities, that the people who live there regard it as inevitable (Willis 2011) and a ‘language of minimisation’ — describing instances of violence as ‘everyday’ or innocuous — is used in communities to avoid confrontation or aggravating the situation (Cripps and Adams 2014; Cripps 2008)

Some factors that have been associated with family and community violence in Aboriginal and Torres Strait Islander populations include:

- high levels of alcohol misuse and illicit drug use
- being male (victim and offender), although Aboriginal and Torres Strait Islander females are equally likely to be a victim of violence as Aboriginal and Torres Strait Islander males
- younger age (14-15 years, reaching a peak during the mid-20s and early 30s)
- childhood experience of violence and abuse
- for mothers, being a single parent and/or being removed from natural family
- low education and income levels and high unemployment levels
- poor and overcrowded housing conditions
- poor physical and mental health
- remote locations and access to services (including police presence) (Bryant 2009; Clapham, Stevenson and Lo 2006; Cripps 2007; Cripps et al. 2009; Wundersitz 2010).

Alcohol stands out as a significant contributor to violence in Aboriginal and Torres Strait Islander communities (Bryant and Willis 2008; Bryant 2009; HEREOC 2006; Livingston 2011; Meuleners et al. 2010; Weatherburn, Snowball and Hunter 2008; Wundersitz 2010). The role of alcohol and drug and substance misuse in Aboriginal and Torres Strait Islander homicides is in sections 11.1 and 11.2.

## **Incidence and prevalence of violence**

The latest estimates of the prevalence of physical or threatened violence are from the 2008 ABS National Aboriginal and Torres Strait Islander Social Survey (NATSISS). The NATSISS collects data on people’s self-reported experiences of physical or threatened violence. The comparison estimates of the prevalence of physical or threatened violence amongst non-Indigenous people are from the 2002 and 2006 General Social Surveys.

- 
- In 2008, 22.9 per cent of Aboriginal and Torres Strait Islander Australians (aged 18 years and over) reported experiencing at least one incident of physical or threatened violence during the 12 months prior to interview, similar to the rate reported in 2002 (23.3 per cent)<sup>29</sup> (table 4A.11.1).
  - The prevalence of physical or threatened violence amongst Aboriginal and Torres Strait Islander Australians decreased with age, from around 30 per cent of 18–24 year olds down to around 8 per cent of those aged 55 years and older (table 4A.11.2).
  - A higher proportion of Aboriginal and Torres Strait Islander Australians reported experiencing physical or threatened violence in the 12 months prior to interview in 2008 than that reported by non-Indigenous Australians in 2006. This gap in the prevalence of physical or threatened violence has narrowed between 2002 and 2008 (from 10.6 to 8.7 percentage points) — caused by an increase in non-Indigenous rates (table 4A.11.3).
  - In all states and territories (except Queensland and the NT, where the proportions were not statistically significantly different), a higher proportion of Aboriginal and Torres Strait Islander Australians than non-Indigenous Australians had experienced physical or threatened violence during the 12 months prior to interview (table 4A.11.3).
  - Aboriginal and Torres Strait Islander females reported experiencing physical or threatened violence in the 12 months prior to interview at twice the rate of non-Indigenous females (table 4A.11.3).

The ABS recorded crime collection relates to victimisation incidents for a selected range of offences recorded by police. There are limits to using police records to measure family and community violence. Police data do not represent all victims of crime, just those who come to the attention of, and whose details are recorded by, police. A high proportion of violent victimisation is not disclosed to police (Wild and Anderson 2007; Willis 2011). Rates of non-disclosure are higher in Aboriginal and Torres Strait Islander communities than non-Indigenous communities, with studies indicating that around 90 per cent of violence against Aboriginal and Torres Strait Islander women is not disclosed (Willis 2011).

Comparable data by Indigenous status are available for NSW, Queensland (excluding physical assaults), SA and the NT, with the most recent data for 2013.

- Rates of *physical assault* for Aboriginal and Torres Strait Islander Australians were 2.8 (NSW), 5.1 (SA) and 6.0 (NT) times the rates for non-Indigenous Australians (table 4A.11.5).
  - Rates of physical assault for Aboriginal and Torres Strait Islander males were 1.8 (NSW), 2.3 (NT) and 2.9 (SA) times the rates for non-Indigenous males (table 4A.11.5).

---

<sup>29</sup> The data for 2008 were not directly comparable to 2002 due to a change in sequencing of questions. Therefore, the ABS adjusted the 2008 data when used for comparison with 2002. The adjusted figure has been used to provide a comparable time series.

- 
- Rates of physical assault for Aboriginal and Torres Strait Islander females were 4.2 (NSW), 7.9 (SA) and 12.3 (NT) times the rates for non-Indigenous females (table 4A.11.5).
  - Rates of physical assault for Aboriginal and Torres Strait Islander females were 1.8 (NSW), 2.2 (SA) and 3.3 (NT) times the rates for Aboriginal and Torres Strait Islander males (table 4A.11.5).
  - Rates of physical assault have been fairly constant since 2010.
  - Over 90 per cent of Aboriginal and Torres Strait Islander female physical assault victims knew the offender compared with 65.9 to 80.3 per cent of non-Indigenous female victims (table 4A.11.6).
  - Rates of *sexual assault* for Aboriginal and Torres Strait Islander Australians were 2.2 (NT), 3.3 (NSW and Queensland) and 4.4 (SA) times the rates for non-Indigenous Australians (table 4A.11.4). Around three-quarters of Aboriginal and Torres Strait Islander victims of sexual assault were female. The majority of Aboriginal and Torres Strait Islander victims of sexual assault were less than 19 years of age (tables 4A.11.7).
  - Both Aboriginal and Torres Strait Islander women and non-Indigenous women (in NSW, SA and the NT) reported violence by a current or previous partner at between 1.7 and 6.7 times the rate for men and reported sexual assault at between 3.3 and 7.8 times the rate for men (tables 4A.11.6 and 4A.11.7).
  - Aboriginal and Torres Strait Islander females reported being *physically assaulted* by a current partner at 1.2 (NSW), 1.6 (SA) and 2.2 (NT) times the rates for non-Indigenous women (table 4A.11.6).
  - Aboriginal and Torres Strait Islander women reported being *sexually assaulted* by a family member (a partner or other family member) at 1.4 (Queensland), 1.5 (NSW and SA), and 3.8 (NT) times the rates for non-Indigenous women (table 4A.11.8).

Victimisation rates for other selected offences and additional information on individual jurisdictions, as well as data for 2010, 2011 and 2012, are available in tables 4A.11.4–21.

## Hospitalisation rates

Hospital records provide some information on instances of family violence that result in hospitalisation, and in some cases death. However, these sources are likely to under estimate the true extent of family and community violence, because not all victims seek medical attention and not all hospitalisations resulting from family violence will be recorded as such.

From 2010-11, Indigenous status in hospital separations data are considered of sufficient quality for reporting in all jurisdictions. Prior to 2010-11, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Aboriginal and Torres Strait Islander identification in hospitalisation data. The attachment

---

tables for this report include data for all jurisdictions for 2010-11 to 2012-13, as well as data for the six jurisdictions for 2004-05 to 2012-13.

Nationally in 2012-13, after adjusting for different population age structures, Aboriginal and Torres Strait Islander hospitalisations for non-fatal family violence-related assaults:

- for females were 34.2 times the rate for non-Indigenous females (table 4A.11.22)
- for males were 28.3 times the rate for non-Indigenous males (table 4A.11.22)
- increased with remoteness (from 197.1 per 100 000 population in major cities to 1510.6 per 100 000 population in remote areas) (table 4A.11.24).

Between 2004-05 and 2012-13, after adjusting for differences in population age structures, for NSW, Victoria, Queensland, WA, SA and the NT combined, the rate of hospitalisations for family violence-related assault for Aboriginal and Torres Strait Islander Australians was between 25.1 and 32.8 times the rate for other Australians (table 4A.11.23).

Data on non-fatal hospitalisations for assaults by sex and relationship of victim to offender, and by remoteness are in tables 4A.11.25–28.

## Homicide rates

Homicide data from the AIC National Homicide Monitoring Program are based on police records, whereas ABS homicide deaths data are based on death registrations. Despite the differences in collections, the AIC and ABS mortality data allow for some detailed examination of the circumstances and characteristics of homicide occurring in the Aboriginal and Torres Strait Islander and non-Indigenous populations.

Mortality data disaggregated by Indigenous status are available for NSW, Queensland, WA, SA and the NT, as these jurisdictions have sufficient levels of Aboriginal and Torres Strait Islander identification and numbers of deaths to support analysis.

From 2003–2007 to 2008–2012, after adjusting for differences in population age structures, the death rate from homicide (for NSW, Queensland, WA, SA and the NT combined) remained steady at around 7–8 deaths per 100 000 population for Aboriginal and Torres Strait Islander Australians and 1 death per 100 000 population for non-Indigenous Australians (tables 4A.11.31–32). In 2008–2012, the death rate from homicide continued to be highest for Aboriginal and Torres Strait Islander Australians aged 25 to 34 years (12.5 per 100 000 population) and 35 to 44 years (15.0 per 100 000 population) (table 4A.11.33).

Aboriginal and Torres Strait Islander Australians remain overrepresented as victims of homicide. Of the 264 homicide victims recorded by police in 2011-12, 35 (13.3 per cent) were identified as Aboriginal and Torres Strait Islander Australians. In 2011-12, the Aboriginal and Torres Strait Islander homicide victimisation rate

---

(5.1 per 100 000 population) was five times as high as the rate for non-Indigenous Australians (1.0 per 100 000 population) (table 4A.11.35).

In 2011-12:

- the Aboriginal and Torres Strait Islander homicide rate in remote areas (10.4 per 100 000 population) was twice the rate in regional areas (5.0 per 100 000 population) and five times the rate in major cities (2.1 per 100 000 population) (table 4A.11.36).
- of homicides where the Indigenous status of victims and offenders was known, around 13.2 per cent of incidents involved Aboriginal and Torres Strait Islander people as both offender and victim. Around 3.5 per cent involved a non-Indigenous offender and an Aboriginal and Torres Strait Islander victim (table 4A.11.37).
- a domestic altercation was the motive for 23.1 per cent of Aboriginal and Torres Strait Islander male homicides and 83.3 per cent of Aboriginal and Torres Strait Islander female homicides (table 4A.11.38).
- the victim and offender were intimate partners in 47.4 per cent of Aboriginal and Torres Strait Islander homicides, compared with 20.9 per cent of non-Indigenous homicides (table 4A.11.39).
- there were no Aboriginal and Torres Strait Islander homicides where the victim and the offender were strangers. The victim and offender were strangers in 8.7 per cent of non-Indigenous homicides (table 4A.11.39).

## **People who seek services due to family violence**

Domestic and family violence-related homelessness is a widespread and growing problem in Australia (Tully et al. 2008). The Specialist Homelessness Services (SHS) data collection provides information on people who seek assistance from agencies funded under the National Affordable Housing Agreement (NAHA) or the National Partnership Agreement on Homelessness (NPAH). The SHS data collection replaces the previous Supported Accommodation Assistance Program (SAAP) data collection, which ceased in 2010-11, following the end of the SAAP and establishment of the NAHA and NPAH. SAAP data are not directly comparable with SHS data. As with SAAP data, SHS data do not capture the full extent of family violence occurring within the community, as not all victims of violence access these services and some may be turned away because the support required cannot be provided (AIHW 2012).

Aboriginal and Torres Strait Islander people are overrepresented amongst those who received assistance from specialist homelessness agencies. Although only representing 3 per cent of the Australian population in 2011, Aboriginal and Torres Strait Islander people represented around one-fifth (22 per cent) of SHS clients (AIHW 2013). However, Aboriginal and Torres Strait Islander people and non-Indigenous people sought services for similar reasons.

---

In 2012-13, domestic/family violence was the second most common main reason both Aboriginal and Torres Strait Islander and non-Indigenous people sought SHS (24.0 per cent and 22.4 per cent respectively), after accommodation difficulties (30.6 per cent and 30.1 per cent respectively) (table 4A.11.40). For both Aboriginal and Torres Strait Islander and non-Indigenous SHS clients, the proportion for whom domestic/family violence was the main reason for seeking assistance increased as remoteness increased (17.0 per cent and 19.4 per cent respectively in major cities compared to 45.0 per cent and 55.3 per cent respectively in very remote areas) (table 4A.11.43). Data on the main reasons for seeking assistance by State and Territory are available in table 4A.11.41.

In 2012-13, the rate of female Aboriginal and Torres Strait Islander SHS clients aged 10 years and over escaping family violence (359 clients per 10 000 population) was 10 times the rate for female non-Indigenous clients (34 clients per 10 000 population) (table 4A.11.44).

Aboriginal and Torres Strait Islander children aged 0–17 years accompanying SHS clients escaping family violence attended an SHS agency at a rate of 443 per 10 000 population, more than 30 times the rate for non-Indigenous children (14 per 10 000 population) (table 4A.11.45).

## Things that work

A range of programs aim to address the risk factors associated with violence in Aboriginal and Torres Strait islander communities, including:

- programs that reduce alcohol misuse can help reduce violent behaviour in Aboriginal and Torres Strait Islander communities (see section 11.1 for more information on alcohol consumption and harm)
- a range of promising programs aimed at primary prevention of violence against women, including those introduced as part of the *National Plan to Reduce Violence against Women and their Children 2010–2022*. Although a relatively new approach, some Australian reviews have assessed developing good practice (ADFVC 2012)
- an evaluation of night and community patrols (one in NSW and one in WA) is under way to determine the effect on community safety. The evaluations should provide a comparison with statistically similar communities that do not operate night patrols. The evaluation are part of a larger cross-jurisdictional project under the National Indigenous Law and Justice Framework to build the evidence base about effective Aboriginal and Torres Strait Islander justice initiatives (CTGCH 2013).

One initiative that may have contributed to a reduction in family and community violence is described in box 4.11.3.

---

#### Box 4.11.3 'Things that work' — family and community violence

The **Alice Springs Domestic and Family Violence Outreach Service** (NT) commenced in 2009 and provides targeted outreach support to women living in Alice Springs and the surrounding town camps, who are experiencing domestic and family violence. The program also runs support and education groups to women in town camps. In 2012-13, almost 400 women were assisted, with around 80 per cent identified as Aboriginal (ASWS 2013).

An independent evaluation of the project in 2012-13 using a mix of interviews and analysis of crisis accommodation data found that:

- 100 per cent of the 19 women (with 43 children in their care) interviewed reported their safety has improved with support of the program
- Of those women that had previously used the crisis accommodation service (84 per cent of respondents), 42 per cent had not used the crisis accommodation since receiving outreach services (Gander 2013).

The project was awarded a National Certificate of Merit at the 2013 Australian Crime and Violence Prevention Awards (AIC 2013).

### Future directions in data

*The National Plan to Reduce Violence Against Women and their Children 2010–2022* (COAG 2010) includes the development of a National Data Collection and Reporting Framework for family and domestic violence and sexual assault (FaHCSIA 2013). All jurisdictions have committed to the national framework, to be operational by 2022. Under the Plan, a Personal Safety Survey was undertaken by the ABS in 2012 (and is to be undertaken every four years across the life of the Plan). However, data are not available by Indigenous status.

Outcome 6 of the National Plan recognises that preventing and reducing violence against women require strong laws and programs to help reduce the level of recidivism and the development of a stronger evidence base to support future policy and program development. Available incidence and prevalence data focus primarily on victim characteristics (number of victims and their demographic characteristics). Work is in progress to develop national outcome standards for perpetrator interventions (Reos 2013).

Outcome 3 of the National Plan recognises that extra effort is needed to reduce the higher rates of violence against Aboriginal and Torres Strait Islander women. Continuing to build the evidence base on violence against women and their children is one of the five national priorities in the National Plan's *Second Action Plan 2013–2016: Moving Ahead* (the Second Action Plan) (DSS 2014).

---

The COAG Working Group on Indigenous Affairs is working towards the development of nationally comparable data sets for Indigenous offending and victimisation (Australian Government unpublished).

## 4.12 Imprisonment and juvenile detention<sup>30</sup>

### Box 4.12.1 Key messages

- In 2008, two thirds of Aboriginal and Torres Strait Islander Australians aged 15 years and over reported never having been formally charged by police (AIHW 2013a).
- However, Aboriginal and Torres Strait Islander Australians are over-represented in the criminal justice system. Aboriginal and Torres Strait Islander Australians make up only 2.3 per cent of the adult population (table 5A.2.4), but made up over a quarter (27.4 per cent) of the adult prison population on 30 June 2013 (table 4A.12.5), with an imprisonment rate of 2039.5 per 100 000 adults (table 4A.12.3).
- At 30 June 2013, after adjusting for differences in population age structures, the rate of imprisonment for Aboriginal and Torres Strait Islander adults was 13 times the rate for non-Indigenous adults (table 4A.12.4). Between 2000 and 2013, the imprisonment rate for Aboriginal and Torres Strait Islander adults increased by 57.4 per cent, while the non-Indigenous rate remained fairly constant, leading to a widening of the gap (from 8.5 to 13.0 times the rate for non-Indigenous prisoners) (figure 4.12.2).
- At 30 June 2013, the rate of imprisonment for Aboriginal and Torres Strait Islander males (3765.1 per 100 000 adult males) was more than 10 times the rate for Aboriginal and Torres Strait Islander females (365.9 per 100 000 adult females). However, the female imprisonment rate is growing faster (a 73.7 per cent increase since 2000 compared with a 38.6 per cent increase for males) (figure 4.12.1).
- Detention is considered a last resort for youth. In 2012-13, the daily average detention rate for Aboriginal and Torres Strait Islander young people was 364.8 per 100 000 10–17 year olds. This was around 24 times the rate for non-Indigenous young people (15.4 per 100 000 10–17 year olds) (figure 4.12.3). Since 2007-08, detention rates for both Aboriginal and Torres Strait Islander and non-Indigenous young people have fluctuated, with no clear trends (figure 4.12.3).
- The daily average rate of Aboriginal and Torres Strait Islander young people subject to community-based supervision was 1585.7 per 100 000 10–17 year olds in 2012-13. This was around 14 times the rate for non-Indigenous young people (117.5 per 100 000 10–17 year olds) (table 4A.12.13). Community based supervision rates in 2012-13 were the lowest since 2007-08 for both Aboriginal and Torres Strait Islander young people and non-Indigenous young people (table 4A.12.13).

---

<sup>30</sup> The Steering Committee notes its appreciation to Dr Kyllie Cripps, University of NSW, who reviewed a draft of this section of the report.

---

#### Box 4.12.2 Measures of imprisonment and juvenile detention

There are two main measures for this indicator:

- *Adult imprisonment* is defined as the rate of people aged 18 years and over (17 years and over in Queensland) in prison. Data are sourced from the ABS Prisoners in Australia collection, with the most recent available data for 30 June 2013 (all jurisdictions; sex; age).
- *Juvenile detention* is defined as the rate of people aged 10 to 17 years in youth detention. Data are sourced from the AIHW Juvenile Justice National Minimum Data Set for all jurisdictions except WA and the NT (data sourced directly from these two jurisdictions). The most recent available data are for 2012-13 (all jurisdictions; sex).

A supplementary measure on young people subject to community-based supervision orders is also reported (all jurisdictions; sex).

---

A large number of Aboriginal and Torres Strait Islander Australians never commit criminal offences (Wundersitz 2010). In 2008, two thirds of Aboriginal and Torres Strait Islander Australians aged 15 years or over reported never being formally charged by police (AIHW 2013a). However, Aboriginal and Torres Strait Islander Australians experience contact with the criminal justice system — as both offenders and victims — at much higher rates than non-Indigenous Australians (The Senate Select Committee on Regional and Remote Indigenous Communities 2010). Section 4.11 (Family and community violence) includes some information on victimisation.

Data on imprisonment and youth detention take account of only one aspect of contact with the criminal justice system. By their nature, offences that result in imprisonment or youth detention tend to be more serious. The data do not address arrests that do not proceed to court (for example, as a result of diversion [see section 11.3], including diversion to the child protection system [see section 4.10]); convictions that lead to outcomes that are not administered by custodial facilities (for example, community service orders and fines); and short term police custody (for example, for public drunkenness).

Drug use, child neglect and abuse, school completion and employment are four major drivers of involvement in crime (Weatherburn, Snowball and Hunter 2008; Weatherburn 2013). The main risk factors linked to violent offending by Aboriginal and Torres Strait Islander Australians include high risk alcohol consumption, illicit drug use, being male, being young, childhood experience of violence and abuse, exposure to pornography, poor schooling, low income, unemployment, poor housing, mental illness and lack of access to services (particularly in remote areas of Australia) (Cripps 2007; Wundersitz 2010). The role of alcohol and drug and substance misuse in Aboriginal and Torres Strait Islander homicides is addressed in sections 11.1 (alcohol consumption) and 11.2 (drug and other substance use).

In addition to the risk factors above, changes to judicial processes have been linked to increases in Aboriginal and Torres Strait Islander imprisonment rates. For example, people with unstable living arrangements or a lack of resources may find it more difficult to

---

comply with strict bail and monitoring conditions (The Senate Legal and Constitutional Affairs References Committee 2013).

Imprisonment has a heavy social and economic impact (The Senate Legal and Constitutional Affairs References Committee 2013). High rates of imprisonment remove adults from their important roles caring for the next generation (Crime and Misconduct Commission 2009) and can lead to the ‘normalisation’ of incarceration among community members. Prison can become more of an expectation than a deterrent; for some it may even become a rite of passage (Brown 2010).

## **Adult imprisonment**

Data on adult imprisonment is a count of prisoners who are held in adult prisons as at midnight on 30 June of each year, and therefore does not represent the flow of prisoners during the year. The nature of the collection means that the majority of prisoners counted are serving long-term sentences for serious offences, whereas the flow of offenders in and out of prisons consists primarily of persons serving short sentences for lesser offences (ABS 2013).

In all states and territories except Queensland, persons remanded or sentenced to adult custody are aged 18 years and over. In Queensland, an adult refers to persons aged 17 years and over<sup>31</sup>.

Nationally at 30 June 2013, the Aboriginal and Torres Strait Islander imprisonment rate was 2039.5 per 100 000 adult population, an increase of around one-third from the rate in 2000 (1433.5 per 100 000 adult population) (table 4A.12.3). Prisoner data reported by State and Territory, by Indigenous status and by sex are available in tables 4A.12.1–5.

At 30 June 2013, the imprisonment rate for Aboriginal and Torres Strait Islander males (3765.1 per 100 000 adult males) was over 10 times the rate for Aboriginal and Torres Strait Islander females (365.9 per 100 000 adult females). However, the female imprisonment rate is growing faster (a 73.7 per cent increase since 2000, compared with a 38.6 per cent increase for males) (figure 4.12.1).

---

<sup>31</sup> Prior to 2006 in Victoria, an adult referred to persons aged 17 years and over. Prior to 2000 in Tasmania, an adult referred to persons aged 17 years and over. In Queensland, adult continues to refer to persons aged 17 years and over. Individual State and Territory data and national data reflect the age scope that applied to these jurisdictions in the relevant years.

Figure 4.12.1 Indigenous adult imprisonment rate, by sex, at 30 June, 2000 to 2013<sup>a</sup>

<sup>a</sup> Rates for all years are calculated using population data based on the 2011 Census.

Source: ABS (unpublished) Prisoners in Australia collection; table 4A.12.4.

---

Although Aboriginal and Torres Strait Islander adults make up only 2.3 per cent of the Australian adult population (table 5A.2.4), they accounted for 27.4 per cent of all prisoners on 30 June 2013 (table 4A.12.5). After adjusting for differences in population age structures, the rate of imprisonment for Aboriginal and Torres Strait Islander adults was 13 times the rate for non-Indigenous adults (figure 4.12.2).

Between 2000 and 2013, the rate of imprisonment for Aboriginal and Torres Strait Islander adults increased by 57.4 per cent while the non-Indigenous rate remained fairly constant, leading to a widening of the gap (from 8.5 to 13.0 times the rate for non-Indigenous adults) (figure 4.12.2).

In 2013, the difference between Aboriginal and Torres Strait Islander and non-Indigenous rates varied across states and territories, though all states and territories recorded increased rates for Aboriginal and Torres Strait Islander adults between 2000 and 2013 (table 4A.12.4).

Around three-quarters of prisoners on 30 June 2013 were sentenced prisoners (75.6 per cent of Aboriginal and Torres Strait Islander prisoners and 76.5 per cent of non-Indigenous prisoners) (table 4A.12.7). Of the Aboriginal and Torres Strait Islander sentenced prisoners, the largest proportion had been sentenced with acts intended to cause injury (29.8 per cent), whereas the largest proportion of non-Indigenous sentenced prisoners had been sentenced for illicit drug offences (14.7 per cent) and sexual assault and related offences (14.0 per cent) (section 4.11 reports on family and community violence). The expected time to serve (median months) was shorter for Aboriginal and Torres Strait Islander prisoners in all offence categories except for sexual assault and related offences (table 4A.12.6).

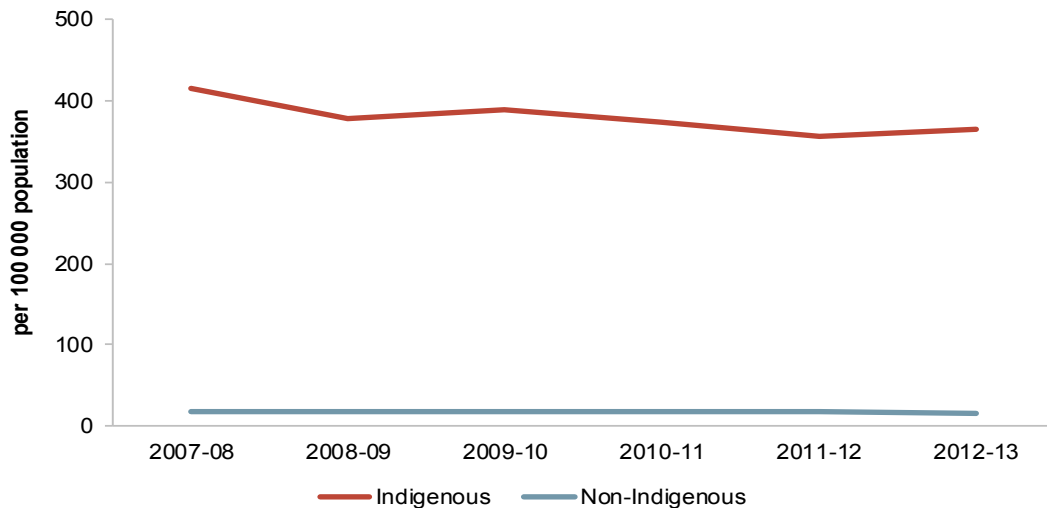

Around 46 per cent of Aboriginal and Torres Strait Islander prisoners were under the age of 30 years, and half of these prisoners were under the age of 24 years (table 4A.12.8). The median age of Aboriginal and Torres Strait Islander prisoners in Australian prisons at 30 June 2013 was 30.8 years, 4.5 years lower than the median age for non-Indigenous prisoners (35.3 years) (table 4A.12.9).

## **Juvenile detention**

One of the key principles underpinning Australia's youth justice system is that young people should be placed in detention only as a last resort. It is also consistent with the United Nations Convention on the Rights of the Child (AIHW 2013b, 2014; Richards 2011).

In 2012-13, a daily average of 454 Aboriginal and Torres Strait Islander 10–17 year olds were in detention (409 males and 47 females), compared with 329 non-Indigenous 10–17 year olds (294 males and 35 females) (table 4A.12.10).

**Figure 4.12.3 Daily average rate of detention of young people aged 10–17 years<sup>a</sup>**

<sup>a</sup> Rates for all years are calculated using population data based on the 2011 Census and are per 100 000 persons aged 10–17 years.

Sources: AIHW 2014, *Youth justice in Australia 2012-13: an overview*, Canberra: AIHW; WA and NT governments (unpublished); SCRGSP (2014), *Report on Government Service Provision 2014*, ABS (2014) *Estimates and Projections, Aboriginal and Torres Strait Islander Australians, 2001 to 2026*, Cat. no. 3238.0; ABS (unpublished) *Australian Demographic Statistics*, December (various years), Cat. no. 3101.0, Canberra; table 4A.12.11.

In 2012-13, the daily average detention rate for Aboriginal and Torres Strait Islander young people was 364.8 per 100 000 10–17 year olds. This was around 24 times the rate for non-Indigenous young people (15.4 per 100 000 10–17 year olds) (figure 4.12.3). This ratio was similar for males and females (table 4A.12.10). Since 2007-08, detention rates for both Aboriginal and Torres Strait Islander and non-Indigenous young people have fluctuated, with no clear trends (figure 4.12.3). Youth detention data by State and Territory are available in tables 4A.12.10–11.

## Community-based youth justice supervision

Community-based youth justice supervision is an alternative to detention, where a sentenced order or unsentenced order (such as conditional bail) are served in the community. Most young people under youth justice supervision are supervised in the community.

In 2012-13, a daily average of 1975 Aboriginal and Torres Strait Islander young people aged 10–17 years were supervised in the community, which equates to a rate of 1585.7 per 100 000 population. The rate for males (2444.5 per 100 000 10–17 year olds) was 3.6 times the rate for females (688.1 per 100 000 population) (table 4A.12.12).

---

In 2012-13, the community-based supervision rate for Aboriginal and Torres Strait Islander young people (1585.7 per 100 000 population) was 13.5 times as high as the rate for non-Indigenous young people (117.5 per 100 000 population). For both Aboriginal and Torres Strait Islander and non-Indigenous young people, the rates of community-based supervision in 2012-13 were the lowest since 2007-08 (table 4A.12.13). Community-based supervision data by State and Territory are available in tables 4A.12.12–13.

## Things that work

Addressing over-representation of Aboriginal and Torres Strait Islander Australians in prisons and youth detention requires testing new approaches. One such approach is Justice Reinvestment, whereby taxpayer funds are reinvested into the community, instead of being spent on imprisoning people for low-level criminal activity (imprisonment remains a measure of last resort) (NCIS 2013). A three-year Justice Reinvestment Project is underway at the National Centre for Indigenous Studies. Using a case study approach, the research will explore the conditions, governance and cultural appropriateness of reinvesting resources otherwise spent on incarceration, into services to enhance youth offenders' ability to remain in their community. It is anticipated that outcomes from the case study will be available for the next report.

## Future directions in data

The Australasian Juvenile Justice Administrators are overseeing several research projects to develop national youth justice policy, research and data capabilities. Current priorities include the development of a linked data collection to report on the relationships between child protection and youth justice, and a recidivism data collection project.

The Australian Human Rights Commission (AHRC 2008) recommends further research into the issue of people with cognitive impairment in the criminal justice system. Cognitive impairment includes intellectual disability, learning disability, acquired brain injury, foetal alcohol spectrum disorders, dementia, neurological disorders and autism spectrum disorders (Gooda 2012). Section 4.8 includes information on disability and chronic disease and section 8.7 includes information on mental health.

TABLE 4A.1.1

Table 4A.1.1 **Estimated life expectancies at birth, NSW, Queensland, WA, NT and Australia, 2010–2012 (years) (a)**

	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>NT</i>	<i>Australia for comparison (b), (c)</i>	<i>Headline Australia (c), (d)</i>
Indigenous						
Life expectancy at birth						
Males	70.5	68.7	65.0	63.4	67.4	69.1
Females	74.6	74.4	70.2	68.7	72.3	73.7
Upper and lower 95 per cent confidence intervals						
Males	69.0-72.0	67.3-70.1	63.4-66.6	61.3-65.5	66.1-68.7	67.8-70.4
Females	73.3-75.9	73.2-75.6	68.8-71.6	66.8-70.6	71.2-73.4	72.5-74.9
Non-Indigenous						
Life expectancy at birth						
Males	79.8	79.4	80.1	77.8	79.8	79.7
Females	83.1	83.0	83.7	83.1	83.2	83.1
Gap between Indigenous and Non-Indigenous life expectancies at birth (e)						
Males	9.3	10.8	15.1	14.4	12.4	10.6
Females	8.5	8.6	13.5	14.4	10.9	9.5

(a) Indigenous estimates of life expectancy are not produced for Victoria, SA, Tasmania or the ACT due to the small number of Indigenous deaths reported in these jurisdictions.

(b) These estimates are not the headline estimates for Australia, because they are calculated without an age-adjustment, but are provided to enable effective comparison with the state and territory, and remoteness area estimates.

(c) Australian total includes all states and territories.

(d) Headline estimates for Australia are calculated using an improved methodology (taking into account age-specific identification rates) that could not be applied at the state and territory or remoteness area levels. Therefore this data should not be compared with data for any state or territory, or remoteness area.

(e) Gaps are based on unrounded estimates.

(a) Deaths per 100 000 population, except age 0.

(b) Deaths where Indigenous status was not stated are not included. As a result, age specific death rates may be under-estimated.

(c) Infant deaths per 1000 live births.

(d) Data are based on jurisdiction of usual residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(e) Data are based on year of registration. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Causes of Death collection have the same meaning.

(f) Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

(g) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

(a) Rates have been directly age-standardised using the 2001 Australian standard population.

(b) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for more information.

(c) Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

(d) Mortality rate for Indigenous people divided by the mortality rate for non-Indigenous people.

(e) Mortality rate for Indigenous people minus the mortality rate for non-Indigenous people.

TABLE 4A.1.7

Table 4A.1.7      **Age standardised all-cause mortality rate, variability bands, rate ratios and rate differences, by Indigenous status, NSW, Qld, WA, SA, NT, five year aggregate, 2008–2012 (a), (b), (c), (d), (e), (f)**

		NSW	Qld (g)	WA	SA	NT	Total (g)
Indigenous Australians							
Rate per 100 000 persons	rate	791.0	950.6	1 293.3	813.8	1 469.1	985.6
Variability bands (h)	±	73.6	92.6	150.8	152.6	165.6	49.1
Non-Indigenous Australians							
Rate per 100 000 persons	rate	594.9	604.7	565.3	618.3	628.1	596.7
Variability bands (h)	±	5.4	7.4	10.0	10.9	62.1	3.7
Rate ratio (i)	no.	1.3	1.6	2.3	1.3	2.3	1.7
Rate difference (j)	no.	196.1	345.9	728.0	195.5	841.0	388.9

- (a) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the direct method, age standardised by 5 year age groups to 75 years and over.
- (b) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (c) Data are based on jurisdiction of usual residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (d) Data are based on year of registration. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Causes of Death collection have the same meaning.
- (e) Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.
- (f) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

TABLE 4A.1.7

Table 4A.1.7      **Age standardised all-cause mortality rate, variability bands, rate ratios and rate differences, by Indigenous status, NSW, Qld, WA, SA, NT, five year aggregate, 2008–2012 (a), (b), (c), (d), (e), (f)**

	<i>NSW</i>	<i>Qld (g)</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (g)</i>
(g) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for more information.						
(h) Variability bands can be used for comparisons within jurisdictions (for cause of death or over time), but not between jurisdictions or between jurisdictions and totals. See data quality statement for details.						
(i) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.						
(j) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in Causes of Death, Australia, 2010 (cat. 3303.0) and Causes of Death Revisions, 2010 and 2011 in Causes of Death, Australia, 2012 (cat. 3303.0).
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (f) Data based on reference year. See data quality statements for a more detailed explanation.
- (g) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (i) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

TABLE 4A.1.8

Table 4A.1.8 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (j)</i>	<i>WA (k)</i>	<i>SA</i>	<i>NT</i>	<i>Total (j), (k), (l)</i>
(j) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.							
(k) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.							
(l) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(m) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.							
(n) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.							
(o) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.							
<b>np</b> Not published.

Table 4A.1.9      **Age standardised mortality rates, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, 2003–2007 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA (k)</i>	<i>SA</i>	<i>NT</i>	<i>Total (k), (l)</i>
Kidney diseases (N00-N29)	no.	3.7	13.9	35.9	np	67.9	19.3
Certain conditions originating in the perinatal period (P00-P96)	no.	0.3	2.0	3.3	np	5.7	2.1
Certain infectious and parasitic diseases (A00-B99)	no.	4.3	12.1	15.7	np	28.6	11.3
Diseases of the nervous system (G00-G99)	no.	-0.9	-6.0	15.1	1.8	12.1	0.7
Other causes (m)	no.	5.5	19.2	94.9	15.6	77.1	33.3
<b>All Causes</b>	<b>no.</b>	<b>147.0</b>	<b>353.9</b>	<b>859.1</b>	<b>197.1</b>	<b>817.6</b>	<b>396.6</b>

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006-2007 (final). See Explanatory Notes 29-33 and Causes of Death Revisions 2009 and 2010 (Technical Note) in Causes of Death, Australia, 2011 (cat. no. 3303.0).
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous mortality rate.
- (d) Data are reported individually by jurisdiction of usual residence for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (f) Data are presented in five-year groupings due to the volatility of small numbers each year.
- (g) Data based on reference year. See data quality statements for a more detailed explanation.
- (h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (i) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

TABLE 4A.1.9

Table 4A.1.9      **Age standardised mortality rates, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, 2003–2007 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA (k)</i>	<i>SA</i>	<i>NT</i>	<i>Total (k), (l)</i>
(j)	Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.						
(k)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.						
(l)	Total includes data for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.						
(m)	'Other causes' consist of all conditions excluding the selected causes displayed in the table.						
(n)	Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.						
(o)	Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.						

**np** Not published.

<b>All causes</b>	<b>306.2</b>	<b>342.5</b>	<b>520.2</b>	<b>404.7</b>	<b>679.4</b>	<b>399.8</b>

(a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised) and 2012 (preliminary). See Explanatory Notes 29-33 and Causes of Death Revisions 2009 and 2010 (Technical Note) in Causes of Death, Australia, 2011 (cat. no. 3303.0).

(b) Crude rate is the average annual number of deaths registered during the reference period per 100 000 estimated resident population at 30 June of the mid-point year. Crude rates cannot be compared over time or across jurisdictions. Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

TABLE 4A.1.10

Table 4A.1.10 **Indigenous mortality rates, by selected causes of death, NSW, Queensland, WA, SA, NT, 2008-2012 (crude rate per 100 000 persons) (a), (b), (c), (d), (e), (f), (g)**

	<i>NSW</i>	<i>Qld (h)</i>	<i>WA (i)</i>	<i>SA</i>	<i>NT</i>	<i>Total (h), (i), (j)</i>
(c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous mortality rate.						
(d) Data are reported individually by jurisdiction of usual residence for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.						
(e) Data are presented in five-year groupings due to the volatility of small numbers each year.						
(f) Data based on reference year. See data quality statements for a more detailed explanation.						
(g) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.						
(h) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.						
(i) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.						
(j) Total includes data for NSW, Queensland, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

**Table 4A.1.12 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2012 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (i)</i>
(a) Causes of death data for 2012 are preliminary and subject to a revisions process. See ABS <i>Causes of Death, Australia, 2012</i> (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.							
(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.							
(c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.							
(d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.							
(f) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.							
(g) Data based on reference year. See data quality statements for a more detailed explanation.							
(h) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(i) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.							
(k) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.							
(l) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.

**Table 4A.1.13 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2011 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>NT</i>	<i>Total (i)</i>
(a) Causes of death data for 2011 are revised and subject to a revisions process. See ABS <i>Causes of Death, Australia, 2012</i> (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.							
(b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.							
(c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.							
(d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.							
(f) Data based on reference year. See data quality statements for a more detailed explanation.							
(g) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.							
(h) Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(i) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(j) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.							
(k) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.							
(l) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.

<b>Total (all causes)</b>	<b>no.</b>	<b>189.2</b>	<b>363.9</b>	<b>673.4</b>	<b>266.8</b>	<b>800.1</b>	<b>386.6</b>

- (a) Causes of death data for 2010 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Data based on reference year. See data quality statements for a more detailed explanation.
- (g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (h) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.
- (i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.

<b>Total (all causes)</b>	<b>no.</b>	<b>180.1</b>	<b>402.8</b>	<b>669.4</b>	<b>207.4</b>	<b>762.5</b>	<b>380.9</b>

- (a) Causes of death data for 2009 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (g) Data based on reference year. See data quality statements for a more detailed explanation.
- (h) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.
- (i) Aboriginal and Torres Strait Islander data for Western Australia were not published in *Causes of Death, Australia, 2010* (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in *Causes of Death, Australia, 2010* (cat. no. 3303.0). This adjusted data has been included in this table.

<b>Total (all causes)</b>	<b>no.</b>	<b>196.4</b>	<b>358.7</b>	<b>850.7</b>	<b>210.1</b>	<b>837.5</b>	<b>419.5</b>

- (a) Causes of death data for 2007 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28–32.
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. The current ABS standard population is all persons in the Australian population at 30 June 2001. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Data are reported individually by jurisdiction of residence for NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (e) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (g) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.
- (h) Data based on reference year. See data quality statements for a more detailed explanation.
- (i) Aboriginal and Torres Strait Islander data for Western Australia were not published in *Causes of Death, Australia, 2010* (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in *Causes of Death, Australia, 2010* (cat. no. 3303.0). This adjusted data has been included in this table.

TABLE 4A.1.17

Table 4A.1.17 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 2007 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld</i>	<i>WA (i)</i>	<i>SA</i>	<i>NT</i>	<i>Total (j)</i>
(j)	Total includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.						
(k)	'Other causes' consist of all conditions excluding the selected causes displayed in the table.						
(l)	Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.						
(m)	Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.

**Table 4A.1.19 Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, 1998 to 2012 (a), (b), (c), (d), (e), (f), (g)**

	Unit	2012	2011	2010	2009	2008	2007	2006	2005	2004	2003	2002	2001	2000	1999	1998
<p>(a) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. See the 'Standard Population for Use in Australian-Standardisation Table' data cube in Australian Demographic Statistics, Dec 2012 (cat. no. 3101.0) for the ABS standard population. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.</p> <p>(b) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.</p> <p>(c) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.</p> <p>(d) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.</p> <p>(e) Data based on reference year. See data quality statements for a more detailed explanation.</p> <p>(f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.</p> <p>(g) Data provided includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.</p> <p>(h) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.</p> <p>(i) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.</p> <p>(j) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.</p> <p>Source: ABS (unpublished) Causes of Death, Australia 2012.</p>

TABLE 4A.1.20

Table 4A.1.20 **Age standardised mortality rates, variability bands, rate ratios and rate differences, by selected causes of death, by Indigenous status, NSW, Queensland, WA, SA, NT, single year, by sex, 2006 to 2012 (a), (b), (c), (d), (e), (f), (g), (h)**

		2012		2011		2010 (i)		2009 (j)		2008 (j)		2007 (j)		2006	
	Unit	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female
Other causes (k)	no.	85.7	58.0	62.0	74.7	116.2	76.3	82.2	112.6	119.3	62.5	108.6	84.1	122.2	92.4
<b>Total (all causes)</b>	<b>no.</b>	<b>457.1</b>	<b>359.8</b>	<b>470.3</b>	<b>322.0</b>	<b>433.2</b>	<b>343.5</b>	<b>363.7</b>	<b>391.3</b>	<b>407.1</b>	<b>347.9</b>	<b>439.5</b>	<b>401.2</b>	<b>478.4</b>	<b>356.5</b>

- (a) All causes of death data from 2006 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2006-2010 (final), 2011 (revised), 2012 (preliminary). See Explanatory Notes 29-33 and Technical Notes, Causes of Death Revisions, 2006 in Causes of Death, Australia, 2010 (cat. 3303.0) and Causes of Death Revisions, 2010 and 2011 in Causes of Death, Australia, 2012 (cat. 3303.0).
- (b) Age standardised death rates enable the comparison of death rates between populations with different age structures by relating them to a standard population. See the 'Standard Population for Use in Australian-Standardisation Table' data cube in Australian Demographic Statistics, Dec 2012 (cat. no. 3101.0) for the ABS standard population. Standardised death rates (SDRs) are expressed per 100 000 persons. SDRs in this table have been calculated using the indirect method, age standardised by five year age group to 75 years and over. Rates calculated using the indirect method are not comparable to rates calculated using the direct method.
- (c) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.
- (d) Causes of death and associated disease codes are from the International Statistical Classification of Diseases and Related Health Problems, 10th Revision.
- (e) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.
- (f) Data based on reference year. See data quality statements for a more detailed explanation.
- (g) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.
- (h) Data provided includes data for NSW, Queensland, WA, SA and the NT only. These five states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.
- (i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.
- (j) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.
- (k) 'Other causes' consist of all conditions excluding the selected causes displayed in the table.
- (l) Rate ratio is the age standardised Indigenous rate divided by the non-Indigenous rate.
- (m) Rate difference is the age standardised Indigenous rate less the non-Indigenous rate.

Table 4A.2.1      **All causes perinatal, infant and child mortality, by Indigenous status, single year, 1998 to 2012 (a), (b), (c), (d), (e), (f)**

	<i>Indigenous</i>					<i>Non-Indigenous</i>			
	<i>Unit</i>	<i>Perinatal(g)</i>	<i>Infants 0-1 (h)</i>	<i>Children 0-4 (i)</i>	<i>Children 1-4 (i)</i>	<i>Perinatal(g)</i>	<i>Infants 0-1 (h)</i>	<i>Children 0-4 (i)</i>	<i>Children 1-4 (i)</i>
(b)	Indigenous and non-Indigenous estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.								
(c)	Data based on reference year for perinatal deaths. Data based on year of registration for infant and child deaths. Note that the terms 'registration year' in the Deaths collection and 'reference year' in the Perinatal Deaths collection have the same meaning.								
(d)	Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality and perinatal mortality rates.								
(e)	Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.								
(f)	The average of three years population data centred around the reporting year has been used as the denominator for child mortality rates.								
(g)	Perinatal deaths include neonatal deaths (i.e. death of a live born baby within 28 completed days of birth) and stillbirths of at least 20 completed weeks of gestation or with a birth weight of at least 400 grams.								
(h)	Infant deaths include all deaths within the first year of life.								
(i)	Includes deaths of all children aged 0-4 years and 1-4 years. Records with not stated age at death have been pro-rated acrosses these two groups.								
(j)	For perinatal deaths, the rates represent the number of deaths per 1000 of all births (including live births and stillbirths of at least 20 completed weeks of gestation or with a birth weight of at least 400 grams). For infant deaths (less than one year), the rates represent the number of deaths per 1000 live births. For child deaths (0-4 years), the rates represent the number of deaths per 100 000 Estimated Resident Population (0-4) years for the mid point year.								
(k)	Variability bands can be be used for comparisons within jurisdictions (for cause of death or over time), but not between jursidictions or between jurisdictions and totals. See data quality statement for details.								
(l)	Rate ratio is the Indigenous mortality rate divided by the non-Indigenous mortality rate.								
(m)	Rate difference is the Indigenous mortality rate less the non-Indigenous mortality rate.

Rate (i)							
Indigenous	per 1000 relevant births	5.8	11.1	11.4	3.7	18.2	9.6
Non-Indigenous (i)	per 1000 relevant births	7.6	9.7	7.5	6.2	7.0	8.1
Rate ratio (l)	no.	0.8	1.1	1.5	0.6	2.6	1.2
Rate difference (m)	no.	- 1.8	1.4	4.0	- 2.6	11.2	1.5

(a) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are considered to have adequate levels of Indigenous identification in mortality data. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.

(b) Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is the mid-point of the population for the time period.

(c) Although most deaths of Indigenous children are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate Indigenous perinatal mortality and, depending on the under-identification in births, may either underestimate or overestimate the rates. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous perinatal mortality rates because of these data quality issues.

TABLE 4A.2.2

Table 4A.2.2      **All causes perinatal mortality, by Indigenous status, 2008–2012  
(a), (b), (c), (d)**

	<i>Unit</i>	<i>NSW (e)</i>	<i>Qld (f)</i>	<i>WA (g)</i>	<i>SA</i>	<i>NT</i>	<i>Total</i>
(d)	All causes of death data from 2007 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised) and 2012 (preliminary). See Cause of Death, Australia, 2010 (cat.no. 3303.0) Explanatory Notes for further information.						
(e)	Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005 to 2010.						
(f)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.						
(g)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.						
(h)	Foetal deaths of at least 20 weeks gestation or with a birthweight of at least 400 grams.						
(i)	Indigenous and non-Indigenous population estimates are available for census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011-census-based Indigenous population projections from the 2011-census based total persons estimated resident population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.						
(j)	Neonatal death is death of a live-born baby within 28 days of birth.						
(k)	Perinatal deaths are all foetal deaths (at least 20 weeks gestation or at least 400 grams birthweight) plus all neonatal deaths.						
(l)	Rate ratio is the mortality rate for Indigenous Australians divided by the mortality rate for non-Indigenous Australians.						
(m)	Rate difference is the mortality rate for Indigenous Australians minus the mortality rate for non-Indigenous Australians.

TABLE 4A.2.4

Table 4A.2.4      **All causes infant (<1 year) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2008–2012 (a), (b), (c), (d), (e), (f)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (g)</i>	<i>WA (h)</i>	<i>SA</i>	<i>NT</i>	<i>Total (i)</i>
Number of deaths							
Indigenous	no.	103	182	85	26	97	493
Non-Indigenous	no.	1 745	1 320	396	290	45	3 796
Rate (j), (k)							
Indigenous	per 1000 live births	3.6	6.9	7.3	5.5	12.5	6.2
Non-Indigenous	per 1000 live births	3.7	4.5	2.8	3.1	3.8	3.7
Rate ratio (k), (l)	no.	1.0	1.5	2.6	1.8	3.2	1.7
Rate difference (k), (m)	no.	–	2.4	4.4	2.4	8.6	2.5

(a) Includes all deaths within the first year of life.

(b) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.

(c) Data are reported individually by jurisdiction of residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Data are presented in five-year groupings due to volatility of the small numbers involved.

(e) Data are based on year of registration. See data quality statements for a more detailed explanation.

(f) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

(g) Care should be taken when interpreting deaths data for Qld as they are affected by recent changes in the timeliness of birth and deaths registrations. Qld deaths data for 2010 have been adjusted to minimise the the impact of late registration of deaths on mortality indicators. See data quality statements for more information.

(h) Due to potential over-reporting of WA Indigenous deaths for 2007, 2008 and 2009, WA mortality data were not previously supplied in 2011. Corrected WA Indigenous mortality data for these years are used in these calculations. See data quality statements for more information.

(i) Total includes data for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(j) Infant deaths per 1000 live births. The volatility in infant mortality rates is partially due to the relatively small number of infant deaths registered.

(k) Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2005 to 2010.

(l) Rate ratio is the Indigenous mortality rate divided by the non-Indigenous mortality rate.

(m) Rate difference is the Indigenous mortality rate less the non-Indigenous mortality rate.

– Nil or rounded to zero.

TABLE 4A.2.8

Table 4A.2.8 **All causes child (0–4 years) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h)**

	<i>Unit</i>	<i>NSW</i>	<i>Qld (i)</i>	<i>WA (j)</i>	<i>SA</i>	<i>NT</i>	<i>Total</i>
Number of deaths							
Indigenous	no.	130	217	110	31	122	610
Non-Indigenous	no.	2 019	1 537	491	364	55	4 466
Rate (k)							
Indigenous	per 100 000 persons	100.1	176.8	207.9	139.9	317.9	166.6
Non-Indigenous	per 100 000 persons	91.3	111.2	69.0	79.0	101.2	92.6
Rate ratio (l)	no.	1.1	1.6	3.0	1.8	3.1	1.8
Rate difference (m)	no.	8.8	65.5	138.9	60.9	216.8	74.0

(a) Includes deaths of all children aged 0–4 years. Records with not stated age at death have been pro-rated across this age group.

(b) Although most deaths of Indigenous people are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these data are likely to underestimate the Indigenous all causes mortality rate.

(c) Data are based on jurisdiction of residence for NSW, Qld, WA, SA and the NT only. These 5 states and territories have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(d) Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases. Total population estimates for 2012, used in the calculation of non-Indigenous comparison rates, are preliminary estimates.

(e) Data are presented in five-year groupings due to volatility of the small numbers involved.

(f) Data are based on year of registration. See data quality statements for a more detailed explanation.

(g) Some totals and figures may not compute due to the effects of using different denominators and of rounding.

(h) The average of the five years of population data has been used as the denominator for child mortality rates.

(i) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and deaths registrations. Queensland deaths data for 2010 have been adjusted to minimise the the impact of late registration of deaths on mortality indicators. See data quality statements for more information.

(j) Due to potential over-reporting of WA Indigenous deaths for 2007, 2008 and 2009, WA mortality data were not previously supplied in 2011. Corrected WA Indigenous mortality data for these years are now available. See data quality statements for more information.

(k) For child deaths (0–4 years), the rates represent the number of deaths per 100 000 Estimated Resident Population (0–4 years) for the 5 year average.

(l) Rate ratio is the Indigenous mortality rate divided by the non-Indigenous mortality rate.

TABLE 4A.2.8

Table 4A.2.8      **All causes child (0–4 years) mortality, by Indigenous status, NSW, Queensland, WA, SA, NT, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h)**

- (a) Causes of death data for 2007-2010 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28-32.
- (b) Causes of death data for 2011 have been revised and are subject to a revisions process. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (c) Causes of death data for 2012 are preliminary and subject to a revisions process. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.
- (d) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis. They do not represent a quasi-Australia figure.
- (e) Perinatal deaths are all fetal deaths (at least 20 weeks gestation or at least 400 grams birth weight) plus all neonatal deaths. See *Perinatal Deaths, Australia* (ABS Cat. no. 3304.0) Glossary for further information.
- (f) Data are presented in 5-year groupings due to volatility of the small numbers involved.
- (g) Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.

TABLE 4A.2.10

Table 4A.2.10 **Mortality rates for selected causes of death, perinatal deaths, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	Indigenous			Non-Indigenous			Rate ratio (l)	Rate difference (m)
	Number	Rate per 1000 relevant births (j)	Crude percentage % (k)	Number	Rate per 1000 relevant births (j)	Crude percentage % (k)		
(h) Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.								
(i) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.								
(j) Crude rates for perinatal deaths represent the number of deaths per 1000 total relevant births which comprises live births and fetal deaths (with at least 20 weeks gestation or at least 400 grams birth weight).								
(k) Crude percentage is number of deaths by cause divided by all deaths registered during the five year period. Crude percentages cannot be compared across jurisdictions or across years.								
(l) Rate ratio calculated by dividing Indigenous rates by non-Indigenous rates.								
(m) Rate difference is the Indigenous rate less the non-Indigenous rate.								
(n) Other conditions' consist of all conditions excluding the selected causes displayed in the table.								
(o) Includes 'No condition in mother'. – Nil or rounded to zero.

TABLE 4A.2.12

Table 4A.2.12 **Mortality rates for selected causes of death, infant deaths, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	<i>Indigenous</i>			<i>Non-Indigenous</i>			<i>Rate ratio (j)</i>	<i>Rate difference (k)</i>
	<i>Number</i>	<i>Rate per 1000 live births</i>	<i>Crude percentage %</i>	<i>Number</i>	<i>Rate per 1000 live births</i>	<i>Crude percentage %</i>		
Certain conditions originating in the perinatal period (P00–P96)	237	3.0	48.1	1 893	1.9	49.9	1.6	1.1
Symptoms, signs and abnormal clinical and laboratory findings, not elsewhere classified (R00–R99)	96	1.2	19.5	368	0.4	9.7	3.0	0.8
Sudden infant death syndrome (R95)	46	0.6	9.3	245	0.2	6.5	3.0	0.4
Congenital malformations, deformations and chromosomal abnormalities (Q00–Q99)	74	0.9	15.0	992	1.0	26.1	0.9	- 0.1
Diseases of the respiratory system (J00–J99)	20	0.3	4.1	69	0.1	1.8	3.0	0.2
External causes of morbidity and mortality (V01–Y98)	17	0.2	3.4	104	0.1	2.7	2.0	0.1
Certain infectious and parasitic diseases (A00–B99)	19	0.2	3.9	51	0.1	1.3	2.0	0.1
Diseases of the circulatory system (I00–I99)	9	0.1	1.8	72	0.1	1.9	1.0	–
Other causes (l)	21	0.3	4.3	247	0.2	6.5	1.5	0.1
<b>All causes</b>	<b>493</b>	<b>6.2</b>	<b>100.0</b>	<b>3 796</b>	<b>3.7</b>	<b>100.0</b>	<b>1.7</b>	<b>2.5</b>

- (a) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are considered to have adequate levels of Indigenous identification in mortality data. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.
- (b) Although most deaths of Indigenous infants are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate Indigenous infant deaths and, depending on the under-identification in births, may either underestimate or overestimate the rates. Different causes of death may have levels of completeness of identification of Indigenous deaths that differ from the all-cause under-identification (coverage) estimates.

TABLE 4A.2.12

Table 4A.2.12 **Mortality rates for selected causes of death, infant deaths, 2008–2012 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	Indigenous			Non-Indigenous			Rate ratio (j)	Rate difference (k)
	Number	Rate per 1000 live births	Crude percentage %	Number	Rate per 1000 live births	Crude percentage %		
(c)	Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is births for the mid-point year for the time period.							
(d)	Because of changes in the level of accuracy of Indigenous identification in the births and deaths data over time, caution should be used in interpreting changes in Indigenous infant mortality rates. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous infant mortality rates because of these data quality issues.							
(e)	All causes of death data from 2007 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2008-2010 (final), 2011 (revised) and 2012 (preliminary). See Cause of Death, Australia, 2010 (cat.no. 3303.0) Explanatory Notes for further information.							
(f)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.							
(g)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.							
(h)	Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2008 to 2010.							
(i)	Indigenous and non-Indigenous population estimates are available for census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011-census-based Indigenous population projections from the 2011-census based total persons estimated resident population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.							
(j)	Rate ratio is the mortality rate for Indigenous Australians divided by the mortality rate for non-Indigenous Australians							
(k)	Rate difference is the mortality rate for Indigenous Australians minus the mortality rate for non-Indigenous Australians.							

TABLE 4A.2.12

Diseases of the circulatory system (I00–I99)	14	0.2	2.4	67	0.1	1.8	2.0	0.1
Other causes (m)	32	0.6	5.6	272	0.3	7.3	2.0	0.3
<b>All causes</b>	<b>576</b>	<b>10.1</b>	<b>100.0</b>	<b>3 729</b>	<b>4.2</b>	<b>100.0</b>	<b>2.4</b>	<b>5.9</b>

- (a) Data are reported for New South Wales, Queensland, Western Australia, South Australia and the Northern Territory only. These five states and territories are considered to have adequate levels of Indigenous identification in mortality data. Data for these five jurisdictions over-represent Indigenous populations in less urbanised and more remote locations. Mortality data for the five jurisdictions should not be assumed to represent the experience in the other jurisdictions.
- (b) Although most deaths of Indigenous infants are registered, it is likely that some are not accurately identified as Indigenous. Therefore, these statistics are likely to underestimate Indigenous infant deaths and, depending on the under-identification in births, may either underestimate or overestimate the rates. Different causes of death may have levels of completeness of identification of Indigenous deaths that differ from the all-cause under-identification (coverage) estimates.

TABLE 4A.2.13

Table 4A.2.13 **Mortality rates for selected causes of death, infant deaths, 2003–2007 (a), (b), (c), (d), (e), (f), (g), (h), (i), (j)**

	Indigenous			Non-Indigenous				
	Number	Rate per 1000 live births	Crude percentage %	Number	Rate per 1000 live births	Crude percentage %	Rate ratio (k)	Rate difference (l)
(c)	Data are presented in 5-year groupings because of small numbers each year. For rate calculations, the numerator is the average of the total number of deaths and the denominator is births for the mid-point year for the time period.							
(d)	Because of changes in the level of accuracy of Indigenous identification in the births and deaths data over time, caution should be used in interpreting changes in Indigenous infant mortality rates. It is also difficult to exactly identify the difference between the Indigenous and non-Indigenous infant mortality rates because of these data quality issues.							
(e)	Deaths prior to 2007 are by year of registration and state/territory of usual residence. Deaths from 2007 onwards are by reference year and state/territory of usual residence. Registration year prior to 2007 is equivalent to reference year from 2007 onwards.							
(f)	All causes of death data from 2007 onward are subject to a revisions process - once data for a reference year are 'final', they are no longer revised. Affected data in this table are: 2003-2007 (final). See Cause of Death, Australia, 2010 (cat.no. 3303.0) Explanatory Notes for further information.							
(g)	Care should be taken when interpreting mortality rates for Queensland due to recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators.							
(h)	Aboriginal and Torres Strait Islander data for Western Australia were not published in Causes of Death, Australia, 2010 (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in Causes of Death, Australia, 2010 (cat. no. 3303.0). This adjusted data has been included in this table.							
(i)	Data have been revised to include previously unprocessed NSW Birth Registrations for the period 2008 to 2010.							
(j)	Indigenous and non-Indigenous population estimates are available for census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011-census-based Indigenous population projections from the 2011-census based total persons estimated resident population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.							
(k)	Rate ratio is the mortality rate for Indigenous Australians divided by the mortality rate for non-Indigenous Australians							
(l)	Rate difference is the mortality rate for Indigenous Australians minus the mortality rate for non-Indigenous Australians.							

TABLE 4A.2.13

(a) Causes of death data for 2006 and 2007 have undergone revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28–32.

(b) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

(c) Includes all deaths of children aged 1–4 years.

(d) Data are presented in 5-year groupings due to volatility of the small numbers involved.

(e) Aboriginal and Torres Strait Islander data for Western Australia were not published in *Causes of Death, Australia, 2010* (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in *Causes of Death, Australia, 2010* (cat. no. 3303.0). This adjusted data has been included in this table.

TABLE 4A.2.15

Table 4A.2.15 **Mortality rates for selected causes of death, children (1–4 years) deaths, 2003–2007 (a), (b), (c), (d), (e), (f)**

<i>Indigenous</i>			<i>Non-Indigenous</i>			<i>Rate ratio (j)</i>	<i>Rate difference (k)</i>
<i>Number</i>	<i>Rate per 100 000 (g), (h)</i>	<i>Crude percentage % (i)</i>	<i>Number</i>	<i>Rate per 100 000 (g), (h)</i>	<i>Crude percentage % (i)</i>		

(f) Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.

(g) Crude rates calculated per 100 000 Estimated Resident Population for children aged 1–4 years for the average of the period 2003–2008.

(h) Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.

(i) Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.

(j) Rate ratio calculated by dividing Indigenous rates by non-Indigenous rates.

(k) Rate difference is the Indigenous rate less the non-Indigenous rate.

(l) 'Other causes' consist of all causes excluding the selected causes displayed in the table.

**np** Not published. – Nil or rounded to zero.

(a) Causes of death data for 2007 have undergone two years of revisions. See ABS *Causes of Death, Australia, 2009* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28–32.

(b) Causes of death data for 2008 have been revised and are subject to a revisions process. See ABS *Causes of Death, Australia, 2009* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.

(c) Causes of death data for 2009 are preliminary and subject to a revisions process. See ABS *Causes of Death, Australia, 2009* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.

(d) Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.

TABLE 4A.2.17

Table 4A.2.17 **Mortality rates for selected causes of death, children (0–4 years) deaths, 2003–2007 (a), (b), (c), (d), (e), (f)**

	Indigenous			Non-Indigenous (g)			Rate ratio (l)	Rate difference (m)
	Number	Rate per 100 000 (h), (i)	Crude percentage % (j)	Number	Rate per 100 000 (h), (k)	Crude percentage % (j)		

(e) Includes all deaths of children aged 0–4 years.

(f) Data are presented in 5-year groupings due to volatility of the small numbers involved.

(g) Non-Indigenous does not include deaths with a 'not stated' Indigenous status.

(h) Crude rates calculated per 100 000 Estimated Resident Population for children aged 1–4 years for the mid-point year.

(i) Denominators used in the calculation of rates for the Indigenous population are *Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians* (ABS Cat. no. 3238.0, series B, 2006 base).

(j) Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.

(k) Indigenous and non-Indigenous population estimates are available for census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the projected Indigenous population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

(l) Rate ratio calculated by dividing Indigenous rates by non-Indigenous rates.

(m) Rate difference is the Indigenous rate less the non-Indigenous rate.

(n) 'Other causes' consist of all causes excluding the selected causes displayed in the table.

(a) Causes of death data for 2007–2010 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28–32.

(b) Causes of death data for 2011 have been revised and are subject to a revisions process. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.

TABLE 4A.2.18

Table 4A.2.18 **Leading cause of death, infant (<1 year) 2007 to 2012 (a), (b), (c), (d), (e), (f), (g), (h)**

	Indigenous			Non-Indigenous (i)				
	Number	Rate per 1000 live births (j)	Crude percentage % (k)	Number	Rate per 1000 live births (j)	Crude percentage % (k)	Rate ratio (l)	Rate difference (m)
(c)	Causes of death data for 2012 are preliminary and subject to a revisions process. See ABS <i>Causes of Death, Australia, 2012</i> (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.							
(d)	Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(e)	Includes all deaths of infants aged less than 1 year of age.							
(f)	Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).							
(g)	Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.							
(h)	Aboriginal and Torres Strait Islander data for Western Australia were not published in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0). This adjusted data has been included in this table.							
(i)	Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(j)	Crude rates calculated per 1000 live births.							
(k)	Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.							
(l)	Rate ratio calculated by dividing Indigenous rates by non-Indigenous rates.							
(m)	Rate difference is the Indigenous rate less the non-Indigenous rate.

(a) Causes of death data for 2007 to 2010 have undergone two years of revisions and are now final. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions, and Explanatory Notes 28-32.

(b) Causes of death data for 2011 have been revised and are subject to a revisions process. See ABS *Causes of Death, Australia, 2012* (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.

TABLE 4A.2.19

Table 4A.2.19 **Leading cause of death, children (0–4 years), 2007 to 2012 (a), (b), (c), (d), (e), (f), (g), (h), (i)**

	Indigenous			Non-Indigenous			Rate ratio (m)	Rate difference (n)
	Number	Rate per 100 000 (j), (k)	Crude percentage % (l)	Number	Rate per 100 000 (j), (k)	Crude percentage % (l)		
(c)	Causes of death data for 2012 are preliminary and subject to a revisions process. See ABS <i>Causes of Death, Australia, 2012</i> (Cat. no. 3303.0) Technical Note: Causes of Death Revisions.							
(d)	Data are based on NSW, Queensland, WA, SA and the NT only. These five states have been included due to there being evidence of sufficient levels of identification and sufficient numbers of deaths to support mortality analysis.							
(e)	Includes all deaths of children aged 0–4 years.							
(f)	Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).							
(g)	Care should be taken when interpreting deaths data for Queensland as they are affected by recent changes in the timeliness of birth and death registrations. Queensland deaths data for 2010 have been adjusted to minimise the impact of late registration of deaths on mortality indicators. See data quality statements for a more detailed explanation.							
(h)	Aboriginal and Torres Strait Islander data for Western Australia were not published in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0) due to investigations being undertaken regarding the volatility of this data. Subsequently, Aboriginal and Torres Strait Islander deaths data in WA for the years 2007, 2008 and 2009 were adjusted to correct for potential over-reporting in this period. This data was released on 22 June, 2012 in <i>Causes of Death, Australia, 2010</i> (cat. no. 3303.0). This adjusted data has been included in this table.							
(i)	Deaths where the Indigenous status of the deceased was not stated are excluded from analysis.							
(j)	Crude rate is the number of deaths registered during the reference year per 100 000 estimated resident population for children aged 0–4 for the average of the 3 years surrounding the reference year. Crude rates cannot be compared across jurisdictions or across years.							
(k)	Denominators used in the calculation of rates for the Indigenous population are Experimental Estimates and Projections, Aboriginal and Torres Strait Islander Australians (ABS Cat. no. 3238.0, series B, 2011 base). There are no comparable population data for the non-Indigenous population. Denominators used in the calculation of rates for comparison with the Indigenous population have been derived by subtracting Indigenous population estimates/projections from total estimated resident population and should be used with care, as these data include population units for which Indigenous status were not stated.							
(l)	Crude percentage is number of deaths by cause divided by all deaths registered during the reference period. Crude percentages cannot be compared across jurisdictions or across years.							
(m)	Rate ratio calculated by dividing Indigenous rates by non-Indigenous rates.							

TABLE 4A.2.19

TABLE 4A.3.1

Table 4A.3.1 **Early Childhood Education and Care in Australia, as at 30 June 2013 (a)**

	<i>Child care</i>	<i>Preschool</i>			<i>Transition to primary school</i> <i>Year prior to Year One</i>	
	<i>Agency (b)</i>	<i>Program</i>	<i>Age of entry</i>	<i>Agency (b)</i>	<i>School year</i>	<i>Age of entry</i>
NSW (c)	Department of Education and Communities	Preschool	generally 4 and 5 year olds	Department of Education and Communities	Kindergarten	5 by 31 July
Vic (d)	Department of Education and Early Childhood Development	Kindergarten	4 by 30 April	Department of Education and Early Childhood Development	Preparatory (Prep)	5 by 30 April
Qld (e)	Department of Education, Training and Employment	Kindergarten	4 by 30 June	Department of Education, Training and Employment	Preparatory Year (Prep)	5 by 30 June
WA	Department of Local Government and Communities	Kindergarten	4 by 30 June	Department of Education	Pre Primary	5 by 30 June
SA (f)	Department for Education and Child Development	Preschool Kindergarten	entry after 4th birthday	Department for Education and Child Development	Reception	entry after 5th birthday
Tas	Department of Education	Kindergarten	4 by 1 January	Department of Education	Preparatory	5 by 1 January
ACT (g)	Community Services Directorate and Education and Training Directorate	Preschool	4 by 30 April	Education and Training Directorate	Kindergarten	5 by 30 April
NT (h)	Department of Education	Preschool	4 by 30 June, or 3 for Indigenous children in remote areas	Department of Education	Transition	5 by 30 June

- (a) The Early childhood education and care chapter reports data for child care and preschool services only. Data on primary school are reported in the School education chapter (chapter 4), but relate to 2012. Information on the first year of primary school are included here to show the point at which children can transition from preschool to the first year of primary school in each jurisdiction.
- (b) The departmental responsibility of agencies varies between child care and preschool. Agency responsibility refers to licensing services for child care, and licensing, funding and/or providing services for preschool programs. State and Territory education departments are responsible for primary school.
- (c) In NSW, all licensed children's services for under 6 year olds (who have not commenced Kindergarten) are required to offer programs that meet children's educational and developmental needs.
- (d) In Victoria, Aboriginal and Torres Strait Islander children and children known to child protection are eligible for free kindergarten through Early Start Kindergarten funding if they are aged 3 by 30 April of the year in which they are enrolled.

Table 4A.3.1 **Early Childhood Education and Care in Australia, as at 30 June 2013 (a)**

- 
- (e) All licensed children's services in Queensland are required to provide an appropriate program that is designed to stimulate and develop each child's creative, emotional, intellectual, lingual, physical, recreational and social potential.
  - (f) In SA, some children are entitled to enrol in preschool earlier. Indigenous children and children under the guardianship of the Minister can enter from 3 years, children with additional needs (which includes gifted children) and those living in small rural communities may commence at 3 ½ years. The compulsory school starting age in SA is 6 years at the oldest.
  - (g) In the ACT, private preschools are monitored and assessed by the ACT Community Services Directorate.
  - (h) In the NT children turning four after 30 June are eligible to enrol in a preschool program after their birthday, if places are available and with the understanding that the child will access more than 12 months of preschool. Indigenous children living in remote areas are eligible to enrol in preschool if they turn three on or prior to 30 June of the same year.

TABLE 4A.3.2

**Table 4A.3.2 Children aged 4 and 5 years enrolled in a preschool program in the year before full time schooling, by State and Territory, by Indigenous status, 2013**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i> (a)	<i>WA</i> (a), (b)	<i>SA</i> (c)	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
<b>Number of enrolled children in YBFS</b>										
Indigenous preschool children aged 4–5 years	no.	3 121	982	3 318	2 094	902	563	129	1 286	12 400
Non-Indigenous children aged 4–5 years (d)	no.	65 691	74 813	58 339	30 362	15 292	5 355	5 262	2 080	257 195
<b>Number of 4 year old children in the population</b>										
Indigenous children (e)	no.	5 176	1 175	5 154	2 109	904	640	138	1 479	16 777
Non-Indigenous children (f)	no.	90 760	70 941	58 534	30 954	19 080	5 856	4 883	2 158	283 193
<b>Proportion of children enrolled in preschool in YBFS</b>										
Indigenous children	%	60.3	83.6	64.4	99.3	99.8	88.0	93.5	87.0	73.9
Non-Indigenous children (d)	%	72.4	105.5	99.7	98.1	80.1	91.4	107.8	96.4	90.8

YBFS = Year Before Full time Schooling.

- (a) Care needs to be taken when interpreting Queensland and WA counts as there may be some duplication of children across different provider types. This is due to the inclusion of child aggregate data from some service providers.
- (b) WA child preschool attendance data have been used as a proxy for enrolment data.
- (c) SA preschools transitioned to the 'Same First Day' enrolment policy in 2013. Enrolments changed from 4 intakes per year previously, to 2 intakes per year in 2013 (Term 1 and Term 2 only). This brings SA closer to alignment with other jurisdictions (which have 1 intake per year).
- (d) Excludes children for whom Indigenous status is unknown or not stated.
- (e) Series B population projections as at 30 June 2013.
- (f) Non-Indigenous population counts are derived by subtracting the Aboriginal and Torres Strait Islander population projections for 30 June 2013 from the estimated resident population (ERP) counts for 30 June 2013. ERP data are preliminary.

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) Due to the low response rate in some school sectors in some states and territories, data are only available at the national level.

(c) The higher level of school or non– school education that either parent/guardian has completed is reported.

(d) Certificate I to IV includes Australian Qualifications Framework (AQF) trade certificates.

(e) Parental education may not have been stated on enrolment forms.

(f) The higher occupational group of either parent/guardian is reported.

(g) Parental occupation may not have been stated on enrolment forms.

(h) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Percentage of students at or above NMS is substantially higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Percentage of students at or above NMS is higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Percentage of students at or above NMS is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Percentage of students at or above NMS is lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Percentage of students at or above NMS is substantially lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

(h) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Percentage of students at or above NMS is substantially higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Percentage of students at or above NMS is higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Percentage of students at or above NMS is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Percentage of students at or above NMS is lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Percentage of students at or above NMS is substantially lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) Due to the low response rate in some school sectors in some states and territories, data are only available at the national level.

(c) The higher level of school or non– school education that either parent/guardian has completed is reported.

(d) Certificate I to IV includes Australian Qualifications Framework (AQF) trade certificates.

(e) Parental education may not have been stated on enrolment forms.

(f) The higher occupational group of either parent/guardian is reported.

(g) Parental occupation may not have been stated on enrolment forms.

.. Not applicable.

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) Due to the low response rate in some school sectors in some states and territories, data are only available at the national level.

(c) The higher level of school or non– school education that either parent/guardian has completed is reported.

(d) Certificate I to IV includes Australian Qualifications Framework (AQF) trade certificates.

(e) Parental education may not have been stated on enrolment forms.

(f) The higher occupational group of either parent/guardian is reported.

(g) Parental occupation may not have been stated on enrolment forms.

.. Not applicable.

Not stated (g)	±	4.3	2.8	4.1	1.0	0.5	0.9

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) Due to the low response rate in some school sectors in some states and territories, data are only available at the national level.

(c) The higher level of school or non– school education that either parent/guardian has completed is reported.

(d) Certificate I to IV includes Australian Qualifications Framework (AQF) trade certificates.

(e) Parental education may not have been stated on enrolment forms.

(f) The higher occupational group of either parent/guardian is reported.

(g) Parental occupation may not have been stated on enrolment forms.

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) Due to the low response rate in some school sectors in some states and territories, data are only available at the national level.

(c) The higher level of school or non- school education that either parent/guardian has completed is reported.

(d) Certificate I to IV includes Australian Qualifications Framework (AQF) trade certificates.

(e) Parental education may not have been stated on enrolment forms.

(f) The higher occupational group of either parent/guardian is reported.

(g) Parental occupation may not have been stated on enrolment forms.

**Table 4A.4.33 Proportion of year 7 students who achieved at or above the national minimum standard for numeracy, by Indigenous status, by geolocation, 2013 (per cent) (a), (b)**

<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
-------------	------------	------------	------------	-----------	-----------	------------	------------	-----------	-------------

(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.

(b) The method used to identify Indigenous students varies between jurisdictions.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Percentage of students at or above NMS is substantially higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Percentage of students at or above NMS is higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Percentage of students at or above NMS is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Percentage of students at or above NMS is lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Percentage of students at or above NMS is substantially lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

**Table 4A.4.36 Proportion of year 9 students who achieved at or above the national minimum standard for numeracy, by Indigenous status, by geolocation, 2013 (per cent) (a), (b)**

	<i>Unit</i>	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
(a) Exempt students were not assessed and are deemed not to have met the national minimum standard.										
(b) The method used to identify Indigenous students varies between jurisdictions.										
(c) Nature of difference refers to the combined impact of statistical significance and effect size.										
▲ Percentage of students at or above NMS is substantially higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.										
△ Percentage of students at or above NMS is higher than and is statistically significantly different from the base year (or previous year) for this State/Territory.										
■ Percentage of students at or above NMS is close to or not statistically different from the base year (or previous year) for this State/Territory.										
▽ Percentage of students at or above NMS is lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.										
▼ Percentage of students at or above NMS is substantially lower than and is statistically significantly different from the base year (or previous year) for this State/Territory.

		2008	2009	2010	2011	2012	2013	2008 vs 2013	2012 vs 2013
<b>Total</b>	<b>no.</b>	<b>405.0 ± 1.1</b>	<b>415.0 ± 1.1</b>	<b>418.6 ± 1.0</b>	<b>420.4 ± 1.1</b>	<b>424.2 ± 1.0</b>	<b>423.4 ± 1.0</b>	▲	■

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

TABLE 4A.4.124

Table 4A.4.124 **Mean scale score for year 5 numeracy, by Indigenous status, by geolocation, by year (number) (a), (b)**

	Unit	Year						Nature of difference (c)	
		2008	2009	2010	2011	2012	2013	2008 vs 2013	2012 vs 2013
<b>Total</b>	<b>no.</b>	<b>479.5 ± 1.0</b>	<b>490.3 ± 1.0</b>	<b>492.6 ± 1.0</b>	<b>491.3 ± 1.0</b>	<b>492.6 ± 1.0</b>	<b>489.8 ± 1.0</b>	■	■

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

TABLE 4A.4.127

Table 4A.4.127 **Mean scale score for year 9 reading, by Indigenous status, by geolocation, by year (number) (a), (b)**

	Unit	Year						Nature of difference (c)	
		2008	2009	2010	2011	2012	2013	2008 vs 2013	2012 vs 2013
<b>Total</b>	<b>no.</b>	<b>581.3 ± 1.5</b>	<b>583.8 ± 1.4</b>	<b>577.1 ± 1.5</b>	<b>582.5 ± 1.5</b>	<b>578.0 ± 1.5</b>	<b>583.6 ± 1.4</b>	■	■

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) The method used to identify Indigenous students varies between jurisdictions.

(b) Each estimate is presented with the 95 per cent within-year confidence interval.

(c) Nature of difference refers to the combined impact of statistical significance and effect size.

▲ Average achievement is substantially above and is statistically significantly different from the base year (or previous year) for this State/Territory.

△ Average achievement is above and is statistically significantly different from the base year (or previous year) for this State/Territory.

■ Average achievement is close to or not statistically different from the base year (or previous year) for this State/Territory.

▽ Average achievement is below and is statistically significantly different from the base year (or previous year) for this State/Territory.

▼ Average achievement is substantially below and is statistically significantly different from the base year (or previous year) for this State/Territory.

(a) Data for Indigenous people are from the 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey. This data should not be compared to the Census of Population and Housing data.

(b) People aged 20–24 years who have completed year 12 or Certificate II or above (includes 'Certificate I/II not further defined (nfd)' and III/IV nfd' but excludes persons with a 'Certificate I and Certificate nfd' and people whose level of non-school qualification could not be determined).

(c) Data for non-Indigenous people are from the 2011-13 Australian Health Survey. This data should not be compared to the Census of Population and Housing data.

(d) Data for Indigenous people are from the 2008 National Aboriginal and Torres Strait Islander Social Survey. This data should not be compared to the Census of Population and Housing data.

(e) Data for non-Indigenous people are from the 2007-08 National Health Survey. This data should not be compared to the Census of Population and Housing data.

(f) Due to the small sample size for the Northern Territory in 2007-08, data for non-indigenous people should be treated with high degree of caution.

– Nil or rounded to zero.

(a) Data in this table are from the Census of Population and Housing. These data should not be compared to data from the AATSIHS, AHS, NATSISS or NHS.

(b) Australia includes 'Other Territories'.

(c) People aged 20–24 years who have completed year 12 or Certificate II or above (includes 'Certificate I or II nfd' but excludes people with a 'Certificate nfd' and people whose level of non-school qualification could not be determined).

(d) Total population of all people aged 20–24 years, excluding persons whose highest year of school completed and/or level of education was not stated.

RSE = Relative Standard error. CI = Confidence interval.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution.

(b) Excludes people attending secondary school.

(c) Includes people who never attended school.

(d) 2004-05 total includes 'not stated'.

(e) Proportions for Equivalised gross weekly household income are of people living in households with a known total income. Households with a not known or not stated income have been excluded.

(f) Whether has long-term condition' is from the Australian Aboriginal and Torres Strait Islander Health Survey 2012-13 (National Aboriginal and Torres Strait Islander Health Survey component). The National Aboriginal and Torres Strait Islander Survey component is based on a sample of 9,300 Aboriginal and Torres Strait Islander people, whereas the Australian Aboriginal and Torres Strait Islander Health Survey Core component (National Aboriginal and Torres Strait Islander Survey and National Aboriginal and Torres Strait Islander Nutrition and Physical Activity Survey) is based on a sample of 12 900 Aboriginal and Torres Strait Islander people.

(g) Total includes persons 15 years and over who have or do not have a non-school qualification, including not applicable and excludes those studying at secondary school.

na Not available.

(a) The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. The Indigenous population are derived from ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (series b, 2011 base).

(a) The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. The Indigenous population are derived from ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (series b, 2011 base). Indigenous and non-Indigenous population estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population estimates/projections from the total population. In the present table, non-Indigenous population estimates have been derived by subtracting the 2011 Census-based Indigenous population estimates/projections from the 2011 Census-based total persons Estimated Resident Population (ERP). Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.

- (a) This is a count of all year 12 students in each year grouped into those achieving ATARs in various ranges. The count includes year 12 students who did not apply for admission to a tertiary institution or college.
- (b) The ATAR is calculated solely for the use of tertiary institutions to compare the overall achievement of students who have completed different combinations of year 12 certificate studies. ATAR was previously known as ENTER (Equivalent National Tertiary Entrance Rank) in Victoria and TER (Tertiary Entrance Rank) in Western Australia, South Australia, Tasmania and the NT. The change to ATAR, the nationally agreed name used by all Australian states and territories (except Queensland), is a change in name only. There is no change to the calculation. Universities admission organisations use year 12 certificate results issued by State/Territory assessment bodies to calculate the ATAR. The ATAR is not a score - it is a rank (which shows a student's achievement in relation to other students). Queensland uses a ranking system (OP) which is not equivalent to the ATAR. A conversion table for the Queensland OP to the ATAR is available on the QTAC website ([www.qtac.edu.au](http://www.qtac.edu.au)).
- (c) Most universities, TAFE colleges and other institutions take a holistic approach when assessing applications from Indigenous students. Institutions typically have parallel assessment processes. This means that Indigenous applicants are often not assessed solely on the basis of their academic results.
- (d) Indigenous status not available for 2006 NSW school-leavers. International students included for NSW school-leavers for all years.

Table 4A.5.11      **Year 12 students achieving ATARs, by ATAR range, 2006–2013 (a), (b), (c)**

ATAR range	Unit	Indigenous	Non-Indigenous	Unknown	All students
------------	------	------------	----------------	---------	--------------

- (e) The ATAR rate shown in this report is the number of students who achieved an ATAR of 50.00 or above expressed as a percentage of the estimated potential year 12 population. The estimated potential year 12 population is an estimate of a single year age group which could have attended year 12 that year, calculated as the estimated resident population aged 15–19 years divided by five. Calculations of rates for the Indigenous population are based on ABS Experimental Projections, Aboriginal and Torres Strait Islander Australians (low series, 2006 base). Non-Indigenous estimates are available for Census years only. In the intervening years, Indigenous population figures are derived from assumptions about past and future levels of fertility, mortality and migration. In the absence of non-Indigenous population figures for these years, it is possible to derive denominators for calculating non-Indigenous rates by subtracting the Indigenous population from the total population. Such figures have a degree of uncertainty and should be used with caution, particularly as the time from the base year of the projection series increases.
- (f) The ineligible data for all students is based on an age-weighted calculation using the ABS estimates of each age cohort and the relative age distribution of people achieving the ATAR in the year. Tasmania was unable to provide this data disaggregated by Indigenous status for 2011 to 2013.
- (g) Ineligible means completed the requirements for an ACT Year 12 certificate only. That is did not meet ACT requirements for an ATAR.
- (h) Does not include WA.

Unemployment rate	%	4.5	4.4	4.5	3.7	4.0	5.3	3.8	0.7	4.3
Upper and lower 95 per cent confidence intervals	%	0.9	1.0	1.0	1.0	1.0	1.7	1.1	1.5	0.4
RSE	%	10.2	11.0	11.4	14.0	12.1	16.8	15.3	na	5.0
Rate ratio (d)		3.4	3.4	3.8	4.3	3.2	3.7	2.2	na	3.6
Rate difference (e)		10.7	10.4	12.5	12.2	8.6	14.4	4.4	na	11.2

**RSE** = Relative standard error.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution.

(b) Data for Indigenous people are from the National Aboriginal and Torres Strait Islander Health Survey for 2004-05, the National Aboriginal and Torres Strait Islander Social Survey for 2008 and the Australian Aboriginal and Torres Strait Islander Health Survey for 2012-13.

(c) Data for non-Indigenous people are from the National Health Survey for 2004-05 and 2007-08 and the Australian Health Survey for 2011-13.

(d) Rate ratio is the Indigenous proportion divided by the non-Indigenous proportion.

TABLE 4A.6.8

Table 4A.6.8      **Proportion of the labour force who are unemployed (15–64 year olds), by State and Territory by Indigenous status, 2004-05, 2008 and 2011-13 (a)**

Unit	<i>NSW</i>	<i>Vic</i>	<i>Qld</i>	<i>WA</i>	<i>SA</i>	<i>Tas</i>	<i>ACT</i>	<i>NT</i>	<i>Aust</i>
------	------------	------------	------------	-----------	-----------	------------	------------	-----------	-------------

(e) Rate difference is the Indigenous proportion less the non-Indigenous proportion.

**na** Not available. – Nil or rounded to zero.

Rate ratio (c)		0.8	0.8	0.8	0.8	0.7	0.8	0.8	0.6	0.8
Rate difference (d)		-18.0	-13.5	-12.9	-17.6	-23.0	-12.0	-12.7	-29.4	-17.6

**RSE** = Relative standard error.

- (a) Data for Indigenous people are from the National Aboriginal and Torres Strait Islander Health Survey for 2004-05, the National Aboriginal and Torres Strait Islander Social Survey for 2008 and the Australian Aboriginal and Torres Strait Islander Health Survey for 2012-13.
- (b) Data for non-Indigenous people are from the National Health Survey for 2004-05 and 2007-08 and the Australian Health Survey for 2011-13.
- (c) Rate ratio is the Indigenous proportion divided by the non-Indigenous proportion.
- (d) Rate difference is the Indigenous proportion less the non-Indigenous proportion.

RSE = Relative standard error. CI = Confidence interval.

(a) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution.

(b) Includes people who have indicated that they have attained a non-school qualification at Certificate III level or above.

(c) Includes people who have indicated that they are studying, but excludes those who already have a non-school qualification at Certificate III level or above.

(d) Total 20–64 year old population, excluding people who were not studying and had a level of non-school qualification that was not stated.

– Nil or rounded to zero.

RSE = Relative standard error. CI = Confidence interval.

(a) Estimates with a relative standard error of 25 per cent to 50 per cent should be used with caution.

(b) Comprises people who have indicated that they have attained a non-school qualification at Certificate III level or above.

(c) Includes people who have indicated that they are studying, but excludes those who already have a non-school qualification at Certificate III level or above.

(a) Success is defined as the student progress rate (SPR), which is the proportion of units passed within a year compared with the total units enrolled.

(b) Numbers have been rounded to zero decimal places.

(c) Data is for domestic students only.

(d) Includes students with unknown Indigenous status.

– Nil or rounded to zero.

(a) Includes all VET delivered by TAFE and other government providers and publicly funded VET programs delivered by private providers. Excludes VET delivered in schools, where the delivery was undertaken by schools.

(b) Remoteness is based on the Access/Remoteness Index of Australia (ARIA+), which was developed by the National Centre for Social Applications of Geographic Information Systems (GISCA). From 2011, remoteness is determined from ARIA+ remoteness regions and ABS SA2 regions, in accordance with the Australian Statistical Geography Standard (ASGS).

(b) The 2012-13 AATSIHS (NATSIHS component) total population is not strictly comparable with 2008 NATSISS as the 2008 NATSISS had a different question ordering which may have overestimated disability prevalence. The ordering of questions in the disability module of the National Health Survey also changed between 2007-08 and 2011-12. 2002 and 2008 NATSISS are not comparable due to the addition of two extra disability categories in 2008. 2004-05 NATSIH and 2004-05 NHS data for this indicator is not available.

**np** Not published. – Nil or round to zero.

(b) The 2012-13 AATSIHS (NATSIHS component) total population is not strictly comparable with 2008 NATSISS as the 2008 NATSISS had a different question ordering which may have overestimated disability prevalence. The ordering of questions in the disability module of the National Health Survey also changed between 2007-08 and 2011-12. 2002 and 2008 NATSISS are not comparable due to the addition of two extra disability categories in 2008. 2004-05 NATSIH and 2004-05 NHS data for this indicator is not available.

**np** Not published. – Nil or round to zero.

**Est.** = Estimate. **Prop.** = proportion. **AS prop.** = Age Standardised proportion. **RSE** = Relative Standard Error. **CI** = Confidence Interval.

- (a) The 2012-13 AATSIHS (NATSIHS component) total population is not strictly comparable with 2008 NATSISS as the 2008 NATSISS had a different question ordering which may have overestimated disability prevalence. The ordering of questions in the disability module of the National Health Survey also changed between 2007-08 and 2011-12. 2002 and 2008 NATSISS are not comparable due to the addition of two extra disability categories in 2008. 2004-05 NATSIH and 2004-05 NHS data for this indicator is not available.
- (b) The rate ratio is calculated by dividing the proportion for Indigenous people by the corresponding proportion for non-Indigenous people.
- (c) Head injury, stroke or brain damage' is a new category in the 2012-13 AATSIHS (NATSIHS component). This item when combined with 'Physical' is comparable to 'Physical' in the other surveys.
- (d) Sum of components may be more than subtotal as persons may have reported more than one disability type.

TABLE 4A.8.10

**Est.**= Estimate. **Prop.**= Proportion. **RSE** = Relative Standard Error. **CI** = Confidence Interval.

- (a) Estimates with a RSE of 25 per cent to 50 per cent should be interpreted with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.
- (b) Remoteness areas are derived from the Australian Statistical Geography Standard (ASGS) developed by the ABS. The ASGS remoteness classification identifies a region in Australia as having a particular degree of remoteness. Remoteness areas comprise five categories: major cities, inner regional, outer regional, remote, and very remote. The degree of remoteness of an area is determined using the Accessibility/Remoteness Index of Australia (ARIA). For more information on how ARIA is defined see the Information Papers ABS Views on Remoteness, 2001 (Cat. no. 1244.0) and Outcomes of ABS Views on Remoteness Consultation, Australia (Cat. no. 1244.0.00.001).
- (c) The rate ratio is calculated by dividing the proportion for Indigenous people by the corresponding proportion for non-Indigenous people.
- (d) Head injury, stroke or brain damage is a new category in the 2012-13 AATSIHS (NATSIHS component). This item when combined with 'Physical' is comparable to 'Physical' in the other surveys.

TABLE 4A.8.11

Labour Force Participation Rate	%	4.6	5.5	4.4	4.3	5.4	5.9	7.3	5.1	2.1

(a) Disability status is for Non-Remote and Remote areas. Due to differences in collection methodology in remote areas, 'All with reported disability' is not comparable to AHS data.

(b) Estimates with a relative standard error (RSE) of 25 per cent to 50 per cent should be used with caution. Estimates with a RSE greater than 50 per cent are considered too unreliable for general use.

– Nil or rounded to zero. **np** Not published.

Third quintile	%	1.5	1.9
Fourth quintile	%	1.7	1.8
Highest quintile	%	0.8	1.3

(a) Disability status is for both Non-Remote and Remote areas. Due to differences in collection methodology in remote areas, 'Total with a disability' is not comparable to Australian Health Survey (2012-13) data.

(b) Non-Indigenous: Equivalised household income quintile boundaries for the total population as derived from the 2011-13 Australian Health Survey are: lowest quintile less than \$399 per week; second quintile \$399-\$638 per week; third quintile \$639-\$958 per week; fourth quintile \$959-\$1 437 per week; highest quintile \$1 438 or more per week.

Indigenous: Equivalised household income quintile boundaries for the total population were derived from the 2011-13 Australian Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2011-12 enumeration period of the National Health Survey and National Nutrition and Physical Activity Survey and the 2012-13 enumeration period of the National Aboriginal and Torres Strait Islander Health Survey. These are: lowest quintile less than \$407 per week; second quintile \$407-\$651 per week; third quintile \$652-\$978 per week; fourth quintile \$979-\$1 467 per week; highest quintile \$1 468 or more per week.

(a) The 'Unpaid Assistance to a Person with a Disability' variable records people who, in the two weeks prior to Census night, spent time providing unpaid care, help or assistance to family members or others because of a disability, a long term illness or problems related to old age.

TABLE 4A.8.17

Table 4A.8.17      **Labour force status of carers aged 15–64 years, by remoteness, 2006 and 2011 (a), (b)**

	<i>Unit</i>	<i>Major cities</i>	<i>Inner regional</i>	<i>Outer regional</i>	<i>Remote</i>	<i>Very remote</i>
(b)	Based on place of usual residence.					
(c)	Includes 'Aboriginal', Torres Strait Islander' and 'Both Aboriginal and Torres Strait Islander'.					
(d)	The number of employed carers expressed as a percentage of all carers aged 15–64 years.					
(e)	The number of unemployed carers expressed as a percentage of all carers aged 15–64 years in the total labour force.					
(f)	The number of carers in the labour force expressed as a percentage of all carers aged 15–64 years.

Chronic obstructive pulmonary diseases (J41–J44)	3 198	59 183	1032.8	232.5	4.4	800.3

**Indig.** = Indigenous. **Non-Indig.** = Non-Indigenous.

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification).
- (b) Directly age-standardised (AS) using the Australian 2001 standard population.
- (c) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous hospitalisation rate.
- (d) Rate difference is the age standardised Indigenous hospitalisation rate minus the non-Indigenous hospitalisation rate.
- (e) Data are reported for public and private hospitals in all jurisdictions. From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality.

(a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis and sub-chapter level diseases in the ICD-10-AM classification were used to select the diseases.

(b) Data are reported for public and private hospitals in all jurisdictions. From 2004-05 to 2009-10, six jurisdictions (NSW, Victoria, Queensland, WA, SA and the NT) were considered to have acceptable quality of Indigenous identification in hospitalisation data. From 2010-11 onwards, data for all jurisdictions are considered to be of acceptable quality.

(c) Data are reported for public and private hospitals in NSW, Victoria, Qld, WA and SA and public hospitals in the Northern Territory, for residents of these jurisdictions.

(d) 'Other' includes hospitalisations of non-Indigenous people and those for whom Indigenous status was not stated.

(e) Directly age-standardised using the Australian 2001 standard population.

(f) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the 'other Australians' hospitalisation rate (which includes Indigenous status not reported).

(g) Rate difference is the age standardised Indigenous hospitalisation rate minus the 'other Australians' hospitalisation rate.

- (a) Categories are based on ICD-10-AM classification of diseases (International Statistical Classification of Diseases and Related Health Problems, 10th Revision, Australian Modification). Principal diagnosis and sub-chapter level diseases in the ICD-10-AM classification were used to select the diseases.
- (b) Disaggregation by remoteness area is based on the ABS' 2011 Australian Statistical Geography Standard (ASGS) and relates to the patient's usual residence, not the location of hospital. Hence, rates represent the number of separations for patients living in each remoteness area divided by the total number of people living in that remoteness area.
- (c) Rates per 100 000 population are calculated using ABS Estimated 2012 Resident Population by remoteness classification from the 2011 Census (as at 30 June 2011). Rates were directly age standardised to the 2001 Australian population.
- (d) Rate ratio is the age standardised Indigenous hospitalisation rate divided by the non-Indigenous hospitalisation rate.
- (e) Rate difference is the age standardised Indigenous hospitalisation rate minus the non-Indigenous hospitalisation rate.

**RSE** = Relative standard error. **CI** = Confidence interval.

(a) Estimates with a RSE of between 25 per cent to 50 per cent should be used with caution.

(b) Equivalised household income quintile boundaries for the total population as derived from the 2004-05 National Health Survey are: lowest quintile less than \$295 per week; second quintile \$295–\$478 per week; third quintile \$479–\$688 per week; fourth quintile \$689–\$996 per week; highest quintile \$997 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.

(c) Equivalised household income quintile boundaries for the total population as derived from the 2008-09 Survey of Income and Housing are: lowest quintile less than \$330 per week; second quintile \$330–\$561 per week; third quintile \$562–\$835 per week; fourth quintile \$836–\$1 240 per week; highest quintile \$1 241 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.

TABLE 4A.9.2

Table 4A.9.2 **Equivalised gross weekly household income quintiles, people aged 18 years or over, by State and Territory, 2004-05, 2008 and 2011-13 (a), (b), (c), (d) (Survey)**

**RSE** = Relative standard error. **CI** = Confidence interval.

- (a) Estimates with a RSE of between 25 per cent to 50 per cent should be used with caution.
- (b) Equivalised household income quintile boundaries for the total population as derived from the 2004-05 National Health Survey are: lowest quintile less than \$295 per week; second quintile \$295–\$478 per week; third quintile \$479–\$688 per week; fourth quintile \$689–\$996 per week; highest quintile \$997 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.
- (c) Equivalised household income quintile boundaries for the total population as derived from the 2008-09 Survey of Income and Housing are: lowest quintile less than \$330 per week; second quintile \$330–\$561 per week; third quintile \$562–\$835 per week; fourth quintile \$836–\$1 240 per week; highest quintile \$1 241 or more per week. These have been applied to both the Indigenous and non-Indigenous populations.
- (d) Non-Indigenous: Equivalised household income quintile boundaries for the total population as derived from the 2011-13 Australian Health Survey are: lowest quintile less than \$399 per week; second quintile \$399–\$638 per week; third quintile \$639–\$958 per week; fourth quintile \$959–\$1 437 per week; highest quintile \$1 438 or more per week.  
Indigenous: Equivalised household income quintile boundaries for the total population were derived from the 2011-13 Australian Health Survey and adjusted for Consumer Price Index (CPI) increases between the 2011-12 enumeration period of the National Health Survey and National Nutrition and Physical Activity Survey and the 2012-13 enumeration period of the National Aboriginal and Torres Strait Islander Health Survey. These are: lowest quintile less than \$407 per week; second quintile \$407–\$651 per week; third quintile \$652–\$978 per week; fourth quintile \$979–\$1 467 per week; highest quintile \$1 468 or more per week.
- (e) Comprises persons living in households where household income was stated. Note that equivalised gross weekly household income quintiles are calculated as a proportion of households with stated household income.
- (f) Total with household income stated shown as a proportion of the total.
- (g) Includes people who reported no source of income.
- (h) Difference between 2004-05 and 2008 Indigenous rate is statistically significant.
- (i) Difference between 2008 Indigenous and non-Indigenous rate is statistically significant.

(a) An income quintile is derived by ranking the population from lowest to highest income, and dividing it into five equal groups. The lowest quintile is made up of the 20 per cent of the population with the lowest incomes.

(b) Data excludes 'all incomes not stated' and 'partial incomes'.

TABLE 4A.9.4

Table 4A.9.4 **Equivalised gross weekly household income quintiles, by State and Territory, and remoteness, 2011 (Census) (a), (b)**

	Quintile 1 (c)		Quintile 2		Quintile 3		Quintile 4		Quintile 5	
Quintile range \$/week	<\$350		\$350–649		\$649–922		\$922–1363		\$1363 or more	
	No.	%	No.	%	No.	%	No.	%	No.	%

(c) Quintile 1 includes households with Negative or Nil Income.

(d) Comprises households where at least one usual resident at home on Census night was of Aboriginal and/or Torres Strait Islander origin.

(e) Total includes Migratory/Offshore/Shipping areas.

(f) Australia total includes Other Territories.

.. Not applicable. – Nil or rounded to zero.

Source: ABS (unpublished) derived from the 2011 Census of Population and Housing.
