

# R&D, Human Capital and Growth

*Steve Dowrick*  
*Australian National University*

# Primary Sources of Growth in Labour Productivity

- **Accumulation of physical capital**
  - ultimately subject to diminishing returns
  - hence it affects level of growth path, not its slope
- **Accumulation of embodied human capital**
  - through education / training / learning-by-doing
  - limited perhaps by finite human capabilities
- **Accumulation of ideas (technological progress)**
  - through R&D
  - through national spillovers
  - through international spillovers

# Evidence on Human Capital

## Microeconomic studies of education and earning

### 1. Estimated impact of an additional year of school on wages

Ashenfelter and Krueger	USA	9% to 16%
Miller, Mulvey and Martin	Australia	4.5% to 8.3%
Lee and Miller	Australia	9.2%

## 2. Estimated impact of attained schooling on wages

	Borland, Hirschberg and Lye	Preston
Completed high school	7.1%	13.4%
Certificate	28.5%	26.9%
Diploma		55.9%
Degree	46.2%	89.3%

# Macroeconomic Evidence on Schooling and Growth in OECD countries

Predicted increase in the level of output for an additional year of national average schooling

<u>STUDY</u>	
Bassanini and Scarpetta (2002)	6 %
Mankiw <i>et al.</i> (1992)	6% - 15%

# Evidence on Increase in Productivity Growth Due to an Additional Year of Schooling

(through international technological spillovers for a country at 2/3 of US productivity level)

Benhabib and Spiegel (1994)	0.3 % <i>p.a.</i>
Frantzen (2000)	0.8 % <i>p.a.</i>
Dowrick & Rogers (2002)	0.2 – 0.5 % <i>p.a.</i>

# Research and Development Industry-Level Evidence

## Private and Social Marginal Rates of Return on Investment in US Manufacturing Industries, 1985

(before tax, net of depreciation)

	Investment in Physical Capital	Investment in R&D	
	<i>Private Returns</i>	<i>Private Returns</i>	<i>Social Returns</i> <sup>1</sup>
Chemical Products	20%	22%	46%
Fabricated Metal	21%	21%	21%
Non-electrical Machinery	24%	25%	40%
Electrical Products	18%	27%	31%
Transport Equipment	26%	23%	35%
Scientific Instruments	28%	28%	86%

Source: Bernstein and Nadiri (1991) Table 6

1. 'Social' returns are defined as private returns plus spillovers to the other industries covered in the study.

# International Evidence

		<i>Private Rate of Return</i>	<i>Social Rate of Return</i>	<i>Cross-country Spillover Elasticity</i>
<b>Lichtenberg and Siegel (1991)</b>	<b>i) survey of 15 previous studies of US firms and industries</b>	<b>25%</b>		
	<b>ii) 2000 US firms</b>	<b>30%</b>		
<b>Nadiri (1993)</b>	<b>survey of 50 US studies of firms and industries</b>	<b>20% to 30%</b>	<b>50%</b>	
<b>Lichtenberg and van Pottelsberghe (1996)</b>	<b>GDP growth across OECD countries</b>		<b>51-63%</b>	
<b>Coe &amp; Helpman (1995)</b>	<b>OECD countries, pooled time-series 1971-90</b>		<b>85%<sup>1</sup></b>	<b>6%<sup>2</sup></b>
<b>Frantzen (2000)</b>	<b>Business sector TFP growth across OECD countries</b>		<b>59%</b>	
<b>Lichtenberg and van Pottelsberghe (1998)</b>	<b>TFP across OECD</b>			<b>5% – 11%</b>

# Concluding Comments

- Investment in both education and R&D promote productivity growth
- There is evidence of significant spillover effects from education in its role as an enabler of technological diffusion
- There is also evidence of substantial national and international spillovers of R&D
- These spillover effects are not captured by standard growth accounting methods
